ABBREVIATIONS

The titles of subjects, which are printed first in bold type, have been abbreviated within each article to the initial letter or letters.

ac., acre(s).
agric., agricultural.
ambas., ambassador(s).
Amer., American.
anot., ancient.
ann., annual.
arron., arrondissement.
A.-S., Anglo-Saxon.
A.V., Authorised Version.
b., born.
Bio. Dic., Biographical Dictionary.
bor., borough.
bp., birthplace.
Bri', British.
C., centigrade.
c., about.
cap., capital.
c., compare.
co., county.
com., commune.
cu. ft., cubic feet.
d., died.
Dan., Danish.
dept., department.
dist., district.
div., division.
E., east; eastern.
eccles., ecclesiastical.
ed., edition; edited.
e.g., for example.
Ency. Brit., Encyclopædia Britannica.
Eng., English.
estab., established; establishment.
F., Fahrenheit.
fl., flourished.
fort. tn., fortified town.
Fr., French.
ft., feet.
Ger., German.
Gk., Greek.
gov., government.
Heb., Hebrew.
hist., history.
horticult., horticultural.
h.p., horse-power.
hr., hour.
i.e., that is.
in., inch(es).
inhab., inhabitant(s).

is., island(s).
It., Italian.
Jap., Japanese.
jour., journal.
Lat., Latin.
lat., latitude.
lb., pound(s).
l. b., left bank.
long., longitude.
m., mile(s).
manuf., manufacture.
min., minute(s).
mrkt. tn., market town.
MS., manuscript.
mt., mount; mountain.
N., north; northern.
N.T., New Testament.
O.E., Old English.
O.F., Old French.
O.T., Old Testament.
oz., ounce(s).
par., parish.
parl., parliamentary.
pop., population.
prin., principal.
prof., professor.
prov., province; provincial.
pub., published; publication.
q.r., which see.
R., riv., river.
r. b., right bank.
Rom., Roman.
R.V., Revised Version.
S., south; southern.
sec., second(s).
sev., several.
Sp., Spanish.
sp. gr., specific gravity.
sq. m., square mile(s).
temp., temperature.
ter., territory.
tn., town.
trans., translated; translation.
trib., tributary.
univ., university.
urb., urban.
vil., village.
vol., volume.
W., west; western.
Wm., William.
yd., yard.

The article ABBREVIATIONS contains a list of those in general use.
 See also ABBREVIATION (music) and ELEMENTS (chemical symbols).

Foote, Samuel (1720-77), actor and dramatist. After squandering his patrimony, went on the stage, making his first appearance in a small part in *Othello* at the Haymarket in 1744. He at once achieved some success, and later became a fashionable actor, and was highly regarded by the public of his day. Occasionally he gave entertainments, in which he was able to exhibit his powers of mimicry, which were very considerable. He wrote many plays, some of which were once highly regarded. More than once the censor interfered with his productions, and he was forbidden to play his *Trip to Calais*, in which he lampooned the bigamous duchess of Kingston. A clever man and a brilliant conversationalist, he was much sought, but his selfishness and unscrupulousness left him almost friendless. There is a biography by Wm. Cooke, 1805. See also Boswell's *Life of Johnson*.

Foot Guards, select regiments, the 'flower of the Brit. infantry,' including Grenadier (three battalions), Coldstream (three battalions), and Scots Guards (two battalions), the Irish Guards (one battalion), and the Welch Guards (one battalion). They form the garrison of the metropolis. See **HOUSEHOLD TROOPS** and under the names of the sev. regiments.

Footpaths, see under **MOUNTAINS**.

Footpaths, and Preservation of, paths for the use of pedestrians (foot-passengers) only, as opposed to highways for vehicles or horses. The Commons, Open Spaces, and Footpaths Preservation Society (formed 1899 by amalgamation of the National Footpath Preservation Society with the Commons Preservation Society) aims at preserving footpaths, bridle-paths, and other rights of way. It serves to guard public rights to common land, roadside waste, vil. greens, and all open spaces of the kind. London offices are at 71 Eccleston Square, Westminster. Scotland has a similar Scottish Rights of Way and Recreation Society Ltd.

Plans for giving to the public new rights of access to mts., moors and other uncultivated land, and for creating new rights of way and defining and maintaining old ones, are outlined in the report of the Special Committee on Footpaths and Access to the Countryside (under the chairmanship of Sir Arthur Hobhouse), which was appointed by the National Parks Committee in July 1916 at the request of the minister of tn. and country planning. The report (pub. as Cmd. 7207 in 1917) strongly recommends (*inter alia*) such schemes as the proposed Pennine Way, along which, according to a preliminary survey, 180 m. of footpath already exist, and the reopening of the old coastguards' path as a right of way for walkers round the whole coastline of England and Wales, except where building

makes this impossible and, in such cases as the latter, detours should be provided. Other long-distance F. recommended are Chilterns to the Devon coast (about 200 m., requiring about 60 m. of new F. from the Gog Magog Hills, near Cambridge, to Seaton Bay); the 'Pilgrims' Way' (Canterbury to Winchester, about 120 m., requiring about 50 m. of new F.); the S. Downs to Salisbury Plain (from Beachy Head to Winchester, about 70 m., requiring about 25 m. of new F.); Offa's Dyke (Prestatyn to the Wye near Chepstow, roughly 150 m., requiring perhaps 50 m. of new F.); The Thames (Teddington to Cricklade via the tow-paths, about 136 m.). The report recognises a national element in the demand for long-distance routes, and recommended that the National Parks Commission (see **NATIONAL PARKS**) should be empowered to make grants to local planning authorities for the creation or improvement of long-distance and coastal F. See Sir L. Chubb and R. Glen, *Maintenance of Public Footpaths*, 1932.

Foot-pound, in mechanics, the unit by which work is measured; the amount of energy to raise a weight of 1 lb. through a distance of 1 ft.

Footscray, busy manufacturing suburb of Melbourne, which lies 4 m. to the E. in Victoria, Australia. It is in Bourke co., and on the Saltwater R., and is noted for its bluestone quarries. Pop. 20,000.

Footwear, see **BOOTS AND SHOES**.

F.O.R. Abbreviation for 'free on rail,' denoting in contracts for the sale of goods that the cost of carriage and handling the goods and putting them on the railway, but not the cost of the railway freight, must be paid by the seller.

Forage Crops, see **FATTENING FOODS**.

Foraminifera (bearing 'foramina' pores). In zoology the name first given by D'Orbigny (1826) to a group of minute animals, a shell or 'test' usually perforated by tiny holes being characteristic of most of the species. Since Dujardin's researches (1835) they have been considered as a sub-div. of Protozoa, and are ranked as an order of Rhizopoda, distinguished by pseudopodia given off from the sarcode (protoplasm) and beautiful calcareous shells. The shells may be chitinous or arenaceous also (covered with sand, mud, etc.), and these are rarely perforated. There are usually one or more general apertures, through which the animal within can come into contact with the water. They are mostly marine animals, but some kinds (with chitinous shells) are found in fresh water. The shells may be formed by a single chamber or by sev. (polythalamous). Comparatively little is known of the animals themselves, but as limestone-builders their deposits remain in S. Europe, N. Africa, and Asia. Among

the chief families are the Gromidae, Miliolidae, Globigerinidae, and Nummulitidae. They appear to have been most abundant since the close of the Paleozoic era. See F. Chapman, *The Foraminifera*, 1902, and Sir R. Lankester, *Treatise on Zoology*, 1903.

Forbach, tn. on a trib. of the Rossel, 33 m. E. by N. of Metz, in the dept. of Moselle, France. Garden tools and papier-mâché are manufactured, and there are coal-mines and iron works. Here the Fr. suffered a defeat during the Franco-Prussian war (Aug. 6, 1870). Pop. 11,400; arron. 113,300.

Forbes, Archibald (1838-1900), Brit. war correspondent and journalist, b. in Morayshire. Served in the Royal Dragoons. But he soon abandoned the army for journalism, and joined the staff of the *Daily News* as war correspondent, accompanying the Ger. Army through the war of 1870-71. During the Afghanist campaign of 1878-79 F. was under fire, and after that he visited Mandalay and Zululand, and his famous ride of 120 m. in 15 hrs. to convey the news of the victory of Ulundi to England ranks as one of the finest achievements in journalistic enterprise. He afterwards devoted himself mainly to lecturing at home and in America and Australia. His pub. are *Souvenirs of Some Continents* (1885) and *Memoirs and Studies of War and Peace* (in many respects autobiographical) (1895).

Forbes, David (1826-76), Eng. geologist and brother of Edward F., b. at Douglas, Isle of Man. In England he was a pioneer in microscopic petrology, and was elected F.R.S. in 1858. Among his scientific papers are *The Relations of the Silurian and Metamorphic Rocks of the South of Norway* (1855); *Researches in British Mineralogy* (1867-68); and *The Causes producing Foliation in Rocks* (1855), etc.

Forbes, Duncan (1685-1747), Scottish statesman and jurist, b. near Inverness. In 1709 he was admitted advocate at the Scottish Bar. He took an active part in putting down the rebellion of 1715. In 1725 he became lord advocate, and in 1737 he was made lord president of the court of session. By his exertions in the Hanoverian interest the rebellion of 1715 was prevented from spreading more widely among the clans. F. was the author of *Some Thoughts concerning Religion, Natural and Revealed* (1735); *Reflections on Incredulity* (2nd ed., 1750); and an autobiography (1748).

Forbes, Edward (1815-51), Eng. naturalist, b. in the Isle of Man. In 1843 he became prof. of botany at King's College, London, and curator of the Geological Society; and ten years later he was elected to the chair of natural hist. in the univ. of Edinburgh. A new era in that branch of zoology was begun by his classification of the Brit. star-fishes. Upwards of 200 of his works and papers were pub., notably *Star-fishes* (1842); *Naked-eyed Medusae* (1848); *British Mollusca* (1848), etc.; and with T. Spratt, *Travels in Lycia* (1847). See G. Wilson and A. Gekie, *Memoir of Edward Forbes*, 1861.

Forbes, James David (1809-68), Scottish

scientist, grandson of Sir W. F. (1739-1806). He was prof. of natural philosophy at Edinburgh Univ. (1833-60), and then became principal of St. Andrews United College. With Brewster he helped to found the Brit. Association (1831). His discoveries relative to the movement of glaciers and the polarisation of heat and light are famous. Among his pub. are *Travels through the Alps of Savoy*... (1843); *Norway and its Glaciers* (1853); *Tour of Mont Blanc and Monte Rosa* (1855); *Dissertation on the Progress of Mathematical and Physical Science* (1858); *Occasional Papers on the Theory of Glaciers* (1859); contributions to the *Edinburgh Philosophical Journal*, signed 'A'. See J. Tyndall, *Professor Forbes and his Biographers*, 1873.

Forbes, Joan Rosita (Mrs. A. T. McGrath) (b. 1893), Eng. traveller and writer, a daughter of H. J. Torr, of Morton Hall, Lincolnshire. She has travelled extensively in Africa, Arabia, and also visited the W. Indies. In 1920 she accompanied an expedition to the Kufra Oasis, Libya, and in the next four years visited A'ir (then in the Yemen) and Abyssinia, through which latter she went with a cinema expedition. Received the gold medal of sev. geographical societies. Novels: *The Jewel in the Lotus* (1922); and *One Flesh* (1931). Books of travel and adventure: *The Secret of the Sahara-Kufra* (1922); *Forbidden Road—Kabul to Samarkand* (1937); *India of the Princes* (1939); *The Prodigious Caribbean* (1940); *Appointment with Destiny* and an *Autobiography* (1946). Married firstly Col. Ronald F., and secondly Col. A. T. McGrath.

Forbes, Stanhope Alexander (1857-1947), Irish painter, b. in Dublin, Nov. 18; educated at Dulwich College, the Lambeth School of Art, and the Royal Academy schools. He also studied in Paris, and became a pupil of Léon Bonnat, by whom and by Jules Bastien-Lepage his subsequent work was strongly influenced. His chief characteristic was faithfulness to the scene in pictures of everyday life, and this with its reaction from romanticism became the dominant feature of the Newlyn school of painters in Cornwall, of which he was the leading representative. He exhibited in the Royal Academy from 1882, when he was elected A.R.A., becoming R.A. in 1910. His first wife Elizabeth was also an artist of distinction, whose influence, like that of her husband, was exerted on the Cornish school of painters. Elizabeth F. d. in 1912. The fresco of the 'Fire of London,' which F. painted for the Royal Exchange was completed in 1899. Among his best pictures are 'The Fish Sale on the Cornish Beach,' 'By Order of the Court,' 'Forging the Anchor,' 'The Smithy,' and 'The New Calf.' In later life he turned his attention away from painting, and more to landscape.

Forbes-Robertson, Sir Johnston (1853-1937), famous Eng. actor, b. Jan. 16, in London; son of the art critic (d. 1903). Educated at Charterhouse, at Rouen, and at Royal Academy. He early won distinction as a painter, exhibiting at the

Royal Academy about 1870. He studied elocution under S. Phelps; making his first stage appearance in 1874, and soon becoming one of the foremost actors of his time, noted for his beautiful voice. He toured with Ellen Terry, and acted also with her sister Marion, making a hit in *Dr. and Mrs. Neill*, and as Geoffrey Wynnard in *Dan'l Druce* (1876). He acted with the Bancrofts, Hare, and Henry Irving, and under his own management with Mrs. Patrick Campbell won success in *The Notorious Mrs. Ebbsmith* (1895), *Romeo and Juliet*, and other plays. He played with Mary Anderson in *The Winter's Tale* (1887), designing the dresses for this production. Among his noted Shakespearian roles were Hamlet, Othello, Shylock, Leontes, and Macbeth. As a romantic actor he triumphed in *For the Crown* (1896), *Mice and Men* (1902), *The Light that Failed* (1903), and *The Passing of the Third Floor Back* (1908). He married Gertrude Elliot in 1900, and appeared with her as his leading lady—frequently touring in America, where *Cæsar and Cleopatra* was first produced (1906). His farewell London season was held at Drury Lane (1913), with selections from his repertoire. He was knighted in 1913, and retired from stage 1915. He wrote *A Player under Three Reigns* (1925).

Forbes-Robertson, Lady, see ELLIOTT, MAY GERTRUDE.

Forbes, fn. on the r. b. of the Lachlan, 90 m. W. of Bathurst, in the co. of Ashburnham, New S. Wales. It has a meat-freezing works and a wool-scouring factory. Pop. 4300.

Forbidden Fruit, or Adam's Apple, so called from the fruit forbidden to Adam (Gen. ii. 17), is the name often applied to sev. species of *Citrus*, especially on the Continent to *C. decumana*, a Malayan or Chinese tree much cultivated in India and Florida. *C. medica* (var. *paradisii*) is also so called. In Great Britain pomeloes, a variety of shaddock, are known by this name. The fruit of *Tabernaemontana dichotoma* (Apocynaceæ) in Ceylon also bears the name, and is fabled to be poisonous since Eve ate of it.

Forbin, Claude, Comte de (1656-1733), one of the greatest Fr. naval commanders. He showed reckless courage at Messina (1675), the Antilles (1680), Algeria (1682-1683). He accompanied Chaumont to Siam (1685), becoming admiral to the king of Siam (1686-89). As *chef d'escadre* in the Sp. Succession war, he fought often against the Eng. and Dutch (1702-10). His *Mémoires* were ed. by Reboulet (1730). See life by A. Richer, 1784.

Force, in mechanics, that which changes or tends to change a body's state of rest, or of uniform motion in a straight line. This definition is derived from Newton's first law of motion, which states that every body continues in its state of rest, or of uniform motion in a straight line, except in so far as it may be compelled by impressed F. to change that state. We can only get an idea of F. by observing its effects, that is, F. can only be measured by measuring the change of motion produced by it. Thus, Newton's second law

states that change of motion is proportional to the impressed F., and takes place in the direction in which the F. acts. By motion Newton meant momentum, which is a function of the mass of a body as well as of its velocity. This agrees with our experience, because the idea of force is derived from muscular effort, and we know that we have to exert more strength to stop the motion of a heavy body than of a light one, just as we have to exert more strength to stop the motion of a rapidly moving body than of a slowly moving one. F., then, is measured by change of momentum, momentum being equal to mass \times velocity. But it is obvious that the longer the F. acts the greater is its effect in changing the momentum. Therefore, we have F. proportional to change of momentum and inversely proportional to the time. The unit of F. may now be expressed as that F. which produces on a unit of mass a unit change of velocity, or, more concisely, force = mass \times acceleration. Given the foot as unit of length, pound as unit of mass, and second as unit of time, we have as the derived unit of F. that F. which, acting on a mass of 1 lb. for 1 sec., produces an additional velocity of 1 ft. per sec.; this unit is called the *poundal*. In the C.G.S. system of units, the unit of F. is the *dynes*, which is that F. which produces in a mass of 1 gramme an acceleration of 1 centimetre per sec. per sec. See F. Barraclough and E. J. Holmyard, *Mechanics for Beginners*, 1931, 1947.

Forcellini, Egidio (1688-1768). It. lexicographer, was the pupil of Jacopo Faccioli, a prof. at Padua. It was F. who assisted the latter in his great work, the compilation of a lexicon, and he, in his turn, brought out a new Lat. dictionary, pub. after his death in 1771. The latest ed. pub. is that of 1858 to 1837. See FACCIOLOTTI, JACOPO.

Forceps, two-bladed metal instrument of the nature of pliers or pincers, used for seizing and holding objects firmly, especially in surgical and obstetric operations, and by dentists and watchmakers. There are many varieties, such as the dissecting F. with roughened points, the lithotomy F., the artery F., Liston's cutting F., and the fenestrated F. with apertures in the blade. The midwifery F., invented by P. Chamberlen in the seventeenth century, came into general use in the eighteenth century. (Chemists and mineralogists use a small F. for adjusting weights and working with the blowpipe. In entomology, the word is applied to an organ or part of the body resembling a F., or to one of its two branches. Examples are the horny appendages at the extremity of the abdomen, found in many male insects, such as the earwig's caudal appendage.)

Forces, Parallelogram of. Forces may be represented graphically by straight lines proportional to their magnitudes. If two forces are represented in magnitude and direction by two sides of a parallelogram drawn from a point, then their resultant is represented in magnitude and direction by that diagonal of the parallelogram which passes through the point.

Forchheim, tn of Upper Franconia, Bavaria, Germany, on the Regnitz, 16 m S E of Bamberg, important in the early Middle Ages. From 1062 to 1802 it belonged to the bishopric of Bamberg. It is noted for textiles and a dye industry. Pop 10,300.

Forcible Entry, see ENTRY

Forcible Feeding, see UNDER FOOD AND FEEDING

Forcing, acceleration of maturity in flower vegetable, or fruit according as blooms, fruit, or foliage are desired. Artificial warmth is essential for F, and while in some cases a hotbed provides sufficient temp in other cases elaborately equipped F houses are needed. Among flowering plants hardy shrubs are most easily forced into early bloom, but they must be thoroughly matured and well provided with flower buds or foliage in stead of blooms will be produced. A large variety of bulbs and bulbous rooted plants are well suited for F and lilacs of the valley are brought into bloom throughout the whole year. Most kinds of fruit can be produced by F. Strawberries are grown in pots standing on ash beds and in a temp of 75° fruit can be ripened by Christmas. Forced tomatoes need a similar temp but they meet with a very severe competition from importations from warmer countries and scarcely pay to grow. Grapes can be ripened at almost any time from the early spring by starting the shoots in a temp of about 40° and gradually increasing it until after the flowering period when from 60 to 70° is needed. Peaches, nectarines and figs are forced in pots, starting with a temp of 45° and increasing to 60°. Hardier fruits are forced in cold or orchard houses. Asparagus potatoes lettuce endive and other salad plants sea kale chicory and rhubarb are all easily forced on hotbeds the three last need to be kept in the dark but the others need abundance of light. Remarkable experiments have recently shown that the natural resting period of plants can be intensified by exposing them with their roots in an air tight box to chloroform or ether. This is followed by much increased activity and lilac and azalea blooms have been produced in about a fortnight. Lilacs of the valley were forced into flower in only ten days. F some of the hardier flowering plants is simplified by retarding the growth for a time in a refrigerating chamber. Following such treatment lilacs lilac spiraea and *Azalea mollis* will come quickly into flower in an ordinary cool greenhouse.

Ford, Edward Onslow (1832-1901) Eng sculptor, studied painting in Antwerp and Munich (1870-72), and then took up sculpture. His most famous works are statues of Sir Rowland Hill (1882 Royal Exchange), W L Gladstone (1883), Irving as 'Hamlet' (1883), Gen Gordon (Chatham, 1890), Shelley memorial at Univ College, Oxford, Marlowe memorial at Canterbury, Huxley (1900, Brit Museum of Natural Hist), busts of Millais, Briton Riviere and others, statuettes of 'Folly', 'Music', 'Dancing', ('Tate Gallery), a relief, 'In Memoriam'

(1885) See M H Spickmann, *British Sculpture and Sculptors of To Day*, 1901

Ford, Henry (1863-1947) Amer industrialist and one of the greatest manufacturers of motor cars in the world, was b at Greenfield near Dearborn Michigan U S A, son of Wm Ford farmer of Irish stock. His mother was of mixed Dutch and Scandinavian origin. He was educated at the dist school where he seemed good but not brilliant at his studies. In 1880 he obtained a situation at \$2.50 a week in a machine shop in Detroit, and night work at mending watches—a thing he had taught himself at home. On his father's farm he experimented in the

HENRY FORD

manuf of a steam tractor. In 1884 his father presented him with 40 ac of timbered land, on which he erected and worked a saw mill to dispose of the wood. In 1887 he became machinist in the employ of the Edison company in Detroit which thereafter was the centre of his activities. In 1892 he produced his first motor car—a two cylinder 4 h p. In 1893 he left the Edison company and went into the motor car business—founding the Detroit Automobile Company. He disagreed with his fellow directors who wished to restrict output to orders, and he resigned directorship in 1902. By himself he built some four cylinder cars and one called 999, won all the races for which it was entered. Then he formed the Ford Motor Company with a nominal capital of \$100,000 by 1916 its assets were valued at \$1,000,000,000. The stock was entirely held by F, and his son, who bought out the other stockholders. He introduced vanadium steel into motor construction, and in 1909 the company

standardised the 'T' model, which was the F. car known all over the world, and was superseded only in 1927 by the 'A' model.

In 1915 he turned his attention to his early preference, the farm tractor, and his Fordson tractor proved of notable use in Britain when there was a food shortage through the Ger. submarine campaign in the First World War. Within twenty-eight years of his start F. had put 20,000,000 cars on the road. His factories employed 200,000 persons, and comprised some fifty complete businesses. In 1914 he made known that throughout his plants there was to be a standard wage of \$5 a day, which at the time was nearly double the average figure of Detroit. Subsequently, when he realised that the old car had had its day, he shut down all his plants, did not re-open until the new models were ready, and then started afresh in full power. In 1940 he built the vast bomber plant of Willow Run. Through 1941-42 Willow Run had the appearance of mass-production's most spectacular failure; but afterwards it functioned to scale when F. had surmounted the difficulties imposed by labour, transport, and the conditions of gov. contracts. He is said to have been a scornful opponent of workers' welfare, but he always argued that no trade union could get for its members any benefit to compare with the F. standard wage. But in some things he moved with the times, and the H. F. hospital in Detroit is a free institution of unrivalled excellence, with the highest standard of comfort and equipment. A few miles out of Detroit, adjoining Greenfield, is the F. Museum of Amer. Hist., the main building of which produces, in Georgian brick, the noble Independence Hall of Philadelphia. That F. was a visionary, ignorant of much that quite ordinary people knew, but with goodwill for all is illustrated by the fact that in 1915-16 he visited Europe as leader of a peace party, whose members went to various neutral capitals in an endeavour to end the war. Yet, in spite of his character as an emotional visionary, he had a power of handling the practical things of life which has seldom been surpassed. In 1918 he ran unsuccessfully for the Senate, and in 1923 there was some talk that he would run for the presidency, but later he announced his refusal to stand against Mr. Coolidge. In the following year his acquisition of the Dagenham site, in addition to his Trafford Park and Cork works was announced. This was part of a post-war policy of expansion, and between 1931 and 1946 over 1,000,000 vehicles were manufactured at the Dagenham factory alone. He founded factories in many European countries, but his plant at Dagenham is the largest outside the U.S.A. He then went into the civil aviation business, and soon afterwards his all-metal monoplanes were on sale. The industrial empire which F.'s imagination and energy estab. was in due course to yield him an immense fortune; but wealth was never his goal. F. wrote four books concerning his own life's work and ideals: *My Life and Work* (1922), and *To-day*

and *To-morrow* (1926), both in collaboration with Samuel Crowther; *Philosophy of Labour* (1929); and *Moving Forward* (1930). See K. C. Thalheim, *Sozialkritik und Sozialreform bei Adde, Rathenau und Ford*, 1929.

Ford, John (c. 1588-c. 1640), Eng. dramatist, b. at Ilstington, Devonshire. His mother was a sister of Lord Chief Justice Popham. F. matriculated at Exeter College, Oxford (1601), and in 1602 became a member of the Middle Temple. In 1606 he pub. his first work, *Fame's Memorial*, an elegy on the death of the earl of Devonshire, with a dedicatory sonnet to Penelope, the earl's widow. In the poem he alludes to a lady, 'bright Lycia, the cruel, the cruel-subtle,' who had evidently scorned him. In the same year he issued *Honour Triumphant, or the Peers' Challenge*, a prose pamphlet, and also, appended to the latter, *The Monarches Meeting*, a poem written in the stanza of Gray's *Elegy*. In 1613 his first comedy, *An Ill Beginning has a Good End*, was produced at the Cockpit. This play was never pub., and is not extant. In 1621 he collaborated with Dekker and Rowley in *The Witch of Edmonton*, a play, pub. in 1633. *The Sun's Darling, a Moral Masque* (1623-24, pub. 1656), is said to be Dekker's original revised by F.; but the masque is variously ascribed to Dekker, F., and Rowley. The episodes of Sir Arthur Clarington, Winnifred, and young Thorney are undoubtedly the work of F. Other plays and masques produced in collaboration are *The Fairy Knight* (masque) and *The Frisious Merchant* (1624) with Dekker; and *A late Murder of the Son upon the Mother* (1621), with Webster. In 1629 a comedy, *The Lover's Melancholy* (psychological, and indebted as to sev. passages to Burton's *Anatomy*), produced 1628, was the first of his plays to be printed. In 1633 his two best tragedies, *'Tis Pity She's a Whore* and *The Broken Heart*, appeared. These are little inferior in impressiveness to the best works of Webster. His other plays are *Love's Sacrifice* (1638) in which Bianca is one of the best drawn of all F.'s characters; *The Chronicle History of Perkin Warbeck* (1634), one of the best historical dramas in the language; *The Fancies Chaste and Noble* (1638), well constructed but marred by a ridiculous story; *The Lady's Trial* (1638 or 1639); and sev. lost dramas. F. is one of the most modern of the Elizabethans: he studied the sources of action and, as a psychologist, subtly analysed the human soul. As regards style, his verse is so steeped in the sweetness of lyric poetry that it sometimes seems hardly adapted to express the stormy passions of his characters. See A. C. Swinburne, *Essays and Studies*, 1875; and M. J. Sargeant, *John Ford*, 1935.

Ford (formerly Hueffer), Ford Madox (1873-1939), Eng. author, son of Dr. Francis Hueffer. His works include *The Heather* (1892); *The Queen Who Flies* (1894); *Ford Madox Brown* (biography) (1896); *The Face of the Night* (1904); *The Heart of the Country* and *The Fifth Queen* (1906); *Mr. Apollo* (1908); *Songs from*

London (1910); *Henry James: a Critical Study* (1914); *Thus to Revist* (1921); *Joseph Conrad* (1924); *New York is not America* (1927); and *The English Novel* (1930). He wrote some remarkable poetry (*Collected Poems* (1913); and *New Poems* (1927)); but his historical romances just missed being excellent. Yet, says Frank Swinnerton, 'the total effect created by Hueffer is less than the total effect created by men of insignificant talent.' He founded the *English Review* in 1908, and was a friend of Conrad (with whom he collaborated in *The Inheritors*, (1908) and *Romance* (1903)), Wells, and Galsworthy. See D Goldring, *The Last Pre-Raphaelite*, 1948.

Ford, Richard (1796-1858), Eng. writer on art and travel; educated at Winchester and at Trinity College, Oxford. Was called to the Bar at Lincoln's Inn but never practised. From 1830 to 1833 he travelled in Spain, becoming intimately acquainted with the country and people, and spending much time at the Alhambra and at Seville. The work by which he is remembered is his *Handbook for Travellers in Spain* (1845), written at the invitation of Murray, the publisher. This is much more than a mere guide-book, and remains one of the earliest and best of travellers' handbooks, notable for its literary quality. He also wrote *Gatherings from Spain* (1846). An accomplished artist and art critic, F. was the first to make Velasquez generally known in England.

Fordingbridge, tn., Hampshire, England, on R. Avon, here crossed by a stone bridge 10 m. S. of Salisbury. There are flax-spinning and canvas industries. Pop. 3400.

Fordun, John of (d. c. 1384), Scottish chronicler. Little is known of his life. He is supposed to have been b. at F. in Kincardineshire, and to have been a secular priest and a chantry priest in the cathedral of Aberdeen. Between 1363 and 1384 he is said to have travelled on foot through Britain and Ireland in search of materials for his chronicle of Scotland. Of his *Scotichronicon*, or *Chronica Gentis Scotorum*, only five books are completed, and the work was continued in 1441 by Walter Bower, who finally brought the list down to 1437. The work is the chief authority for Scottish hist. before the fifteenth century. The best ed. of F.'s work is by W. F. Skene, 1871-72.

Foreclosure, see MORTGAGE.

Foreign Debts, see PUBLIC DEBT.

Foreign Enlistment Act, 1870, an Act passed in 1870, which forbade the enlistment of any Brit. subject in the army or navy of any foreign state at war with any friendly state. The Act states definitely that no Brit. subject shall under any conditions enter into the service of any state at war with a state which is friendly to the Brit., save with the consent of the king, or by an Order in Council. The officers of the customs or of any port have full power to detain any vessel concerning which they hold information that she is proceeding to the aid of some foreign

state which is at war. This legislation was undoubtedly an immediate outcome of the celebrated *Alabama* case. Any ship so taken, together with all stores, arms, and equipment, is confiscated. It was under the provisions of this Act that the leaders of the Jameson Raid were punished (1895).

Foreigners, see ALIEN.

Foreign Exchange, see EXCHANGES; FOREIGN MONIES AND EXCHANGE RATES.

Foreign Jurisdiction. The administration of Brit. law in countries outside the dominion of the Crown is regulated by the Foreign Jurisdiction Act of 1890, extended by a further Act in 1913. The power of exercising jurisdiction in foreign countries may be acquired by the Crown as a result of treaty or capitulation, and is usually vested in the consular officers. The jurisdiction is generally limited to Brit. subjects or persons under Brit. protection, and covers civil and criminal cases. The Foreign Jurisdiction Act may also apply in a Brit. protectorate, where the ter., not having been annexed, remains outside the normal colonial administration. See also CAPITULATIONS.

Foreign Law. The Eng. courts do not take judicial notice of F. L., and the party who relies on a F. L. must prove it like any other fact. Strictly, all F. L. has, as such, no extra-territorial force; such effect as it has is by virtue of comity (q.v.), and unless specially proved in any particular case, the law of another state will be presumed to be similar to Eng. law. *Written* F. L. must be proved by the text or some authoritative collection or duly certified copy of the same; expert evidence in such cases being merely by way of secondary evidence. *Foreign* unwritten law is generally proved by oral evidence.

Foreign Legion, military unit formed of men who are foreigners to the country in whose service they are engaged. The F. L. *par excellence* is the Fr. *régiment étranger*, organised in 1831, and later forming a permanent regiment of sev. battalions based on Algiers. Recruits were accepted for service of varying periods without proof of identity. A F. L. of Swiss and Gers. volunteered for Brit. service in the Crimean war. F. Ls. served in Spain in the Carlist war (1872-76), and in the Civil war (1936-39).

Foreign Marriages, see MARRIAGE AND MARRIAGE LAW.

Foreign Monies and Exchange Rates. Bank of England, Empire Exchange, and other rates, are given in the table opposite.

Foreign Office (England), that dept. of the executive through which negotiations with foreign powers are conducted. At the head of it is the principal secretary of state for foreign affairs, appointed from the dominant party in Parliament. The foreign secretary is assisted by three parl. under-secretaries, a parl. private secretary, who also go out with the gov., a permanent under-secretary and four assistant under-secretaries. It is needless to say that the post of foreign secretary is of such vital and commanding importance that it is essential to appoint to it a minister who, by reputation and

attainments, is as far as possible above the rancour of merely party politics. In the discharge of the prin. function, which is nothing less than the formulation of Brit. foreign policy, the foreign secretary is responsible both to the Cabinet (*q.v.*) and to Parliament; and for its due fulfilment he is necessarily in constant touch with the ambass., envoys, plenipotentiaries, or other foreign representatives in England, and with Brit. diplomatic agents abroad, the latter of whom it is his duty to advise; and through our ambass. and foreign representatives in England he should endeavour, so far as is consistent with Brit. state interests, to promote cordial relations with foreign powers. Among the purely formal duties of a foreign secretary are the reception of new ambass. and their presentation to the king. He has an extensive patronage, appointing not only our ambass. to foreign courts, but numerous diplomatic agents and consular officers. Among his other duties are the superintendence of the preparation of trade statistics supplied by Brit. agents abroad, and the pub. and distribution of the same to the different chambers of commerce; the granting of passports, and the protection of Brit. subjects abroad who have suffered injury or wrong whilst abroad. The Dept. of Overseas Trade (whose parl. head is one of the parl. under-secretaries of state of the F. O.) is really a joint dept. under the F. O. and the Board of Trade. In conjunction with the rest of the Cabinet the foreign secretary carries into execution the treaty-making prerogative of the Crown (*q.v.*).

The merging of the F. O., the diplomatic, and the consular service into a combined foreign service was one of the reforms which Mr. Anthony Eden (*q.v.*) announced in Parliament in June 1911. Another reform was in the system of recruiting for the service. These reforms were the outcome of the report of Sir Malcolm Robertson to the foreign secretary on the reform of the foreign service, a report which, in part, recommended the acceptance of proposals urged upon the Brit. Gov. by the MacDonnell Commission in 1911; while the abolition of the means test for the diplomatic service was one of the major reforms of 1919, reforms which, however, did not seriously alter the character of the service up to as late as the outbreak of the Second World War. If it be true that a diplomatic service reflects the complexion of a society of which it is the expression, then most embassies to-day require men capable of understanding the habits and purposes of classes outside the *élite* circle to which the average Brit. diplomat generally restricts himself (see on this H. Butler, *The Lost Peace*, 1942). The prin. change, however, in the reforms of the foreign service, as explained in the Commons (March 18, 1943) may be said to meet this need, that change being the disappearance of the system under which diplomacy was the business of a small class whose sphere was confined to a few drawing-rooms and chancelleries, although members of the F. O. were not even at that time drawn from so restricted a class or so limited in their ideas. As envisaged by these

reforms, diplomacy must now be based on the representation of the whole nation, and must comprehend the whole life of the nations to which it is accredited. An even greater change is the growing fusion of politics and economics in foreign affairs. It should, however, be realised that the function of the F. O. is interpretative, not positive, i.e. it does not bear responsibility for foreign policy.

Foreign Relations Committee. The U.S.A. have a secretary of state in the president's Cabinet who deals with foreign affairs. The president, however, is himself the responsible official for dealing with international subjects, but his decisions need the endorsement of two-thirds of the Senate. This arrangement, as laid down in Section 2 of Article Eleven of the Constitution, was planned with the object of maintaining a democratic hold upon the foreign policy of the gov. The difficulty of such a large body being required to deal with issues, many of which are too delicate and intricate in nature to permit of open discussion, and the fact that the president has no absolute guarantee that his actions will be endorsed, has led to the estab., within the Senate, of a F. R. C., the restricted and qualified powers of which are fully realised by other nations. This committee works in close touch with the Senate and the president. 'Even when the Foreign Affairs Committee approves an action by the president, it is not always certain that the Senate will approve.'

Foreland, North and South, two capes of England, projecting from the E. coast of Kent. They are composed of chalk cliffs. N. Foreland is situated in lat. 51° 22' 28" N., and long. 1° 26' 48" E., and is 66 m. E. of London. A lighthouse is placed with a fixed light, 138 ft. high, visible 20 m. off. S. Foreland is 16 m. S. of N. Foreland, situated in lat. 51° 8' 23" N., and long. 1° 22' 22" E. It juts out into the Dover Strait, 4 m. N.E. from Dover. There are here two fixed lights which are visible at distances of 22 m. and 25 m. Near here was fought a naval battle in 1666, between the Eng. under Albemarle and the Dutch under De Ruyter.

Forensic Medicine. see MEDICAL JURISPRUDENCE.

Foreshore, see SEASHORE and COAST PROTECTION.

Forest (Flemish Vorst) tn. in the prov. of Brabant, Belgium, and suburb of Brussels, 3 m. to the S.W. of the city. Pop. 47,300, engaged in agriculture and manufs. of stoves, footwear, carpets, chemicals and soap. It has breweries and malt houses.

Forest, Lee De, see DE FOREST.

Forest and Forest Laws. Forest is defined by Manwood, the old authority on the Forest law, as being 'a circuit of woodes, grounds, and pastures, known in its bounds, and privileged for the abiding of wild beasts and fowls of forest, chase, and warren, to be under the king's protection for his princely delight.' According to Coke, the royal forests in his time appear to have been sixty-nine in number, while

the origin of by far the greater part was lost in remote antiquity. The four prin. forests in England were the New Forest, Sherwood, Dean, and Windsor. Among the others were Epping (Essex), Dartmoor (Devon), Wichwood (Oxfordshire), Salecy, Witlebury, and Rockingham (Northamptonshire), Waltham (Lincolnshire), and Richmond (Yorkshire). Prof. Freeman has pointed out that afforestation in its older connotation had nothing to do with trees, and simply meant putting a tract of land outside the common law in order to secure for the king, by special laws, the freer enjoyment of the pleasure of hunting. The forests were the private property of the king, and trespassers were so barbarously punished, that one of the chief things insisted upon in the early national demand for the reform of the forest laws was the mitigation of the severe code of punishments. The policy of afforestation of William I. was continued by his immediate successors to the throne, but although the forests were strictly guarded by the Conqueror, no forest laws are attributed to him. Subsequently, in the reign of Henry I., a system of forest laws, with special courts for their administration, was estab. and developed by Henry II. These courts were (1) the Court of Attachments, or Woodmote, held every forty days to punish offences against vert and venison (trees and covert and game); (2) the Court of Swelmote, held three times a year, originally for business relating to agistment, but later to punish general offences under the forest laws; (3) the Court of Regard, held triennially, for the expeditation of dogs, i.e. the cutting of the claws in such a way as to prevent their use in hunting; and (4) the Court of Justice Seat, held before the itinerant justices of the Ex. for the trial of all causes connected with Ex. Besides the justices, the officers were the wardens, verderers, foresters, agisters, regarders, keepers, bailiffs, and beaules. The assize of Woodstock of 1184 made attendance at the forest courts compulsory, and heavy fines were extorted for every breach of the forest law. The first substantial concessions were those granted by Magna Carta, under which all forest made by John were to be disafforested, and all bad customs connected with forests abolished. Then came the Carta do Foresta of Henry III., the first separate charter of forests, which disafforested private lands improperly afforested, and abolished the punishments of death and mutilation for offences against the forest laws. This charter was confirmed by Henry III. in 1225, but so often infringed by him and Edward I. that the latter monarch had to promise and carry out reforms under the Articuli super Cartas of 1300. From the time of the Confirmatio Cartarum of 1327 the forest laws began to fall into disuse, and the oppressive powers vested in the Crown had almost ceased to be exercised at the time of the Stuart dynasty, when Charles I. revived them with the object of replenishing his empty exchequer by fines for trespass. This was one of the grievances to which the Long Parliament directed its attention, and

from the passing of the 16 Car. I. c. 16, the whole forest organisation fell into a state of decay. In 1817 the offices of warden, chief justice, and justice in eyre of the f's. were abolished, and the powers attached to these offices, relating mainly to the revenues of such royal forests as remain, were vested in 1829 in the Commissioner of Woods, Forests, and Land Revenues. In 1832 the powers of the commissioner passed to the predecessors of the Commissioners of Woods and Forests, an emanation of the Commissioners of Works and Public Buildings. *See FORESTRY.*

Forestalling, originally the practice of buying goods before they reached the market in order to raise the price of them. There were laws against this practice, but they were repealed by statute 7 and 3 Vict. c. 24, and it is now considered a lawful way of trading. *See ENGROSSING and REGRATING.*

Forest City: 1 Tn. in Susquehanna co., Pennsylvania, U.S.A., 5 m. N. of Carbondale. Has silk mills and is a centre of a farming and mining dist. Pop. 5000. 2. Also the name of three vills. in Colorado, Iowa, and N. Dakota.

Foresters, Ancient Order of, estab. in 1831. It is one of the larger friendly societies of the class designated 'affiliated' societies in the report of the royal commission of 1870, that is, having a central body to the funds of which the branch bodies or 'courts' contribute. The objects of this order, which was estab. in 1831, are to secure to its members, their wives, husbands, and other relatives or dependants weekly allowances during sickness or other infirmity, in old age (*i.e.* after fifty), or in widowhood, also to provide sums at death or during unemployment or other distress and by way of endowment insurance. The Order administers the National Health Insurance Acts through its central office, dists. and court branches (*see* on general objects of a friendly society, **FRIENDLY SOCIETIES**). The Order has an approximate membership of 712,000, and its funds (in 1938) exceeded £15,400,000.

Forest-fly, *see* HORSE-FLY.

Forest Gate, populous suburb of E. London in the co. bor. of W. Ham, 5 m. from the city of London. Pop. 19,000.

Forest of Dean, *see* DEAN, FOREST OF.

Forestry: Historical.—Forest may be described as an area set apart for the production of timber and other forest produce, or which is expected to exercise certain climatic effects or to protect a locality against injurious influences. Probably the greater part of the dry land was formerly covered with forests which consisted of a variety of trees, and which were grouped according to climate, soil, and configuration of the sev. localities. When old trees reached the limit of existence they disappeared and younger trees took their place, and conditions for uninterrupted continuation of the forest were thus rendered favourable. The result of this was a healthy and vigorous production by the creative powers of soil and climate. The interference of man broke this continuous chain and gradually

the area under forest has been greatly reduced. Then the estab. of domestic animals showed the first decisive interference in the life of the forests. Forests were burnt down in order to obtain pasture and later for agric. purposes. In modern times the ruthless cutting down of trees for timber is a menace to the already decaying supply of wood and other forest products.

Character and distribution of Forests.—

The character and distribution of the now remaining forests differ immensely. Generally speaking large forests consist of a number of different species of trees, but there are also forests containing trees of one species only. In most of the tropical forests hundreds of species are to be found on a comparatively small area. In Burma, for example, there are thousands of species, while in Sind there are only ten species. In central Europe exist forests of fifty species, while in N. Europe the forests contain only half a dozen. Generally speaking, however, it may be said that the tropics and their adjacent countries of the earth unmodified by considerable elevation, contain broad-leaved species, such as palms, bamboo, etc. In these parts most of the hardest timbers, such as teak, ebony, and mahogany, are found. The N. countries, on the other hand, are rich in conifers. Just as the temp. varies as one travels N. or S. from the equator, so, in travelling in the same directions, various characteristics of vegetation dependent upon climatic conditions may be seen. The countries between central Africa and N. Europe exhibit nearly all the varieties of forest trees. S. and N. of the equator is a large belt consisting of hardwood. In the Sahara and on the Mediterranean coasts are forests of oak and cork. In Italy the oak, olive, and chestnut are predominant, and ash, sycamore, beech, birch, and certain pine species may also be found. The Swiss and Ger. forests contain chiefly silver fir and spruce, and the Baltic countries produce forests of Scots pine, spruce, and birch. In Siberia the forests consist of larch, hornbeam, willow, and poplar. In India the forests are greatly influenced by elevation and rainfall. In dists. where there is heavy rainfall the forests consist of evergreens, such as fig, palm, bamboo, and indiarubber trees. In dists. where rainfall is less deciduous forests appear, such as teak (*q.v.*), sal (*q.v.*), and other valuable trees. Where the rainfall is very slight the vegetation is sparse, and places where rainfall is nil are desert. The Himalayas provide an excellent illustration of the effect of elevation upon the character of forests. Here are found forests which contain, according to the elevation, pines, firs, deodars, oaks, chestnuts, laurels, and bamboos. As the conditions vary from sub-tropical to arctic, so the character of the forest also varies. In Australia most of the trees belong to the eucalyptus genus. Over 200 species have already been found. Some of these trees reach an enormous height. In N. America tropical and sub-tropical forests consisting of evergreen broad-leaved species and pines are found.

In the Atlantic region the forests consist of broad leaved deciduous trees and pines. In Canada larches, spruces, and firs are predominant. Proceeding W from the Atlantic regions the forest changes into shrubby vegetation, and this into prairies. Towards the Pacific coast extensive forests of pine, larch and fir are found.

Use of Forests—Forests are absolutely indispensable to mankind as regards both their direct and indirect value. They are indirectly valuable through their influence on climate, stability of soil, regulation of moisture, healthiness and beauty of the country. Their direct value is through

regulate the water supply, tend to reduce violent floods and produce a more sustained feeding of springs, (5) they assist in preventing denudation, erosion, landslides and avalanches, (6) under certain conditions they improve the healthiness of a country and help its defence, (7) they increase the beauty of a country and tend to produce a healthy æsthetic influence upon people.

The direct utility of forests is due (1) to the produce they yield, (2) to the capital they represent, and to the work they provide. The produce consists of timber and firewood, which are both necessities

OLD FOREST OAKS IN ENGLAND

the produce they yield. Bare land is exposed to the full effects of the sun and air currents and the climatic conditions produced by these agencies. Land which is covered with a growth of plants and especially with dense forest enjoys the benefits of certain agencies which modify the effect of sun and wind upon soil. The chief of these modifying agencies are: (1) crowns of trees which intercept the rays of sun and falling rain and reduce radiation at night, (2) leaves, flowers and fruits together with certain plants which grow in shade of trees form a layer of mould, this protects the soil against rapid change of temp. and greatly influences the movement of water in it, (3) roots of trees bind the soil together. By careful experiment the following results proving the utility of forests have been obtained: (1) Forests reduce the temp. of air and soil to a moderate extent and render climate more equable, (2) they increase the humidity of the air and reduce evaporation, (3) they tend to increase the precipitation of moisture, (4) they help to

for the daily life of people. Conifers are the most important timber trees for economical purposes. They are found in large quantities in the Baltic provinces and in N. America. Iron now serves in many ways, particularly in the building trade, where timber was once used and coal largely takes the place of firewood. Wood however has displaced other materials. Spruce wood is now used to manufacture a fabric closely resembling silk. The minor products of the forest are numerous and essential to mankind. The yield of fodder is of the utmost importance in countries which are subject to periodic droughts. In many places it is impossible to grow field crops successfully without leaf-mould and brushwood. The industries maintained by products of forests are numerous and include commercial fibre, tanning materials, dyestuffs, turpentine, resin, rubber, and gutta-percha. The United Kingdom imported during 1934 wood and timber to the value of £12,852,348 (exclusive of rubber and paper-making material), in 1948 the total value was

£93,242,213, of which soft wood accounted for £51,383,930, pit-props £13,332,000. The chief countries whence these imports came in 1948 were Canada, £26,753,687 (excluding Newfoundland, £636,845); Finland, £13,928,877; Sweden, £13,180,392; Germany, £9,864,926; U.S.A., £7,109,292; Yugoslavia, £4,215,090; Brit. W. Africa, £3,144,046. Imports of paper-making materials (*i.e.* pulp of wood, esparto, linen and cotton, etc., rags) were £17,737,915 in 1938 and £52,278,303 in 1948. In 1938 the total imports of manufs. of wood and timber was £6,286,774; in 1948, £12,340,868 (including furniture and cabinet ware, £2,143,150; plywood £7,879,748; wooden containers, bobbins and reels, prefabricated houses, £2,883,441). In Russia and in other N. countries the people are largely dependent on the produce of forests. Their houses are almost universally made of timber; wood is everywhere used for fuel, and they often employ a slip of birch wood, which is lighted, as a candle. Potash, which is made from the ashes of burnt trees, is exported in large quantities. From the wood of the birch the Russians procure a species of tar, empyreumatic oil, which is used in dressing that kind of leather commonly known by the name of Russian leather, and much employed in book-binding.

The capital employed in forests consists chiefly of the value of the soil and the growing stock of timber. The latter is generally of much greater value than the former. The rate of interest yielded by capital invested in forests may under proper management be placed equal to that yielded by agric. land. Forests require labour in many ways, such as furation, tending, and harvesting; transport of forest produce; and industries which depend on forests for their chief material. The greatest amount of labour is required in the manuf. of raw materials yielded by forests, *e.g.* chair-making at High Wycombe, Buckinghamshire, England, from beeches in the adjoining country, which employs over 20,000 workmen. One great feature of forest work is that it can be done at seasons when field crops do not require attention, thus fitting in admirably with agric. work.

The Supply of Timber.—The extent of land under forest varies in the different countries, and thus some countries are able to export large quantities of timber, while others are forced to import the necessary quantities. The chief producing countries of Europe in their order are Russia, Sweden, Finland, Germany, and France. All the other countries either have only enough for home consumption, or import timber. W. Africa exports hardwoods and imports coniferous timber. Cape Colony and Natal import considerable quantities of pine and fir wood, and some oak. Australia exports hardwoods, and New Zealand, kauri pine, and they import larger quantities of light pine and timber. The U.S.A. imports nearly as much from Canada as they export. Canada exports large quantities of timber. The quantity of land under forest in the

dominion amounts to more than 1,000,000 sq. m., or 31½ per cent of the whole area. There is enormous forest wealth, with which she might supply nearly all the other countries deficient in material. The policy of the dominion and provincial govs. is to dispose of the timber by means of licences to cut, rather than to sell timber outright, thus retaining the ownership of the land and controlling cutting operations. Protection of timber from fire is afforded by each of the prov. govs. maintaining an organisation which co-operates with owners and licensees of timbered areas. The most important single development in forest fire protection in late years has been the use of aircraft for the detection and suppression of forest fires. The most valuable timber, the white pine, is gradually being exhausted, great forests of spruce are being rapidly destroyed, and forests of Douglas fir have been attacked for export to the U.S.A., and other countries. In comparing stocks of the various countries it has been found that a sufficient quantity of hardwoods is available, but the only countries which are able to supply coniferous timber for export on a large scale are Russia, Sweden, Norway, Austria, Hungary, and Canada. In some countries there is no room for extension of land under forest, but in Great Britain and Ireland no such plea can be made. There are about 2,000,000 ac. of waste land, and about 12,500,000 ac. of mt. and heath land generally used for light grazing. If one-quarter of that area were placed under forest it would produce all the timber now imported which can be grown in Great Britain, that is to say, about 95 per cent of the total. The serious encroachments made upon Brit. forests during the First World War, in order to supply enormous quantities of wood for trench-supporting purposes, and the presence of numbers of Canadian lumbermen created wide national interest in afforestation, with the consequence that a F. commission was set up by the Forestry Act of 1919. It is the duty of the commissioners to promote the interest of F. and develop afforestation with the aim of increasing the supply of timber in Great Britain. Including the former Crown woods, which have passed into the care of the commission, the dept. has acquired over 1,270,000 ac. of land, of which 60 per cent are plantable, and they have planted over 462,000 ac. Adequate grants are supplied by the gov.

British Forests.—The oak and the beech are natives of Great Britain. The elm was introduced at an early date. Each of these trees has its appropriate soil. In the W. part of the co. of Sussex we have two distinct belts of country, each strongly marked by the character of its vegetation. To the N. there is a strong and deep clay, admirably adapted to the growth of oak. Then come the chalk hills where the luxuriant growth of the beech attests that this tree has found its congenial soil. The elm is not met with N. of Stamford in Lincolnshire. The elm seen in Scotland and the N. of England is the wych elm, a different species, growing in a more

straggling form, with pendent branches and a larger leaf. Its wood is very unlike that of the Eng. elm, and more resembles that of the ash. In the approaches to some of the royal palaces in Spain are some rows of elms, which, we are assured by Evelyn, were transplanted from England by Philip II, husband of Queen Mary of England, the elm not being a native of Spain. In addition to the above-mentioned trees, the ash, the maple, the sycamore, and small leaved limes may be enumerated as growing wild in Great Britain. The chief forests of England are the New Forest, the Forest of Dean, and Epping Forest.

the Crown, inclosed and cultivated, and the residue belongs to the Crown, but subject to the rights of common of a large body of owners and occupiers of cultivated lands in the neighbourhood of the forest. *The Forest of Dean*, about 19,000 ac in extent, is another of the few remaining royal forests, which has come under the consideration of Parliament in recent years, and where the policy of maintenance has prevailed over that of inclosure. The forest lies in the hundred of St. Briavel between the estuary of the Severn and the R. Wye, about 12 m. from Gloucester. The Crown is the owner of the soil and of all the timber growing on it.

MATURE SCOTS PINE

The New Forest was originally a royal forest. The origin of royal forests is lost in antiquity. There are said at one time, in England alone, to have been sixty-eight forests in the possession of the Crown. All the sixty-eight forests have long ago been disforested, in the sense that the sovereign has no longer the privilege of maintaining deer and other game in them for sport, protected by special laws and tribunals. A few only exist in the popular sense of the term, that the land is still uncultivated and covered wholly or partially by woods such as the New Forest, the Forest of Dean, Epping Forest, Windsor Forest, and the Forest of Dartmoor. The New Forest (Hampshire) was created by William the Conqueror, who in doing so, is popularly believed to have devastated a wide dist. of cultivated land, demolished churches, and converted the land to the use of wild animals. The forest now practically consists of 65,000 ac., of which a little over 2000 are the demesne lands of

the forest, about 4000 ac. consist of heath and open land, the residue is planted with oak trees. *Epping Forest* consists of a little over 6900 ac. of wood land open to the public at all points, extending for a distance of nearly 13 m. from Winstead, on the confines of London to beyond the vil. of Epping with an irregular breadth at its widest part of about 1 m., and in its narrower parts of about half a mile. It is densely covered with timber consisting of hornbeam, beech, and oak trees. See ARBORICULTURE, DARTMOOR, DEAN FOREST OF LINCOLN, FOREST AND FOREST LAWS, FOREST COMMISSION.

Forestry Commission, body corporate appointed quinquennially under the Forestry Acts 1919-27, and charged with the general duty of promoting the interest of F., the development of afforestation and the production and supply of timber in Great Britain. The Forestry Act of 1945 removed the independence of the

then existing F. C., and created a new commission for which the Brit. and Scottish ministers of agriculture were to take political responsibility. But the F. C. was maintained, however, as the expert advisory and executive authority. The proposals of the F. C. in their white paper on post-war forest policy (Cmd. 6447, June 1943) contemplate a great expansion of the forest area of Great Britain, from between 5 and 6 per cent of the total land area to between 9 and 10 per cent, mainly by the new planting of about 3,000,000 ac. of rough hill pasture and moorland. In addition they recommend direct or indirect executive control over 2,000,000 ac. of existing private woodland, much of which had been cleared and felled during the war, and required replanting. See also AFFORESTATION; FORESTRY.

Forez, former co. of France, partly corresponding to the dept. of Loire. It was united to the Crown under Francis I. in 1532.

Forez, *Monts du*, mts. in France, forming a branch of the Auvergnats. They are situated between the rvs. Altier and Loire. Highest peak, *Pierre sur Haute* (5380 ft.).

Forfar, cap. of the co. of Angus, is a royal and parl. burgh of Scotland. It is situated in the valley of Strathmore, 13 m. N.N.E. of Dundee. Its chief industry is the linen manuf.; there are also jute factories, tanning works, iron foundries, bleaching works, and breweries. F. was a royal residence of Malcolm Canmore and his queen Margaret. David I. made the tn. a royal burgh in 1124-53, and in 1308 Robert Bruce destroyed the castle. F. unites with Montrose, Arbroath, Brechin, and Inverurie in returning one member to Parliament. Pop. 9600.

Forfarshire, see ANGUS.

Forfeiture: 1. Denotes the divesting of property or the loss of rights entailed by law as a consequence of some crime or breach of condition. Formerly any conviction and attainder (*q.v.*) for treason or felony was followed by the transfer to the Crown or the feudal superior of the person convicted of all his lands and goods. Since the passing of the Forfeiture Act, 1870, F., in this sense of the word, may be said to be practically obsolete. By that Act it is provided that no conviction for any treason, felony, or *felo de se* shall cause any attainder, forfeiture, or escheat. But the Act does not affect the consequences of outlawry or the putting of a person outside the protection of the law for refusing to make himself amenable to legal process. Apparently F. may still follow on conviction for misprision of treason (*q.v.*). But the Forfeiture Act further provides that the property of a convicted felon may be committed to the custody and management of an administrator appointed by the court, or in default of such administrator, to the management of an interim curator appointed by magistrates on an application made on behalf of the convict or his family. The management of the convict's estate, whether by an administrator or curator, is, of course,

entirely in the interests of his family; but the Act allows the court to order a convicted felon to pay a sum not exceeding £100 as compensation for loss sustained by any person in consequence of the felony. But a conviction for treason or felony, where the sentence is at least imprisonment for more than twelve months, or if less, with hard labour super-added, entails the loss of any military, naval, or civil office, or any other public employment or eccles. benefice or pension or superannuation allowance, unless a pardon is received within two months after conviction, or before the filling up of the office if the pardon comes at a later period. Furthermore, sentence completed, the felon until pardoned is debarred for the future from the above offices, and from sitting in Parliament or exercising the parl. or municipal franchise. 2. F. also denotes the loss of land or hereditaments consequent on a breach of covenant between landlord and tenant. But the right to take advantage of a F. may be waived by any act of the landlord which recognises the continuance of the title of the tenant, as, for example, the acceptance of rent by him in respect of a time subsequent to the act by which the F. was incurred. Equity, however, has for long given a tenant a right to apply for relief upon certain terms, such as payment of compensation to the landlord. 3. F. in the language of statutes is used to denote 'penalty' (see FINE). 4. The term is now used to denote the seizure by revenue officers, the police, or other authorised persons, of goods in regard to which some breach of the law has been committed. 5. Failure to perform the condition of a bond on the part of the obligor (see BOND) formerly entailed a penalty. Equity, however, has long relieved the obligor from F. of anything more than the other party was in conscience entitled to be paid. The like observations apply to the case of foreclosure as between mortgagor and mortgagee. 6. As to F. of contraband of war see DECLARATION OF LONDON. Other uses of the term, such as F. of marriage—the penalty imposed on a ward who married contrary to the wishes of a guardian—and F. for waste of a freehold inheritance, are obsolete. See also CONFISCATION.

Forged Transfer Acts, 1891 and 1892. These Acts empower a company to make cash compensation out of its funds for any loss occasioned by a forged transfer of its shares or stock, or by a transfer under a forged power of attorney. It is always desirable to set aside a fund exclusively for such compensation, because the title of the true owner of shares can never be affected by a forged transfer, and he can always compel the company to recognise him as the holder of the shares so transferred, and to cancel the forged transfer. The Acts enable a company to form a compensation fund by insurance or out of reserve capital, or in any other way it may resolve upon; and it may also borrow on mortgage to effect the same object. If the company elects to create the fund by insurance it may do so by charging

transfer fees not exceeding one shilling per £100, and not less than threepence. The Acts also empower a company to guard itself against loss from forged transfers by imposing reasonable restrictions on the right to transfer shares or stock, as, for example, by giving the directors the right of veto. See Buckley on *Companies and Limited Partnerships Acts*; and Palmer's *Company Law*.

Forgery, falsification or alteration of any document or writing with intent to defraud. The crime is only a misdemeanour at common law; but as commerce developed and paper credit became proportionately extended, many Acts were passed enumerating the most important classes of commercial and official documents, and making it a felony, punishable in most cases with penal servitude for from three years to life or imprisonment not exceeding two years, not only to forge or alter but also to alter or 'put off' any such document knowing the same to be forged. There can be no conviction for statutory F., unless the instrument purports on the face of it to be valid for the purposes for which it was created; hence a forged cheque with no signature on it will sustain at most only a charge of F. at common law. F. only applies to documents in writing, therefore passing off a counterfeit picture for that of a particular artist by painting his name in the corner is not F., though it may constitute obtaining by false pretences. F. implies a general intent to defraud and not necessarily an intent to defraud any particular person. It may be noted that an instrument may be a F., even though the forger has put his own name to it, e.g. if A transfers shares to B, and subsequently with a fraudulent intent purports to assign the same shares to C by a signed transfer, the latter instrument is a F. See also COINING.

Literary forgery means the passing off of spurious literature as the work of well-known writers. See LITERARY FORGERY.

Forgery in Art, or Faking—The executing of a new or altering of an existing work of art with the intention of passing it off as the work of a particular famous artist or of a well-known 'school' or period—usually that of the old masters. The art of faking—a source of considerable amusement and excitement to the world at large—is a serious matter for dealers, collectors, etc., and the ever-increasing resources of science are needed and used to the full in this battle of wits in which the unravelling of a good piece of faking is rather like the unfolding of a first-class detective story.

Faking can take many forms—complete copies, touching up and additions, imitations, transpositions, etc., 'variations in the style of'. Methods of detection include examination of technique and materials and details of costume, inscriptions, furnishings, etc. The general run of faking is crude enough and usually designed to be accepted as the work of a minor artist of the period currently most popular with collectors: real artistic talent is more likely to interfere with

slavish imitation and strike a discordant note. There are, however, fakes which have genuine merit, e.g. the Renaissance sculptures of Giovanni Bastiani, which have a place of their own in the Victoria and Albert Museum and Rouchomovsky's famous gold bottle. The Van Meegeren (q.v.) case in 1948 concerning forged Vermeers and de Hoochs was typical of the interest aroused in art F.: here the forger seemed to have a genuine talent perverted by admiration of his own cleverness. There are at present only two collections of avowed fakes—Dr. Ruhemann's and that of the scientific dept. of the Courtauld Institute of Art, and these are invaluable for teaching purposes. See O. Kurz, *Fakes: a Handbook for Collectors and Students*, 1948; and H. Tietze, *Genuine and False*, 1948.

FORGET-ME-NOT

Forget-me-not, popular name of *Myosotis palustris*, a plant belonging to the Borage family. It grows abundantly in damp places throughout Britain, and flowers all through the summer and autumn. The stem is succulent and grows to about 1 ft. in height. The flowers are blue and have a five-cleft calyx. Several other species of *Myosotis* are common, and many are cultivated in gardens; *M. alpestris* is a rock plant and *M. lithospermifolia* has the largest flowers of the genus.

Forging. See ANNEALING; DROP-FORGING; WELDING.

Forio, seaport and com. of Italy on the Is. Ischia, in the circle and 16 m. W.S.W. of Pozzuoli. It is noted for its warm mineral springs. Pop. 7200.

Fork, implement used for different purposes, and having two or more points or prongs. The various kinds of F. include Fs. for the table, pitch-Fs., hay-Fs., and tuning-Fs. (q.v.). The table-F. does not seem to have been used in England before the reign of Charles I. The oldest Eng. F. known is at present in the Victoria and Albert Museum, London. It was made for John, earl of Rutland in 1632, and has two prongs. Fs. are made of various materials, such as silver, silver plate, white metal, and steel. The making

of Fs. consists first in forging the tang, shoulder, and shank, and the piece from which the prongs are made. The other processes are the grinding, polishing, and hafting or fitting into the handle. The hay-F., used for turning and tossing hay, and the pitch-F. used as a garden implement have long wooden handles—occasionally short ones—and usually two prongs called tines. There is also a three-pronged F. used for some purposes in agriculture. The tuning-F., made completely of metal, has two prongs and is tuned to A above middle C. The method of producing this note is that of striking the tuning-F., which vibrates and produces the required sound.

Forli: 1. Prov. of Italy in the div. of Emilia, central Italy. Area 725 sq. m. Pop. 300,000. 2. Cap. of the prov. of the same name, situated about 40 m. S.E. of Bologna, and at the foot of the Apennines. Its cathedral (San Girolamo) and churches are noteworthy on account of their works of art by Cignani, Guido, and others. It also contains an art gallery and a citadel dating back to 1361, and now used as a prison. Its manufs. are varied, including silk and cloth. The tn. itself, Forum Livii, is said to have been founded during the third century B.C. In the Second World War the Gers. mined buildings and shelled the city after the Allies occupied it in 1944. The monumental part of the cathedral, including the cupola with Cignani's frescoes, escaped damage. The church of S. Biagio was destroyed and with it Ferrucci's tomb of Barbara Manfredi. The clock-tower of the public hall was demolished by the Gers., and the main building damaged, and the picture gallery and museum sustained some injury, but their collections had been moved to safety. Pop. about 58,000.

Form: 1. In philosophy means that which makes matter a determinate species (see **FORMALISM**). 2. In music, means the plan upon which a piece of music is constructed, e.g. Sonata F., which implies two prin. sections, the exposition, consisting of first and second subject specifically related, and the development or working out, leading to recapitulation of original subjects in different keys. Other Fs. in music are fugue, rondo, scherzo (q.r.).

Formaldehyde ($\text{H}\cdot\text{CHO}$), one of the organic substances called aldehydes which are formed when the primary alcohols lose two atoms of hydrogen, hence alcohol *dehydrogenatum*. F. is prepared by oxidising methyl alcohol by passing air saturated with the alcohol vapour over red-hot platinised asbestos. It is a gas at ordinary temps., condensing at -21°C . It rapidly decomposes to form metaformaldehyde, a crystalline compound. When the metaformaldehyde is heated F. is again formed, which decomposes once more on cooling. When the aqueous solution of F. is evaporated, the F. is converted into paraformaldehyde, an amorphous substance. All three substances have the same percentage composition, so that they form an example of polymerisation. F. occurs in the chloro-

phyll cells of plants, and is an effective germicide. **Formalin** is a trade product, consisting of an aqueous solution containing about 40 per cent of F.; it is much used as an antiseptic. F. reacts with ammonia to form a white solid, hexamine, which, when treated with concentrated nitric acid yields cyclonite ($\text{CII}_2\cdot\text{N}\cdot\text{NO}_2$). Cyclonite (R.D.X.) was a prin. ingredient in the under-water explosive used against U-boats in the Second World War. With phenol (q.v.) F. reacts to form the well-known and extensively used plastic bakelite. F. is used in tanning leather, in the dye industry, and in the synthesis of many drugs.

Formalin. Solution obtained from formaldehyde (q.v.) which has great powers of deodorising and preserving various substances. The former fact makes it a particularly unsuitable medium for preserving foodstuffs, where the odour is often the chief check the consumer has upon the good or bad quality of an article; none the less it is largely used on the Continent for this purpose. F. is used in many industries because of its chemical effect upon soft substances, and is also of value in some important secret processes. It is also a powerful antiseptic and disinfectant.

Formalism (in philosophy). According to Kant those qualities and determinants which fix the arrangement of matter, and thus invest a thing with identity. F. becomes a kind of enhanced idealism. Aristotle says that in organisms an individual has two aspects: matter, out of which he is emerging, and form, into which he is passing. Thus everything is matter, and the potentialities of the individual thing which impel it to its reality are its form. The form is therefore immanent. In reason, matter corresponds to the passive reason, while form is the active reason. In art, form is the third of the four causes, material, efficient, formal, and final. Advanced F. actually denies the existence of matter and recognises form only.

In religion F. stands for excessive devotion to formal precedence and observance, as distinct from the spirit.

Forma Pauperis, see **IN FORMA PAUPERIS**.

Formia, city, situated in the S. of Italy in the prov. of Caserta and on the gulf of Gaeta; its original name being Mola di Gaeta. It was an old Rom. tn., its name then being Formie, and it still contains the remains of villas formerly inhabited by Rom. nobles including Cicero. It was also famous for its wines. The best objects of the museum were taken to Naples for safety during the fighting of 1943, but only to be destroyed there. The church of St. Dominic suffered great damage, and that of St. Teresa was practically destroyed. Pop. 8500.

Formic Acid, fatty acid, being a derivative of methyl alcohol or formaldehyde. It is a colourless liquid of specific gravity 1.24; it solidifies at low temps., melting at 8°C . and boiling at 101°C . It has a powerful irritating odour, and blisters the skin on contact. It occurs in

nature in nettles, ants, and other stinging creatures, and owes its name to the ant (*formica*), whose irritating sting is due to the secretion of F. A. The molecular formula of F. A. is CH_2O_2 , and the substance may be prepared by heating oxalic acid with glycerin. The salts of F. A. are termed formates and may be prepared by neutralising the acid with the appropriate alkalis, hydrates, etc.

Formic Ether, or **Ethyl Formate**, ester of formic acid. It may be prepared by treating formic anhydride with alcohol. Its formula is $\text{H.CO}_2\text{C}_2\text{H}_5$; it is a colourless liquid with a pleasant peach-like odour, boiling at 55°C . Like many of the esters of organic acids, it is used as a perfuming and flavouring agent in the preparation of sweets, etc. It is also used as an ingredient of a kind of rum.

'Formidable', name of a Brit. battleship. It was torpedoed and sunk by the Gers. on Jan. 1, 1915. The present *F.* is an aircraft carrier of 23,000 tons displacement, completed in 1940.

Formosa, or **Taiwan**, large and important is. of the W. Pacific, which, until 1895, formed part of the Chinese empire when it came into the possession of the Jap., who held it until 1945. The story of *F.* furnishes an insight into Jap. methods, determination, and stubbornness against odds. The indifference of the Chinese to an is. so close to their shores may seem surprising, especially since they were there first, following the influx of 100,000 refugees from the Manchus three centuries ago. But Japan went in, and in place of shabby, sprawling insular huts there appeared roads, railways, hotels, and other amenities of civilisation. When it came to subduing savage head-hunters, who for centuries denied the hinterland (and later the camphor forests) to all comers, then Japan proved equal to the task by savagery, or even by electrified fences and other devices borrowed from W. peoples. Although there were at first many endeavours to form a republic, the Jap. rule was later accepted without demur, and the area became peaceful. After the Second World War *F.* was constituted a prov. of the republic of China.

The is. is 225 m. long, and from 60 to 80 m. broad, and is about the same size as Kiushiu, one of the four chief is. forming Japan proper. *F.* is regarded by some as a link in the chain of volcanic is. which form the K. escarpment of a former Malayo-Chinese continent. The backbone of the is., extending N. and S., is formed of a range of densely wooded mts., of which the highest peak is Mt. Morrison (14,720 ft.), and the second Mt. Sylvia (12,480 ft.). E. of this the country is mountainous, terminating in a precipitous coast and a few rocky is. The W. coast presents a remarkable contrast to the bold rocky face of the E., which contains the highest known sea cliffs in the world (3000 ft.). It consists of a broad, alluvial plain scamed by a number of water channels, and terminating at the coast-line in sandbanks. The land on this side is regularly gaining on the sea, prob-

ably owing to the sediment brought down from the mts. by water-courses during the rainy season. The climate is damp, hot, and malarious, and on the whole very trying to many people. The driest and best months in the N. are Oct., Nov., and Dec. Violent typhoons are very common at certain seasons in the sea immediately S. of *F.* The is. is famous for the rich luxuriance of its vegetation. Orchids and other ornamental plants of *F.* enrich our European greenhouses. There is also a profusion of ferns, fern-trees, camphor, bamboos, pines, palms, and banana trees. The pineapple, too, grows in abundance. Of animal life, there are at least three kinds of deer, wild boars, monkeys, flying squirrels, and at least forty-three species of birds peculiar to the is. Noxious wild animals are few. Little is known of the geology of the is. Gold is obtained in the Kelung dist., and bituminous coal and sulphur abound. Petroleum and natural gas are also found, but are undeveloped. The chief industry is agriculture, carried on by the Chinese settlers; tea and sugar are the staple products. It is the prin. source of the world's camphor supply. Other products are rice, fruits, indigo, opium, and tobacco. Area 13,886 sq. m. The pop. is estimated to number 5,212,000. The pop. of the cap., Taihoku (Taipei) is 230,000. See R. Goldschmidt, *Neu-Japan, Reisebilder aus Formosa*, 1927; and A. J. Grajdancev, *Formosa To-day*, 1942.

Formosa: 1. Ter. in the Argentine Republic, S. America, in the extreme N. It lies between the Rs. Pilcomayo and Bermejo. The estimated area is 29,143 sq. m.; pop. 112,000. This ter. forms part of the great Chaco plain. Not very much is known about the region, except that it is covered with forests and in large sections liable to inundations; the summer rains lasting from Oct. to May. 2. *F.* is the chief tnn. situated on the Paraguay R. It was founded after the defeat of the natives of Chaco by Gen. Victoria in 1884-85. Pop. 16,000.

Formula, chem., a collection of symbols which indicates the composition and certain other characteristics of a substance. Each element is represented by a letter or two letters derived from the Eng. or Lat. name; thus O is an abbreviated form of oxygen, Hg stands for mercury (Lat. *hydrargyrum*). But the symbol not only stands for the name of the element, it also represents a definite relative weight. This weight is known as the atomic weight of the element, and it indicates the smallest quantity of the element that is known to enter into chemical composition, measured in terms of the atomic weight of hydrogen as unit. When two or more symbols are placed in juxtaposition, the resulting *F.* indicates that the elements are in chemical combination in the proportions shown by their atomic weights. Thus H_2O represents water, and indicates that 2 parts by weight of hydrogen are united to 16 parts of oxygen, 16 being approximately the atomic weight of oxygen. A figure placed to the left of a *F.* applies to the *F.* as a

whole. Thus, in the equation $3\text{NO}_2 + \text{H}_2\text{O} = 2\text{HNO}_3 + \text{NO}$, we have indicated the fact that 138 parts of nitrogen peroxide react with 18 parts of water to produce 126 parts of nitric acid and 30 parts of nitric oxide. In the formula NO_2 , N stands for 14 parts by weight of nitrogen and O for 16 parts of oxygen; NO_2 therefore represents 46 units of weight, while 3NO_2 means three times that quantity. A F. which simply indicates the respective proportions of the elements is called an *empirical F.* Thus H_2O and H_2O , might both serve as empirical formulae for water, as they represent the same ratio of the weights of hydrogen and oxygen when H is understood to indicate 1 unit and O 16 units of weight. In every quantity of the same chemical compound the constituent elements are in an invariable ratio. The smallest portion of matter that can exist by itself is called a molecule, and in the molecule of a compound the same invariable ratio of the quantities of the elements is maintained. Each element of the compound is present in every molecule in the form of one or more atoms, and it is desirable that the F. of a substance should represent the actual numbers of the atoms of each element in the molecule. Such a F. is called a *molecular F.*, and in order to obtain it the molecular weight of the substance must be found. The estimation of molecular weight is based on the hypothesis of Avogadro, who suggested that equal volumes of all gases at the same temp. and pressure contain the same number of molecules. By finding the density of a gas, that is, the ratio of its weight to the weight of an equal volume of hydrogen under the same conditions of pressure and temp., we find also the ratio of the weight of a molecule of the gas to that of a molecule of hydrogen. As other considerations have led to the conclusion that a molecule of hydrogen contains two atoms, it follows that the molecular weight of a substance is twice its vapour density. The importance of molecular weight in this connection is seen from the following example. Formaldehyde, acetic acid, and lactic acid have the same empirical formula CH_2O . The molecular weight of formaldehyde is 30, that of acetic acid 60, and that of lactic acid 90. Assuming from other evidence that the atomic weight of carbon is 12 and that of oxygen 16, it follows that the number of atoms in the molecule must be represented as CH_2O for formaldehyde, $\text{C}_2\text{H}_4\text{O}_2$ for acetic acid, and $\text{C}_3\text{H}_6\text{O}_3$ for lactic acid. Among organic compounds there are many cases of different substances with the same molecular F., but with different physical and chemical characteristics. This is explained by assuming a difference of structure or arrangement of the atoms in the molecule, and another form of F. is necessary. The disposition of the atoms in a molecule of ethyl alcohol is

thus indicated: $\text{H}-\text{C}-\text{C}-\text{O}-\text{H}$. This

is called a *graphic F.*, and shows that one carbon atom is directly united with three hydrogen atoms, the second carbon atom with two hydrogen atoms, and the oxygen atom with one hydrogen atom. This linking of atoms agrees with the behaviour of organic substances, as in chemical action the atoms tend to be replaced in groups. The same information is conveyed by the more concise *structural or constitutional formula*, $\text{CH}_3\text{CH}_2\text{OH}$. In *electronic Fs.* crosses, circles, and dots are used as well as the literal symbols, to indicate the various types of electrical bonds assumed to be holding the atoms together: thus the formula $\text{H} \times \text{C} \cdot \text{C} \cdot \text{O} \cdot \text{H}$ indicates that in the molecule of hydrogen chloride the hydrogen and chlorine are bound by a link consisting of one electron (\times) from the hydrogen and one from the chlorine.

Foro Appio, see **FORUM APPII**.

Forres, royal burgh of Moray, Scotland. Close to this tn. on Chiny Hill is built a hydropathic estab. There is also a tower erected in honour of Nelson, and an auct. obelisk. Pop. 4400.

Forrest, Edwin (1806-72), Amer. tragedian b. in Philadelphia, of Scottish and Ger. descent. He made his first public appearance in 1820 in Philadelphia in the part of Douglas in Home's tragedy of that name. He crossed to England in 1836 and entered on a season at Drury Lane Theatre, London, where he achieved distinction in the Shakespearian roles of Macbeth, Lear, Othello, and Richard III. He finally returned to the New York stage, and his last appearance was in 1871. See J. Rees, *Life of Edwin Forrest*, 1838; and L. Barrett, *Edwin Forrest*, 1881.

Forrest, John, first Baron Forrest of Bunbury (1817-1919). Australian explorer and statesman, son of Wm. F. Educated at Perth, W. Australia. At the age of twenty-two, after four years' service in the State survey dept., he was sent in charge of an expedition to seek for traces of the lost explorer Leichhardt. Five years later he explored the colony of W. Australia from Champion Bay to Port Darwin, being awarded for this and his other journeys the gold medal of the Royal Geographical Society and other honours, together with a large grant of colonial land. On the attainment by W. Australia of responsible government, for which the colony was largely indebted to his exertions, he became its first Prime Minister, and held office for over ten years. In his term as Premier important gold discoveries were made in W. Australia, and it was to his vision and determination that the colony owed the Fremantle harbour works, the projection of railroads to the mining dists., the goldfields water scheme and its excellent land laws. He held many ministerial posts in the federal Parliament, including those of treasurer and acting Prime Minister. He pub. *Explorations in Australia* (1876). See H. G. Turner, *First Decade of the Australian Commonwealth*, 1911.

Forrest, Nathan Bedford (1821-77), soldier, was b. near Chapel Hill, Tennessee.

On joining the Confederate army after the beginning of civil war in America, he became a commander of the cavalry and did some distinguished service for his country. Military men rank him as one of the greatest of natural cavalry leaders. In the campaign of 1862 he made a dash across the state of Tennessee and for two weeks cut Gen. Grant off from communication with the world and seriously delayed the advance on Vicksburg.

Forrestal, James Vincent (1892-1949), Amer. statesman, b. in Beacon, Dutchess co., New York. Went to local schools, and then worked as a newspaper reporter; but later went to Dartmouth College, and Princeton Univ. Sold bonds for the banking house of Dillon, Read and Company. In 1918 he served in the office of naval operations, in the Navy Dept., Washington, and subsequently as a naval aviator. After the war he returned to his banking house, becoming its president in 1937. Nominated by President Roosevelt to be under-secretary of the navy—a newly-created post, entailing responsibility for all material provided for the navy. Acting-secretary of the navy 1944; secretary a month later. F. was the driving force behind an immense production of ships, planes, guns, and other munitions of war, besides establishing close relations with Britain in solving problems connected with the Lend-Lease Act. In 1947 he was appointed first U.S. Secretary of Defence. Resigned (for health reasons) 1949, being awarded the Distinguished Service Medal, the highest honour given to civilians in the U.S.A.

Forskål, Peter (1736-63), Swedish botanist. In 1761 he was chosen by the king of Denmark to join the scientific expedition to Arabia, and here he collected sev. hundred plants, previously unknown, and pub. a 'Flora' at Malta. He d. on his return journey from Arabia, having contracted the plague. His papers, etc., were pub. by Niebuhr under the titles: *Descriptiones Animalium, Arum, Amphibiorum, Piscium, Insectorum quae in Itinere Orientali observavit P. Forskal*, 1775; *Flora Aegyptiaco-Arabica*, 1775, etc. The genus *Forskalia* is called after him.

Forst, Jn. of Brandenburg, Germany, F. of Citharus, on the R. Neisse. It is noted chiefly for the manuf. of woollen cloths. Pop. 45,000.

Forster, Edward Morgan, Eng. novelist and essayist, b. in London, Jan. 1, 1879, of Anglo-Irish extraction on his father's side. He was educated at Tonbridge School where he was a day-boy, and at King's College, Cambridge, where he took his degree in classics and hist. in 1901. He became a fellow of King's in 1927. At Cambridge he made a lifelong friendship with Lewis Dickinson, who with F., Nathaniel Wedd, his classics tutor, G. M. Trevelyan, and others founded the *Independent Review*. F.'s first novel *Where Angels Fear to Tread* (1905) was written at the age of twenty-six while F. was living in Italy. It was followed by others in quick succession, *The Longest Journey* (1907), *A Room with a View* (1908), and *Howards End* (1910). These 'project an

exquisite and animated crowd of beings—delicious elderly ladies, priggish or tormented or cheerfully barbarian young men, perceptive or conventional young women, beautifully of their period and class; and all set in the silver-point world of their creator's 'civilised irony' (Rose Macaulay). *The Celestial Omnibus*, a collection of short stories, appeared in 1911. The last of his novels, and the best known, *A Passage to India*, was begun shortly afterwards, but not completed and pub. until the year 1924. All F.'s novels have in common a preoccupation with personal relationships and the difficulty, or rather impossibility, of harmonising opposing conceptions of life. Two worlds are sharply opposed in one of his best novels, *Howards End*, in which one of the characters Helen Schlegel says: 'Personal relations are the important thing for ever and over, and not this outer world of telegrams and anger.' In his novels the people of the outer world of convention and formality, hidebound, not lacking in intelligence but failing a real sense of human values, are constantly thrown up against situations where they are powerless whereas the apparently ineffective characters are revealed to have some quality of personal power springing from their sense of a real and inner truth. In spite of personal failures and misjudgments they are better equipped to deal with emotional stress and crisis. In this connection the construction of plot is important in F.'s hands, and he relies at times on situations of extreme violence to test the qualities of his characters. *A Passage to India* (later pub. in Everyman's Library with the addition of F.'s own notes) gained him a wide reputation for the insight and wisdom with which he depicted the relations between the Indians and the Eng. in India. There are many striking passages in his books, while, as a satirist dealing with conventions, he is both penetrating and mordant. Again, as in the novels of Hardy, there is a subtle and often bitter irony in the situations in which his characters find themselves impotently struggling against the monstrous effects which have sprung from the most trifling causes. Sometimes, indeed, the conviction persists that the characters are prisoners of their creator's ingenuity, unable to escape into the real world. The integrity with which F. approached life in his novels has also enhanced the value of his miscellaneous and critical writings. *Aspects of the Novel* was delivered first as the Clark lectures at Cambridge in 1927 and pub. in the same year. A vol. of short stories *The Eternal Moment* appeared the following year and included stories such as *The Story of the Siren* which were written much earlier. Other books include *What I Believe* (1939), *Nordic Twilight* (1940) and the Rede lecture on Virginia Woolf, pub. in 1942. Contributions to Eng. periodicals in the twenties were collected and pub. under the title *Abinger Harvest* (1926). See Rose Macaulay *The Writings of E. M. Forster*, 1938; L. Trilling, *E. M. Forster*, 1944. Studies of F. also appear in B. Dobrée's *The*

Lamp and the Lute, 1929; Virginia Woolf's *The Death of a Moth*, 1929; Katherine Mansfield's *Novels and Novelists*, 1930; C. Connolly's *Enemies of Promise*, 1938; and Lord D. Cecil's *Poets and Story-Tellers*, 1949.

Förster, Friedrich Christoph (1791-1868), Ger. historian and poet, and brother of the painter Ernst Joachim F., b. at Münchengosserstadt. He first devoted himself to the study of archaeology and the hist. of art, but on the outbreak of the War of Liberation, in 1813, joined the army, where he quickly attained to the rank of captain, and by his fiery war-songs stirred up his countrymen against the Fr. On his return to Berlin, he taught in the school of artillery and engineering for a short time, and in 1829 became custodian of the Royal Art Museum with the title of court councillor. F. was connected with various journals and was the founder and secretary of the *Wissenschaftlicher Kunstverein* in Berlin. His prin. works are *Der Feldmarschall Blücher und seine Umgebungen*, (1821); *Friedrichs des Grossen Jugendjahre, Bildung und Geist* (1822); *Albrecht von Wallenstein* (1834); and *Wallensteins Prozess* (1844). He also wrote poems and a drama, *Gustav Adolf* (1833), and adapted sev. of Shakespeare's plays for the theatre.

Forster, Hugh Oakeley Arnold, see ARNOLD-FORSTER, HUGH OAKELEY.

Forster, Johann Georg Adam (1751-94), eldest son of Johann Reinhold F., b. at Nassenhuben near Danzig. At the early age of seventeen he accompanied his father on Cook's second voyage, and pub. an account of the expedition. He was for sev. years prof. of natural hist. at Cassel and Vilna (Vilna) respectively, and then became librarian to the elector of Mainz in 1789. His writings, of which the most important are *Ausichten vom Niederrhein* (1791-94) and *Beschreibung einer Reise um die Welt* (1784), rank high amongst Ger. works descriptive of nature. His *Letters* were pub. by his widow in 1829 (2 vols.). See J. Moleschott, *G. Forster, der Naturforscher des Volks*, 1874; A. Leitzmann, *Georg Forster*, 1893; and P. Zinke, *Georg Forsters Bildungs- und Wandlungszeiten*, 1925.

Forster, John (1812-76), biographer, b. at Newcastle; educated at the grammar school there, and at Univ. College, London. Became a barrister of the Inner Temple, but soon gave up law for literature, having, indeed, at an early age become a contributor to the newspapers and reviews. At the age of twenty he was appointed dramatic critic to the *True Sun*, and two years later ed. the short-lived *Illustrator*, to which his friends Lamb and Leigh Hunt contributed. During this period he did much journalistic work, but his ambition was to write books, and between 1836 and 1839 he wrote the *Lives of the Statesmen of the Commonwealth*. In 1846 he was for a few months ed. of the *Daily News* in succession to Dickens, and in the next year he became ed. of the *Examiner*. His admirable *Life and Adventures of Oliver Goldsmith* appeared in 1848. Being appointed in 1855 secretary to the Commissioners of Lunacy, he at once gave up

journalism, and devoted himself to more serious labours. Among his close friends were Carlyle, Dickens, and Landor. His best known work is his biography of Dickens (1872-74), which, in spite of many defects, still ranks as the standard authority. He also wrote *Lives of Landor* (1868), *Sir John Elliot*, and the first vol. of a life of Swift. See P. H. Fitzgerald, *John Forster, by one of his Friends*, 1903; and R. Renton, *John Forster and his Friendships*, 1912.

Forster, William Edward (1818-86), b. at Bradpole, Dorset, was of Quaker ancestry, and remained a member of the Society of Friends until his marriage in 1850 with a daughter of Dr. Arnold. He was brought up to go into business, and in 1842 became a partner in a firm of woollen manufacturers that, after overcoming initial difficulties, became a very prosperous concern. He became Liberal member for Bradford in 1861, and held the seat until his death. He made his mark in Parliament early, and in 1865 was appointed under-secretary for the colonies. He became vice-president of the Council three years later, and was given charge of various Bills, which he piloted successfully through the House. Upon Gladstone's return to power, in 1880, he became chief secretary for Ireland. He made an earnest effort to cope with the Irish problem, but, losing the support of his colleagues over the imprisonment of Parnell and other Land League leaders, he resigned. There is a biography by Sir T. Wemyss Reid (1888).

Forsyth, Alexander John (1768-1843), inventor, b. in Aberdeenshire. After the death of his father he became the minister of Belhelvie, Aberdeenshire, and about the year 1806 invented the percussion lock, which sec. Napoleon offered to buy for £20,000, but was refused. See Sir A. J. Forsyth Reid, *The Rev. Alexander J. Forsyth and his Invention of the Percussion Lock*, 1909.

Forsyth, Andrew Russell (1858-1942), Brit. mathematician; b. at Glasgow; son of John F. Educated at Liverpool College and Trinity College, Cambridge. He became prof. of mathematics at Univ. College, Liverpool, 1882-83, and Sadlerian prof. of pure mathematics at Cambridge, 1893-1910. Chief prof. mathematics, Imperial College of Science and Technology, S. Kensington, 1913-23. F.'s chief work was *Theory of Differential Equations* (1890-1906). He also pub. *Intrinsic Geometry of Ideal Space* (1935).

Forsythia, or **Golden Bell**. Deciduous shrub of the family Oleaceae, blooming very early in advance of the leaves, and with yellow flowers. Two well-known species from China are *suspensa* and *viridissima*, and popular varieties are *atrocaulis*, *Fortunei*, *Sieboldii*, *intermedia*, and *spectabilis*. Plants are all 6 to 8 ft. in height.

Fort, see FORTIFICATION.

Fortaleza, also called Ceará, the cap. of the state of C. in Brazil. It is a seaport, being situated on a bay, though vessels cannot anchor very far into the harbour. The tn. itself is well arranged, and is connected by rail with the interior

regions of the country, which are much more fertile than its environs. It trades principally in coffee, sugar, rubber, and drugs. Pop. 143,200.

Fort Atkinson, city of Wisconsin, U.S.A., lies on the Rock R., 55 m. S.W. of Milwaukee. Situated in an agric. locality, its industries consist of the manuf. of harrows and dairy machinery, chairs, sleighs, and carriages. It has also knitting mills and meat-packing establs. It received its name from a fortification erected there, in 1836, by Gen. Atkinson during the Black Hawk war. Pop. 6,100.

Fort Augustus, vil. on the Caledonian canal at the head of Loch Ness, 33 m. S.W. of Inverness. It was built in 1716, under the name of Kilchumin, and captured by the Jacobites in 1745. After the battle of Culloden it was reoccupied and received its present name in honour of Wm. Augustus, duke of Cumberland, the victorious general. It was then used as a sanatorium till 1857, and in 1876 was presented to the King, order of Benedictines, and converted into a stately abbey, college, and hospice. Pop. 6,100.

Fort Beaufort, dist. in the S.E. of the prov. of the Cape of Good Hope. Its cap. is F. B., which lies 45 m. W. by N. of King William's Tn. Pop. of dist. 20,000.

Fort Bilov, see *MONILE*.

Fort Collins, cap. of Lorimer co., Colorado, U.S.A., 74 m. N. of Denver, on the Colorado and S. railroad. The state agric. college was opened here in 1879. The city is the centre of a fertile region and has an extensive system of irrigation. Pop. 12,200.

Fort Dodge, cap. city of Webster co., Iowa, U.S.A., and is situated on the Des Moines R., and on sev. railroads. Has coalfields, quarries of building stone, and manufs. of pottery, plaster, stucco, and foundry products. Pop. 22,500.

Fort Edward, vil. in the co. of Washington, New York, U.S.A. It stands on the Hudson R., and on the Delaware and Hudson railroad to the N. of Troy. It has iron and brass works, also paper mills and potteries. Pop. 4,000.

Fortescue, Adrian (1871-1923), Eng. Catholic priest, scholar, orator, and artist. Son of former provost of St. Ninian's, Perth, who was received into the Catholic Church. Educated at Jesuit preparatory school, Boulogne; St. Charles College, Bayswater; Scots College, Rome; Innsbruck Univ. An exceptional linguist, studied Hungarian, Arabic, Syriac, Russian, as well as the more regular Hebrew, Greek, Italian, German, and French. At Innsbruck, prescribed for himself in due course Sanskrit, Icelandic, and Old English—'If God spares me.' A vivid and powerful personality, as interested in action as in literature, he wrote and drew standing at his desk. Fought at least twice for his life, with fanatics or brigands in E. Europe. Held pastoral posts at Ger. Church, Whitechapel, 1899; Chipping Ongar, Colchester, Enfield, Witham, and Maldon. In 1907 appointed to the charge of the Catholic community at the new garden city, Letchworth, which he held for his last sixteen years. F. lec-

tured, talked, and debated with startling ease, force, and charm on a wide variety of linguistic and scholarly subjects. Among the polychromatic series of his lectures were such as Philosophy of St. Thomas; Science and Faith; The Alphabet; Organisation of the Church in First Three Centuries; Mormons in Utah; Religion and Politics in Balkans; Christianity and War; The Italo-Greeks; The Slavs; Socrates; The Uniate Churches; Boethius; Essence of the Catholic Religion; Life of Dante; Learning Languages; Charles III. (Young Pretender); Christianity in Rom. Empire before Constantine; Religion and Philosophy in the Rom. Empire; Dante; Christ and Plato; Austria-Hungary; Turkey; Death of the Gods. Ease and verve in him were never superficial, and in every study he went deep. Preached his last sermon on 'Christ our Friend and Comforter,' Letchworth, Dec. 31, 1922, before going for surgical operations in London; d. Feb. 11, 1923. Among his many pub. works are books on the Gk. Fathers and the Orthodox E. Church; *Liturgy of St. John Chrysostom* (1908); Preface to Thomas à Kempis' *De Imitatione Christi* (1919) and Roman Missal (1920) *The Mass* (1920); *The Ceremonies of the Roman Rite*, with designs by the author (1920); *Histoire des Patriarches d'Alexandrie* (par Jean Maspero), revu par A. Fortescue and G. Wiet (1923). Pamphlets: *How to Pronounce Latin* (1908); *Pope Gregory VII.* (1909); *The Branch Theory* (1910); *The Vestments of the Roman Rite* (1912); *Formula of Hormisdas* (1914); *Russia and the Catholic Church* (1915); *Pacifism* (1916); *Date of Anglican Schism* (1917); *Catholic because Roman Catholic* (1917). See *Adrian Fortescue*, memoir by J. G. Vance and J. W. Fortescue, illustrated with his illuminated penwork, 1924, and R. L. Hine, *Confessions of an Un-common Attorney*, 1946.

Fortescue, Sir John (c. 1394-c. 1476), b. in Somersetshire and educated at Oxford. He was three times appointed governor of Lincoln's Inn during Henry VI.'s reign, and in 1442 was chief justice of the king's bench, being highly recommended for his wisdom, gravity, and uprightness. He was a great favourite with Henry VI. and held office during the remainder of his reign, faithfully serving, and steadily adhering to him. At the accession of Edward IV., F. was charged with high treason, and accompanied Queen Margaret and her court in their exile to Holland. He afterwards returned to England and received a pardon from Edward IV. on the defeat of the Lancastrian party. F.'s fame rests on his work, *De laudibus legum Anglie*, written c. 1470 (printed 1537), written during wanderings abroad for the instruction of the young Prince Edward, and on *On the Governance of the Kingdom of England*, not printed until 1714. See Lord Clermont, *History of the Family of Fortescue*, 1869.

Fortescue, Sir John William (1859-1933), Brit. military historian, a son of the third Earl Fortescue. Librarian at Windsor Castle, 1905-26. Author of

History of the British Army (1890-1920), a monumental work in many vols. Other pubs: History of the 17th Lancers (1895); Wellington (1925).

Forteventura, see FUERTE VENTURA.

Forteviot, vil. of Scotland, situated in the co. of Perthshire. It stands on the R. Earn to the S.W. of Perth. The old tn. of that name, which was close by, was the cap. of the Picts and Scots. Pop. 600.

Fort Garry, see WINNIPEG.

Fort George, fortress in the co. of Inverness, Scotland. It is situated at the mouth of the Moray Firth.

Forth, Scottish riv., formed by the

of 100 tons up to Stirling, and for vessels of 300 tons to Alloa. Grangemouth on the F. is connected with Bowling on the Clyde by the F. and Clyde Canal, about 38 m. long, on which Symington tried his first steamer in 1801-2. It is proposed to construct a new canal for large ocean-going vessels. The firth is a bay-like extension of the riv., about 50 m. long, with an average breadth of 2½ m. (as much as 17 m. wide at Prestonpans). At Queensferry it is only 1 m. across, and is spanned by a cantilever railway bridge, 8295 ft. long, with two main spans of 1710 ft. each, built between 1882 and 1890.

Valentine & Sons Ltd., Dundee

THE FORTH BRIDGE FROM SOUTH QUEENSFERRY

union of two headstreams, the Duchray Water and the Avonduh, which drains Lochs Chon and Ard. Rising on the N.E. side of Ben Lomond, the F. flows E., joining the Laggan or Avonduh (Perthshire) just above Aberfoyle. The 12½ m. between Stirling and Alloa are known as the 'Links of F.', from the many picturesque windings. The riv. then expands into the arm of the North Sea called the firth of F. (Bodotria, Boderia, Æstuarium, Scots Water). The riv. is about 107 m. long, reaching Stirling after a picturesque course of 39 m., instead of a direct one of 18 m. Its chief tribes are the Teith, draining Lochs Katrine, Achray, Vennachar, and Lubnaig (by means of the Leny), the Allan Water, and the Devon. The riv. and, lower, the firth, divide the shires of Perth, Clackmannan, and Fife on the N. from Stirling, W. Lothian, Midlothian, and E. Lothian on the S. The riv. is navigable for vessels

The firth is from 3 to 37 fathoms deep, and has good harbours, St. Margaret's Hope being one of the safest Scottish roadsteads. Rosyth, near by, became a naval base in 1903. The Bass Rock and the Isle of May are at the entrance to the firth, which encloses the is. of Inchcolm (with a ruined monastery), Cramond, and Inchkeith (with a lighthouse, as has also the Isle of May). The chief rivs. flowing into the firth are the Carron, Avon, Almond, Water of Leith, Esk, and Leven. Its chief port is Leith, the port of Edinburgh. Others are Granton, Ho'ness, Grangemouth, and Kirkcaldy. Salmon and herring fisheries are carried on in the F.'s basin, and white fish abound. There are vast deposits of coal beneath the bed of the firth, already worked by the Fife collieries. There are various places of historical interest on the riv.'s banks, amongst them Stirling (once a royal residence), Cambuskenneth, Alloa, Kincardine,

dine, and Aberfoyle, Falkirk, near by, has the remains of the wall of Antoninus, and Carberry Hill and Loch Leven, noted in the hist. of Mary Queen of Scots, are not far distant. Bede (d. 735) called the fifth *Sinus orientalis*; to Nennius (fl. 796) it was the *Mare Friesicum*. Consult Dick *The Pagant of the Forth*, 1910.

Fort Hamilton, vil. of Kings co., New York, situated on Long Is. The fort serves as a defence of New York.

Forth and Clyde Canal, canal 40 m. in length by means of which the R. Forth communicates with the Clyde. It extends from Grangemouth on the E., to Bowling, Dumbartonshire, on the W., and divides the country at its narrowest part. It was completed in 1791. It is not used regularly by any great volume of traffic.

Fortification, 'the art or science of fortifying places in order to defend them against an enemy.' F. may definitely be divided into three parts: First, permanent F.s. which are being continually built in time of peace to defend some vulnerable point in the defences of a country. Much time and labour are given to this, as, especially on the Continent, the permanent F.s. form a very essential part of the country's defences. Secondly, semi-permanent F.s., such, for example, as are erected when war is to be imminent and care is being taken to see that all points of the defence are made secure. Thirdly, field F.s., e.g. such military works as are constructed by military engineers during a campaign which have no real permanence and which are only of value during the campaign itself. Such works are built to strengthen the position taken up by an army and to provide as many obstacles as possible to the attacks of the enemy. Field F.s. reached an extraordinary pitch of development in the First World War (see e.g. HINDENBURG LINE; ILOHENZOLLERN REDOUT).

During the early stages of the world's hist. defence was stronger than attack. The main weapons of attack were the battering-ram and the catapult. This latter weapon usually hurled huge stones at the walls of the place attacked. Obviously then the best means of defence against attacks of this kind was the building of huge walls. These, which often attained a thickness of 30 to 40 ft., were practically impregnable, and to this fact the baron owed a great deal of his baronial power. It was obviously impossible for the king to take the castles save by a long siege, and the time expended on such a proceeding was not sufficiently compensated for by the result. The great curtain wall of the castles was commanded by huge towers at each corner, which prevented the enemy from easily attacking the walls, since they could be met by a front and flank defence. Up to the time of the Renaissance the castle may be regarded as the chief method of F. The invention of gunpowder did not immediately bring with it the abolition of the castle. At first the difficulties of firing and the bad ammunition used (usually stone balls) caused little or no damage to the fortified places, but with

the invention and customary use of cast-iron cannon balls, the superiority of the fortified places over the army of attack came to an end. The classic example is the rapid success of Charles VIII. of France during his attack upon the fortified places of Italy. Before his artillery these places fell rapidly, and new means had to be adopted to prevent the enormous damage done by the artillery fire. Mounds of earth began to replace the towering walls of the forts, and these mounds were protected by means of wide deep ditches. The depth was usually 20 to 30 ft., and the ditches were strengthened with masonry (revetments). The face of the castle also began to alter, and the sixteenth century saw the erection of great bastioned fortresses. The enemy naturally massed their artillery together when besieging a fortress in order the more easily to breach the curtain wall.

The bastion (see BASTION) consisted of two faces and two flanks, and a cross fire was able to be poured on to the massed artillery of the enemy from the face of the bastion, whilst at the same time from the flank of the bastion the curtain wall could be easily defended. The enemy could also be attacked by a direct fire from the curtain wall. The attacking army gradually altered its tactics. Instead of attempting to breach the curtain wall, it began to attack the bastion itself. The usual point of attack was the salient angle of the bastion—that is, the angle formed by the meeting of the two faces of the bastion itself. Ravelins or outworks which commanded the position of the attacking artillery were consequently added in order to counter this form of attack, and under the great engineers of the sixteenth and seventeenth centuries, the outworks of the bastions were extended until they became what can best be described as a step-by-step defence, i.e. the garrison resisted to the best of their ability until forced to retire from the outer line, when they fell back on the next line, resisting all the time. The names of famous engineers during this period are legion, but probably the greatest of all names is that of the Fr. engineer, Sébastien le Prestre de Vauban. This great engineer took part in numerous sieges between the years 1667-98, and was eminently successful in his work. He was essentially practical, and although he himself did not believe in systems of F., still it is chiefly by his first, second, and third systems that he is known to posterity. The art of war underwent some considerable modification during the seventeenth and eighteenth centuries, but in no essential feature did it actually change. The sieges of the Napoleonic wars were conducted on almost similar lines to those of Marlborough's campaigns, but with the end of these wars a change was brought about. The range of the artillery was rapidly increasing, the distance from which they were effective had increased to half a mile. It became obvious, therefore, after the Napoleonic wars that the guns of the besiegers must be kept at a greater distance. The enceinte, i.e. the

line of Fs. forming the chief works of a fortified place, must be more amply defended. To do this fortresses were built some distance from the enceinte and yet sufficiently close to one another to be able to give support when attacked. Each of these smaller fortresses was self-sufficient, i.e. it was adequately garrisoned and adequately provisioned so that if necessary it could stand a siege by itself. These fortresses were built on much the same plan as was used for the larger fortresses themselves. The introduction of rifled artillery fire caused stonework Fs. which were exposed to artillery to be condemned. The Franco-Prussian war and the siege of Paris proved the uselessness of the fortress defended by bastions. Fortresses were thrown out to prevent the direct attack of the enemy on the enceinte to greater and greater distances. This in itself made it necessary that the besieging army should increase in proportion to the distance to which the protecting fortresses were thrown out, since the zone to be invested by the besieging army had become much greater. The main lines which modern Fs. follow (subject to the lessons taught by the First World War, as to which see *infra*), however, are: That in the first place the girdle of fortresses should be thrown out to such a distance that direct bombardment of the place cannot take place. Secondly, that the guns in the fortresses should be protected by armour, but that the bulk of the defending artillery should be outside the defended fortress. Thirdly, that the defence should depend to a very large extent upon the infantry, and that for this purpose the forts should be connected one to another by means of infantry entrenchments. Fourthly, that the lines of communication should be kept open and well guarded between the main fortress and the girdle of defensive fortresses. The guns outside the fortresses are either to be concealed or protected by means of eupolas, and the entrenchments of the infantry should be made bomb-proof. The great art in defence as well as attack in modern times is concealment, and this has been made much more possible by means of the invention of smokeless powder. Modern F. is rapidly approximating to field F., since, as stated above, the main line of defence is the infantry strongly entrenched in redoubts prepared and made bomb-proof. The strength of a fortified position depends upon its communications, the rapidity with which the defending infantry can co-operate, and the concealment of its guns. The famous Maginot line, extending from the Swiss frontier to Verdun, was pre-eminently a combination of passive obstacle and active defence. Its construction marked the abandonment of the 1914 conception of the *offensive a outrance*, which led to such tragic results in the First World War. Galleries were hollowed out, which, in a straight line, would cover the distance from Paris to Liège, and the whole work cost 7,000,000,000 francs. The towers of the subterranean workings, which weighed 120 tons, were monolithic, and no shell

could penetrate their concrete walls. Defence against gas was assured by a special process. In order to do away with loop-holes, the guns in the turrets pivoted on a ball mounted in the armour plate. Artillery officers saw the outside world through panoramic telescopes built into the armour plate. Telephone lines were buried five metres deep in concrete slabs. The 'zone of fire' was protected by look-out posts, alarm signals, sound-locating posts, and barrages of infra-red rays. The big forts were nothing less than buried barracks with kilometres of passages lit by electricity and provided with metallised tracks. They were habitable for months on end. The Maginot line conformed to the formula of Marshal Pétain (*q.v.*): 'The minimum of danger, the maximum of comfort.' Behind their cusped embasures the men of the Maginot line could have literally covered the frontier zone with a sheet of fire through which no infantry could possibly have advanced. That, at all events, was what was claimed for these Fs. Its cardinal defect was that the line was not prolonged to the coast. Its strength for defence was never tested in the operations of 1910, for the Gers. broke through the allied lines at Mauntricht, and outflanked the line. In the operations of 1914, when the Anglo-Amér. armies advanced on Germany, the enemy was favoured by the advantages accruing from his strong defensive lines, first the Siegfried Fs. (*q.v.*), and behind them the great barrier of the Rhine. The Maginot line, as such, was no integral part of his defence. See further under WESTERN FRONT IN SECOND WORLD WAR.

Field Fortification.—The differences between permanent, semi-permanent, and field Fs. were a century ago very much more strongly marked than they are at the present time. Nowadays no masonry defences are necessary to make a place defensible, and in a short time, with surprisingly little material, very strong Fs. can be made. The elementary field F., such as the use of obstacles for defence, have been known practically since the dawn of hist. Trenches, abatis, and stakes have always formed a part of the protective measures of even savage tribes. But the art of field F. has undergone tremendous changes during the last century. Practically up to the present time the great object aimed at by field engineers was to obtain command and to defend by obstacle, nowadays military engineers aim at obtaining concealment and protection. The main points to be noticed in modern field Fs. are that the works erected are adapted to the ground which is being defended. The line of the trenches usually follows the natural line of the hill and valley on which they are erected. Secondly, the erection of elaborate bomb-proof shelters and parapets has been made practically useless, since no military work can be thrown up in a short time which is able to resist the highly explosive shell which is fired nowadays. Thirdly, the most important point of all is to obtain a concealed position. This is an additional reason why parapets

are made nowadays comparatively low, seldom, if ever, exceeding 18 in. in height. Fourthly, although obstacles are still used and created, i.e. wire entanglements, pits, and abatis, these are gradually falling more and more out of use, but they are still of considerable value when stopping the rush of the enemy, and give the defender an opportunity of attacking the enemy while he is labouring under difficulties. Another object of field F. is to give the enemy as little shelter as possible. With this object the ground in front of

Antwerp was carried out on different lines from that of Liège and Namur. Although the Gers. soon demolished the forts they had also to contend with a defensive trench line held jointly by some Belgian forces and the Brit. naval div. along the Rs. Nethe and Rupel. Sev. attacks were made on the Nethe line, but were all repulsed, until the Gers. secured a crossing on Oct. 6. Although the steel and concrete forts and works fell in four days, the trench line held out for six. Maubeuge was similar to Antwerp. Here the com-

K.L.M

THE FORTIFIED TOWN OF NAARDEN, HOLLAND

Beyond the town, on the right, is the shore of the IJssel Meer (Zuyder Zee)

the position to be defended is cleared as far as possible to the limits of the range of fire. The outstanding military lesson from the First World War is that it is practically useless to depend on permanent works of defence constructed some years before a campaign, because the continued progress of scientific and industrial development in relation to offensive weapons more than counterbalances the military value of such works. Liège, with its twelve forts in a perimeter of over 30 m., fell within nine days under the pounding of Ger. howitzers of 21 cm., 28 cm., and 42 cm. As the ground between the forts had not been provided with field defences or obstacles, the Ger. infantry were in the city before the forts had fallen. Namur fell in a similar manner, the forts being literally blown to pieces. The Ger. bombardment opened Aug. 20, 1914, and all forts were destroyed by the 26th. The defence of

namer constructed field works well in advance of the permanent works, and although the forts were swiftly destroyed, the field works held the Gers. in check for over a week, a delay which had an important bearing on succeeding events, because it held up 60,000 Ger. troops and deprived von Kluck of facilities for supplying his command in its advance to the Marne. Verdun was mainly a repetition of Maubeuge as regards methods of defence. Confidence was not placed in the great forts, but during the winter of 1914-15 a new defence line was constructed some miles beyond the outer line. This line was eventually forced back to within 4 m. of Verdun, but it covered the most important points. See also VERDUN.

Some of the new features that have affected F.s. are *Aircraft*, which can locate works hidden by rising ground and can bomb at practically any distance in the

theatre of operations; *Artillery*—long-range heavy guns can be made mobile by mounting on railways; *Camouflage* (q.v.) can be used by both sides, i.e. to hide works and also to screen guns.

Concrete 'pill-boxes' were an undoubted success in the First World War. They could resist a direct hit by a 6-in. shell and were usually too small and well concealed to be hit by large shells. The use of gas by an attacker can render areas in F.s. virtually ineffective for sev. days, according to the type and quantity of gas used.

Field Fortifications and Tactics in the Second World War.—With the development of tanks and aircraft after 1918 and of deep infiltration as a basic tactical principle, attack, which had been much more costly than defence, became cheaper in lives and material than defence, and, in consequence, fortified posts held by machine-gun fire were overrun by *blitzkrieg* methods. Protection in the Second World War was no longer mainly given by earthworks; it was mainly given by armour and invisibility. In 1918 tanks won a great war; by 1938, with their increased speed and offensive power, they revolutionised warfare and outmoded many former conceptions of F.s. The development of planes was no less decisive. As a flying artillery, planes could do what guns used to do in Napoleon's day—open a breach in the enemy's field F.s. for decisive manoeuvre. The modern tank, combined with swiftly-moved lorry-borne infantry, produced a new type of force, capable of a strategic infiltration, that was the essence of the war by the end of 1941. Motorization gives the blitz attack the power to penetrate almost any linear defences, because it gives the power to concentrate spearhead forces of half a dozen divisions on a mile or two of front. But another form of defence, a non-linear form, was also demonstrated in the Second World War, especially on the Russian front. This is the form known as 'web defence,' of which the basis was the holding, not of consecutive lines, but of is. or strong points of resistance or 'hedgehogs' capable of all-round defence, capable of continued fighting for long periods after they have been surrounded. This form of defence was learned in the Russian Civil war, in which the rapidly-moving fronts and partisan or guerrilla fighting crystallised around positions defended in isolation, and particularly around tns., vlls., and other road centres. These defensive tactics were borrowed from the Ger. methods in the First World War, or system of defence by strong point; but in the Ger. invasion of 1941, the Russians developed the system to a much greater depth of defence and much more reliance on the fortified strong point, with the result that each blitz offensive by the Gers. was less of an actual victory and more of a stalemate. One of the essential features in any modern system of defence, especially in web defence, is the use in F.s. of an immense number of land-mines. In the Russian and Libyan campaigns both sides used

land mines in quantities never before employed. Indeed the Brit. defences in Libya, like those of Rommel earlier in the campaign, consisted largely of vast mine-fields and Ger. offensive tactics consisted in opening breaches through the mine-fields and forming, with armoured forces, a *kessel* or cauldron, to attack the defending troops in the rear and so widen the gap. The tactics of the phalanx or spearhead of tanks in the blitz attack were shock tactics, since the tanks tried to get to close quarters with the enemy as quickly as possible, using projectile weapons at short ranges; and this was effective against troops deployed in linear positions. But when troops were deployed defensively in fortified tns. and vlls., into which the tanks could only penetrate at great risk, and in is. of resistance or 'hedgehogs' bristling with weapons in all directions and either naturally tank-proof or made proof against direct tank assault by the use of deep mine-fields, tanks could no longer employ shock tactics in the same way and the pendulum began to swing back from shock towards fire, the tank being armed with an artillery piece equivalent in size to a field gun. During 1942 the *blitzkrieg* won full successes only against obsolete field F.s.; against the modern methods of defence shown in Russia it could only prevail at greatly increased cost. Another method of nullifying F.s. is by the use of airborne troops dropped behind the enemy's defences, the logistic problem being solved in the same way, namely by airborne supplies. In a period dominated by armour and mobility it is impossible for infantry to protect themselves on the battlefield mainly by entrenchment. Their chief protection becomes invisibility, and this is the first reason why the methods and tactics of modern infantry in the Second World War were largely approximated to those of guerrillas; for a guerrilla force is essentially invisible, strikes from the void and retires or scatters to disappear after it has struck its blow. See also ENTRENCHMENT. See Sir G. Clarke, *Fortification*, 1907; H. Plessis and E. Legrand, *Manuel complet de fortification*, 1900; O. Micksche, *Blitzkrieg* (trans.), 1941; and T. Winttingham, *Weapons and Tactics*, 1943.

Fortiguerra, Niccolò (pseudonym Caratteromaeo) (1674–1735). It. poet and bishop, b. at Pistoia. His best remembered work is *Il Ricciardetto* (1738), a comic epic, parodying Pulci, Boiardo, and Ariosto. See F. Camici, *Notizie della vita e della opere di Niccolò Fortiguerra*, 1895.

Fortitude Valley, suburb of Brisbane in Queensland, Australia. Pop. about 16,000.

Fort Johnston, station of Brit. Central Africa. It is situated in Nyasaland at the spot where the R. Shire flows from Lake Nyasa.

Fort Lee, bor. of New Jersey, U.S.A., lies on the W. bank of the R. Hudson, opposite the N. part of New York, of which city it is a residential suburb. It received its name in honour of Gen. Charles Lee, being originally a fortification erected by the Amers. early in the War of

Independence. Held in 1776 by Gen. Greene, it was abandoned by him on the advance of Lord Cornwallis, and an attempt to recover it in 1780 failed. Pop. 9,400.

Fort Madison, cap. city of Lee co., Iowa, U.S.A. It is situated on the Mississippi R. and on sev. railroads, including the Atchison, Topeka and Santa Fe railway. The state penitentiary is in this tn. It has also iron foundries, paper mills, and machine shops and manufs. farm implements. Pop. 14,000.

'**Fortnightly Review**, The,' Eng. periodical for the expression of political and social views of the philosophical Radicals, estab. in 1865 by George Henry Lewes. Two years later John (Lord) Morley succeeded to the editorship, and till 1882 he continued to direct the periodical. He, in turn, was succeeded by T. H. S. Escott, Frank Harris (q.v.) and Wm. L. Courtney (q.v.), who took over the *Fortnightly Review* in 1893 and retained the editorship till his death. Became a monthly very early in its career. Since 1934 title changed to *Fortnightly*.

Fort Panmure, or **Rosalie**, see **NATCHRZ.**
Fortrose, bor. of Scotland, situated on Moray Firth, 7½ m. N.E. of Inverness. It consists of two tns., Rosemarkie and Chanoury. There is a good harbour, and it is a summer resort for golf and bathing; there are interesting ruins of a red sandstone cathedral (1460). Pop. 860.

Fort St. George, see **MADRAS.**
Fort Scott, city of Kansas, U.S.A., and cap. of Bourbon co. It has two foundries and flour mills, and manufs. machinery. Pop. 10,500.

Fort Smith, city of Arkansas, U.S.A., and cap. of Sebastian co.; it is situated on the Arkansas R., 140 m. N.W. by W. of Little Rock, and is served by four lines of railway. It has a good position as a trade centre; the manufs. are chiefly oil, furniture, etc. Pop. 36,500.

Fort Sumter, fort in Charleston harbour, S. Carolina, U.S.A., about 4 m. from Charleston. Here the first Civil war engagement took place in 1861. The Federals under Major Anderson surrendered to the Confederates. In 1865, at the fall of Charleston, the fort was captured and destroyed by the Federal fleet.

Fortuna or **Fortune**, goddess of chance in classical mythology; an It. goddess of great antiquity, extensively worshipped from an early period under a variety of different names. The Gks. called her Tycho, and she was represented on coins as either the giver of prosperity, the controller of destinies, or as indicating the uncertainty of the future. She worked with no reference to law, entirely at her own good pleasure, dispensing joy or sorrow indifferently, unlike the goddesses of destiny or fate. F. had temples at Smyrna, Corinth, Elis, Antium, and Praeneste, and in the last one, two statues of her were consulted as oracles. She is generally represented by Gk. sculptors with a rudder, cornucopia, ball, wheel or wings, as her distinctive symbols. See W. Roscher, *Mythological Lexicon*

1889-1902; and G. Wissowa, *Religion und Kultur der Römer*, 1912.

Fortunate Isles: 1. Another name for Canary Is. (q.v.). 2. See **ISLES OF THE BLEST.**

Fortunatus, popular collection of tales, centring on the adventures of F. and his son, with their inexhaustible purse and wishing-cap, the moral being that worldly prosperity alone is insufficient to produce lasting happiness. The book originated about the end of the fifteenth century, though some of the legends included are of older date still. The oldest printed ed. now extant bears the date 1509. Versions of the story have appeared in Ger., Fr., It., Dutch, Eng., Dan., Swedish, and Icelandic. The story was dramatised by Hans Sachs in 1553, and by Thomas Dekker in 1600. An unfinished narrative poem of the tale, entitled *Fortunatus and his Sons*, was left by Ludwig Uhland. See J. J. Görres, *Die deutschen Volksbücher*, 1807; Father W. V. Schmidt, *Fortunatus und seine Söhne*, 1819; and H. Günther, *Fortunatus*, 1914.

Fortune-telling. Under the Vagrancy Act of 1821 in England any one pretending to tell fortunes is liable to imprisonment as a disorderly person, but prior to this date, the telling of fortunes by palmistry, astrology, or other forms of divination was not an offence against the law. The art of palmistry, viz. revealing and foretelling events, past and future, by examination of the palm of the hand, is of great antiquity, and there is much reference to the subject in different writers. See **DIVINATION** and **PALMISTRY.**

Fortuny y Carbó, Mariano José Bernardo (1839-74), Sp. painter and etcher, b. at Reus in Catalonia. He studied in the academy of Barcelona, and in 1856 won a prize which enabled him to study at Rome. During the Sp. war against Morocco, F. followed the army to Africa and filled his portfolios with studies from E. life. He had an exceedingly dexterous touch, and treated his subjects simply as colour schemes for gorgeous draperies and vivid sunlight. F.'s work is distinguished by a superlative facility of execution, and a marvellous cleverness in the arrangement of colours. Some of his most noted pictures are: 'The Spanish Marriage,' 'The Poet,' 'The Rehearsal,' 'The China Vase,' 'The Trial of the Model,' 'An Ecclesiastic,' 'Don Quixote,' 'The Snake Charmers,' 'Moors Playing with a Vulture,' 'Hindoo Snake Charmers,' 'The Butterfly,' 'Camels at Rest,' etc. A large number of his works are in America, both in public and private possession. See C. Davillier, *Fortuny, sa vie, son œuvre, sa correspondance*, 1876; and lives by C. Yriarte, 1886; E. Calvi, 1911, and J. Cervo, 1920.

Fort Wayne, Indiana, U.S.A., cap. of Allen co., 148 m. from Chicago. It is an important railway centre, and manufs. organs, woollens and engines. It is the seat of a Catholic bishop and has a convent, academies, and colleges. Pop. 118,400.

Fort William, Calcutta, name given to

three vils. conferred upon the E. India Company in 1700 by the Emperor Aurangzebe. They were immediately fortified, and received their name in honour of William III.

Fort William, city of Ontario on the delta of the Kaministiquia R. on the shores of Lake Superior, Canada, 600 m. N.W. of Toronto. Has one of the finest land-locked harbours in the world. The city has ten parks, the largest, Chippewa Park, having 3 m. of shore line on the lake. Has a fine library, collegiate school and vocational school; all public utilities are municipally owned. It is on the Canadian National and Canadian Pacific railways, and there is a good airport 4 m. distant. Its chief business activities are railways, shipping, grain elevators and allied waterfront undertakings, paper and pulp mills, general timber operations, water power, steel products. It is the greatest coal-handling centre in Canada, having handled 2,500,000 tons in 1948. Originally settled by Fr. fur traders in 1678 as Fort Kaministiquia, was renamed F. W. in 1806. Notable as ann. meeting place of old 'fur brigades' from far W. and N. with Hudson's Bay Company's dealers from Montreal. Incorporated as a city in 1907. Pop. 33,600.

Fort William, tn. of the co. of Inverness, Scotland, near the head of Loch Linnhe, at the S. end of the Caledonian Canal. The fort was built in 1665 by Gen. Monk; rebuilt in 1690; besieged by the Jacobites in 1746, and demolished in 1890 to make room for a railway station. For many years F. W. was the key of the Highlands, and is now a well-known centre for tourists and mt. climbers. Ben Nevis, 4106 ft., the highest mt. in Great Britain, is 3 m. S.E. of the tn. Pop. 3100.

Fort Worth, city of Texas, U.S.A., cap. of Tarrant co., on Trinity R., 30 m. from Dallas. It is on the Missouri, Kansas and Texas, Texas and Pacific, and other railways. There are flour and grist mills, machine shops, foundries, and tanneries. Manufactures include flour, woolen and cotton goods, cotton-seed oil, agric. implements. F. W. is the seat of a polytechnic college, it has a stockyard, a univ. (1881), and a medical college. There are also a court-house, a city hall, and two opera houses. Pop. 177,800.

Forty, cardinal number equivalent to four tens, denoted by the symbols 40 or XL. From time immemorial this number has apparently been regarded with superstitious veneration by both Jews and Moslems, and figures largely in the Bible and in Mohammedan writings. See notes to W. A. Clouston's *Group of Eastern Romances and Stories* (privately printed, 1889) for Biblical references. Moslems mourn F. days for their dead, and consider women ceremoniously unclean until F. days after childbirth. Similarly the number 60 appears repeatedly in Moslem fictions, as in the Arabian *Tale of the Third Calender*, or *Aladdin and his Wonderful Lamp*, or the Persian romance of *Nasir*. Gangs of robbers in E. tales usually number F. (cf. *Ali Baba and the Forty Thieves*). In Wales F.

loaves of bread and F. dishes of butter commonly occur in records of rent paid to the bishop of Llandaff. A bard's fee for his song was 40d. if a disciple, twice 40d. if a master. Ships suspected of being infected with cholera or any infectious disease are placed under quarantine, forbidden to land passengers or cargo, for F. days. The privilege of sanctuary lasted F. days. There is a popular superstition that St. Swithin's Day is followed by F. days of either rain or sunshine.

Forty-five ('45), The term employed by modern writers for the year 1745 and the Jacobite rising under Prince Charles Edward, 'the Young Pretender,' or 'Bonnie Prince Charlie,' which was crushed at Culloden Moor, 1746. See Hume Brown, *History of Scotland*, iii., 1909.

Forty-shilling Freeholder, see ELECTORATE.

Forum, in Rom. times the central public space of a city, especially the market-place of Rome itself, the *forum magnum*, extending from the foot of the Capitoline to N.E. of the Palatine. It was used as a place of assembly for political, judicial, and other public business. Discussions were held there, and speeches made from the *rostra*. By degrees the original single forum developed into numerous different fora, each for some special purpose. See H. Jordan, *Topographie der Stadt Rom im Alterthum*, 1871; O. Marucchi, *Le Forum romain*, 1901; Chambers, *New International Encyclopedia*; and Smith, *Dictionary of Classical Antiquity*.

Forum Appii (mod. *Foro Appio*), small tn. of ant. Latium, Italy, on the Appian Way among the Pontine marshes, 43 Rom. m. from Rome. A canal started from here, running S. nearly to Terracina. See Horace, *Satires*, I. v. 3; Acts xxviii. 15.

Forum Julii, see *FRIGIUM*.

Forum Sempronii, see *FOSCOMBRONE*.

Foscari, Francesco (b. c. 1372), a doge of Venice (1423-57). In early life he was guardian of the young marquis of Mantua, and won fame as one of the procurators of San Marco. As doge he waged numerous wars against Filippo Maria Visconti, duke of Milan, and other It. princes, securing Carnagnola as general of his allied forces. After the first war (1426-27) Venice won the provs. of Cronona, Bergamo, and Brescia. The second war (1431-33), after a hard struggle, fixed the Adda as the Venetian boundary. A third war, against Bologna, Milan, and Mantua, broke out about 1435. Supported by Cosmo de' Medici and Francesco Sforza, Venice finally conquered Bellagio, Peschiera, and Lonato. The peace of Lodi (1454) put an end to hostilities. F.'s later life was clouded by the cruel machinations of his rival, Jacopo Loredano, especially directed against F.'s son, Jacopo. The latter, according to legend, was condemned and tortured, probably unjustly, by the Council of Ten, 1444-57. Research, however, seems to have estab. that this story of the cruelty of Jacopo's accusers is, in details, apocryphal, and that in fact Jacopo was treated with exceptional leniency. The doge was de-

posed in 1457, and d. a few days later. See Byron's tragedy, *The Two Foscari*, 1821; S. Rogers, *Italy*, 1839; Verdi's opera, *I Due Foscari*, 1844; H. Brown, *Venice*, 1893, and H. Kretschmayr, *Geschichte Venedigs* 1920-34.

Foscolo, (Niccolò) Ugo (1778-1827). It poet and patriot, went to Venice from his bp Zante about 1793. From 1798 on ward he was an officer in the armies of various attempted It republics and served in France (1804-6). In 1808 he

Journey. See F. Le Monnier, *Collected Works*, 1850-62 and ed. by Tobler, 1871. G. Gemelli, *Della vita e dell' opere di U. Foscolo*, 1839; G. Chiarini, *Gli amori di U. Foscolo*, 1892, and *Poesie di U. Foscolo*, 1882; G. Citanna, *La Poesia di Ugo Foscolo*, 1932, also lives by G. Chiarini, 1910, 1927, C. Antona Traversi and A. Ottoloni, 1927-28, A. Viviani 1938, and F. Flora 1940.

Foss, Foss-way, or Fosseway, one of the great anc't military roads constructed by

THE FORUM ROMANUM FROM THE PALATINE

An engraving dated 1864

In the foreground are the Arch of Septimius Severus the Temple of Fortune the Column of Phocas and three columns of the Temple of Jupiter Stator. At the end of the Via Sacra are the Arch of Titus, and to the left, the Coliseum.

was appointed to the chair of eloquence (shortly afterwards abolished in all It univs) at Pavia Univ. delivering the discourse 'Dell' origine e dell' ufficio delle letterature'. His tragedy, *Ajace* (performed 1811, first pub 1828), supposed to contain hits at Napoleon whom he no longer admired caused him to leave Milan till 1813 and the decline of Napoleon's power. When the Austrians regained control of the It, F's patriotic sentiments forced upon him a voluntary exile in Switzerland and England (c. 1816). His remains were removed from Chiswick to Florence, 1871. His works include *Le Ultime lettere di Jacopo Ortis* (1797 a novel partly founded on Goethe's *Werther*), *Luigia Pallavicini caduta da cavallo* and *All' amica risanata* (two odes 1799-1803), *I Sepolcri* (1807-8), *Sul testo della Commedia di Dante* (1842 ed. of Dante's poem); trans. of Homer, and Sterne's *Sentimental*

the Romans in England and other parts of Europe so called from the fosse on either side to keep it well drained and dry. This road or series of roads ran from Lincoln, via Leicester (Ratæ) and Bath to Exeter. It went past Newark and High Cross (Venoni) intersecting Watling Street at a point called the 'centre of England', then on past Cirencester, Bath, the hills near Chard, Axminster, and Honiton to Exeter. It is mentioned by eleventh century writers as one of four 'royal roads' in Britain. See also WATLING STREET. See E. Guest, 'The Four Roman Ways' in *Origines Celticae*, 1883; and H. W. Temperley, *Shropshire Hills*, 1947, also I. D. Margery, *Roman Ways in the Weald*, 1948.

Foss, or Fosse (Lat. fossa, a ditch, from *fodere* to dig), in fortification a long narrow excavation, such as a moat or ditch, dug outside the walls or rampart of a fort to serve as barrier against the

advancing foe and prevent an escalade. It is often filled with water or with abatis and palisades.

Fossa (Fossan), or Foussa, largest carnivorous mammal of Madagascar. A link between cats and civets, it is about twice the size of a house-cat (about 5 ft. long), with a long tapering tail, and sharp, curved, retractile claws. The naked soles of the hind feet rest entirely upon the ground in walking. The colour is usually a uniform, unspotted, pale brown, and the hair short and close. These animals are of a very savage disposition, and of nocturnal habits. They feed on small animals and birds, sometimes invading poultry yards. They are usually regarded as representing a group within the civet family (Viverridae), under the name *Cryptoprocta sericea*.

Fossa Clodia, see CHIOGGIA.

Fossa di Furca, see PIT AND GALLOWR.

Fossano (Fons Sanus, or Fossanum), tn. and episcopal see of Piedmont, Italy, Cuneo prov., 14 m. from Saluzzo, on R. Stura. It has old walls, a cathedral with good paintings, palaces, theatre, a scientific academy, and a fourteenth-century castle. There are mineral baths, and manufs. of paper, leather, and silk. Pop. about 18,100.

Fossil Copal, hard resin found in the earth as the product of trees long since dead. Copal is a name given generically to almost any resin that is capable of being used in the preparation of varnish. The variety known as F. C. is found in the regions around Zanzibar, where it is dug up in the form of pebbles or nuggets.

Fossils. The term F. (Lat. *fossus*, dug up) was formerly applied to any object taken out of the earth's crust, whether mineral or organic. Its meaning has now been restricted so as to include only the remains or traces of animals and plants which have been buried in the earth by natural causes. We therefore include under the term not only remains of organisms but objects which point to the previous existence of organisms. Thus the footprints of animals and the burrows and trails of worms in shales and sandstone are as much F. as are the remains of the organisms themselves. The majority of F. are the actual parts of animal or plant organisms, such as the shells of molluscs, the calcareous skeletons of corals, the teeth and bones of vertebrate animals, and the trunks, branches, and leaves of plants, the state of preservation being dependent on the amount of change undergone subsequent to their burial. For preservation in the F. state it is self-evident that the organism must be covered up by sediment, or it will disappear by the processes of decay. The remains, then, of terrestrial animals and plants are less likely to become preserved than marine organisms, and the conditions must necessarily be local. Hence, land plants and animals may be found in lakes, peat bogs, and marshes, in deltas, mineral springs, etc. Thus we have the Irish elk preserved in the peat bogs of Ireland, land animals and herbage which have been swept by rivers into lakes and deltas and

there deposited, together with fauna and flora of distinctive lacustrine type, and we have also higher forms of terrestrial life preserved in 'bone caves.' It is in the sea that the most favourable conditions for the preservation of organic forms prevail. In the marginal waters of the ocean sheets of mud and sand are laid down and cover the remains of the fauna which flourish there. Masses of organic limestone (e.g. fossilised sea lilies and foraminifera) are formed in the deeper waters, and, finally, in the deepest parts of the ocean we have only the remains of the harder parts of organisms, such as teeth and ear bones covered up in the abysmal sediments. The conditions of the preserved remains depends upon the structure and composition of the organisms, and also on the manner of fossilisation. The skeletons of most vertebrates consist of calcium phosphate. In the invertebrates the durable parts may be carbonate of calcium (calcite or aragonite) as in the mollusca, or may be composed of silica as in the diatoms. The relics of insects preserved to us we owe to the durability of their chitinous integuments, while coal is the result of the preservation of the durable cellulose and wood of the plants. As regards the condition of preservation, we may distinguish the following types: (1) *The original substance is preserved unaltered*. In the case of the Siberian mammoth, the whole carcass is retained, while entire insects have been preserved in amber. All bodies originally stony, such as shells, corals, and, in a lesser degree, trees and their fructifications, are sometimes wholly preserved. Naturally, we find F. least changed from their original condition in the newest rock formations and most changed in the oldest, but all fossiliferous strata contain some F. which are practically unaltered. (2) *The original substance is replaced by mineral matter with partial or entire preservation of the structure of the organism*. This is also known as petrification, the organic matter being replaced, molecule for molecule, by mineral matter, such as calcite or silica. The most minute structure has thus been preserved, as in the case of silicified wood, where the organisation of the plant may be seen under the microscope as distinctly as in the section of a modern tree. The aragonite shells of invertebrates, such as Gastropods and Lamellibranchs, are dissolved away, and entirely replaced by more durable calcite, forming 'pseudomorphs after aragonite.' (3) *The original substance is wholly removed, the external form being retained*. After mineral matter has gathered round the organism and hardened there, the organism itself decays. There is left, then, merely a hollow mould retaining the external form of the organism. These hollow casts may be filled later by mineral matter, which may have been mechanically deposited or chemically precipitated from infiltrating waters, forming what are called 'solid casts.' These casts show none of the internal structure of the organism but only the external form.

F., as well as being of interest as records

of the progress of organised life on the globe, and lending strong support to the doctrine of evolution, are of use to the geologist in throwing light on the former conditions of physical geography. The distribution of sea and land, the various changes of climate, and the distribution of plants and animals in past times are indicated. Further, they are of great importance in geological chronology. The order of superposition of the strata having been determined, it has been possible by the use of the contained F. to correlate the sequence of stratified formations in different parts of the world, still further to fix stratigraphical horizons and subdivide any one formation into a series of life zones. The fossil hist. of some animals, e.g. the bery, is now known in great detail, and the evolution of man has been partly traced by his fossilised remains. *Archæopteryx*, an interesting missing link between reptiles and birds, is illustrated in the article BIRDS. See also ANTHROPOLOGY, GEOLOGY, and PALÆONTOLOGY. See C. Darwin, *Origin of Species*, 1859; H. Nicholson, *Manual of Palæontology*, 1872, and the *Monographs of the Palæontological Society*; A. Seward, *Fossil Plants*, 1892, and *Plant Life through the Ages*, 1931; H. Hutchinson, *Extinct Monsters*, 1892; W. Dyer, *the Fossilisation*, 1923. Fossils, Money, see NUMISMATICS.

Fossombrone (Forum Sempronii), tn. and episcopal see of the Marches, Italy, prov. of Pesaro and Urbino, 16 m. from Fano, on R. Metauro. It has a cathedral, silk manufs., and mineral springs. The tn. was seriously damaged in the Second World War. The bridges of Trajan and Mucietian, and the bridge of Marchionni, have all blown up and destroyed by the Gers., and much damage was done to the museum and library. Pop. (com.) c. 11,000.

Fossombroni, Vittorio, Count (1754-1844), It. statesman and scientific writer, studied at Pisa Univ., excelling in mathematics and philosophy. He became minister of foreign affairs to the grand duke of Tuscany (1796), and held offices under the new gov. of Bonaparte (1799). Refusing to act as councillor of state on the formation of the kingdom of Etruria (1801), he consented to act as commissioner of finance. On the restoration of the grand duchy (1814) F. became Primo Minister, under Ferdinand III. and Leopold II. He put Tuscan finances on a sound footing. He wrote treatises on hydraulics, mathematics, etc., including *Sur l'intensité de la lumière* (1782); *Memorie idrostatiche sopra la val di Chiana* (1789); *Sur le principe de la flaccidité virtuelle* (1796); and *Sur l'amélioration des marais Pontins* (1805). See G. Capponi, *Il Conte V. Fossombroni*.

Foster, Sir Michael (1836-1907), Eng. physiologist, graduated at London Univ. in medicine, 1859. He practised for a time at his native Huntingdon, then returned to London, becoming prof. of practical physiology at Univ. College, 1869, and at Trinity College, Cambridge, 1870-83. He was biological secretary of the Royal Society, 1881-1903; and prof. of

physiology at Cambridge Univ., 1883-1903. In 1900 he was Liberal representative of London Univ. in Parliament, but was defeated in 1906. F. was chairman of the royal commission on tuberculosis, and member of that on sewage disposal. He greatly influenced the study of biology in Great Britain. His works include *Primer of Physiology* (1874); *Studies from the Physiological Laboratory in Cambridge University* (1876-77); *Textbook of Physiology* (1876); *The Elements of Embryology* (with F. M. Balfour) (1874); *Course of Elementary Practical Physiology* (with J. N. Langley) (1876); *Lectures on the History of Physiology in Sixteenth, Seventeenth, and Eighteenth Centuries* (1901). He was joint editor (with Sir E. Ray Lankester) of *Scientific Memoirs of Thomas H. Huxley* (1898-1902).

Foster, (Myles) Birket (1825-99), Eng. painter and engraver, early apprenticed to the wood-engraver Landells. He engraved plates for Gray's *Elegy*, Coleridge's *Ancient Mariner*, Longfellow's *Evangeline* (1850), *Old English Ballads*, and the works of Milton, Goldsmith, and others. From 1859 F. began painting in water-colours. His landscapes and scenes of rural and child-life were his best works. Some of the best known are 'Nutting', 'The Bird's Nest', 'Sailing the Boat', 'Cows in the Pool', 'Feeding the Ducks', 'Arundel Mill', 'Castle of Rheinfels'. His illustrated *Christmas with the Poets* appeared in 1850; *Copper's Task* (1853); *Brilliant* (1878); and *Some Places of Note in England*. See Scherer, *The Birket Foster Album*, 1880; and H. M. Cundall, *B. Foster*, 1906.

Foster, Stephen Collins (1826-64), Amer. song composer, b. near Pittsburgh, Pennsylvania. He is especially noted for his Negro melodies, which have become very popular in all Eng.-speaking countries, notably; *The Old Folks at Home*; *Mussa's in the Cold*, *Cold Ground*; *Louisiana Belle*; *Come where my Love lies Dreaming*; *Nellie Bly*, etc.

Fostoria, tn. of Ohio, U.S.A., in Seneca co., S. of Toledo and 21 m. S.W. of Fremont. It is intersected by five lines of railway, and is therefore an important railway centre. There are four mills and glass works. Pop. 14,400.

Fothergill, John (1712-80), Eng. physician of Yorkshire. He was a Quaker, and noted for philanthropy and professional skill. He helped to found a school for Quaker children at Ackworth, and assisted Howard in his efforts to reform prison management. He wrote papers for *Philosophical Transactions*, and for *Medical Observations and Inquiries by a Society of Physicians in London* (1773-75). His *Account of the Sore Throat* (1748) won him fame. See *Works* (Lettsom's ed.), 1783-84; *Memoirs* by J. Elliot, 1781; Thompson, 1782; and J. C. Lettsom (4th ed.), 1782; and *Lives of British Physicians*, 1830.

Fotheringhay, par. and vil. of Northamptonshire, England, on the R. Nene, 9 m. S.W. of Peterborough. A castle was built here in the time of William the Conqueror, but was much altered and

enlarged by the son of Edward III. Here Richard III. was b., and Mary Queen of Scots was imprisoned and executed, 1586. The mound and moats still remain. The magnificent fifteenth-century collegiate church is but the nave, aisles, and W. tower of a far larger structure, the choir and aisles of which were destroyed at the Reformation. On the S. side of the nave are the foundations of the collegiate buildings. Pop. 200.

Foucauld, Vicomte Charles de (1853-1916), Fr. explorer and hermit, b. at Strashurg, famous in the annals of Fr. exploration in the Sahara. At one time a soldier, and later monk and hermit. In 1883-84 he travelled through the first and middle ranges of the desert and, disguised as a Jew, made three routes over the Great Atlas Mts. Lived as a hermit at Tamanrasset, and was assassinated on the doorstep of his hermitage in 1916. He enjoyed the greatest prestige with the Hoggar Tuaregs, who to-day consider him a saint and martyr. He compiled, amongst other works, a Tamashok dictionary, and made a collection of Tuareg poems and proverbs. His name is spoken, and his life and work are immortalised, in every corner of Algeria. See E. F. Gautier, *Le Sahara, Conquête du Sahara*, 1881-1909, and *Oasis Sahara*, 1905; P. Turnbull, *Sahara Unveiled*, 1940; and P. de Boissieu, *Le Père de Foucauld*, 1945.

Foucault, Jean Bernard Léon (1819-68), Fr. natural philosopher and mechanician, noted for his investigations in optics and mechanics. He perfected the process of Daguerre and Niépce, known as the daguerrotype process, and worked with Flizeau and Arago. In 1844 he invented an apparatus for using electric light in optical experiments and microscopic researches. From 1845 he conducted the scientific section of the *Journal des Débats*. F. demonstrated the earth's rotary motion by means of the pendulum, and invented the gyroscope (1851-52). After that his fame was firmly estab. He became physicist to the imperial observatory, 1855, and won the Copley medal of the Royal Society for his researches concerning the velocity of light, showing it not to be the same in a vacuum as in the air. His scientific treatises form part of the *Bibliothèque d'instruction populaire*. F. became a member of the Academy of Sciences, 1865. He was about to undertake astronomical researches with the aid of physics when his health failed. See J. Lissajous, *Notice historique sur la vie et les travaux de L. Foucault*, 1875; C. M. Gariel and J. Bertrand, *Recueil des travaux scientifiques de L. Foucault*, 1878.

Fouché, Joseph, Duke of Otranto (1759-1820), Fr. statesman, b. at Le Pellerin, Nantes, brought up at the Oratoire. On the outbreak of the revolution he was principal of the college of Nantes. In 1792 he represented Loire-inférieure in the national convention, and sided with the Montagnards. Chosen to organise the resistance to the rebellion of La Vendée and that at Lyons (1793), he assisted in the cruelties of Collet d'Herbois. Re-

turning to Paris, he was elected Jacobin president, and helped to overthrow Robespierre. F. became minister of police of Paris (1799), retaining this office under Bonaparte till 1802. He was recalled in 1804, and granted various titles. After 1810 F. was replaced by Savary in Napoleon's favour, as he was suspected of intriguing with the Bourbons. For a time F. held office under Louis XVIII., but was forced to resign (1815), and d. an exile. His writings include *Notes aux ministres étrangers* (1815); *Lettre au duc de Wellington* (1817); *Mémoires* (1824, probably genuine). See Le Comte de Martel, *Étude sur Fouché*, 1873-79; L. Madelin, *Fouché*, 1901; E. d'Hauterive, *La Police secrète du premier Empire*, 1907; and S. Zweig, *Fouché*, 1930.

Fouquet, Jean, see **FOUQUER**.

Fougères, tn. of France, in the dept. of Ille-de-Vilaine. It is the cap. of that arron. also, and is situated 30 m. N.E. of Rennes. Leather, boots, and flannel are manufactured, and there are glass-works. F. has an ant. castle, and sev. Interesting old churches. There is a monument erected to the soldiers who fell in 1870-71. Pop. 19,200; arron. 81,000.

Fouillée, Alfred Jules Émile (1838-1912), Fr. philosopher, a member of the academy of moral and political sciences. He greatly influenced modern philosophy thought. His *Mémoires sur la philosophie de Platon* (1869) and *Mémoires sur la philosophie de Sorrate* (1874) were crowned by the Academy. Other works are *La Liberté et le déterminisme* (1883); *Histoire de la philosophie* (1875); *La Science sociale contemporaine* (1880); *Critique des systèmes de morale contemporains* (1883); *La Morale, l'art, et la religion, d'après Gayau* (1889); *L'Évolutionnisme des idées-forces* (1890); *Tempérament et caractère* (1895); *Psychologie du peuple français* (1898); *Le Moralisme de Kant et l'amoralisme contemporain* (1905); *La Morale des idées-forces* (1907). His wife wrote under the pseudonym 'G. Bruno.' See A. Guyau, *La Philosophie et la sociologie d'A. Fouillée*, 1913.

Foulahs, or Foulhas, see **FULAHs**.

Fould, Achille (1800-67), Fr. financier and politician, of Jewish parentage. After the revolution of 1818 he was minister of finance, and as such introduced many innovations and improvements. He became senator and minister of state (1852-1860). F. gave the first impulse to the foundation of the Crédit Mobilier (q.v.). He was reappointed minister of finance by Louis Napoleon (1861-67), having resigned (1852) on the confiscation of the property of the Orleans family.

Foulds, John Herbert (1880-1939), Eng. composer and conductor, b. in Manchester; his father was a member of the Hallé Orchestra, Manchester, and F. began his professional career as a cellist in that orchestra. He was conductor of the Univ. of London Musical Society. As a composer he theorised, like Busoni, on the subject of quarter-tones, and even smaller intervals than these, experimenting in the use of micro-tones in his *Dynamic Triptych*, and in that of tertia-tones in his

orchestral *Music-Pictures*, Op. 33 (1913), and in parts of his chief work, *World Requiem*, Op. 80 (1923). His many and varied works include also songs, a cello sonata, Keltic suite, choruses in the *Hippolytus* of Euripides, *Gandharva-Music*—his wife, Maud MacCarthy, besides being well known as a violinist, was an authority on Indian music; and much incidental music for theatre productions, such as Ernst Toller's *Musses and Men*, Sacha Guitry's *Deburau*, and Tagore's *Sacrifice*. Wrote *Music To-day* (1934).

Foulis, Andrew (1712-75) and Robert (1707-76), two noted Glasgow printers, who set up their business in 1711. Robert became printer to the univ. in 1743. They followed their profession for over thirty years, issuing eds. of Gk. and Lat. classics, poetry, plays, tracts, etc. Their 'immaculate' *Horace* (1744) is famous, but has six misprints. Another famous work is the fine folio *Homer* (1756-58). In 1753 they founded an academy at Glasgow for engraving and modelling. The expenses incurred unfortunately proved their ruin. Their collection of old masters was sold by auction at Christie's in 1776, after Andrew's death. See W. J. Duncan, *Literary History of Glasgow* (Maitland Club), 1831; J. Ferguson, *The Foulis's*, 1886; and D. Murray, *Robert and Andrew Foulis*, 1913.

Foundations, in building, the base upon which the structure is built up, generally used of those parts of the building which are below the level of the ground and whose purpose is to determine the way in which the weight of the building shall be applied to the earth. In all buildings the weight is concentrated in certain small areas, the bases of walls, columns, etc. The aim of foundation courses is to distribute that weight over as large a surface as possible, so that each square yard shall support as little weight as possible. The possibilities of well devised F. are illustrated by the construction of the Eiffel Tower, where a weight of 7500 tons is so distributed that each square foot sustains only 2½ cwt. The measures to be taken for the construction of F. depend upon the weight of the building in comparison with the area of the base, the manner in which the weight is distributed, and the character and circumstances of the underlying earth. The character of land used for building varies from hard stable rock to loose sand or marshy soil. Between these extremes are gradations of soft rock, firm earth, hard compact clay, dry gravel, and dry close-packed sand. The presence of absence of water is a great consideration, as anything in the nature of a fluid foundation is obviously unstable. The slope of the strata and the possibility of sliding effects are also matters of importance. In order to ascertain the methods and measures necessary, borings are made in the ground so that the succession and depth of strata may be determined. When the ground consists of hard rock little needs to be done except procuring a level surface upon which to build the walls. Where the foundation is earth a certain amount of excavation has

to be done, and the first courses are laid down to a breadth exceeding the width of the walls to be supported. Usually the excavations are filled in with concrete and the brickwork is laid on top of the concrete. According to the London Building Acts the footings, or courses, laid nearest to the concrete, must project on each side to half the thickness of the wall and must diminish with each course to a height equal to at least two-thirds of the thickness of the wall. When the nature of the earth or the presence of water renders the natural F. unstable, it is necessary to have special F. to procure the requisite rigidity.

For small buildings on soft ground the distribution of the pressure may be effected by laying down a row of stout planks spiked together, and superposing another row of planks laid transversely, the brickwork then being commenced on the planking. For large buildings on loose and untrustworthy ground some method of piling is adopted. In the simplest cases piles shod with iron points and headed with metal bands are driven down by releasing a weight some distance above them. Where it is necessary to enclose thoroughly a section of earth, sheet piling is used. This consists of piles driven in at intervals and timbers driven in between so as to make a continuous wall; this prevents lateral shifting of loose earth. In providing for larger buildings the piles are reinforced by concrete. The heads of the piles are rigidly connected, and are set in concrete. Iron girders are also used to connect the various vertical supports and the whole mass is set in concrete, thus giving the effect of a solid block of concrete underlying the whole area of the building. Concrete piles are often used for the building of bridges over rivers, or for heavy buildings on marshy land. The piles are made of blocks of Portland cement concrete sunk in by excavations made after they are placed in position. Sometimes cylinders of brickwork are constructed; these are gradually carried downwards and filled with blocks of concrete. This somewhat resembles the so-called 'well' F. employed for the Madras public buildings. A circular course of bricks about 3 ft. across is laid on the ground and firmly cemented together. The earth is then excavated within and without the circle so that the course sinks. Another course is then laid on top and the excavation proceeded with once more. In this way successive courses are built up, or rather allowed to sink down, to a depth of about 12 ft., and the inner space is filled with rubble.

Where special circumstances make it impossible to sink a deep foundation directly underneath a heavy wall, the cantilever system is sometimes adopted. The foundation piers are sunk some distance from the wall to be supported, and steel cantilevers are run out from these piers to the wall; they are built into the wall at one end and are firmly secured to piers at the other. The difficulty of water which cannot be drained away is sometimes met by constructing what is

called a 'dock' foundation. This consists of the construction of a closed wall of concrete built round a bed of concrete covering the whole area, thus forming a concrete tank which prevents the entrance of water. Cofferdams (q.v.) are also used in the construction of F. on wet sites. Wooden piles are driven down about 6 ft. apart, and the intervals filled in with sheet-piles. A double wall of these piles is built enclosing the site, and the space between the boards is filled with clay puddle, thus forming a watertight barrier which keeps the enclosure dry. The F. may then be laid within this temporary structure. See W. M. Patton, *A Practical Treatise on Foundations*; L. Whitto and E. Prentis, *Modern Underpinning*, 1929.

Founder, see under HORSE (DISEASES).

Founders' Shares. When a limited liability company is formed, provision is usually made that, after outside shareholders have received a reasonable profit upon their investments, the original owners of the business or other founders of the company shall receive the larger share of benefit from any excess profit. In the early days of limited companies this was often contrived by the issue of F. S. to these privileged persons. The plan worked fairly well in many cases, as the especial benefits they carried did not become operative until the public subscribers had obtained a satisfactory profit. It was discovered however by some rather unscrupulous promoters that, by the insertion of apparently innocent conditions and advantages for these special shares in the articles of association, it would be possible to saddle the outside investor with all the loss, and give him little of the profit. In consequence F. S. fell into disrepute, and the more satisfactory method of issuing preference shares was generally adopted where it was thought desirable to have two classes of shareholders. The newer method gives the outside investor the first claim upon profit up to a certain percentage, but when he has received that share, he only benefits in any further profits that may be made in such a way as his arrangement or the prospectus has defined. Preference shares are of so many kinds, and can be issued upon so many conditions, that there is no object now in issuing shares of which the popular record is unsavoury.

Founding, or Metal Casting, see CASTING; IRON AND STEEL; STEREOTYPING; TYPE AND TYPEFOUNDING; TYPE-CASTING AND TYPE-SETTING MACHINES.

Foundling Hospitals, or Asylums. Originally these were institutions for the rearing and care of children who were deserted by their parents, by means of private charity, or at public expense. They were intended mainly to prevent infanticide or wilful procurement of abortion, and the exposure and abandonment of children.

The more enlightened Rom. emperors, Constantine, Valentinian, and Justinian, took measures to abolish such offences. In the sixth century the bishop of Trèves ordained that the Church should support

all children abandoned and placed in a marble basin by the cathedral porch. The capitularies of the Frankish kings mention similar arrangements. The Council of Nîmes in A.D. 787 decreed that every city should have an institution for the care of neglected children, resulting in the first true foundling hospital (as now understood) at Milan (787), estab. by Datheus. Between the eleventh and fourteenth centuries many similar institutions followed this in France, Italy, and Germany. In France, especially, the subject received much study and attention. Children were first received in the porch of Notre-Dame at Paris. Marguerite de Valois opened a special home in 1536, but no sum was set aside by the state for the maintenance of the foundlings till 1552. The bishop of Paris founded the Couche, but owing to limited accommodation children could only be taken in by drawing lots.

St. Vincent de Paul and Colbert, in the seventeenth century, tried to remedy the evils that had become prevalent, and the former estab. a home in 1638. Out of it grew the famous Paris foundling hospital, incorporated in 1670 under Louis XIV. The Couche was united with it in 1688, and Marguerite de Valois's orphanage in 1772. This hospital takes in all *enfants assistés*, including illegitimate children and *enfants moralement abandonnés* (incorrigibles), as well as real foundlings (*enfants trouvés*), almost indiscriminately. The children are generally boarded out in the country after a few days, a sum being paid for their keep, but decreasing yearly and ceasing when the child is twelve years old. The child then usually becomes the apprentice or servant of its foster-parents, but is more or less under gov. supervision till the age of twenty-one. This institution also aims at helping poor parents, and allows the reclaiming of children at any time. Capt. Cornam's foundling hospital in London was estab. in 1739, but reserved for illegitimate children. Real foundlings and waifs and strays are admitted to Dr. Barnardo's Homes, Wantage Infant Orphan Asylum, or similar institutions. In the early nineteenth century an arrangement called the 'cradle-tour' (revolving basket or box) was in use for admitting children secretly. This system existed at Marseilles in the thirteenth century, but was much abused, and mostly abolished as illegal in 1834. Since 1801 children are admitted to the London foundling hospital only after personal examination of the mothers. The previous good character of the mother and her necessity, and the desertion or death of the father, must be known to the committee. Admission is free, and no payment is taken; all children admitted must have had their applications approved before they were two months old; some live in the hospital, while others are boarded out. In 1925 the historic site was sold for £1,630,000, and the governors temporarily housed the children in the former Royal Asylum of St. Anne's Society, Redhill, Surrey. In 1929 they completed the purchase of the

Ashlyns Hall Estate, Berkhamsted, Hertfordshire, with 200 ac. of open land on a healthy altitude, for the permanent estab. of the new foundling hospital. The London offices are 40 Brunswick Square, W.C.1. The musical traditions inaugurated there by Handel are still kept up. At Moscow and St. Petersburg (Leningrad) two such institutions were founded by Catherine II. (1729-96). They are to be found also in Italy, Austria, Spain, Scandinavia, China (Canton, 1856), Mexico, Buenos Aires (1774), Rio de Janeiro, and elsewhere. There are many (mostly privately supported) homes in U.S.A., such as the almshouses, Sisters of Charity Foundling Asylum (1869), Infants' Hospital (1868), Infant Asylum (1871), all at New York. The Dublin Home (1704-1835) was closed owing to the high rate of mortality. The death-rate often ranged from 90 per cent upwards, and averaged 75 per cent. In France and London, especially, this very high figure has now been reduced to about 4 per cent and under. See also CHILD WELFARE; AND LABOUR. See II. Folks, *Care of Neglected and Dependent Children*, 1902; Henderson, *Dependents, Defectives, Delinquents*, 1901 and *Modern Methods of Charity*, 1901; . . . Page, *The Foundling Hospital*, 1925; Women's Group on Public Welfare, *Children without Homes: Proceedings of a Conference*, 1945; and H. Donington, *The Care of Homeless Children*, 1946.

Fountain (Fr. *fontaine*, from late Lat. *fontana*, from Lat. *fons*, spring), term applied to places where there is a continual flow of fresh water, by either artificial or natural means. The earliest existing example is that of the Babylonian F., dating from 3000 B.C., and next comes the Assyrian F. at Babylon, sculptured in the face of the rock and consisting of a series of basins descending in steps to the stream. Auct. Gk. Fs. of any size were usually enclosed, and were common in the cities, springs being plentiful in Greece. They were dedicated to gods, goddesses, nymphs, deities, etc., and were frequently placed in or near temples. The water-supply of Rome was on a large scale, and the remains of the aqueducts form some of the most striking monuments of Italy. These supplied the baths and the public Fs., which were of a large size and numerous. Public and private Fs. were some of the most interesting of the Pompeian discoveries; the private ones were of rich and varied shapes, generally in the form of a niche. Utility was the first object of a F. in early times, and in times where a number of people might require to draw water at the same time a large basin was erected with a pillar in the centre, from which pipes, each with a separate jet to supply the running water, radiated all round. Many examples of this kind of F. remain throughout Italy and in the old Ger. tns., and a modern reproduction of the kind is to be seen at Holyrood Palace, Edinburgh. Drinking Fs. for wayfarers, as well as horses and other animals, are commonly placed in streets and public resorts, and the Metro-

politan Drinking Fountain Association was formed in London in 1859.

Fountain Pen. Ingenious contrivance so arranged that the penholder is a hollow shaft, and serves as a reservoir for ink, releasing it at a sufficiently rapid rate to maintain a steady flow, no matter at what speed it may be used. At first the difficulty of producing a pen that was always fluent for varying rates of speed, but capable of retaining ink, without leakage, when not in use, was not easily overcome, but a workable feed was ultimately evolved, the principle of which is, that air can only be admitted to release the ink and cause it to flow as the tiny sub-reservoirs around the nib become empty. For a long time most pens needed to be charged with ink by means of an independent filler, but later an India-rubber bag was made, on which a bar, raised or depressed by means of a lever, filled or expelled the ink as required. The more recent leverless type is filled and emptied by turning a knurled knob at the top of the barrel.

Fountains Abbey, Cistercian abbey of W. Riding of Yorkshire, England, 3 mi. from Ilkton, founded in 1132, and famous as one of England's most glorious anct. monuments. F. A. shows a mellow blending of the Transitional, Early Eng., and Perpendicular styles, and it is not difficult to imagine what it looked like in its heyday. Save for being roofless, the great church, its towers set, curiously, at the end of the N. transept, seems at first sight to be complete, with its long narrow nave, plain and unadorned in conformity with the Cistercian austerity; its chancel enlarged and rebuilt in the thirteenth century; and its beautiful chapel of the Nine Altars or B. transept, which no doubt inspired its only Eng. counterpart at the cathedral of Durham. The 'great cloisters' vaulted with two aisles and 300 ft. in length, or more properly the cellarium, is a unique feature of the ruins; there are a refectory and a chapter house, in which later were interred the remains of nineteen abbots.

In Aug. 1916 it was announced that the abbey, together with Fountains Hall and 60 ac. of land bounded by the original abbey walls, was being sold to a group of leading Rom. Catholics, including the duke of Norfolk, who proposed to restore the abbey and use it as a Benedictine monastic house, and as an international memorial to all Rom. Catholics who were killed in the two World Wars. The announcement gave rise to some controversy, it being regarded by some as highly debatable whether or not a building of the architectural and artistic stature of F. A. was a fit subject for such a revival. For F. A. has been described as 'the crown and glory of all that monasticism has left us in England.' For four centuries it flourished as the greatest Cistercian house in England, and even in its ruined state enables us to recover, better than any other remains of the kind in England, the plan and arrangement of a large Cistercian monastery. F. A., or the abbey of the Blessed Virgin Mary at

Fountains, originated in a revolt of some monks against the laxity of discipline and worldly tendencies that prevailed at the Benedictine abbey of St Mary's, York, and in their determination to withdraw from this abbey. This they did in 1132, and were provided by Archbishop Thurstan of York with a dwelling place at Fountains. Very early the monks had applied for admission to the Cistercian order, and thus being granted, Fountains became the spiritual daughter of

member to member of the family, eventually passing to Commander Clare Vyner, the owner, in 1946. See F. A. Hodges, *Fountain's Abbey*, 1904, and C. O. Bell, *The Story of Fountain's Abbey*, 1932.

Fouqué, Friedrich Heinrich Karl de la Motte (1777-1843), Ger. writer, novelist, and poet of the Romantic movement, b. at Brandenburg. Between 1810 and 1815 F.'s popularity was at its height, and he wrote numerous novels, romances, plays,

FOUNTAINS ABBEY

John H. Stone

Clairvaux in Champagne at that time governed by St Bernard. The little community lived wretchedly for years, but later three monks of York (Hugh the dean, and Serlo and Iosif) came to the monastery and bestowed their wealth upon it. Other benefactors followed, and participation in the medieval wool trade brought enormous wealth to the foundation. In 1539 the abbey was surrendered to Henry VIII who sold the whole estate to Sir Richard Gresham whose son, the founder of the Royal Exchange, broke the estate up, and sold the abbey to Sir Stephen Proctor. The latter used stones from the ruins of the abbey's house to build Fountains Hall, ruining himself in the process. After many alienations the abbey and hall passed in 1768 to the Aislabies, ancestors of the earls of Gray and marquesses of Ripon and, for more than 160 years the abbey descended from

and epic. The culdest and best known of his works is *Undine* a classic of romanticism which appeared in 1811, and is the work by which his memory now lives. Amongst other poems may be mentioned *Der Zauberring* (1813) and *Die Jahren* *Indulfs des Islanders* (1815). See L. Jenche, *Fouqué als Erzähler* 1910, J. Haupt, *Elementargelehrte bei Fouqué*, *Innsbruck und Hoffmann*, 1923, and life by J. Reinhard, 1926.

Fouquet (or Foucquet), Jean (c. 1415-c. 1455), Fr. painter, miniaturist, illuminator, and painter to Louis XI. His miniatures rival those of Clovis and Attavanti. His famous portrait of Charles VII. dates from 1412. About 1418 he painted the miniatures illustrating *Le Cas des nobles hommes et femmes*, from the Lat. of Boccaccio (later in Royal Library, Munich). Portions of the famous Book of Hours are in the Brentano-Laroche

collection at Frankfort. The Antwerp gallery contains his 'Virgin and Child' (tradition says that the Virgin is a portrait of Agnos Sorel). In 1461 F. painted forty miniatures for Etienne Chevalier, Charles VII.'s treasurer. He united the manner of Van Eyck with the It. style, and influenced contemporary painters largely. See writings of Count Léon de Laborde, Brentano, Count de Bastard; G. Lafenestre, *Jehan Fouquet*, 1905; P. Durrieu, *Jehan Fouquet*, 1908; and P. Wechsler, *Jehan Fouquet and his Time*, 1948.

Fouquet (or Foucquet), Nicolas, Vicomte de Melun et de Vaux, Marquis de Belle-Ile (1615-80), superintendent of finance in France under Louis XIV., b. in Paris, the son of a Fr. nobleman in the confidence of Richelieu. In 1650, through the influence of Mazarin, he was given the important position of procureur-général to the parlement of Paris. As minister of finance, F.'s fortune, largely acquired by fraudulent operations, surpassed even Mazarin's, and the latter's successor, Colbert, who was instructed to inquire into the state of the finances, secretly influenced the king against F. He was finally arrested at Nantes and charged with malfeasance in office to the king's detriment, and sentenced to imprisonment for life. See P. A. Cheruel, *Mémoires sur la vie publique et privée de Fouquet*, 1862; J. Lalr, *Nicolas Fouquet*, 1890; and E. Laloy, *Qui était le masque de Jers?*, 1931.

Fouquier-Tinville, Antoine Quentin, (1746-95), Fr. revolutionist, the public accuser of the tribunal during the Reign of Terror, b. at Hérouel, Aisne. Here, for a time, he practised law, and then came to Paris, where he turned spy. He was one of the fiercest of democrats on the outbreak of the revolution, and his activity earned him the reputation of one of the most terrible and sinister figures of the revolution. As public accuser, he was as ruthless as Robespierre himself. With the fall of Robespierre and the Terrorists his career came to an end, and he was brought to trial, condemned to death, and guillotined in May 1795. See G. Lecoq, *Notes et documents sur Fouquier-Tinville*, 1885; A. Dumoyet, *Fouquier-Tinville, accusateur public du tribunal révolutionnaire*, 1913; and J. W. Barwisch, *Fouquier-Tinville*, 1944.

Fourchambault, tn. of France, in the dept. of Nièvre, situated on the Loire 4½ m. N.W. of Nevers. It is noted for its mineral springs, and has important iron and steel works, with manufs. of nails and wire. Pop. 5000.

Fourcroy, Antoine François, Comte de (1756-1809), Fr. chemist, and the son of a druggist, b. in Paris. He was one of the earliest converts of Lavoisier's theories, in conjunction with whom, together with Berthollet and De Morveau, he prepared the *Méthode de nomenclature chimique* (1787). He organised the Ecole Polytechnique, and instituted schools of medicine. In 1801, under Napoleon, he became director-general of public instruction. The Royal Society's *Catalogue of Scientific Papers* enumerates fifty-nine memoirs by F.

Four Freedoms, peace objectives enunciated by President Franklin Roosevelt at a period in the Second World War when the U.S. Gov., while not yet at war, was playing a by no means negligible part in the 'white' warfare of diplomacy in pursuit of its two major aims: defence of the W. hemisphere at a distance, and support for the free values of the W. This diplomatic warfare was intensified by the Nazi efforts to persuade the Russians, with whom they were still outwardly on friendly terms, that Stalin had been classified by President Roosevelt with the Axis dictators. In his ann. message to Congress of Jan. 6, 1941, President Roosevelt answered the Nazi peace drive in relation, especially, to Hitler's real intentions towards Russia, by repudiating a 'peace dictated by aggressors and sponsored by appeasers,' and set forth his famous 'four freedoms'—freedom of speech, of worship, from economic want, and from aggression. He thus offered a basis for the kind of world worth striving for after the war. But the basis was too generalised, having the disadvantage, in addition, of being unilateral, like Wilson's Fourteen Points; and further, the F. F. had been launched in a message to Congress. They therefore bound nobody but their authors. When President Wilson undertook to negotiate with Prince Max of Baden for a truce on the basis of his Fourteen Points, they still, strictly speaking, bound no one else, Wilson not having thought it necessary to gain the sanction of Lloyd George and Clemenceau, an oversight that by no means eased his tasks at the Paris Conference. Roosevelt wished to avoid so obvious a pitfall and envisaged an agreement with the Brit., on broad political and economic principles while America was still at peace and, above all, he wished to commit the Brit., grimly fighting for survival, to a post-war programme. Whence the negotiations in Aug. (1941) between President Roosevelt, Mr. Sumner Welles (foreign affairs), and Mr. Harry Hopkins (g.v.) on the one hand, and Mr. Winston Churchill and Sir Alexander Cadogan (permanent under-secretary of state for foreign affairs) on the other, for the Atlantic Charter, which incorporated (*inter alia*) the substance of the F. F. See ATLANTIC CHARTER; ROOSEVELT, FRANKLIN DELANO.

Fourier, François Marie Charles (1772-1837), Fr. socialist writer, b. at Besançon. He was educated at the college in his native tn. and then travelled in France, Germany, and Holland. He inherited a considerable sum of money on his father's death, but this he subsequently lost at the siege of Lyons, all his property, in which he had invested his inheritance, being destroyed. He then entered the army, but was discharged on account of ill health. He afterwards turned his attention to mercantile pursuits, and obtained sufficient by this means to satisfy his wants, and devote his leisure time to the elaboration of his first work on the organisation of society. This is entitled *Théorie des quatre mouvements et des destinées générales* (1808). This work

contains his whole system, and was later republished under the title *Théorie de l'unité universelle* (1841), and *Le Nouveau Monde industriel, ou invention du procédé d'industrie attrayante et combinée distribuée en séries passionnées* (1829-30). *Le Nouveau Monde industriel* is probably the most finished exposition of F.'s views, and on its pub. in 1830 he began to attract some attention, adherents gathering round him.

F.'s system was partly one of co-operation, partly of Socialism. His scheme was that, what he named a phalanstery (from the word phalanx), consisting of about 400 families, should live together, combining their labour, upon a dist. of about a square league in area. The buying and selling transactions necessary for the support of the community were to be controlled by one person, so as to avoid chaffering. If any member brought capital with him it was not confiscated, and he was paid interest on it. Profits of labour were apportioned on a system which first allowed subsistence money for every member of the community, including those who were incapable of labour. The rest of the profits were then divided in agreed proportions, to remunerate labour and skill or talent, and to pay interest on the capital received. The individual recipients of these shares of the profits could spend the money as they pleased. In 1852 an attempt was made to found an industrial colony on F.'s plan, but it was not successful. His complete works were pub. 1841-48. See C. Pellarin, *Fourier, sa vie et sa théorie* (5th ed.), 1872; W. Sarrant, *Social Innovators*, 1859; M. R. Reybaud, *Reformateurs modernes*, 1843; V. Considérant, *Exposition abrégée du système de Fourier*, 1845; Transon, *Théorie sociale de Charles Fourier*, 1832; A. Bebel, *Charles Fourier*, 1888; Sambuc, *Le Socialisme de Fourier*, 1900; H. Bourgin, *Fourier, contribution à l'étude de socialisme français*, 1905; and W. Vessels, *Charles Fourier als Vorläufer der modernen Genossenschaftsbewegung*, 1929.

Fourier, Jean Baptiste Joseph (1768-1830), famous Fr. mathematician, b. at Auxerre, was educated at the military school in his native tn. and afterwards taught mathematics in the same institution. In 1795 he became prof. in the Ecole Normale at Paris, which he shortly left for the Polytechnique. In 1798 he accompanied Bonaparte to Egypt, and took a prominent part in the gov. He returned to France in 1801, became prefect of Isère, holding that office until the return of Bonaparte from Elba, when he was dismissed. In 1817 he was elected to the Académie des Sciences, and in 1826 was admitted member of the Fr. Academy. F. was a voluminous and versatile writer. His chief interest was mathematics and mathematical physics, but he entered into the public life of the time with an enlightened enthusiasm. On his return from Egypt he contributed to the *Description de l'Égypte*. In 1822 he pub. *La Théorie analytique de la chaleur*, which had formed part of a thesis awarded a prize by the Académie des Sciences in

1812. *Analyse des équations indéterminées* was pub. in 1831, after his death. A collected ed. of his works was pub. in 1889-90. F. is best remembered for his development of the series which bears his name, and which has subsequently become of basic importance in the development of the theory of physics, especially wave motion and heat radiation. The general form of the series is that of the representation of the function of a variable between fixed limits by a series of sines or cosines, as

$$a_1 \sin \frac{\pi x}{l} + a_2 \sin \frac{2\pi x}{l} + \dots + a_n \sin \frac{n\pi x}{l} \\ + \dots \text{ and } b_1 + b_2 \cos \frac{\pi x}{l} + b_3 \cos \frac{2\pi x}{l} \\ + \dots + b_n \cos \frac{n\pi x}{l} + \dots,$$

where the limits are 0 and l . The investigation and criticism of the series were continued by such mathematicians as Dirichlet, Riemann, Cantor, Lebesgue.

Four Lakes, chain of lakes situated in co. Dane, Wisconsin, U.S.A. They are connected by short canals, and upon an isthmus between the lakes Mendota and Monona is the city of Madison, which is the cap. of the state.

Fourmies, tn. of France, in the dept. of Nord, and the arron. of Avesnes, situated on a trib. of the R. Sambre, 40 m. S.E. of Valenciennes. It is an important industrial centre; wool combing and spinning are largely carried on, and cloth is manufactured. There are ironworks, forges and foundries, and glass factories. Pop. 12,600.

Fourmier, Henri Alain (Alain-Fournier) (1886-1914), Fr. novelist, b. at Cher, was educated at Brétat and later at the Lycée Lykanal, near Paris. He spent two years in military service, followed journalism, and in 1913 pub. *Le Grand Meaulme* (trans. 1948), his only completed novel, and the basis of his reputation. It is a romantic novel, with an underlying suggestion of deeper significance, and the basic idea is symbolist in character. Fragments of his *Colombe Blanchet* were pub. (1922), and *Miracles* (1924). See T. Rivière, introduction to *Miracles*, 1921; H. Ellis, *From Rousseau to Proust*, 1935; and H. Peyro, *Hommes et œuvres du XX^e siècle*, 1938.

Foursome Reel, see under REEL.

Fourteen Points. Code of allied war aims set forth by President Woodrow Wilson before Congress on Jan. 8, 1918; which for clarity and liberality was in marked contrast to the vagueness and reactionary character of the ideals of the professional diplomats of 'the balance of power.' The F. P. were instrumental at a critical period in rallying the spirits of many of the oppressed nationalities of central Europe. The points were (1) open covenants of peace and no secret diplomacy; (2) freedom of navigation in peace and war outside territorial waters, except where seas may be closed by international action; (3) removal of economic barriers; (4) adequate guarantees for reduction of armaments; (5) an absolutely impartial adjustment of all colonial claims, the

interests of the peoples concerned having equal weight with the equitable claim of the gov. whose title is to be determined; (6) all Russian ter. to be evacuated and Russia to be given full opportunity for self-development with the aid of the powers; (7) complete evacuation of Belgium and restoration of Belgium without any limit to Belgian sovereignty; (8) all Fr. ter. to be freed, invaded portions to be restored, and the wrong by Prussia in regard to Alsace-Lorraine to be righted; (9) lt. frontiers to be adjusted on lines of nationality; (10) peoples of Austria-Hungary to be given an opportunity of autonomous development; (11) Rumania, Serbia, and Montenegro to be evacuated, Serbia to have access to the sea, and the relations of the Balkan States to be settled on lines of allegiance and nationality under international guarantees; (12) non-Turkish nationalities of the Ottoman empire to be assured of autonomous development and the Dardanelles to be free to all ships; (13) Polish independence to be restored, the independent state to include ters. inhabited by indisputably Polish pops., and to have access to the sea; (14) a general association of nations to be formed under specific covenants to afford mutual guarantees of political independence and territorial integrity to both great and small states. In Oct. 1918 numerous diplomatic notes were exchanged between Germany and the U.S.A., at a time when the Ger. Gov. realised that their military forces were doomed to defeat, in which Germany endeavoured to obtain some modification of this 'charter of allied aims', but were gradually brought to realise that Wilson would only recommend a cessation of hostilities on condition of unreserved acceptance by Germany of the F. P. The trans. into practical politics of the celebrated F. P. imposed difficulties on the most experienced diplomatists and statesmen, trained as were the majority in an atmosphere foreign to the idealism of this code. But at the very opening of the Versailles Treaty figured the creation of the League of Nations bound together by covenant; and much after that time was accomplished in the matter of the reduction of armaments though, ultimately, Germany under the Nazi regime stultified the whole policy of disarmament; while the map of Europe was remade on lines which appeared to conform as far as practicable to the principle of self-determination. In this last-mentioned respect Nazi Germany defied the principle of self-determination by seizing Austria, Czechoslovakia, Danzig, and half of Poland. Points one (so far as secret diplomacy was concerned), three, four, five, and nine have never been implemented. The remaining points, except in certain particulars, and in respect of proposed international guarantees, were more or less fulfilled, being embodied in the ill-fated Covenant of the League of Nations. Nazi propagandists emphasised the non-fulfilment of some points, particularly disarmament, by way of justifying Ger. rearmament and their violation of the peace

treaties. *See also* COVENANT; EUROPE; PEACE CONFERENCE (1919); VERSAILLES, TREATY OF. *See* H. S. Baker, *Woodrow Wilson and World Settlement*, 1922; and W. Lippmann, *U.S. War Aims*, 1944.

Fourteenth Army, largest single army of Second World War. It held the longest battle-line in the war—from the bay of Bengal northwards to where India and Burma border on China. In 1941 and 1945 the F. A. was about 1,000,000 strong (including all its ancillary formations), and just before the fall of Rangoon it had 500,000 fighting men at its disposal. The divs. that served with it were 2nd and 36th Brit.; 3rd Indian (the Chindits), and the 5th, 7th, 17th, 19th, 20th, 23rd, 25th, and 26th Indian; 11th E. African, and the 81st and 82nd W. African. One-third of each Indian div. consisted of Brit. troops and the African divs. had Brit. officers and N.C.O.s. The army was grouped into three corps: the 4th, 15th, and 33rd Indian Corps. Later the 15th Corps was detached from the F. A. for the 1945 Arakan and Itanngoon offensives more. A fourth corps—the 34th—was formed for the invasion of Malaya. The F. A. was the army which broke the myth of Jap. invincibility on land; which denied the enemy the road to India, and finally threw him back in two great thrusts—from Kohima to Mandalay and from Mandalay to Rangoon. Its victory was not only over the Jap., but over the terrain, the jungle, and the climate. Until Mandalay was passed there were no roads, save those they built themselves, no railways, and few tns. It was the first army to plan and execute the movement of whole infantry divs. by air. It was the only army in the war to develop air supply to the extent of maintaining its front-line troops entirely by air; and from the time of crossing the Chindwin to the fall of Rangoon the whole campaign was based on air supply, which reached a rate of 3000 tons a day. Lt.-Gen. (later Gen., and F.M.) Sir Wm. Slim commanded the F. A. from its formation until just before the Jap. surrender. In its last ten months of operations the F. A. covered more than 1000 m. *See also* BURMA, SECOND WORLD WAR CAMPAIGNS in.

Fourth Estate. Edmund Burke, in alluding to the three estates of the realm, viz. lords, clergy, and commons, constituting the Brit. Parliament, termed the public press the F. E., by reason of the enormous influence journalism exerts over both imperial and domestic affairs.

Fourth Party, name applied to a small opposition group within the Eng. Conservative party about 1880, under the leadership of Lord Randolph Churchill in the House of Commons. He had active coadjutors in Sir Henry Drummond Wolff and Sir John Gorst, and occasionally received the assistance of Mr. A. J. (later, Earl) Balfour. The F. P. made itself conspicuous in 1880 and the succeeding years by its vigorous attacks upon the recognised leaders of both parties. *See* W. Churchill, *Life of Lord Randolph Churchill*, 1906; and H. E. Gorst, *The Fourth Party*, 1905.

Four-year Plans, German, for economic development, prepared in imitation of the Soviet's five-year plans (*qv*). The first (1933-36), announced by Hitler, was, ostensibly, a limited plan of road construction and public works, but was soon superseded by a huge rearmament programme, which rapidly absorbed all Germany's unemployed. The next plan (1937-40) covered the development of *Erste* (substitute) industries designed to make Germany self-sufficient. The chief of these industries were those for distilling oil from coal, the manuf. of artificial textiles, and the exploitation of indigenous ore reserves. This plan, too, was accompanied by continued rearmament, and it was still in progress when war broke out (1939). Germany having failed to attain self-sufficiency in any sphere. Oil production had reached only one-third of Germany's peacetime requirements, iron ore and artificial fibre about 20 to 25 per cent, base metal ores 15 per cent, and fats about 50 per cent.

Fouta Djallon see **FUTA-DJALON**

Fowey, par and tn of Cornwall, England, situated on the R. Fowey, 28 m S.W. of Devonport, and 280 m from London. In early times it was an important seaport, and ships for the crusades were fitted out here. In the reign of Edward III the tn equipped a fleet of forty-seven vessels, and about 800 men for the siege of Calais. The inhab. were in later times convicted of piracy, and were deprived of their vessels. Queen Victoria and the Prince Consort visited the tn in 1846. The prin. industry is pilchard fishing, and there is a deep and sheltered harbour. The chief exports are china stone and iron ore. There is a coastguard and lifeboat station. Pop. 2300. See **W. Macarthur**, *The River Fowey*, 1918.

Fowl, see **POULTRY**

Fowler, Henry Watson (1857-1933). Eng. lexicographer and linguist, son of the Rev. Robert F. of Tunbridge Wells. Educated at Rugby school and Balliol College, Oxford. Assistant master at Sedburgh School, 1882-99. In 1905 he produced, in collaboration with his brother I. G. F. a trans. of Lucian, which was pub. by the Oxford Univ. Press. The following year the brothers brought out *The King's English*, which was most successful. They were then commissioned by the Oxford Univ. Press to prepare an abridgment of the *Oxford Dictionary*, which was pub. in 1911 as *The Concise Oxford Dictionary*. Both brothers served with the B.K.F. in the First World War. F. G. F. losing his life. F. then finished alone the *Pocket Oxford Dictionary*, which they had begun in collaboration. The work by which F. will, perhaps be chiefly remembered is his *Dictionary of Modern English Usage* (1928)—highly original in treatment, and valuable as an aid to correct expression in Eng. This was followed in 1929 by the second ed. of *The Concise Oxford Dictionary*, embodying changes in the lan-

guages since 1911—the purpose of the work from the first being to 'present as vivid a picture as the small dictionary could be made to give of the English that was being spoken and written at the time.' He also prepared much of the third ed. (1931), which was pub. with a supplement by H. G. Le Mesurier shortly after his death. His various linguistic speculations appeared in the pubs. of the Society for Pure English. Other pubs. *If Wishes were Horses* (1929); and *Some Comparative Values* (1929).

Fowler, John (1826-64), b at Melksham in Wiltshire. An Eng. inventor, chiefly famous for his steam plough, in which the plough is moved by traction of a stationary engine. This was first employed with satisfactory results in 1840 in the drainage of Hainault Forest in Essex. F. was also the inventor of other improved agric. machines.

Fowler, Thomas (1832-1904). Eng. philosopher, b in Lincolnshire. He received his education at King William's College, Isle of Man, and at Merton College, Oxford, where he graduated in 1854. In 1881 he was elected president of Corpus Christi College, which position he filled till his death, and from 1873 to 1888 he was prof. of logic at Oxford. From 1899 to 1901 he was vice-chancellor of the univ. of Oxford. His pubs. include *The Elements of Deductive Logic* (1867, 1892), *The Elements of Inductive Logic* (1870, 1901), *Baron's Notion Organum* (1878, 1889), *Logic* (in *Eng. Men of Letters*, 1880), *Francis Bacon* (1881), *Progressive Morality: an Essay in Ethics* (1895), *History of Corpus Christi College* (1899).

Fowling, hunting and catching of birds and wild fowl generally, viz. swans, geese, and the different varieties of ducks—canvas-backs, reubens, mallards, teal, pintail, and wood ducks, etc. F. is performed in a variety of ways, such as by concealment of the hunter, by decoy, or occasionally, in some parts, by the training of dogs and of ponies to attract the birds. See also **WILD FOWL**.

Fox, Charles James (1749-1806), Eng. statesman, third son of Henry F., first Baron Holland, was one of the most popular men of his day and one of the most charming of any age. As a lad, encouraged by his father who desired to make a man of him, to ape the vices of those older than himself, he became a heavy drinker and a reckless gambler. At cards and dice he lost a great fortune, but Lord Holland and his friends always came to his rescue, although on one occasion before assistance was forthcoming his furniture was sold for the benefit of his creditors. In later life, however, the gaming table had less attraction for him. F. entered Parliament when he was in his twenty-first year, and after he attained his majority he was made by Lord North a lord of the Admiralty, which office he held only until 1772, when he resigned in order to be at liberty to oppose the Royal Marriage Act. He proved himself so excellent a debater that North persuaded him to rejoin the ministry at the end of the year as a lord of the Treasury, but his

independence was so marked that the king insisted upon his dismissal. In opposition he attacked vigorously the ministerial policy which cost England the U.S.A. In 1782 he became foreign secretary under Rockingham, but on the death of his chief refused to serve under Shelburne. In the following year he formed a coalition with North, becoming joint secretary of state with him under the duke of Portland, but was dismissed in Dec., when, by the king's intervention, his India Bill was thrown out. The king, who disapproved of F.'s opinions and resented his friendship with and his influence over the Prince of Wales, was determined never again to let him take office, and he managed to exclude him from the Coalition ministry of 1804, but two years

CHARLES JAMES FOX

later, when Grenville became Prime Minister, had to accept him as foreign secretary. Thus, by the irony of fate, F., who had been in opposition for more than twenty-three years, *d.* in office. He *d.* on Sept. 13, aged fifty-seven, and was buried in Westminster Abbey, close by his great opponent, Pitt, who had predeceased him by a few months. F. had little or no opportunity to show what ability he possessed as a constructive statesman, but as a leader of opposition he proved himself the right man in the right place. His readiness in reply, his power of speaking at any time and on any subject, made him invaluable to his party, and his eloquence was always a thorn in the side of the ministry. His personal popularity kept his party together, though his approval of the Fr. Revolution caused a political and personal breach between him and Burke, who could see no good in it. F. was an ardent Whig, and had a healthy passion for opposing all abuses and restrictions of the liberty of the subject. Only shortly before his death he brought in a measure to abolish the slave trade. F. was one of the two men of his century who may be described as founders of Brit. Liberalism—the other being Burke. In the hour of their separa-

tion F. described in broken sentences the debt he owed to Burke's inspiration. Burke had found the Whigs a world of selfish nobles who cared only for the spoils of office, and had created a new Whig party with principles and ideals, and F. soon fell under his spell. He became Burke's chief ally in the battle for justice to the Amer. colonies, justice to Ireland, justice to India, and for the estab. of effective parl. gov. As the advocate of Burke's large ideas F. rapidly made himself the leading popular politician in England. But the great fund of prestige and popularity that he won during his struggle against the king and Lord North during the Amer. war he threw away by a series of sensational blunders. In these Burke, who had been his teacher, was closely associated, for Burke, like F., was a bad tactician, and had a headstrong and wilful nature. Each of them in his own way redeemed his mistakes, Burke by the literary power which found in the Fr. Revolution a magnificent theme, and F. by the courage and debating strength that made him the most powerful and passionate champion of popular ideas and freedom at a time when class prejudice almost extinguished liberty in England. Few would say that F. was always well advised in his opposition to Pitt during the Fr. wars. But whatever view is taken of his actions, or of the inevitability of the Fr. wars, few can doubt that it was well that a man of his position should have resisted the campaign of domestic repression that set in when the war began and lasted for more than twenty years; and in this way F.'s conduct during the Napoleonic wars served the cause of national unity, though it might seem at the time so adverse to it. See Lord John Russell, *Life and Times of Charles James Fox*, 1859-66; Sir G. O. Trevelyan, *Early History of Charles James Fox*, 1880; J. L. Hammond, *Charles James Fox, a Political Study*, 1903; J. Drinkwater, *C. J. Fox*, 1928; and C. H. House, *Fox*, 1934, 1948 (with an essay by H. Nicolson).

Fox, George (1624-91), founder of the Society of Friends or Quakers. He was b. in Fenny Drayton, Leicestershire, and was the son of a weaver, Christopher F. At an early age he was apprenticed to a shoemaker, who also traded in cattle and wool. He was of a spiritual disposition, and while tending the sheep was occupied in holy meditation. At the age of nineteen he felt he had a divine call, and in consequence left his home and friends and 'broke off all familiarity or fellowship with old or young.' For the following four years he wandered about the country, with Bible in hand, attending meetings, conversing with 'professors,' and publicly expressing his disapproval of 'steeples, houses,' church bells, and all kinds of formalism, religious and social. About 1646-47 he began to realise an inner light in his heart, which appeared to him to be a divine revelation. He not infrequently interrupted services when the preacher was teaching doctrines which seemed to him erroneous, and in 1649 he was imprisoned at Nottingham for so doing. In

the following year he was again imprisoned in Derby on a charge of blasphemy, and on his release walked barefoot through Lichfield, cursing the tn. with the words, 'Woe to the bloody city of Lichfield.' Between the years 1653 and 1673 he was imprisoned on six different occasions. During his whole life, in fact, he was continually subjected to persecutions. He gathered together a faithful band of followers, of whom there were, in 1656, nearly a thousand in jail. In manner and speech they separated themselves from their fellows, saying 'thee' and 'thou' to 'all men and women without any respect to rich or poor.' They interpreted Christ's words literally, and thus opposed war and the taking of oaths, and advocated poor relief and self-help. F. also taught that the sacraments of the Lord's Supper and baptism were not essential, and that there was no need for an ordained or paid ministry. He visited Barbados, Jamaica, and America in 1671, and Holland in 1677 and 1684. His *Journal*, ed. by Thomas Ellwood, F.'s literary executor, and other friends, was pub. in 1694, and *The Short Journal and Itinerary Journals of George Fox*, ed. from MS. by N. Penney in 1925. The complete list of his writings occupies fifty-three pages of Joseph Smith's *Descriptive Catalogue of Friends' Books*, 1863. See S. M. Janney, *Life of George Fox*, 1853; J. S. Rowntree, *The Life and Character of George Fox*, 1891; T. Hodgkin, *George Fox*, 1896; D. Butler, *George Fox in Scotland*, 1913; L. Knight, *The Founder of Quakerism, a Psychological Study*, 1922; and E. Taylor, *The Valiant Sixty*, 1917.

Fox, Henry, and Henry Richard Vassall, see HOLLAND, BYRON.

Fox, or Foxe, Richard (c. 1418-1528), bishop and statesman, b. at Bospeslev; educated at Oxford. He was a trusted adviser of Henry VII., and held the posts of secretary of state, privy seal, bishop of Exeter (1487), of Bath and Wells (1492-1494), of Durham (1494-1501), and of Winchester, besides performing many diplomatic missions. In 1516 he retired from court and founded Corpus Christi College, Oxford.

Fox (Dutch *vos*; Ger. *fuchs*), name properly applicable only to the Brit. representative of the family *Canis*, but now used to include many other species. The feminine form, 'vixen,' represents the O.E. *fyren* (fox plus the feminine termination -en). The genus *F.* (*Vulpes* *alopeus*) is distinct from the genus *Canis* by the slimmer build, the long and bushy tail, and the large ears of the members of the former. Also the projection behind the eye-socket has its upper surface concave, with a raised ridge, instead of regularly convex as in the genus *Canis*, and there is not a hollow chamber within the frontal bone of the forehead. The range of the *F.* extends eastwards across Europe to Japan, and to the S. across N. Africa, Persia, N.W. India, and the N. Amer. side of the Atlantic. Naturally over such an area many local differences are found, and the red *F.* of N.W. Europe differs considerably from the white-footed

F. of Persia and Arabia, whilst both are in many respects dissimilar to the black *F.* of N. America. Among other species may be mentioned the Himalayan *F.* (*Vulpes montanus*), the Tibetan *F.* (*V. ferrilatus*), the Alaskan *F.* (*V. harrimani*), the largest species, the Indian *F.* (*V. bengalensis*), the *V. famelicus* or *egyptiacus* of Egypt, the Arctic *F.* (*Alopex lagopus*), etc. The

ENGLISH FOX

Amer. grey *F.* (*Urocyon cinereo-argenteus*) is a separate sub-genus of *Canis*, whilst the long-eared *F.* of S. and E. Africa (*Otocyon megalotis*) forms a distinct genus. The skins of many varieties of the *F.* are valuable, and are largely imported into this country for furs. The cunning of the Eng. *F.*, which owes its survival to the sport of fox-hunting, is well known. The vixen brings forth a litter of from five to eight cubs in April, the period of gestation being sixty to sixty-five days. The cubs take eighteen months to grow to their full size and strength; the average life of the *F.* is about thirteen years.

Fox-bat, see FRUIT BAT.

Foxe, John (1516-87), Eng. martyrologist, b. at Boston, Lincolnshire. He entered the univ. of Oxford, taking both the bachelor's and master's degrees in 1537 and 1543 respectively, being elected a full fellow of Magdalen College in 1539. He applied himself assiduously to the study of theology, and became a convert to the principles of the reformation in 1545, resigning his fellowship in consequence. He then went abroad and gained a livelihood as corrector of the press for an eminent printer at Basle. In the reign of Elizabeth he returned to England and came under the notice of the duchess of Richmond, through whose influence he eventually obtained employment as tutor to the children of her brother, the earl of Surrey. In 1550 *F.* was ordained deacon by Ridley, bishop of London, and began preaching the doctrines of the reformation. He was ordained priest in 1560, and three years later was made a prebendary in Salisbury Cathedral by the influence of Cecil. He held successively the livings of Shipton and Cripplegate, but soon re-

signed these, and for a year held a stall at Durham. The work that has immortalised F.'s name is his *History of the Acts and Monuments of the Church* (1563), known as *Foxe's Book of Martyrs*, on which, however, reliance for historical accuracy may not be placed. The Lat. ed. was printed in 1559. The first Eng. ed. appeared in 1563, and it has since gone through innumerable eds., the best ones being by S. R. Cattle, (1837-41), and J. Pratt, and J. Stoughton (1877). Besides this F. wrote numerous controversial and other works. F. d. in London, and was buried in the church of St. Giles's, Cripplegate. See W. Winter, *Biographical Notes on John Foxe*, 1876.

Foxglove, genus of hardy biennial or perennial plants of the order Scrophulariaceae and genus *digitalis*. Only one, *D. purpurea*, is a native of Great Britain; it is a stately plant, bearing spikes of drooping, thimble-shaped pink flowers, spotted inside. A number of other species were introduced from W. Asia and S. Europe. Their flowers are purple, white, yellow, brown, or pink. The large wrinkled leaves yield digitalin and other active principles useful as heart tonics and sedatives. See DIGITALIS.

Foxhound, small hound especially trained for fox-hunting. It has been most carefully bred and reared for over 300 years: it is a combination of the old S. hound, with its keen nose, and a greyhound, with its swift foot. It possesses great staying powers, and is often used to work in thick covert or run across open fields for 10 hrs. at a stretch. Fs. are

are annually drafted to make room for the puppies. The chief points of a F. are as follows: Head large and full, with a girth in front of the ears of at least 16 in.; ears set low, close to the head; nose, with wide-open nostrils, should measure 4½ in.; neck free from all throatiness; shoulders long, muscular, and well-sloped; back short and strong; loins square, with a slight arch; legs absolutely straight and very strong; feet round and cat-like, with good strong pads; hind quarters strong, straight stiles preferred; stern, arched over the back, hairy below, and tapering to the end; coat short, thick, and glossy; colour not very important, and varying between black, white, and tan, black and white, and pled with hare, badger, tan, or yellow.

Fox-hunting, as practised at the present time, is not of very great antiquity. Foxes existed in this country from early times, and they were hunted in the days of Edward I., but such hunting was as different from F. proper as light from dark. Wm. the Twin, who was head huntsman to Edward II., mentions the fox as belonging to the inferior class of animals that should be exterminated by any means, and again in the *Records of the Chase*, written in the time of Edward III., the fox is named with contempt. In those times Reynard was pursued with no ceremony or method, but caught in nets, or shot, or dug up from his earth and slaughtered at every possible opportunity. Such views prevailed until the eighteenth century, when F. began to take its place as a sport. It is not possible to say with exactitude when the first pack of hounds was maintained in England entirely for F., but the following facts throw some light on the matter. In a letter from one of his descendants, it is stated that Lord Arundale, between 1690 and 1700, kept a pack of fox-hounds which were maintained in the family until they became the property of Hugh Maynell in 1782. The *Field* of Nov. 6, 1875, describes a horn, which later became the property of Thomas d'Avenant, Esq. The inscription on this reads: 'Thomas Boothby, Esq., Tooley Park, Leicester. With this horn he hunted the first pack of foxhounds then in England for fifty-five years. Born 1677. Died 1752.' These statements are not conclusive, as the packs mentioned may not have hunted foxes exclusively, but they serve to indicate the probable truth of the statement in Lord Wilton's *Sports and Pastimes of England* (1868) that hounds began to be entered solely to fox about 1750. In the early days of F. the procedure was somewhat different from the present. The meet took place in the early hours of the morning, and the fox was traced by his 'drag,' that is, the line he had taken on his return from a foraging expedition on the previous night. The disadvantage of such a course was that a fox was very liable to be scared by the hounds on the drag scent, and make good his escape before they caught the real scent.

Now, owing to the decrease in woods, etc., it is considered the better way to find the fox in his kennel, and the hour of the

FOXHOUND

1 Fall

hunted in packs, generally dogs and bitches separately. The dogs stand 24 in. at the shoulder, and the bitches 20 or 21 in. The puppies are entered at cub-hunting in company with older hounds, so that, in being trained for hunting, their natural faults may be quickly cured. In many packs it is still the custom to 'round' the dog's ears at about four months old, so that there may be less likelihood of their getting torn in brushwood. The hounds

meet is retarded until about eleven in the forenoon. When the fox breaks away from the covert he is allowed to travel for some little distance before the alarm is given, in order that he may not retrace his steps into the covert. The rules which govern scent are as little understood to-day as ever. On some days when all things seem propitious the scent will fail, and vice versa. It is thought by some that the manner in which hounds come out of covert may be taken as an indication; if they dwell for some moments before settling to the line the scent is good, but if the scent be poor they will make all haste not to lose it. An easterly wind is probably the best for scent, in spite of the poet who sings of 'a southerly wind and a cloudy sky.' An extraordinary circumstance is that if the fox is coured at any period of the run by a dog, the scent falls after that point. The most dreaded foe of the fox-hunter is of course frost. The hunting season proper begins in Nov.; but during part of Sept., the actual date of starting varying according to the time of harvest in different parts of the country, and during the whole of Oct. cub-hunting is carried on. The object of this is indicated by the name, to blood young hounds, and teach them their business. Cub-hunting is commenced in the early morning, about 7 a.m., and the fox is hunted by the drag. The size of packs naturally varies from very large estates, in the Shires to small kennels in the N. of England. If a pack hunts for five days in the week, or possibly six, as some do, about seventy-five couples of hounds will be required; if four days are hunted, from fifty to sixty couples; or if only two days, from twenty-five to thirty couples. A new entry begins cub-hunting at the age of about eighteen months, and is then probably of the first class for three or four more seasons. Many hounds last longer than this, and it is recorded of 'Potentate,' a noted hound belonging to a duke of Bedford, that he hunted for eleven seasons. The pick of the hunting in this country is supposed to be in 'the Shires,' a somewhat arbitrary term, which conventionally means Leicestershire, Northamptonshire, and Rutlandshire, but does not exactly correspond with these. The packs which are considered the best are the Belvoir, the Cottesmore, the Quorn, and the Pytchley.

Despite various agitations and remonstrances, the sport of F. has not declined in popularity of recent years; but the active work of the National Society for the Abolition of Cruel Sports (101 Chandos House, Westminster, S.W.1) and the League against Cruel Sports (58 Maddox Street, Bond Street, W.) has forced the fox-hunting fraternity into forming a society called the Brit. Field Sports Protection Society. A Bill for the banning of blood sports, including F., was introduced by a private member in 1949, but met with no great support in the Commons so far as F. was concerned.

In 1940 there were 234 packs of hounds in the Brit. Is.—193 in England and Wales, 29 in Ireland, and 12 in Scotland.

As regards the cost of hunting, it may be taken as a rough estimate that for every day in the week that hounds hunt the cost per annum will be between £500 and £600; various local circumstances will influence the cost in each case, but it will not as a rule fall below £500. Any price may be given for hunters, from £30 to £800; sev. hundreds of horses, ranging in price from 200 guineas to 650 or 700 guineas, passing annually through the hands of Tattersall's in London and Warner Sheppard and Wade's in Leicester. If a man wishes to hunt regularly with a pack in the Shires, he must, of course, have a far greater estab. than a man who hunts in the N. The sums of money that are spent on hunting every year in this country in normal times are very large and many persons are employed in connection with the sport. The officials of a hunt comprise the master (M.F.H.), one or two 'whippers-in,' and a kennel huntsman or 'feeder.' If the huntsman is an amateur, he is also invariably the master; if the master does not hunt his own hounds a paid huntsman is employed. In large packs two whippers-in are employed, but in some packs only one. The duties of whipper-in and kennel huntsman are often performed by one person, especially if the master hunts his own hounds. The kennel huntsman proper is the man who undertakes all responsibility connected with the hunt, save the actual hunting, walks out the pack, prepares the food for the pack that is hunting, etc. It was, however, the opinion of Lord Willoughby de Broke, one of the foremost authorities, that the man who hunts the hounds should also feed them. It is the first duty of a huntsman to gain the confidence of his hounds; the sagacity and resource of a well-trained pack are remarkable. The whipper-in, or whippers-in, when the hounds are drawing a covert, should be neither too near nor too far away from the hounds; when they have found, he should get to them as soon as possible, and take a line parallel to that of the huntsman, and prevent the pack from dividing. The quality of the hunting enjoyed at the present day is probably as good as ever it was. Great care is exercised in the breeding of hounds and of horses, and the pace is set, on the whole, faster of late years.

F. is by no means confined to England at the present time, but has been transported to various quarters of the globe. Manitoba has had a pack since 1826, and the Peshawar Vale hounds in India are as celebrated as the Belvoir or Quorn in England. The enthusiasm of the garrisons at Alexandria and Cyprus caused hunting to be instituted there, and among other places where the sport is carried on may be mentioned Florida, where meets are held in moonlight, Bechuanaland, New Zealand, and parts of the U.S.A. There are eighty-three packs of hounds hunted in the U.S.A.

Schwerdt, *Hampshire Hunt*, 1929; T. R. Quarrell, *Worcestershire Hunt*, 1929; L. D. R. Edwards, *Huntmen Past and Present*, 1929; S. Sassoon, *Memoirs of a Fox hunting Man*, 1929; and A. H. Higginson, *Two Centuries of Fox Hunting*, 1916.

Fox River, name of two rvs. of Wisconsin, U.S.A. 1 The F. or Pishtaka R. has a course of 220 m., flowing first S., then S.W. entering the Illinois at Ottawa. 2 The F. or Nienah R. has a generally N.E. course for 250 m. In the wet season

Though not snappy and quarrelsome, they are always ready for a fight, and make excellent ratters. The chief points are. Head long, flat, and narrow, with very strong teeth, small ears, small keen eyes, black nose, and clean cheeks, shoulders sloping, forelegs very straight and bony, with firm, compact feet and arched toes; chest and fore ribs narrow, hocks strong; stifles well bent; tail, which is usually cut short in puppyhood, is held erect, colour, white with black or tan markings, brindle spots being objectionable. The smooth-haired variety should have a thick, dense, and smooth coat, the rough haired, coarse, wiry and rather longer. Weight, 15 to 18 lb.

SMOOTH HAIR'D FOX TERRIER

WIRE HAIR'D FOX TERRIER

- the floods spread and a natural connection is established between Lake Michigan and the Mississippi. By means of a canal, however, ships can pass all the year round.

Fox-shark, or Thresher, name given to *Alopias vulpes*, the commonest species of sharks found in the Mediterranean and the Atlantic. Its chief characteristic is a very long tail, nearly half of its own length, which is from 12 to 15 ft., with this appendage it lashes the water furiously, hence its name. The F. follows the shoals of small fish, such as herrings or pilchards, and destroys them in great quantities.

Fox-terrier, small dog used formerly to run with hounds, and it is probable that the F. has developed from these small hunting dogs. They were used particularly to unearth foxes from holes, but since the speed of hounds has increased it has been found impossible for such comparatively small dogs to keep up with the chase. Smooth haired terriers were first exhibited about the middle of the nineteenth century, and have become very popular as house dogs. The rough-haired variety were exhibited in 1872. F. make intelligent and affectionate companions.

Foy, Maximilien Sébastien (1775-1825), distinguished Fr. military officer and orator, b. at Ham in Normandy, France. He fought in the Peninsula under Junot, Soult, and Masséna. It was in the campaign of 1811 that he chief distinguished himself, however, receiving his fifteenth wound on the field of Waterloo, refusing, nevertheless, to quit his post till the close of the engagement. He was afterwards employed as inspector general of infantry. From his M.S. his widow, in 1827 pub. *Histoire de la guerre de la Péninsule*.

Fra Angelico, see ANGELICO

Fra Bartolommeo, see BARTOLOMMEO DI PAGHIOLO DEL FIORINO

Fracastoro, Girolamo (1493-1553), It. physician and poet, b. at Verona, studied at Padua, becoming learned in medicine and belles-lettres. In 1502 he became prof. of philosophy at Padua, and later practised as a physician in Verona. Among his intimate friends were Cardinal Bembo, Julius Scaliger, and Gianbattista Ramusio. Among his works are *Symphylidis, seu Morbi Gallici libri tres* (1530, Eng. trans., 1656), a medical poem, *De uni. temperatura* (1534); *Homocentricorum*

(1535); *De sympathia et antipathia rerum* (1546); and *De contagionibus* (1546). His *Opera Omnia* were pub. at Venice in 1555, and his poems at Padua in 1728.

Fraction, mathematics, a number which indicates one or more equal parts of a whole. A vulgar fraction is expressed by means of two numbers, thus, $\frac{1}{2}$ or $\frac{1}{4}$. The upper, or first, number is called the *numerator* of the F.; the lower, or second number is called the *denominator* of the F. The denominator indicates the number of parts into which the whole (or unit) is divided, and the numerator indicates the number of those parts taken to form the F.; thus, $\frac{3}{4}$ of £1 means three parts, each of which is a $\frac{1}{4}$ of £1, therefore the measure of the F. is 15s. A F. is termed *proper* when the numerator is less than the denominator, *improper* when the numerator is greater than the denominator. An improper F. can, therefore be expressed as a mixed number, i.e. a number of wholes + a F.; thus, $1\frac{1}{2}$. A F. may be indicated in many ways, according to the number of parts expressed by the denominator, thus, $\frac{1}{2}$; $\frac{1}{3}$; $\frac{1}{4}$; $\frac{1}{5}$; $\frac{1}{6}$, etc., that is to say, if the numerator and denominator be both multiplied, or both divided, by the same number, the value of the F. is unaltered. The div. may result in a *complex* F.; thus, $\frac{5}{2} = 2\frac{1}{2}$. Addition and subtraction of Fs. are performed by bringing both denominators to a common multiple; thus, $\frac{1}{2} + \frac{1}{3} = \frac{3}{6} + \frac{2}{6} = \frac{5}{6}$. To multiply two Fs. we multiply both numerators and both denominators; for instance, to multiply $\frac{1}{2}$ by $\frac{1}{3}$, we take first $\frac{1}{6}$ of a seventh part, that is, six sixths of the unit; but, of $\frac{1}{6}$ is six times as much, that is, it equals $\frac{1}{6}$. A decimal F. is indicated by a succession of digits after a decimal point. These digits indicate the numerators of vulgar Fs. whose denominators are 10, 100, 1000, and so on successively. It is only when the denominator of a vulgar F. contains factors of 2 and 5 that it can be expressed as an ordinary, or terminating, decimal, as it is only in those circumstances that its denominator can be expressed as a power of 10, that is, as 1 followed by noughts. Where there are other factors in the denominator, the vulgar F. is expressed as a *recurring* decimal F. In algebra the same rules apply for the generalised symbols as in

arithmetic; $\frac{a}{b}$ and $\frac{a+b}{a-b}$ are thus

algebraical Fs. The form $\frac{1}{a + \frac{1}{b + \frac{1}{c + \dots}}}$, etc.,

is called a *continued* F.

Fractional Distillation, see under DISTILLATION.

Fracture, in surgery, the breaking of any part of the bony structure of the body. The general cause of F. is a stress too great for the integrity of the bone to be maintained. The stress may result from direct violence, when the bone is directly acted upon by some external force; in this case the interposed soft tissues are usually crushed and lacerated. It may also result

from indirect violence, when the shock is distributed through various parts of the skeleton, the weaker bone or part of a bone being broken; for instance, a fall on the outstretched hands is likely to cause F. of the collar-bone, although that is to some extent remote from the seat of violence. A F. may be simple, when the softer tissues are unwounded, or compound, when the broken end ruptures the skin. It may be comminuted, when the bone is broken in more than two pieces; or impacted when one broken end is driven into the other. Greenstick F. occurs in children, and consists of a bent and splintered bone: this is an incomplete F., as are also depressed, sub-perosteal, and fissured Fs. Multiple is when more than one F. is present. F. is rendered more likely by any morbid condition weakening the condition of the bone, by the condition of old age, when bone becomes more brittle, and by frosty weather, when not only is the ground harder and more slippery, but the bones themselves appear to be affected. F. may be recognised by the helpless condition of the limb. After this sign further investigation must be carried on with the minimum of movement. There may be local inflammation, and in the limbs considerable distortion may take place owing to the lack of resistance to contraction of muscle. An unmistakable symptom is *crepitus*, by which is meant the grating sensation of the broken pieces passing over each other; this symptom should never be looked for except by a surgeon. The treatment is mainly expectant; the broken ends are fitted accurately together, and the part is secured by splints or other apparatus to secure immobility. When the bone has joined, gradually increasing movement is advocated in order to accustom the muscles, tendons, etc., to the resumption of their functions.

For Fs. in horses, see under HORSES, (DISEASES).

Fracture, in geology, the characteristic appearance of the broken surfaces of minerals when they are broken in directions other than cleavage planes. The various types of Fs. are (1) smooth, where there are no marked irregularities; (2) splintery, where the surface is covered with partly detached splinters; this F. is characteristic of minerals of fibrous structure; (3) hackly, where the surface is covered with sharp irregularities of varying shape; (4) conchoidal, where the surfaces are smooth and curved.

Fra Diavolo, see DIAVOLO.

Fragaria, or Fragaria, see STRAWBERRY.

Fragmental Volcanic Rocks, see under IGNEOUS ROCKS.

Fragonard, Jean Honoré (1732-1806), Fr. painter, b. at Grasse, Provence; studied under Chardin and Boucher, and in 1752 won the Prix de Rome. He then went to Italy, and was much influenced by the work of the Venetian painter Tiepolo. He illustrated St. Non's *Voyage de Naples et de Sicile*. In 1785 he returned to France, and executed 'Callirrhoe,' commissioned by Louis XV. for reproduction in tapestry. He produced sev. decorative

paintings and many landscapes, and also worked in pastel and water-colour and engraved, but his best known works are *genre* paintings of contemporary life, notable for their humanity, free-drawing, and charming colour. Many are in the Louvre, including 'Bacchante Asleep,' 'Nymphs at the Bath,' 'Music Lesson,' 'The Guitar Player,' 'Cupid and a Girl,' 'The Happy Mother,' and 'The Cradle.'

'Fram' (Norwegian, forward), ship especially designed for Arctic exploration by Dr. Fridtjof Nansen, and used by him in 1893. The strength of the ship, combined with the sloping sides, successfully withstood the pressure of the ice.

Frambessia, see YAWS.

Frameries, tn. in the prov. of Hainaut, Belgium, 4 m. S.W. of Mons. There are important coal-mines here, and also a chalk quarry. It has manufs. of chicory and ropes, breweries, distilleries, brickworks and limekilns. Pop. 12,000.

Framingham, tn. of Middlesex co., Massachusetts, U.S.A., on Sudbury R., 21 m. W. of Boston. It includes S. F. and Saxonville. There are manufs. of blankets and other woollens, straw and rubber goods, and boots and shoes. It was settled in 1647 as Danforth's Plantation and incorporated as F. in 1700. A state normal school is situated here. Pop. 23,200.

Framlingham, tn. of Suffolk, England, 22 m. N.E. of Ipswich. The tn. is built round a spacious market-place, and contains a fine flint-work church (in which are tombs of sev. notable members of the Howard family), the Albert College (1864), and the castle. This last, dating from the fourteenth century, was largely destroyed in 1650. It served as a stronghold for the Bigods, the Mowbrays, and the Howards, and was the refuge of Queen Mary after Edward VI.'s death. Pop. 2100.

Frampton, Sir George James (1860-1928), Eng. sculptor. He studied under W. S. Frith, entered the Royal Academy schools in 1881, gained the gold medal and travelling studentship in 1887, and studied in Paris under Merrille and Dagnan-Bouveret. In 1894 he exhibited at the Royal Academy and was elected an associate. In 1900 he gained the *medaille d'honneur* at the Paris Exposition. He was elected a royal academicien in 1908, and knighted in the same year, and during 1911-12 was president of the Royal Society of Brit. Sculptors. Among his works are 'Peter Pan' in Kensington Gardens, the Edith Cavell memorial in Westminster, 'Lamia,' the Mitchell memorial at Newcastle, the Keene memorial, statues of Queen Victoria at Calcutta, Winnipeg, etc., and the sculpture on many famous buildings, such as the Constitutional Club and the Glasgow Art Galleries, and the figures on St. Mary's spire, Oxford.

Franc, unit of money in France and other countries. The name dates back to the fourteenth century, when, in 1360, a gold coin was struck bearing the effigy of King John II. on horseback and the legend *Johannes Dei gracia Francorum rex*. This particular

coin went out of use in the latter half of the fifteenth century, and silver *frs.* bearing the figure of the king were struck in Paris from 1576 onwards. These pieces were worth about 2 fr. 80 c. of Fr. money at pre-1914 value. But it was in 1793, just after the Fr. Revolution, that the F. assumed the value (about 10*l.* in Eng. money) which it bore with slight variations from that date up to 1914. On Dec. 23, 1865, an agreement was signed by sev. European countries by which they bound themselves in the Int. Monetary Union to adopt the decimal system of the Fr. F. In Switzerland the unit is called the *F.*, in Italy the *lira* and in Greece the *drachma*. The F. is divided into 100 centimes. Like the monies of the other European belligerents, the Fr. F. suffered a very serious fall in value during the First World War. It dropped gradually till it reached $\frac{1}{2}$ of its value as against gold. Through the energetic measures adopted by Raymond Poincaré the value of the F. was stabilised at 124.21 to the £. As a temporary measure tokens of 1 fr., 2 fr., and of 50 c. in aluminium bronze were issued from 1920 by Fr. Chambers of Commerce. The F. was fixed at 200 to the £ on the liberation in 1944, but there were three further devaluations up to 1948 when it fell to 1060 to the £.

Francavilla, com. of Messina prov., Sicily, 10 m. N.W. of Taormina, and 27 m. N. of Catania. Pop. 6000.

Francavilla-Fontana, com. of prov. Lecce, Apulia, Italy, 20 m. S.W. of Brindisi. It has manufs. of leather and textiles. Pop. (com.) 19,000.

France, Anatole (Jacques Anatole Thibault) (1841-1924), most famous Fr. author of his time, was b. in a house now demolished at 19 Quai Malaquais, Paris; son of François Noël Thibault—an old soldier, a devout Catholic, and fervid monarchist, who kept a bookshop and specialised in rare vols. and MSS.; and who, when writing bibliophile articles, used the pseudonym *France Libraire*—France being short for François in his native Anjou. Anatole's childhood's acquaintance included a grandfather who had fought at Waterloo, and a grandmother belonging to a still earlier generation. He was sent to the Jesuit College Stanislas, where he became strongly attracted to the anc. classics—especially Homer; and he learned medieval hist. at the Ecole des Chartes. When he was fifteen he dedicated to his parents his first literary work, *Le Légende de Sainte Radegonde* (1859). He contributed verse and articles to the smaller reviews: it was in the *Revue théâtrale* that he first signed himself Anatole France—in allusion to his father's pseudonym. For Pierre Larousse's *Grand dictionnaire* he wrote articles on masterpieces of antique art. His first pub. vol. was *Étude sur Alfred de Vigny* (1868). Later appeared some vols. of his verse. In 1876 he became an assistant in the library of the Senate under Leconte de Lisle. For the publisher Lemerre he wrote a series of 'notices' and introductions for the Fr. classics. In 1879 he pub. in one vol. two little novels,

Jocaste and *Le Chat maigre*, which show the influence of Daudet and Dickens. His originality was manifested in *Le Crime de Sylvestre Bonnard* (1881), 'a model of prose, harmonious and winged.' *Les Désirs de Jean Servien*, a sad tale of the Commune, came out in 1882. *Le Livre de mon ami* (1885) is a delightful assortment of childish recollections.

On March 21, 1886, he joined the staff of *Le Temps*, succeeding Claretie as writer of 'Vie à Paris.' The following year he succeeded Scherer as writer of 'Vie littéraire' in the same paper. His conduct of this dept. illustrated his famous definition of the office of a critic: 'Raconter les aventures de son âme au milieu des chefs-d'œuvre.' In 1889 appeared a vol. of stories entitled (from the first of them) *Balthazar*. In 1890 came *Thais*, a story of a courtesan of Alexandria converted by the monk Paphnutius. About 1891 A. F. had a literary dispute with Leconte de Lisle, and was obliged to leave the Senate library. In 1892 appeared *L'Étui de nacre*, containing fifteen stories that had come out separately in different pubs.—one of them the famous *Procureur de Jude*. In 1893 he left *Le Temps*; and in the same year appeared *La Rotisserie de la reine Pédauque*, 'a story of magic, somewhat baroque, a little too erudite in places,' but introducing the Abbé Jérôme Colgnard, who has been called 'the most graciously eloquent of the author's mouthpieces,' and who reappears in *Les Opinions de Jérôme Colgnard* (1893). Some change of style is noted in *Le Lys rouge* (1894), a story of passion and jealousy, with characters identifiable in real life, and with picturesque scenes in Florence. A return to meditateness marked *Le Jardin d'Épicure* (1894) and *Le Puits de Sainte-Claire* (1895).

On Jan. 23, 1896, A. F. was elected to the academy in place of Ferdinand de Lesseps. Soon afterwards the Dreyfus affair became a national scandal, and engaged much of A. F.'s activity for the next few years. It is the main theme of *Histoire contemporaine*, whose hero, the immortal M. Bergeret, voices the ideas of the author throughout four vols., *L'Orme du mail* (1897), *Le Mannequin d'osier* (1897), *L'Anneau d'améthyste* (1899), and *Monsieur Bergeret à Paris* (1901). Other works, intervening, are *Pierre Nozière* (1899) and *Chlo* (1900). *Crainquebille* first appeared in 1902; the 1904 ed. was dedicated to Mine Arman de Caillavet, who had been the author's inspiration for more than twenty years. About this time he wrote sev. political works: *Opinions sociales* (1902), *L'Église et la république* (1904), and *Vers les temps meilleurs* (1907). *Histoire comique*, telling of the neutralisation of a guilty passion by the suicide of the wronged lover—by no means a comic story—came in 1903. *Sur la Pierre blanche* (1905) contains a picture in the manner of H. G. Wells of a future world with no ins. The very well-known *L'Île des pingouins* (1908) is a hist. of modern France in fable recalling Voltaire. *Les Contes de Jacques Tournebroke* (1908) are simple and pleasing. *Les Sept*

Femmes de la Barbe-Bleue (1909) is a white-washing of the character of Bluebeard after the fashion of modern historians. *La Vie de Jeanne d'Arc* (1908), in two large vols., expounded the thesis that Jeanne was perpetually under hallucination, of mediocre intelligence, and without military talent—noting but a tool in the hands of the clergy, partisans of Charles VII. It was not popular.

Les Dieux ont soif (1912) had appeared serially as *Erastote Gamelin*. It is among A. F.'s masterpieces, reproducing the atmosphere of the end of the eighteenth century. He visited England in 1913, fraternising with his Socialist comrades there. *La Révolte des anges* (1914) is a story of the other world, and of fallen angels become anarchists here below.

In the First World War A. F.'s occupation being wellnigh gone, he retired to Saint-Cyr-sur-Loire, near Tours. He pub. *Sur la voie glorieuse* (1915), a collection of patriotic articles; and he protested against the idea of a peace without victory. But the peace as settled was hateful to him, and made him an anti-militarist. By his first marriage, in the eighteen-eighties, with a great-niece of the miniature painter Jules Guérin, he had a daughter, Suzanne, who married Michel Psichari. Renan's great-grandson, killed in the First World War, and who d. leaving a son, Lucien Psichari. In the autumn of 1920 A. F. married Mlle Emma Laprevotte. In 1921 he received the Nobel prize for literature. His last two works, *Le Petit Pierre* (1918) and *La Vie en fleur* (1921), were in continuation of his autobiographic, half-true, half-romantic sketches of a past epoch. His eightieth birthday brought him the homage of all the literary world; six months later he d. at La Bécheillerat, Saint-Cyr-sur-Loire. See G. Truc, *Anatole France, l'artiste et le penseur*, 1924; J. L. May, *Anatole France: the Man and his Work*, 1924; N. Ségur, *The Opinions of Anatole France* (trans. by J. L. May), 1928; L. P. Shanks, *Anatole France*, 1932; E. Seillière, *Anatole France, critique de son temps*, 1934; and E. P. Durgan, *Anatole France*, 1937.

France is a large republic of W. Europe, lying between 51° 5' and 42° 20' N. lat., and 4° 42' W., and 7° 38' E. long. It is bounded on the N. by the Eng. Channel and the strait of Dover; on the S. by the Mediterranean Sea and Spain; on the E. by Belgium, Luxembourg, Germany, Switzerland, and Italy; and on the W. by the bay of Biscay. It is well defended by natural boundaries, the Vosges Mts. and the Rhine being on the Ger. frontier, the Juras on the Swiss, the Alps on the It., and the Pyrenees on the Sp. Only on the Belgian frontier is there no natural protection. The country is very compact in shape, somewhat like an irregular hexagon. Its greatest length is 860 m. and its greatest breadth 540 m. The area before the First World War was 207,054 sq. m., but owing to the restoration of Alsace-Lorraine by the treaty of Versailles, and the addition of four small frontier dists. from Italy in 1947 (the Tenda and Briga area (225 sq. m.)) is

now 212,659 sq. m. (including Corsica, 3367 sq. m.).

F. has a length of coast line of 1500 m. It is washed by three seas: the Mediterranean, the bay of Biscay, and the Eng. Channel. The Mediterranean has sev. good harbours in the E. part, but the W. part is flat and not easy of access. The W. coast is deficient in good harbours, many of them having been constructed at great outlay. The Riviera coast is bold and lofty, but that of the bay of Biscay is flat, with a chain of dunes, or sand-hills, near the shore, behind which lagoons are formed in many places. The Brittany coast is rugged and fringed with is. F. has, however, no is. of importance. Corsica is, geographically, rather a part of Italy, though politically belonging to F. and the Channel is. belong to England. The biggest is. are Belle Île, Île de Ré, and Île d'Oléron in the bay of Biscay. The surface of F. is generally level. High lands are found in the E. and S.E. only. The N. and W. parts, exclusive of the heights in Brittany, consist of low lands which form part of the great central plain of Europe. E. of the dunes, between the Pyrenees and the Gironde, is a barren stretch of sand called 'Landes,' which is covered with coarse grass. In the S. central part of the country lie the Auvergne Mts., a cluster of heights of volcanic origin rising to between 5000 and 6000 ft., and forming a watershed whence rise the Loire, the Allier, and the Dordogne. Between the Auvergne Mts. and the Mediterranean is a chain known as the Cevennes, which rise to some 6000 ft. Their S. slopes are fertile and sunny, while the N. slopes are high-lying and dreary. N. of the Cevennes and skirting the Rhone and the Saône lies a low range of hills some 2000 ft. in height, known as the Côte d'Or, while to the E. of the N. portion of the Côte d'Or rises the lower end of the Vosges Mts., some 4000 ft. in height. The slopes of the Vosges are covered with thick forests. To the S. of the Vosges are the Jura Mts., separated from the former by a narrow depression through which runs the Saône-Rhône Canal. The Jura Mts. are over 5000 ft. in height, clothed with forests, and supporting a dense pop., engaged mainly in cattle breeding and agriculture. S. of the Jura Mts., and separated from them by the valley of the Rhone, which here widens out into Lake Geneva, are the Alps, containing Mt. Blanc (15,732 ft.). The Alps are divided into sev. chains, including the Pennine Alps in Savoy, with Mt. Blanc and the Graian, and Cottian Alps further S. The Savoy Alps are largely visited by tourists, Chamonix being a well-known resort, but the Graian Alps are thinly populated. The Pyrenees on the S. frontier rise to a height of 10,000 ft. (Mt. Nethou, 11,168 ft.) and possess but few passes. The prin. is the pass of Roncevaux, 40 m. from the Atlantic coast celebrated as the scene of the death of Roland in covering the return of Charlemagne's army from Spain after war with the Saracens. Other passes are those of Perche and Pertuis in the E., near

the Mediterranean coast. Owing to the height of the passes railways do not traverse the Pyrenees, the routes between France and Spain lying close to the seaboard. In the E. Pyrenees is the little republic of Andorra, 175 sq. m. in area, inhabited by 6000 people.

The largest rivs. in F. are the Loire, Garonne, Dordogne, and Adour flowing into the bay of Biscay, the Seine and Somme into the Eng. Channel, and the Rhone into the Mediterranean. The Loire is the longest riv. in F., being over 600 m. in length. Its prin. tribs. are the Sarthe on the r. b. and the Allier, Cher, and Vienne on the left. With its tribs. the Loire drains an area of some 47,000 sq. m., a fifth part of the whole of F. Rising to the N. of the Cevennes, it flows in a northerly direction, gradually changing to westerly until Orleans is reached, from which point it flows W. by S. until it enters the sea. The country it serves is the finest in F., consisting of rich agrio. and pasture lands, and vineyards towards the mouth. It enters the sea by a broad estuary, at the head of which stands the port of Nantes. The riv. here is too shallow for large vessels, so another port, St. Nazaire, has been made at the foot of the estuary on the N. bank. Unfortunately the bed of the Loire contains many sand-banks which, combined with its immense floods, greatly detract from its value as a navigable stream. The Rhone is 500 m. in length. It rises in the glaciers of the St. Gothard group of mts., the celebrated Rhone glacier lying just N. of the Furka Pass. Before its entry into F. it flows through Lake Geneva, and the upper portion of its course is between mt. ranges. On reaching Fr. ter. it flows through the plain of Dauphiné until it receives the waters of the Saône at Lyons, when it turns at right angles and flows due S. to the Mediterranean. Besides the Saône, with its sub-trib. the Doubs, the Rhone receives on its l. b. the Isère and Duranco. Its valley is sharply delimited by the Alps and the Cevennes, while the bed of the Saône and the Doubs is enclosed by the Côte d'Or Mts. and the Vosges and Jura chains. The lower part of the Rhone valley is covered with vineyards. The mts. lying so near the riv. on both sides, their torrents give it an impetuous flow that renders it of little use for navigation. Moreover, the Mediterranean being practically tideless, the soil washed down quickly deposits at the mouth and chokes it up. The Saône and Doubs are, however, tranquil streams on which a good deal of domestic traffic is carried on. The quantity of water discharged by the Rhone is so great that it exceeds that of all other Fr. rivs. put together.

The Seine is 485 m. in length. It rises N. of Dijon and flows in a north-westerly direction. On its right it receives the Marne and Oise and on its left the Yonne. Its flow is regular and calm. Upon its banks stands Paris and at its mouth Le Havre, the second port of F. The stream is easily navigable, and ships of considerable tonnage can go up as far

as Rouen, 56 m from Le Havre. The Garonne, 346 m in length, rises in Spain and flows after making a broad easterly sweep N.W. into the Gironde estuary at Bordeaux. It receives on its r.b. the Lot, Tarn, and Dordogne, all of which rise in the Auvergne Mts. Though the torrential rains cause frequent floods on the Garonne it is nevertheless a stream of great importance for navigation. The fertile waters and the banks of the Gironde are mainly devoted to the cultivation of the vine.

average temp during the winter is only 36°F , and the hot spell during the summer is not of long duration. The rainfall in Paris is 150 days per annum. The climate of the Mediterranean seaboard is of a sub-tropical character the winter being temperate and the summer intensely hot. It is moderated however by the 'mistral' a cold, boisterous wind which blows with great force from the central plateau, and which by driving off the moist air from the Mediterranean

A FISHING BOAT AT THE VILLE PORT MARSEILLE

John H. Ston

Climate—Owing to its proximity to the sea the climate of F. is on the whole temperate. It feels the moderating effect of the Gulf Stream not however to so great an extent as in England. The winters are mild and the summers not overwhelmingly hot. The prevailing wind is westerly and brings many rainy days especially on the coast of Brittany, where it rains some 170 days during the year. The rain is however very slight and the annual rainfall is therefore small being only some 20 in. Snow is not very heavy in the plains but is of course abundant on the Pyrenees and Alps as well as in the mountainous districts of the centre. The N.E. highlands have a climate resembling that of central Europe. The climate of Brittany corresponds closely to that of the S.W. coast of England, and is more moderate than the rest of F. In Paris the extremes are greater, but even here the

lessens the frequency of rainfall along the Riviera.

Agriculture and Land Tenure—The soil of F. enjoying genial sunshine and frequent showers is on the whole very fertile and in 1917 12 420 000 workers were employed in agriculture. The total agric. land in 1914 was 136 000 000 ac. of which 99 000 000 ac. were under crops, fallow or grass 23 000 000 forest, and 11 500 000 moorland or uncultivated. Wheat is the chief cereal crop. The area sown with wheat in 1917 was 9 342 000 ac., producing 3 300 000 tons—a figure only half that of 1916 owing to the bad 1917 harvest. Next in importance among cereals are oats 6 247 500 ac. (1917), rye, 1 225 000 (1917), barley, buckwheat and maize. Nearly 2 000 000 ac. were devoted to potatoes in 1917, and just over 3 000 000 ac. to roots and cabbages. Beet is also considerably cultivated for

the purpose of making sugar, and 732,500 ac. were devoted to it in 1947. About 3,800,000 ac. were under vines in 1947. Although F. is the greatest wine-producing country of the world, its yield in 1947 being about 1,000,000,000 gallons, nevertheless the imports of this commodity from N. Africa greatly exceed the exports. Cider is also made on a very large scale in the N. and W., some 2,000,000 tons of apples being produced in 1947. In 1938 1,275,000,000 gallons of wine were produced; in 1942 the amount fell to 840,000,000 gallons, and in 1947 about 890,000,000 gallons. In the S. of F. mulberry-trees are specially cultivated for silkworms, particularly in Provence, Dauphine, and Languedoc. There were, before the Second World War, about 65,000 producers, and the ann. prod. was between two and three thousand metric tons. Under the Ger. occupation the number of producers dropped to 15,500, and total production dropped to 5000 quintals. The chief industrial crops are tobacco, 73,000 ac. (1947), which is a gov. monopoly, largely grown in the basins of the Garonne and Rhone; oilseeds, 327,000 ac. (1947); flax, 87,000 ac. (1947); and hemp, 15,000 ac. (1947). The largest forests are thus of Compiègne, Ardennes, Fontainebleau, Orléans, and the Vosges, the trees being chiefly oak, birch, pine, elm, and beech.

Industry.—In mineral wealth F. is much poorer than England. Coal and iron are widely diffused, but are found far away from each other, which greatly increases the cost of production. In 1947 the coal-mines of F. produced 47,500,000 tons, and about 220,000 underground workers were employed in the collieries in that year, now shafts were sunk in the Nord, Lorraine, and the Cevennes, and new production methods introduced as a result of the modernisation and equipment plan. The prin. coal-fields are in the N.E., near Belgium, in the valley of the Upper Loire, around St. Etienne, and around Creuzot on the Canal du Centre. The production of iron reaches in normal times an ann. average of some 45,000,000 long tons. The prin. producing dist. is in the valley of the Moselle, near Nancy, Longwy, and Briey. Other deposits are worked near Creuzot, and also in the W. Other minerals are not very abundant. Copper, zinc, lead, tin, nickel, and gold are produced, but not nearly in sufficient quantities to satisfy the nation's demands. The production of iron ore in 1947 was 18,700,000 metric tons. Oil fuel production for the same year was 4,600,000 tons. Salt is produced from brine pans on the shores of the Mediterranean and the bay of Biscay, while rock salt is found in great quantities near Nancy in the N.E. The ann. production of rock salt is some 481,000 metric tons, while the potash deposits in Alsace near Mulhouse produce about 714,000 tons annually. The country is very rich in granite, building stone, plaster, chalk, and slates.

F. ranks as one of the leading manufacturing countries of the world, and engages in normal times some 9,000,000 people in

manufacturing industries. Many industries have been nationalised, including coal, electricity, gas, and aircraft production. The cement industry produces about 3,850,000 tons annually, and important progress is being made in the production of cement slag (1,150,000 tons in 1947), which was scarcely developed before the Second World War. The main textile industries are cotton, woollen, silk, and linen. The silk industry, which produces about 17,000 tons annually, is chiefly carried on around Lyons in the Rhone valley, also at Nîmes, Paris, St. Etienne, Tours, and other tns. Over 250,000 persons are engaged in the cultivation of silkworms, and in the manuf. of the product, and though F. no longer monopolises the world's silk trade, she is, nevertheless, the prin. nation engaged in this industry. Woollen and cotton goods are chiefly made at Tourcoing, Roubaix, Lille, and St. Quentin on the Belgian frontier, and at Rouen. Linen goods are made at Lille and Amiens, and other tns. The carpets and tapestry of Aubusson in the dept. of Creuse are world famous. Leather goods are manufactured at Paris, Blois, Marseilles, and boots and shoes at Paris, Limoges, Marseilles, and Toulouse. After Belgium F. is the leading country for lace, which is largely manufactured in the N.E., especially at Valenciennes. The sugar industry which produced 688,000 tons in 1947 is protected by heavy tariffs, and gives employment to some 28,000 persons. F. is also the chief glove-producing country of the world, Paris and Grenoble being the centres of the industry. The country is also noted for its dyeing and calico printing; its ceramic ware and glass, its porcelain, for which Sévres is specially renowned; its millinery, haberdashery, fancy goods, perfumes, furniture, bronzes, and other *objets d'art* and luxury. Paris is especially the home of a great number of small industries, no less than a quarter of the total output being produced in the capital and its environs. The fishing industry is a considerable source of wealth, and employs over 130,000 persons. Apart from the Newfoundland fisheries, sardines and mackerel are caught in the bay of Biscay, and tunny off Corsica. Whaling is also carried on from Dunkirk.

Foreign Trade.—The Fr. mercantile navy in 1939 numbered 14,000 vessels of some 3,000,000 gross tons, together with sixty motor ships and about 180 sailing boats. At the end of the Second World War the tonnage had fallen to 811,000 tons, but an efficient rebuilding programme raised this to 2,500,000 tons by the end of 1948. Figures for the same year show that the tonnage of Fr. and foreign vessels entering Fr. ports amounted to 52,750,000 tons, of which 15,000,000 tons were Fr.; while the total clearings amounted to nearly 44,000,000 tons, of which about 13,000,000 were Fr. The leading ports are Marseilles, which does a quarter of the whole of Fr. shipping, Rouen, Le Havre, Dunkirk, Cherbourg, Bordeaux, Boulogne, Nantes, Calais, and St. Nazaire. The Rhone is navigable for

1200-ton vessels from the sea to Switzerland. The prin. imports are wine, coal and coke, wool, cotton, cereals, petroleum, chemicals, oleaginous fruits and seeds, machinery, raw skins, timber, rubber, copper, and coffee. The prin. exports are chemical products, iron and steel, textiles, automobiles, wine, soap, perfumes, and glass. In 1947 Fr. foreign trade comprised some 346,000,000,000 fr. worth of imports and 213,000,000,000 fr. worth of exports. The total imports comprised food and drinks, 92,154,843,000 fr.; raw materials, 169,873,697,000 fr.; and manufs. 34,464,687,000 fr. The total exports were food and drinks, 31,177,165,000 fr.; raw materials, 39,150,738,000 fr.; and manufs., 152,493,712,000 fr. Nearly one-half of the trade is with the Fr. colonies. Imports from Great Britain to F. in 1947 were 3,321,847,000 fr., and exports from F. to Great Britain were 5,178,922,000 fr.

Communications.—The compactness of Fr. ter. is very favourable to the development of good communications. Possessing as it does all kinds of stone and road-making materials, it has been able to construct a fine system of highways, due principally to the energy of Napoleon. There are now about 50,000 m. of national roads, 3500 m. of departmental roads, and 340,000 m. of local roads. The central position of the cap. also rendered it possible to plan a convenient system of railways radiating to all parts of the country. The total mileage is 26,416 m., and the main lines are the W. Railway, connecting Paris with Brest, Cherbourg, and Le Havre; the N. Railway, connecting Paris with Calais, Lille, Valenciennes; the Orleans Railway to Bordeaux and Toulouse; the E. to Strasbourg, Belfort, and Basle; the Paris-Lyon-Mediterranean Railway, and the Midi through Toulouse to the Mediterranean and the Pyrenees. All the main lines are now nationalised, and many of them electrified, including the Paris-Orleans, the P.L.M., and the Midi. Considerable damage was done to the Fr. railways by allied bombers during the Ger. occupation, and the consequent disruption of transport throughout the country greatly hampered recovery after the Second World War, but the reconstruction and re-equipment effort continues steadily.

The 150 navigable streams of F. provide over 6000 m. of internal communication, and they are connected by canals which add another 3000 m. of navigable route. The Fr. system of canals is the finest in Europe. The chief among them are the Marne and Rhine canal, which connects the Rhine with the Seine, crossing the Vosges at a height of 1110 ft.; the Canal du Centre, connecting the Saône with the Loire; the Canal du Bourgogne, connecting the Saône with the Yonne, crossing the Côte d'Or near Dijon at a height of 1300 ft.; the Canal d'Alsace, or the Rhine and Rhone canal, and the Canal du Midi, connecting the bay of Biscay with the Mediterranean by joining the Garonne at Toulouse with Cote. Inland water transport was increased during 1947 by 230,000 gross tons, and capital investment to the

amount of 2,800,000,000 fr. was devoted to material, and 800,000,000 fr. to the repair of canal and riv.-beds.

Air F. is the national air line of F., centred on Paris, the two chief air stations being Le Bourget and Orly. Le Bourget, the medium distance terminus, radiates all the European services and metropolitan services to Brussels, Amsterdam, Vienna, Prague, Cologne, Berlin, Istanbul, Warsaw and Moscow; and from Le Bourget are also operated lines to Marseilles, London, Birmingham, Manchester, Glasgow, and Belfast, all these being direct services from Paris. Also operated from Le Bourget are the metropolitan services to N. Africa. Over the long-distance lines from Orly are operated the services to New York, Buenos Aires, W. Africa (Lagos and Duala), E. Africa, Madagascar, Mauritius, and, across India, to Fr. Indo-China for Shanghai. The Fr. submarine cable system covers about 80,000 km., and all war damage on the cables is now repaired. In 1948 there were 1,350,000 telephone subscribers, of whom 363,500 were in Paris, compared with 975,000 in 1938, of whom 270,000 were in Paris.

Population.—The soil of F. was occupied in early historical times by a mixture of races, of which the Celtic Gauls preponderated. The shores along the Mediterranean were occupied by the Ligurians, the S.W. by Iberians, and the N.E. by the Belgae. Ger. immigrants who had adopted the Celtic language. Subsequently came the invasion of the Phoenicians and the Gks., the latter of whom founded Massilia, the present Marseilles. Caesar subjugated the land and laid it open to Rom. influences. At the end of the fourth century began the invasion of the Teutonic tribes, and in the ninth century those of the Northmen or Normans. This mixture of races has produced the Fr. nation. The Bretons of Brittany, descended from the anc. Celts, have only in recent times become assimilated to the rest of the nation, and some 1,250,000 still use Breton as their native tongue, although about half of them also speak Fr. In the S., near the Pyrenees, some 125,000 persons speak Basque, while Flemish is spoken in Fr. Flanders, Walloon in the N.E. of F., and Ger. in Alsace and Lorraine. Considerable differences are to be found in the inhab. of the various parts of F. The N. Frenchman is taller in stature, less vivacious than the S., the latter being darker in complexion and of more volatile disposition. The natives of different provs. exhibit different characteristics. The Gascons are loquacious and boastful, the men from the central uplands reserved and slow to make friends; the Breton melancholy and mystical; the Norman tall and self-controlled. As a nation the Fr. are gay and vivacious, renowned for politeness and sociability, artistic in their tastes, frugal and thrifty, capable of periods of great enthusiasm and liable to corresponding periods of depression. They are of great practical sense and extremely good organisers. The pop. of F. at the 1916 census was 40,518,884 (exclusive of

military, air, and naval forces, which in 1946 numbered 310,000. The pop. per sq. m. (about 190) is very low, considering the fertility of the country. The following is a list of the depts. with their areas in sq. m. and pops. (1946):

Ain (2248) 306,700; Aisne (2868) 453,400; Allier (2848) 373,300; Alpes, Basses- (2697) 83,300; Alpes, Hautes- (2178) 84,900; Alpes-Maritimes (1443) 448,900; Ardèche (2144) 254,500; Ardennes (2027) 245,300; Ariège (1892) 145,900; Aube (2328) 235,200; Aude (2448) 268,800; Aveyron (3385) 307,700; Belfort (235) 86,600; Bouches-du-Rhône (2025) 976,200; Calvados (2197) 400,000; Cantal (2229) 186,800; Charente (2305) 311,100; Charente-Maritime (2791) 416,100; Cher (2819) 286,000; Corrèze (2272) 254,000; Corsica (3367) 267,800; Côte-d'Or (3391) 335,600; Côtes-du-Nord (2786) 526,900; Creuse (2163) 188,600; Dordogne (3550) 387,600; Doubs (2052) 298,200; Drôme (2532) 268,200; Eure (2330) 315,900; Eure-et-Loir (2291) 258,100; Finistère (2729) 125,700; Gard (2270) 393,200; Garonne, Haute- (2457) 512,200; Gers (2428) 190,400; Gironde (4140) 858,300; Hérault (2402) 461,000; Ille-et-Vilaine (2697) 578,200; Indre (2664) 252,000; Indre-et-Loire (2377) 341,300; Isère (3178) 574,000; Jura (1951) 216,300; Landes (3604) 218,300; Loire-et-Cher (2478) 242,100; Loire (1852) 631,500; Loire, Haute- (1930) 228,000; Loire-Inférieure (2693) 665,000; Loiret (2629) 346,900; Lot (2017) 154,800; Lot-et-Garonne (2078) 265,400; Lozère (1996) 90,500; Maine-et-Loire (2811) 496,000; Manche (2475) 435,100; Marne (3167) 386,900; Marne, Haute- (2120) 181,800; Mayenne (1986) 256,300; Meurthe-et-Moselle (2036) 528,800; Meuse (2408) 188,700; Morbihan (2738) 506,800; Moselle (2403) 622,100; Nièvre (2658) 248,500; Nord (2228) 1,917,400; Oise (2272) 396,000; Orne (2371) 273,100; Pas-de-Calais (2606) 1,168,500; Puy-de-Dôme (3090) 478,700; Pyrénées, Basses- (2977) 415,700; Pyrénées, Hautes- (1750) 201,900; Pyrénées, Orientales- (1598) 228,700; Rhin, Bas- (1848) 673,200; Rhin, Haut- (1354) 471,700; Rhône (1104) 918,800; Saône, Haute- (2014) 202,500; Saône-et-Loire (3330) 506,700; Sarthe (2410) 412,200; Savoie (2388) 235,900; Savoie, Haute- (1741) 270,400; Seine (185) 4,775,700; Seine-Inférieure (2448) 846,100; Seine-et-Marne (2275) 407,100; Seine-et-Oise (2184) 1,414,900; Sèvres, Deux (2337) 312,700; Somme (2443) 411,300; Tarn (2231) 298,100; Tarn-et-Garonne (1410) 167,600; Var (2233) 370,600; Vaucluse (1381) 249,800; Vendée (2690) 393,700; Vienne (2711) 313,900; Vienne, Haute- (2119) 336,300; Vosges (2303) 342,300; Yonne (2892) 266,000.

In 1946 four colonies were included as overseas depts.: Guadeloupe (688) 271,200; Martinique (385) 261,500; Réunion (970) 220,900; and Guiana (34,700) 28,500.

There is a tendency for the pop. to concentrate in the tns., twenty-three of which have over 100,000 inhab., viz.: Paris, 2,725,300; Marseilles, 1,636,200; Lyons, 460,700; Bordeaux, 253,700; Nice,

211,100; Toulouse, 264,400; Lille, 188,800; Nantes, 200,200; Strasbourg, 175,500; St Etienne, 177,900; Le Havre, 166,900; Toulon, 125,700; Rouen, 107,700; Nancy, 113,400; Rhelms, 110,700; Roubaix, 100,900; Clermont-Ferrand, 108,000; Rennes, 113,700; Dijon, 100,600; Grenoble, 102,100; Limoges, 107,800; Nîmes, 104,100; and Le Mans, 100,400.

The Fr. do not emigrate very much, but, on the contrary, many foreigners make their homes in F., there being over 1,670,700 aliens. The div. of the pop. into trades is as follows: agriculture, 9,000,000; mining, 300,000; manufs., 6,000,000; commerce, 2,000,000; transport, 1,000,000; professions, 600,000; public service, 1,000,000.

F. has been a republic since the overthrow of the empire of Napoleon III. in 1870. The constitution which was in operation until the defeat of F. in 1940 was highly central and retained many forms which had survived from the times of the kings and the emperors. It was definitely settled by the law of 1875. The country is composed of coms., each of which elects a mayor and communal council to control its affairs. Every group of ten or more coms. forms a canton, and the cantons are further grouped into arrons. Each arron. elects a council which controls local taxation. The arrons. are grouped into depts., each of which contains on an average some four arrons. The depts. have replaced the old historical provs. into which F. was formerly divided, and are ninety in number, excluding three in Algeria, but including Corsica. The following is a list of the old Fr. provs., together with the depts. to which they roughly correspond: Alsace-Lorraine (Moselle, Rhin-Bas, Rhin-Haut); Angoumois (part of Charente-Maritime); Anjou (Maine-et-Loire, parts of Sarthe, Mayenne, and Indre-et-Loire); Artois (part of Pas-de-Calais); Auvergne (parts of Puy-de-Dôme, Cantal, and Haute-Loire); Avignon (part of Vaucluse); Béarn (Basses-Pyrénées); Berri (Cher and Indre); Bourbonnois (parts of Puy-de-Dôme, Creuse, and Cher); Brittany (Finistère, Côtes-du-Nord, Morbihan, and Loire-Inférieure); Burgundy (Saône-et-Loire, Côte-d'Or, and parts of Yonne and Nièvre); Champagne (Ardennes, Marne, Aube, and Haute-Marne, and parts of Aisne, Seine-et-Marne, and Yonne); Dauphiné (Drôme, Hautes-Alpes, and Isère); Flanders (Nord); Poix (part of Ariège); Franche-Comté (Doubs, Haute-Saône, and Jura); Gascony (Landes, Gers, Hautes-Pyrénées, part of Basses-Pyrénées); Guénoie (Gironde, Dordogne, Lot-et-Garonne, Lot, Tarn-et-Garonne, Landes, Gers, parts of Hautes-Pyrénées, Haute-Gironde, Ariège, and Basses-Pyrénées); Île-de-France (Seine-et-Oise, Seine-et-Marne, Aisne, Oise, parts of Eure-et-Loir, Loiret, and Yonne); Languedoc (Tarn, Aude, Hérault, G.-I., Ardèche, parts of Haute-Loire, Haute-Garonne, and Tarn-et-Garonne); Limousin (Corrèze, part of Haute-Vienne); Lorraine (Meurthe-Moselle, Meuse, and Vosges); Lyonnais

(Rhône and Loire); Maine (Mayenne); Marche, La Creuse); Nivernais (Nièvre, part of Cher); Normandy (Seine-Inférieure, Calvados, Manche, and Orne); Orléannais (Loiret, Loir-et-Cher), and parts of Eure-et-Loir, Nièvre, and Yonne); Picardy (parts of Pas-de-Calais, Somme, Nord, Oise, and Aisne); Poitou (parts of Vienne, Vendée, and Deux-Sèvres); Provence (Bouches-du-Rhône, Var, Basses-Alpes, and part of Vacluse); Roussillon (Pyénées-Orientales); Saintonge (part of Charente-Maritime); Touraine (part of Indre-et-Loire).

The depts. have each a general council, whose proceedings are watched by the prefect appointed by the gov. The legislative power of the country, until the Second World War, was vested in the two Houses—the Chamber of Deputies and the Senate. Parliament is still bicameral, but the two Houses are now called by other names, while the new National Assembly has greater powers in relation to the new Council of the Republic than the old Chamber of Deputies had in relation to the Senate (see below). The Chamber of Deputies was elected for four years by manhood suffrage, and consisted of 615 members, including ten for Algeria and ten for the other colonies. The Senate formerly contained 300 members, but with the return of Alsace-Lorraine the number was 314. By the revision of 1931, when the provisional character of the constitution was removed, the life-membership of senators was abolished. Senators were then elected for nine years by an electoral college in each dept. One-third of the Senate was re-elected every three years. Every new law must be passed by both Houses. The executive power was vested in the president of the republic. He was supported by a body of ministers whom he selected from the Chamber of Deputies.

The judicial system is under direct control of the gov. Justices of the peace exist in each canton for deciding small cases. Larger issues must be brought before the dist. tribunals. In criminal cases the preliminary investigation is carried on by an official under secrecy, and the accused is not allowed benefit of counsel until the case comes into court. The assize courts are assisted by a jury chosen by the mayor and justice of the peace in each dist. from citizens over thirty years of age. The gov. is represented by the public prosecutor. Appeal is allowed from the tribunals to the court of cassation. Convicts condemned to hard labour are transported to the penal settlements in New Caledonia and Fr. Guiana.

Defence.—Before the Second World War the Fr. active army consisted of metropolitan troops and colonial troops, and a *force mobile*. The latter was created in 1927, being a select body whose duty it was to resist sudden foreign attack. The metropolitan troops serve in F. and N. Africa, and the colonial troops in colonies outside N. Africa. The metropolitan army is recruited partly by conscription, but the three-year service, instituted in 1913, was reduced to eighteen months in

1923, and to one year in 1928. The peace strength of the metropolitan army in 1930-37 was 450,000 all ranks, including the (military) air force (40,000); the war strength was estimated at about 1,500,000. The peace strength of the colonial army was 200,000 (about 50,000 white troops, with some 10,000 in the foreign legion). During the First World War nearly 10,000,000 men passed into mobilisation. The Fr. Air Force in 1931 numbered 1350 planes, with a personnel of 62,000 (excluding the naval defence service). The number of first-line aircraft, including civil, in 1938, was approximately 3000. Precise figures for aircraft in 1939-40 are not available, but in relation to the Ger. Air Force the Fr. force was almost negligible. The strength of the Fr. Air Force, trained and equipped by the Allies, was greater in April 1945 than at the outbreak of war in 1939. The size of the Fr. Navy in relation to that of the other powers was the subject of naval conferences between the world wars. By the naval part of 1931, which supplemented the Washington Conference (q.v.) and the London Naval Conference, the following tonnage of the Fr. Navy was agreed at: Capital ships, 46,666 (parity with Italy); aircraft carriers, 56,146; cruisers with guns of more than 6.1, 70,000 (parity with Italy); cruisers with guns of 6.1 or less, and destroyers, 195,233; and submarines, 81,989. Allied aid to F. after the national resurgence under the leadership of Gen. de Gaulle included the complete training, equipment, and maintenance of the Fr. Army by the Amer. Army in Morocco and F., with contributions to equipment and maintenance from Great Britain and Canada. Twenty Fr. warships (including the battleship *Richelieu*) were overhauled, refitted, and re-armed at a cost exceeding £50,000,000, and 200 vessels were added to the Fr. Navy. At the beginning of 1919 the warships in service were two battleships *Richelieu* and *Jean Bart* (each 35,000 tons), launched respectively in 1939 and 1910; nine cruisers, all launched between 1923 and 1936, and ranging from 5886 to 10,000 tons; a 1943 aircraft carrier of 13,190 tons, and an escort carrier of 8200 tons. In the flotillas were included ten destroyers (2126-2620 tons), eighteen ships rated as torpedo boats, half a dozen ex-Amer. destroyer escorts; also fifteen submarines. Most of these vessels are of recent design and construction.

French Possessions.—F. possesses the second largest colonial empire. Under the Third Republic this was seriously developed, and F. regards the inhab. of the colonies as Fr. citizens and receives from them military and economic assistance. Algeria (q.v.) is divided into three depts., and governed as part of F. Morocco and Tunisia are under the minister of foreign affairs, and the other possessions are directed by the minister of colonies. By the treaty of Versailles (1919) F. received under mandate part of the former Ger. colonies of Togoland and Cameroon, ter. of Syria, and the Lebanon, which, however, gained their independence in 1943.

The Asiatic colonies consist of Fr. India (Pondicherry, Karikal, Chandernagore, Mahé, and Yanam: 196 sq. m., pop. 346,100 in 1946) and Indo-China (Viet-Nam, Tonking, Annam, Cambodia, Laos, and Cochinchina: 286,000 sq. m., 26,643,000 in 1946). Africa contains the prin. Fr. colonies, including Algeria (847,500 sq. m., 7,234,600 in 1946); Fr. Morocco (153,800 sq. m., 8,499,900 in 1946); Tunisia (48,300 sq. m., 2,608,300 in 1936); Fr. W. Africa, including Senegal, Mauritania, Fr. Sudan, Niger, Fr. Guinea, Ivory Coast, Dahomey, and Upper Volta (1,815,700 sq. m., 15,996,000 in 1945); Fr. Equatorial Africa, including Gabon, Middle Congo, Ubanqui-Chari, and Chad (959,200 sq. m., 4,120,000 in 1946); Togoland (21,800 sq. m., 918,600 in 1946); Cameroons (166,400 sq. m., 2,819,900 in 1946); Fr. Somaliland (9070 sq. m., 44,800 in 1946); Madagascar (241,000 sq. m., 4,000,000 in 1946); Comoro (140 sq. m., 158,000 in 1946). In America the prin. possessions are St. Pierre and Miquelon in Newfoundland, important on account of the adjoining fisheries, Martinique and Guadeloupe, and Fr. Guiana. The area and pop. of St. Pierre and Miquelon is 93 sq. m., 4300 in 1945. The area and pop. of Fr. America is 75,800 sq. m., 565,500. In Australasia Fr. possesses New Caledonia (8500 sq. m., 61,200 in 1947) and Oceania (1500 sq. m., 55,700 in 1946).

Constitution.—The preamble to the constitution of 1946, or the first constitution of the Fourth Republic, reaffirms the declaration of 1789 and the fundamental principles recognised by the laws of the republic, and proclaims, besides, a number of political, economic, and social principles as especially necessary to-day. These include equal rights for women with those of men; the right of asylum for those persecuted in their struggle for liberty; the right to work; freedom from victimisation in employment on account of beliefs, opinions, or origins; the liberty to defend one's rights and interests by syndicalist action; the right to strike within the law; collective ownership of any undertaking which has acquired the character of a national public service or *de facto* monopoly; national assurance to the individual and his family of the conditions essential to their development; guarantee to all, especially children, mothers, and the aged, of safeguards for health, material security, leisure, and rest; the solidarity and equality of all Fr. people in sacrifices resulting from national calamities; equal educational and cultural opportunity for all; and the organisation of free, public, lay education at all stages to be a state obligation. The preamble further declares that F. will undertake no war of conquest nor use its armed forces against the freedom of any people; subject to reciprocity F. assents to restrictions on her sovereignty essential to the organisation and defence of peace; and enters with her overseas peoples into a union founded on equal rights regardless of differences of race or creed—this Fr. union to comprise nations and peoples who pool their resources and efforts to develop their

respective cultures and ensure their security. The preamble concludes with the declaration that F. intends to promote self-government among her dependent races so that they may manage their own affairs democratically; and, avoiding any arbitrary system of colonisation, guarantees to all equality of access to public office, and to the exercise of the rights and liberties set out in this regard in the constitution. Many of the provisions of the constitution which follow the preamble are reaffirmations of the constitution of the Third Republic prior to 1940 by way of repudiating the reactionary principles of Marshal Pétain; thus is reaffirmed the principle of 'government of the people for the people and by the people.' In matters constitutional the people exercise their sovereign rights through the votes of their representatives and by referendum. The franchise is given to both sexes. Parliament consists of the National Assembly and the Council of the Republic. The assembly is elected by direct universal suffrage, the council by indirect suffrage through coms. and depts. The assembly can itself elect councillors to a number not exceeding one-sixth of the total number of members of the council. The number of members of the council may not be less than 250, nor more than 320. The council is re-eligible to the extent of one-half. Sessions may not be interrupted by adjournments for a longer total period than four months. Both Houses sit at the same time. Sessions are public. Each chamber elects its committee annually, and when the Houses are in joint session for the election of the president of the republic their committee is that of the assembly. When the assembly is not sitting its committee can convene Parliament; and it must do so on the demand of a third of the deputies or on that of the president of the council of ministers. Legislation is initiated by the president of the council of ministers and the members of Parliament. Propositions of law formulated by the Council of the Republic are transmitted without debate to the assembly, but are not valid if they involve a reduction of revenue or increased expenditure. Budgets are the province of the assembly, but the budget bill may contain no other than strictly financial provisions. The initiation of expenditure is vested in the deputies in National Assembly. The Council of the Republic advises on Bills and propositions of law transmitted by the assembly after first reading, and if its opinion is unfavourable or not given within a specified time, the law will be promulgated in the text as voted by the assembly. If remitted with amendments the assembly will give the measure a second reading, either accepting or rejecting the council's amendments in whole or in part, and the vote on second reading is then taken publicly, and on an absolute majority, after a further vote by the council in the same conditions, becomes law. No one may be a member of both the National Assembly and Council of the Republic. An economic council examines Bills, within its competence,

as submitted by the assembly. The president of the republic is elected by Parliament for seven years, and is only re-eligible once. He appoints the council of ministers and the councillors of state. He communicates with Parliament by messages addressed to the assembly. The functions of the president are incompatible with the exercise of any other public functions. The president, after the customary consultations, chooses the president of the council of ministers or Premier, who submits to the assembly the programme and policy of the Cabinet he proposes to constitute. The Premier and Cabinet cannot be appointed until the Premier has received the confidence of the assembly by an absolute majority. Confidence can only be refused by an absolute majority, and the passing of a vote of censure involves the resignation of the whole Cabinet. The constitution provides for dissolution of the assembly following two ministerial crises within a period of eighteen months. General elections take place at earliest in twenty days and at latest in thirty days, after the dissolution. Ministers are criminally responsible for crimes and offences committed in the exercise of their duties; they may be charged by the assembly and sent before the high court chosen by the assembly at the beginning of each new chamber. The organisation and procedure of this court are determined by a special law. There is provision for a superior council of the magistracy composed of fourteen members under the presidency of the president of the republic and vice-presidency of the minister of justice, six members chosen by the National Assembly and others, including four magistrates. Revision of the constitution is decided by resolution of an absolute majority of the assembly. After a second reading within three months the assembly frames a Bill, which is then submitted to Parliament, and voted on as an ordinary law. It is then submitted to a referendum, excepting where it has been adopted on its second reading by a two-thirds majority of the assembly, or voted by a majority of three-fifths by each of the two Houses. No constitutional revision respecting the existence of the Council of the Republic can be effectuated without the consent of the council, or by recourse to a referendum. A constitutional committee, presided over by the president of the republic, and comprising the presidents of each House, seven members chosen by the assembly, and others decides whether any law voted by the assembly in effect revises the constitution. If it does the law is sent back to the assembly for fresh deliberation. If Parliament adheres to its original vote the law cannot be promulgated before the constitution has been revised by the process described above. The republican form of government, however, cannot be the subject of any proposed constitutional revision.

The Fr. union is formed, as to one part, of the Fr. republic, comprising metropolitan F. and the depts. and ters. over-

seas and, as to the other part, of the associated ters. and states. The gov. of the republic co-ordinates their combined defensive resources and directs the policy appropriate to that defence. The central organs of the union are the presidency, the high council, and the assembly of the union. The president of the Fr. republic is president of the union. The council consists of a delegation of the Fr. Gov. and of the representatives of the associated states, and its function is to assist the gov. in the general conduct of the union. The assembly of the union consists, as to half, of members representing metropolitan F. and as to the other half of members representing overseas and associated ters. The members are elected by the territorial assemblies so far as concerns overseas depts. and ters.; and, as concerns metropolitan F., as to two-thirds, by the members of the National Assembly, and as to the remaining third by the members of the Council of the Republic. The associated states may designate delegates within the limits and conditions fixed by the legislation of each state. The president convenes the assembly of the union, and closes the sessions. He must convene it on the requisition of half the members. The assembly has cognisance of Bills and proposals submitted for its advice by the National Assembly or the gov. of the Fr. republic or the govts. of the associated states. In the overseas ters, the legislative power belongs to the Parliament as regards criminal legislation, public liberties, and political and administrative organisation; in all other matters Fr. law is applicable only by express provision, or if extended to the overseas ters. by decree on the advice of the assembly of the union. One of the chief criticisms of this constitution was that the president of the republic ought to be in the position of an arbiter, and therefore elected by secret ballot, for the president should have no personal power and power should rightly be vested nowhere else but in the assemblies. M. Edouard Herriot thought that, as regards the assembly, the constitution gave no political powers, but rather privileges, so that the House was merely a kind of academy of moral and political science, rather in the position of a doctor called in for consultation, but without authority to sign a prescription. Another fundamental objection is that there is no true separation of powers as will be found, for example, in the Brit., Amer., and other democratic constitutions. It is open to doubt whether the constitution is consistent with an independent judiciary or an administration above party; for, as to the former, the council of the magistracy comprises only four magistrates out of fourteen members; and as to the latter it might seem that the country is split into a series of departmental compartments, separated from each other by different administrations. Extreme left-wing critics objected that in 1945 the people had condemned the Senate by an overwhelming majority, whereas in the new constitution the Senate reappeared under

a new name. The objection that the constitution institutes indirectly government by assembly is, however, hardly consistent with a president of the republic elected by both Houses, who, after eighteen months of a new legislature's existence, can dissolve the assembly; which body confers on him, in accord with the president of the Council of the Republic, the exceptional right to suspend a law for unconstitutionality; nor is such criticism consistent with a constitution which gives to the Council of the Republic the initiative in legislation, and the power

E. N. A.

BRETON PEASANT GIRL

to nominate an important fraction of the assembly of the Fr. union and committee of constitutional control. Finally it may be objected that the Council of the Republic is deprived of all powers, and that by the very manner of its election it does not represent the com. of F., and is merely the pale reflection of an omnipotent assembly.

Finance.—F. favours indirect rather than direct taxation, i.e. on commodities rather than on persons. Before 1914 the old direct tax system, the *Quatres vieilles Contributions*, was in operation—taxes on real estate, on doors and windows, on business, and on presumptive income. Only the first exists to-day, and only in a modified form. In 1907 Caillaux, finance minister in the Clemenceau Cabinet, proposed the suppression of the old taxes and the creation of a new income tax. Fiscal reform was still under discussion

on the declaration of war, which found F. as financially unprepared as she was in 1939. By 1914 the public debt had grown to 33,000,000,000 fr., and was to become 300,000,000,000 fr. by 1928. Half the public debt was floating or short-term debt, but whereas before the war the service of the debt took about 1,000,000,000 fr. (20 per cent of the Budget), after the war it amounted to 18,000,000,000 fr. out of a state expenditure of some 40,000,000,000 fr., while civil and military pensions accounted for 5,000,000,000 fr. During the war F. lived on borrowing, and a war profits tax, instituted in 1918, failed to compensate for the expenditure. The pre-war income tax scheme was not applied until 1917. Immediately after the armistice Fr. financial policy was based on the assumption that Germany could pay a sum estimated at the huge figure of 400,000,000,000 gold marks. By the Act of June 1920 the tax system was revised and the business turnover tax introduced, together with higher rates of income tax. After 1921 F. entered on a period of inflation in order to meet the cost of reconstruction, and the policy of borrowing continued until, in 1923, the net borrowings amounted to nearly 16,000,000,000 fr. During the occupation of the Ruhr the value of the franc declined, and the Morgan bank of New York put at the disposal of F. 100,000,000 dollars' worth of credits. In 1924 the Poincaré Gov. proposed an all-round increase of taxes and drastic economy cuts, but in the May elections of that year Poincaré was defeated on his financial policy. The franc was then at sixty-seven to the pound sterling; by 1926 it was at 250 to the pound. Poincaré was again called upon to form a ministry of national union, and later that year the franc was stabilised at about 160 to the pound and thirty-three to the dollar. A Bill was put through the chamber providing for 100,000,000,000 fr. of fresh taxation, and an independent sinking fund was estab.

In 1938 the Fr. internal debt was 384,849,000,000 fr., and the foreign debt (as at 1934) was 3,863,850,000 dollars, owed to U.S.A., and 2755,875,000 sterling owed to Britain. The commercial debt to the U.S.A., England, Japan, Holland, Argentina, etc., was about 5,000,000,000 gold francs. In 1928 the stabilisation law was passed, fixing the franc at a fifth of its normal value, i.e. at 65.5 mg. of gold instead of 322.6 mg. Fr. financial policy, as formulated in 1937, was opposed to all forms of exchange control, and adhered to the principles of the three-power monetary agreement of 1938 between Britain, F., and the U.S.A., which was, in itself, a condemnation of such control. At the end of 1944 the internal debt was: consolidated, 581,110,000,000 fr., floating, 1,028,444,000,000 fr.; total, 1,609,554,000,000 fr. On Feb. 8, 1944, a financial agreement between the Brit. Gov. and the Fr. Committee of National Liberation fixed the rate of exchange at 200 fr. to the pound. A financial agreement between Great Britain and F. was

concluded in Paris (March 27, 1945) containing 'the necessary financial foundation for the resumption and development of commercial intercourse' between the franc and sterling zones, including reciprocal credits (£100,000,000 in London for F. and 20,000,000,000 fr. in Paris for Great Britain) to finance imports.

Education.—The beginning of the present century saw the final triumph of the State in its long struggle with the Church for the control of education in F. Previous to 1880 the Church controlled its own primary and secondary education and had the power of granting univ. degrees. The law of 1880 made primary education under state control free and compulsory and took away the special privileges of the Church. Religious teaching was abolished in the schools at the same time. In 1904 teaching by religious bodies was forbidden and religious schools were closed. The highly developed educational system of F. retains the essential features which characterized it under the Third Republic (irrespective of changes made by the Vichy Gov.). Under the Third Republic the State elementary schools constituted the univ. of F., and were graded into primary, secondary, and higher classes. There was a supreme council, with administrative and deliberative functions, and a consultative committee to advise on the functioning of the school system, but the inspectors-general were in direct communication with the minister of instruction. For local administration the whole country was divided into academic areas under academic councils, which dealt with all grades of education. The law of Aug. 9, 1879, made it obligatory for each dept. to maintain two elementary training schools, one for male and one for female teachers. The Pétain Gov., however, suppressed the *écoles normales* or colleges for training elementary teachers. Teachers study for three years at a secondary school, and afterwards at special institutes. In 1938 there were upwards of eighty normal schools, each for men and women teachers. The law of June 16, 1881, made education free in all state elementary schools, and that of Aug. 9, 1882, made it obligatory for all children from six to thirteen years of age, and this age limit was extended in 1936 to fourteen years of age. The law of Oct. 30 was the organic law of education; it replaced the *salles d'asiles* by *écoles maternelles*; and estab. the freedom of private schools under the supervision of the State authority. In 1938 there were 315 higher elementary schools for boys and 240 for girls. Higher elementary education is provided in continuation schools attached to the elementary schools. Secondary education is given by the State in the *lycées* and by the coms. in the *collèges*. In *écoles libres*, by private individuals. The graduate course of study extending over four years is given, being either (a)

purely classical; (b) purely modern; (c) Lat. and sciences; or (d) Lat. and modern languages. Before the war secondary education was free, but the Vichy Gov. required payment of fees in the upper forms. Higher instruction is given by the State in the univs. and in special schools, and by private individuals in the private faculties and schools. The law of July 12, 1875, provided that higher education should be free, but the law was modified in 1880 when the State secured the exclusive right to grant degrees. A decree of Dec. 28, 1885, created a general council of the faculties. There were, before the war, seventeen univs. founded in the years shown: Aix-Marseilles (1409); Algiers; Besançon (1485); Bordeaux (1441); Caen (1432); Clermont-Ferrand (1808); Dijon (1722); Grenoble (1339); Lille (1530); Lu Lyons (1530); Montpellier (1125); Nancy (1572); Paris (1150); Poitiers (1431); Rennes (1735); Strasbourg (1567); and Toulouse (1230). Faculties are of four kinds: law, medicine, science, and letters, and in 1945 there were about 35,000 law students, 18,000 medicine, 25,000 science, 30,000 letters, and 7000 pharmacy, and about 100 theology. There is in Paris also an institution for free higher education in political science and another for the study of international law. Other higher institutions under the Ministry of Public Instruction are the Collège de F. (founded in the early sixteenth century, and with courses in literature, archaeology, mathematics, psychology, political economy, etc.); the Muséum of Natural Hist.; the École Pratique des Hautes Études for hist. and philology, physico-chem., physics, etc., and having its seat at the Sorbonne; the École Normale Supérieure, which prepares secondary school teachers; the École des Chartes (for palaeography); the École des Langues vivantes; the École du Louvre (art and archaeology); the École des Beaux Arts (*q.v.*), and others. There are also a number of institutions of higher or technical instruction dependent on other ministries, giving courses on the applied sciences and social economy, commerce, forestry, colonial agriculture, veterinary science, civil, mining, etc., engineering; besides military and naval schools. Technical schools of a somewhat lower grade under the Ministry of Public Instruction are numerous, comprising national schools of art at Aix, Angers, Châlons, Lille, Paris, etc., and a number of professional schools and practical schools of industry and commerce.

Music.—The earliest surviving Fr. music is that of the troubadours and trouvères (eleventh-thirteenth centuries), an aristocratic art based on popular song, rhapsodic in style with an instrumental accompaniment probably improvised. Adam de la Halle (c. 1230-c. 1287), a trouvère, wrote pastoral plays interspersed with songs. In church music the new polyphonic method known as *Ars nova* was introduced from Italy by Philippe de Vitry (1291-1361) and Guillaume de Machaut (c. 1300-77). The leading

composers of the great polyphonic period that followed were Flemish, but many of them, including Dufay, Okeghem, and Josquin des Prés, lived and worked partly in F. or Burgundy. A distinctively Fr. form of secular music popular in the fourteenth-sixteenth centuries was the *chanson*, akin to the madrigal and written either for sev. voices or for solo voice and instrumental accompaniment. About 1500 the gulf between sacred and secular music widened. The Huguenot Claude Goudimel (c. 1505-72), who composed for both Catholic and Protestant rites, was the leading church composer; Clément Jannequin (c. 1475-c. 1560) treated the words of the *chanson* descriptively.

The late sixteenth century saw the origin of the ballet, a court entertainment with poetry as well as dancing. It. opera was introduced by Cardinal Mazarin about 1645. The Académie Royale de Musique, now the Paris Opéra, was founded in 1669 by the poet Perrin, who collaborated with Robert Cambert (c. 1629-77) in the first Fr. opera (1671). With the fusion of Fr. ballet and It. opera in the work of the naturalised It. Lully (1632-87), the Fr. operatic tradition began.

Chambourni (1602-c. 1672) was the first of an important line of keyboard composers, basing his style on lute technique and traditional dance measures. His most important successor was François Couperin le Grand (1668-1733), whose suites greatly developed the range of keyboard music and instrumental technique. He was followed by Rameau (1683-1764), who foreshadowed the *galant* style in instrumental music, and later in life developed Lully's operatic style, preserving the classical subjects and the prominence of the ballet but broadening the means of expression, especially in harmony. The *concerts spirituels*, founded by A. D. Philidor in 1725, opened the way for instrumental music and led eventually to the modern symphony concert.

The Paris performance in 1752 of Pergolesi's opera buffa, *La Serva padrona*, led to the so-called *guerre des bouffons* between partisans of the Lully-Rameau school and of the lighter It. style, among the most vocal of the latter being the philosopher Rousseau. From this controversy arose the distinctively Fr. form of *opéra-comique*, the first bourgeois non-aristocratic movement in Fr. music, though the Opéra-Comique itself had been founded in 1716 for parodies of grand opera with spoken dialogue. The chief *opéra-comique* composers of the century were Monsigny (1729-1817) and Grétry (1742-1813), another Belgian. The reforms of Gluck, aimed at reducing the supremacy of singers over dramatists and composers, were in great part associated with the Paris Opéra (1774-79). The Paris Conservatoire was founded in 1784 and reconstituted in 1795. A new type of romantic and patriotic opera was evolved by Cherubini (1760-1842), who as director of the Conservatoire exercised great influence, and Méhul (1763-1817).

For another fifty years the stage remained the centre of Fr. musical life and continued to be dominated by foreigners. The *concerts spirituels* had lapsed during the revolution, but the Société des Concerts du Conservatoire, founded by Habeneck in 1823, preserved the thread of instrumental tradition and introduced Beethoven's symphonies. Grand opera reached a peak with Rossini's *Guilleaume Tell* (1829). Auber (1782-1871) was the most successful of many composers of *opéra-comique*, but after 1830 that too declined. Quite apart stood the uncouth genius of Berlioz (1803-69), whose very original work for orchestra, stage, and church was not appreciated in his lifetime. The presence of Chopin and Liszt encouraged a cult of *salon* keyboard music.

The characteristic product of the Second Empire was the operetta school of Offenbach (1819-80). Gounod's (1818-93) rather sentimental lyric drama was an attempt to bridge the artificial gap between opera and *opéra-comique*, a result achieved by Bizet (1838-75). The foundation of the Société Nationale de Musique in 1871 helped native chamber and orchestral music. Among the most distinguished composers in these forms were Franck (1822-90), a Belgian who introduced a strong mystical and Teutonic flavour, Lalo (1823-92), Saint-Saëns (1835-1921), and Fauré (1845-1924). Opera declined under Massenet (1842-1912) and was stunted by the misunderstood doctrines of Wagner. A composer of great originality who scarcely fulfilled promise was Chabrier (1841-94). In 1894 the pupils of Franck founded the Schola Cantorum, ostensibly to raise the tone of Fr. church music, but its influence has been far wider. A new kind of musical expression, allusive rather than explicit, based on an acute harmonic perception while having much in common with the methods of painting and poetry and hence generally known as impressionism, was introduced by Debussy (1862-1918). Ravel (1875-1937), a subtle miniaturist, and the enigmatic Satie (1866-1925) belong to the same group. A more austere method appears in Roussel (1869-1937), who continued to use the traditional forms.

Under the influence of Stravinsky and others, a deeper feeling has appeared in recent years. Of new leaders, the most prominent are Honegger (b. 1892), Milhaud (b. 1892), and Poulenc (b. 1899), all of whom are still active in many fields of music.

Religion.—The prin. religion is the Rom. Catholic, which was recognised by the State until Dec. 1905 as the national religion. Before that date the State had paid for the Rom. Catholic, the Protestant, and the Jewish religions, in proportion to their respective numbers, but afterwards it paid no salaries, nor subsidised religions in any way. Marriage made by the Church is not recognised by the State, which requires the ceremony to be performed before a public functionary. On the contrary, the Rom. Catholic Church does not recognise state marriage. There are seventeen Rom. Catholic archbishops

and sixty-eight bishops. The Protestants number about 1,000,000, the majority being Calvinists, and there are about 70,000 Jews.

Law.—The laws of France were codified at the beginning of the nineteenth century at the instigation of Napoleon Bonaparte, and are still in force with but few amendments (see CODE NAPOLÉON). The administration of justice in France is organised under four systems, known as *juridiction civile*, *juridiction commerciale*, *juridiction administrative*, and *juridiction correctionnelle et criminelle*. Within the first system come all civil cases between individuals, and these are adjudicated upon by the *tribunaux civils*. All commercial suits within the usual category are judged by the *tribunaux de commerce*, which adjudicate also upon cases of bankruptcy, there being no separate bankruptcy courts. The third system, *juridiction administrative*, comprises all actions against the gov., these being submitted to the *tribunaux administratifs*. The fourth system, *juridiction correctionnelle et criminelle*, covers all application of the penal law—by the *tribunaux correctionnels* for the repression of misdemeanours and by the courts of assize for criminal cases. The jury system is adopted in these latter only. Civil cases in which a sum of not more than 200 fr. is in dispute are tried before a justice of the peace (*juge de paix*), one being appointed to each canton. Civil cases outside the jurisdiction of the *juge de paix* are tried in the first instance before *tribunaux civils* of first instance, which exist in every *sous-préfecture*. The *tribunal civil* may also adjudicate in commercial cases where a separate *tribunal de commerce* does not exist. Appeal against the decisions of civil and commercial tribunals is made to one of the courts of appeal of which there are twenty-five. The special jurisdiction over commercial cases is administered only in those dists. where a *tribunal de commerce* has been estab. by the gov. Fr. law does not allow any act of the administration to be submitted to the ordinary courts. Special tribunals, called *conseils de préfecture*, exist in every *préfecture* to adjudicate in all cases between individuals and gov. agents. Appeals against the decisions of these tribunals are made by the *conseil d'état* in Paris. Appeal against the decisions of the correctional tribunals and the courts of assize can be made only to the court of cassation, which exists to ensure the proper application of Fr. law. It has authority over all the tribunals of F., civil, commercial, administrative, and criminal. (There is a special system of law for and special tribunals for the adjudication of questions in which the State or its officials are concerned (see DROIT ADMINISTRATIF).)

For Fr. language and literature see FRENCH LANGUAGE AND LITERATURE; for Fr. art see FRENCH ART.

History.—The Phœnicians and Gks. had left their mark in Gaul by the estab. of the trading station which afterwards de-

veloped into the tn. of Marseilles, but that was all. With the invasion of Gaul by Julius Cæsar, however, the hist. of F. begins. By Cæsar Gaul is divided into three parts, corresponding roughly with the following divs.: S. of the Garonne, the Aquitanians; from Garonne to Seine, the Celts; and from Seine to Rhine, the Belgæ. We know that these races were composed of uncivilized tribes, and yet tribes which had risen to as high a state of civilisation as was possible without outside influence. The Gauls rapidly assimilated the civilisation and culture of Rome; they adopted a form of its language, they accepted its laws and its administration. Rom. colonies sprang up all over the country, schools were built, learning flourished, and by the second century A.D. Gaul was regarded very much in the light of the centre of learning of the Rom. Empire. But with the decline of the Rom. Empire Gaul rapidly fell under aristocratic influence. She also began to suffer from the invasions of the outside barbaric tribes, and crushing of the poorer classes by the aristocracy and clergy led to the outbreak of many revolts which were cruelly suppressed. From 395 onwards the hosts of Goths, Vandals, and Burgundians, who had long been pent up E. of the Rhine, commenced their attacks upon the W. The Burgundians were the first to settle, and they founded a kingdom which stretched down the Rhine valley from the Vosges to the sea. The Vandals, ever pressing westwards, founded a Visigothic kingdom in Spain, a kingdom which, however, included that part of Gaul which Cæsar had called Aquitaine, together with a part of the Celtic domain. In 451 at the great battle of the Catalaunian plain Ætius, the last of the Romans, in Gaul, defeated the Huns of Attila. The most important of the barbaric invaders of Gaul was Clovis, the Merovingian king of the Franks. The Franks were a Teutonic tribe who had lived in Belgium (the Salian Franks) and on the banks of the Sambre and the Meuse (the Ripuarians). Led by their king (Clovis, 481-511), the Franks invaded Gaul and quickly overran it, advancing rapidly towards Paris, which they made their capital. The master-stroke of the Fr. king Clovis was his adoption of the Christian faith. He was recognised by Rome; he was made a consul and patrician by the emperor of the E. Yet no more bloodthirsty ruffian could well be found in the hist. of Europe than this sanguinary king, and yet contemporary documents give him place in paradise, whilst that most enlightened of monarchs, Theodoric (an Arian), is borne off, on the testimony of the same documents, to everlasting torment. The Franks maintained their old Salic law, but at the same time they adopted the civilisation of Rom. Gaul. Clovis was the founder of the Merovingian line of kings. Up to the time of the conquest of Gaul the Merovingians had been but chieftains of roving tribes; now, however, they inherited the monarchy of F., and with it, to a very great extent, the imperial ideals which were kept up by the

officials who represented their power throughout the land, and who were chosen from the original inhab. of the land. The king held in his own hands the reins of justice, finance, and administration. But the Merovingian line spent too much of their time in quarrelling amongst themselves, and so grew up the power of the mayors of the palace, who gradually won for themselves a position which was greater than that of the king himself. A long line of puppet Merovingians followed; then for a short time a struggle between mayor and king would take place, but the mayors of the palace won, and the line of *rois fainçants* continued just as long as the mayors of the palace cared to let them. The Merovingian line was maintained until 732, although Charles Martel (q.v.), from 737 to 741, ruled as a mayor of the palace without even a nominal king. The greatness of the Carolingian dynasty begins with Charles Martel, who united in himself the lines of Pepin (or Pippin) and Adulf, and can therefore be said to have represented church and state. Charles Martel was responsible for the overthrow of the Arabs at Tours (732). In 741 he d., and was succeeded by his sons, Carloman, who shortly retired to a monastery, and Pepin, better known as Pippin the Short, who finally, in 751, took the name as well as the power of king. The bishops of Rome were at this time just rising to a full realisation of their power and demanding recognition as the heads of the Church. The rising powers of the papacy, joined to the rising power of the Carolingians, were wellnigh unconquerable, and Pepin was not slow to recognise the benefits of such an alliance. He was protector of the Church; twice he descended into Italy and forced the king of the Lombards to cede him possessions which he in turn ceded to the papacy, and thus gave the papacy its claim to temporal greatness, which persisted right up to 1870. He was crowned and anointed by the pope (Stephen II.), and regarded himself not only as a king but as a priest also. He succeeded in making Aquitaine a part of the kingdom of F. This was the position when he d. in 768. He left two sons to succeed him, Charles the Great (Charlemagne) and Carloman. At first it seemed that the Neustrian king (Carloman) would, by his ambition and his restless spirit, cause the break-up of the kingdom, but three years after his accession he d., and although he left sons, still Charles the Great was accepted by the Church and the baronage as king both of Austrasia and Neustria. Charles continued the policy of his father; he crossed the Alps to the help of the papacy again; he restored the gift of Pepin the Short; he crushed the Lombards. Then he turned his attention to the Saxon and the Arab, and after many campaigns he finally crushed also their power. He fought the Avars of Hungary; he defeated the Danes, who were at this time just beginning to make their power felt. He was to all intents and purposes overlord of W. Europe. His power was recognised in the E., the Moor trembled at his name; the king of Mercia was made

more powerful by his recognition. He now felt that the time had come when he could claim for himself the position of the emperor of the W., and re-establish a W. empire, and on Christmas Eve of the year 800 he was crowned with the imperial crown by the pope, who also did him homage. Thus was re-established the medieval ideal of a united Church and empire: the domination of the world by pope and emperor working together for its good. The immediate results of this coronation were that the papacy became the greatest power in Italy, and the title of Charles the Great to the Frankish kingdom was considerably strengthened. Charles, although he had realised the very real danger which threatened the empire from the incursions of the Danes, nevertheless helped in the disruption of his own empire by the divs. he himself made. This empire was split up and divided between his sons Charles, Pepin, and Louis. The two former d. very shortly after their father, but Louis the Pious partitioned his empire whilst his sons were yet alive, and this led to constant quarrelling and revolt. Finally, after his death, the empire was definitely partitioned between his three sons, and the three kingdoms of F., Germany, and Italy may be said to have been founded by this partition (treaty of Verdun, 843). For the next century and a half the hist. of F. and of the Holy Rom. Empire is simply the story of constant war and rebellion. The great enemies of order and the power of the Crown during this period are the baronage and the Northmen. Rouen, Bordeaux, and Aachen all fell into the hands of the Northmen. Paris itself in 886 underwent a terrible siege, and yet no peace came to the land. The king (Charles the Bald) tried to buy them off, but they came again and again, each time with fresh demands. The Northmen settled at the mouths of the rivs., and from there ravaged the country. Finally, in 889, Paris was again besieged. Charles the Bald was driven from the throne, and Count Odo elected king of F., but he owed his election solely to the need of driving away the Northmen, and he was kept on the throne only by the influence of the nobles. In 911 Charles the Simple, who had succeeded Odo, made peace with the Northmen, and ceded to them Normandy (the mouth of the Seine). Rollo became a Christian, paid homage of a sort to the king, and then settled in his own ter. The Northmen soon showed that they were easily able to assimilate the culture, language, and customs of the Fr., and before long had lost their old N. coarseness and tongue, and had become a Fr.-speaking chivalrous nation while still retaining the vigour of their original race. Charles the Simple showed himself as incapable as Charles the Bald, and rapidly the Carolingians became as weak as the Merovingians had been, but they still retained some of their former power. Louis IV. tried hard to win back prestige for the Crown, and to put down the power of the nobles, but Hugh, count of Paris, overshadowed him. Although Hugh could

easily have declared himself king of F., he maintained the old Carolingian line, leaving it to his son, Hugh Capet, to found the Capetian dynasty. In May 987 Louis V. d., the last of the direct line of the Carolingians, and Hugh Capet were elected king by the Church and the baronage. It was the victory of the feudal system over the monarchy. The first few Capetian kings were merely great feudal nobles who were given the royal title and a nominal allegiance. F. had by this time become a feudal monarchy. But Hugh Capet did at least one great thing for the F. monarchy: he added to an *effete* power the *Île de France* and Paris, and also he was the first F. king with *national* ideals. But the power of these early kings was but nominal. The influence of Normandy, however, must not be overlooked. The Normans had taken part in all the great movements of the time, they had supported the Cluniac Reformation, they had supported the Capetian dynasty, and although they owed allegiance to the F. king, they were in reality much more powerful than he. Henry I. tried conclusions with Normandy and was defeated. Baldwin of Flanders, father in law of the Conqueror, and regent for Philip I., did not in any way hinder William, duke of Normandy, from invading England. In the meantime the F. kings had revived the ancient Carolingian claims to the middle kingdom and to sovereignty over the Church but the great struggle of empire and papacy was within sight, and Hildebrand, with his ideals of the universal power of the papacy, was preaching them during the reign of Philip. Philip I. struggled against William of Normandy toward the end of his reign, and had great trouble with the papacy, being excommunicated. During his reign occurred the first Crusade.

Under Louis VI. the Capetian monarchy began to increase rapidly, and under his famous grandson, Philip Augustus, it became definitely established. Louis V. had quarrelled with the papacy, Louis VI. by an alliance with the Church strengthened the power of the Crown. He attacked the power of Henry I. of England in Normandy, and attempted to check the power of the counts of Blois. The house of Blois, however, was strengthened by the accession of Stephen of Blois to the crown of England, this, however, was neutralized by the marriage in 1137 of Louis's son to the heiress of Aquitaine. Louis VII.'s reign saw a reaction of the feudal baronage against the power of the Crown, which was, however, repressed. Louis VII., in 1147, set out on the Second Crusade, which proved, however, the opposite of glorious. The power of the Crown, however, did not decrease during the royal absence, and the administration under Abbot Suger was both wise and capable. In 1153 Louis VII. divorced Eleanor of Aquitaine, who six weeks afterwards married Henry of Anjou, king of England and ruler of the Angevin Empire. Henry II.'s power was by far the greatest danger which the monarchy in F. had yet to face. By his marriage Henry II. had established an empire,

which extended from the Pyrenees to the Cheviots; he ruled in F., Normandy, Maine, Anjou, Touraine, Gascony, Aquitaine, and Poitou. The two greatest dangers to the F. monarchy had arisen during the reign: the fear of the power of the house of Blois and the rise of the Angevin Empire. The accession of Philip Augustus (1180-1223) marks the highest point to which the monarchy had risen. By skillful attacks on the house of Blois he consolidated F. power in the N., and by alliances with the rebellious sons of Henry II. he prepared the way for the break up of the power of the Angevins. In 1191 he took part in the Third Crusade. Before Richard's return he had attempted to solve the greater part of Normandy, but had failed, and Richard built up a strong alliance against him. But in 1199 the death of Richard and the accession of John made clear the way for the overthrow of Angevin power in F. The battle of Bouvines (1214) founded definitely the power of F. in the N. The coms, whom he had always befriended, fought for him here. Then for a time he paused. Finally the Albigensian Crusades gave Philip a hold on the S., a hold which was strengthened by his son and grandson. Administration, justice, law, had all been firmly established during his reign, and in 1223, when Philip d., he left a F. strong consolidated, and powerful in the councils of Europe.

Louis VIII. (1223-26) succeeded quietly and continued the work of his father. His son Louis IX. (1226-70), usually known as St. Louis, was only twelve years of age when his father d. His mother, Blanche of Castile, ruled for him, and during the period of the regency, as was not unnatural, there was a feudal reaction. The power of the Crown was largely extended during this reign in the S., and Henry III.'s attempts to reconquer the F. possessions of his house were a failure. Louis himself was noted for the piety of his life, a piety, however, supported by good generalship, statesmanship, and vigour. In 1235 began his period of personal rule, and during that period F. flourished. He continued the work of his grandfather (Philip Augustus). Perhaps the most important side of his reign was the development of the *Parlement de Paris*, and the subjugation of the feudal nobles by depriving them of their rights to judicial combat and private war. During his reign also was developed the *univ.* of Paris, and he himself founded the Sorbonne. His reign was one of the most glorious F. has ever experienced, and he himself, judged from the point of view of Christian general or statesman, must be adjudged truly great. He was succeeded by Philip III. (the Bold) (1270-85), during whose reign progress continued steadily. Events outside F. influenced his list to a very great extent. The Sicilian Vespers put an end to the power of the F. in Italy, where Charles of Anjou, a clever and unscrupulous brother of St. Louis, had established a kingdom, whilst the provs. of Anjou, Toulouse, and Auvergne, together with Provence, fell into the power of the Crown. Champagne was also united to

the Crown during this reign. Philip IV. (1285-1314) was cunning, unscrupulous, and ambitious. He desired to weld F. into one compact kingdom, and to extend her power. In 1286 he had recognised Edwards I.'s claim to Gascony and Aquitaine, but taking as a pretext the quarrels between the sailors of the Cinque Ports and the men of Normandy, Gascony and Aquitaine were declared forfeited.

Edward now built up an alliance against Philip, but he also allied himself with the Scots, and so commenced the traditional alliance which lasted down to 1560. In

the Fr. throne, when he roused the hatred of the Eng., and began the Hundred Years war. Philip's policy of conquest in Gascony and Aquitaine, his interferences in Flanders, and hence his hindering of the Eng. woollen trade, and the help which he gave to the Scots, were the real causes of the war. The succession question in Brittany gave Edward III. an opportunity of retaliating in F. Sluys was won in 1340, Crécy in 1346, and in the following year Calais surrendered. For three years war was stopped by the outbreak of the Black Death (1347-50), and

1300 he annexed Flanders to F., and was two years later defeated at Courtrai (1302). This victory was important, because it showed the beginning of the overthrow of the feudal cavalry by an efficient infantry. Philip summoned the states-general, which consisted of representatives of the nobles, clergy, and citizens. They were summoned first in 1302, and again in 1308 and 1314. The death of Philip the Fair saw the beginning of a rapid decline in the power of the monarchy in F. During Louis X.'s reign there was a feudal reaction and the nobles increased their power. On his death his daughter was declared incapable of ascending the throne by reason of the Salic law. His brother therefore succeeded him, and finally, with Charles IV., who ruled only six years, the Crown passed from the main line of the Capetians to the cadet house of Valois. Philip of Valois, the sixth of that name, seemed to have firmly estab. himself on

in 1350 Philip VI. d. He was succeeded by King John (1350-61), who was defeated and captured by the Black Prince at Poitiers (1356). The regency of the Dauphin Charles during the imprisonment of King John led to an attempt on the part of the states-general to control the policy of F., and this, being opposed by the baronage, led to civil war and the peasant rising known as the Jacquerie. In 1360 peace was made with England. By this treaty Edward gave up his claim to the Fr. throne, and received large ters. to the S. of the Loire. In 1364 John d. Before his death he had estab. his fourth son as duke of Burgundy, and thus founded the Valois house. Charles V. (1364-80), who succeeded John, was successful in establishing again the power of the Crown.

In 1370 the peace of Bruges ended the first period of the Hundred Years war. Charles, however, failed to annex Brittany, although he was successful both

against the Eng. and Spaniards. He, however, depended largely for his success upon the generalship of Bertrand du Guesclin, who had adopted defensive tactics. The regency which was necessary owing to the minority of Charles VI. (1380-1422) witnessed another feudal reaction. Charles became insane in 1392; this led to the quarrels between the powerful families of the Orleanists (Armagnacs) and the party of Burgundy. The dukes of Burgundy had by this time become powerful princes, whose ambitions tended to make them less and less Fr., until we find Charles the Bold attempting to found an independent kingdom. The Armagnacs were the feudal party, the Burgundians the party of the Parisians upon whom they relied chiefly for help. The Burgundians allied themselves with the Eng., and obtained control of the mad King Charles. Henry V., renewing the quarrel with F., won the battle of Agincourt (1415), and later, with the help of the Burgundians, overran the N. of F. and forced the Fr. to sign the treaty of Troyes. By this treaty Henry V. became regent of F., married the king's daughter, Catherine, and was to succeed to the Fr. throne on the death of the king. Henry, however, d. before Charles VI., and his young son, Henry VI., was proclaimed king on the death of Charles. Simultaneously with the proclamation of Henry VI. in Paris, Charles VII. was proclaimed at Bourges. Although the duke of Bedford ruled wisely as regent, he was able only to control the N. of F. and the conduct of Gloucester drove the Burgundians into the arms of the Fr. national party. The encouragement which Joan of Arc's victories gave to the Fr. helped to a tremendous extent in bringing about the ultimate downfall of Eng. power. In 1435 the treaty of Arras was concluded between the Burgundians and the Fr. In the following year Paris was recaptured, the power of the Crown was increased by the granting of a national revenue and the control of the forces, and a despotism was made possible. Gradually the conquests of the Eng. were won back until by 1453 Calais alone remained in the hands of the Eng. king. Louis XI. did more than any other monarch to strengthen the royal power in F. The beginning of his reign, however, was not propitious. He alienated Charles the Bold of Burgundy, his nobility, and his clergy, and by the want of wisdom of his acts welded them together in the league of Public Weal. He raised up rebellions in Liège, and whilst Burgundy was occupied in putting them down he won back Normandy, which by the treaty of Conflans he had ceded without interference. After 1467 he had to oppose the schemes of Charles the Bold. He managed to hold his own until the failure of Warwick and the Lancastrians in England brought his fortunes down to a low point. He was already at war with Burgundy. Charles aimed at occupying the ter. of Lorraine and extending his possession down to the Mediterranean. He found that his scheme evoked considerable opposition and tried to occupy

the attention of Louis by an Eng. invasion of F. Edward IV., however, was bought off by Louis at the treaty of Pecquigny and returned to England. Charles the Bold was finally killed at the battle of Nancy in 1477. Louis seized Burgundy and Artois, and finally it was arranged by treaty between Maximilian and Louis that Margaret, the heiress of Burgundy, should marry the Dauphin Charles and bring as her dowry the country of Burgundy and Artois. Louis had at last triumphed. Louis d. in 1483. F. was governed immediately after his death by the regent, Anne of Beaujeu. The great achievement of the regency was the marriage of Charles VIII. to Anne of Brittany, in face of the opposition of the powers of Europe and her marriage by proxy to the Emperor Maximilian.

The hist. of modern F. begins with the reign of Louis XII. The death of Charles VIII. had again raised the vexed question of the succession in Brittany, and this was again solved by the marriage of Louis XII. to Anne. He remitted much taxation, and gave the country an opportunity of becoming prosperous and wealthy. But his reign was one long story of tortuous diplomatic intrigue; first in the league of Cambrai (1508) he fought with the papacy against the growing power of Venice, next by the Holy League (1511) he found himself deserted by his one-time allies, and although Gaston de Foix won for him some successes in Italy, he was forced to make peace. England during this period once more came to the front as a European power, and by the battle of the Spurs (1513) and Flodden (1513) helped to weaken the power of F. Louis d. in 1515. The reign of Francis I. (1515-47) is important in many respects. In the first place, we have the beginning of the struggle between the house of Hapsburg and the Fr., the estab. of the Fr. military prestige, the beginning of the alliance between F. and Turkey, and the preparation by the acceptance of Calvinism for the religious wars. Francis won the battle of Marignano (1515), and forced from the papacy a concord which gave him practical control of the Church in F. He became a candidate for the empire in 1519, but was unsuccessful, and in 1525 was defeated at Pavia, captured and taken a prisoner to Spain. Here he signed the treaty of Madrid, but failed to keep the terms of that treaty, and so the war dragged on during his reign. Many attempts were made to end it, e.g. at Cambrai, but it was not until towards the end of the reign that the treaty of Crespy recognised the actual facts. Francis had also inaugurated the policy of being Catholic in his policy at home and Protestant abroad. Henry II. (1547-59) was a Rom. Catholic. The Protestants were persecuted bitterly in F., although his struggles with Charles V. made a continuance of the Protestant policy necessary abroad. Charles attacked Metz, but was unsuccessful, and finally in 1556 he resigned the Crown of Spain to his eldest son. But the war dragged on, chiefly owing to the influence of the Guises in

F. Calais was won back in 1552, and in 1559 the treaty of Cateau-Cambrésis put a period to the struggles of the Hapsburgs and the Fr. The next period of Fr. hist. is taken up almost entirely with the wars of religion. During the next thirty years the real power lay in the hands of the nobility. Chief amongst the leaders of the nobles were the family of Bourbon, which was Huguenot, and which was represented by Antony of Bourbon and his brother Condé, the family of

national motives. They could not, of course, depend upon as large a body of troops as the Catholics, and the Catholics were often also supported by the king of Spain (Philip II). Between 1562 and 1570 the civil war broke out three times. Each time the war was ended by a promise of toleration to the Huguenots, and finally, in 1570, matters appeared to be particularly bright for the Huguenots, who were given good terms in the treaty of St. Germain. This treaty was due largely

Chatillon represented by the statesman and warrior, Coligny, admiral of F., also Huguenot; on the other side were the Guises, who, during the reign of Francis II. (1559-60), gained great influence owing to the fact that the queen (Mary Queen of Scots) was their niece, and that they were allied to the queen-mother (Catherine de' Medici). The power of the Guise family declined when Francis II. d. Charles IX. (1560-74), a boy of ten, succeeded, and the regency was obtained by the queen-mother (Catherine de' Medici). In 1562 the Guises started the religious wars by killing a number of Huguenot soldiers, and the wars thus started dragged on from 1562 to 1598. The Huguenots may on the whole be regarded as the party with

to the growing feeling in F. that the real enemy was Spain, and Charles IX. planned a united attack of Protestants and Catholics on Spain. Charles IX., between 1570 and 1572, was entirely under the influence of Coligny, and this roused the jealousy of the queen-mother, who came over completely to the side of the catholic party, and planned the assassination of Coligny and the massacre of St. Bartholomew's Eve (1572). The fifth civil war saw the rise to power of that body known as the Politique. This was an association of men who desired only the peace of the realm, and who supported the Huguenots with that aim during this war. Henry III. (1574-89) declared at first for toleration, and later against the Huguenots.

At the end of the seventh civil war, the great Catholic League was formed. Its policy was to prevent the accession of Henry of Navarre, the next heir, and a Protestant, and this policy was accepted by Henry III. In 1587 the eighth civil war broke out; but the league paid but little attention to the claims of the sovereign, and finally Henry of Guise was assassinated by command of Henry III. Paris rose in revolt against the king, who united with Henry of Navarre and besieged it. Henry III. was, however, assassinated himself, and the league was victorious for the time being. Henry of Navarre (1589-1610) was now lawful king, but the league for the time being refused to recognise him. Henry defeated the league at Arques (1589) and at Ivry (1590). He next besieged Paris; disensions were already breaking up the league, and in 1593 Henry, who for a long time had refused to change his creed, became a Catholic, and was recognised by the states-general as king of F. In 1598 was signed the treaty of Vervins, by which Spain kept but little, and Calais was restored to F. With the aid of Spain taken away, the Catholic League collapsed, and order was restored in F. The reign of Henry IV. saw the growing popularity of the Crown. The Edict of Nantes was issued in 1598. By this edict toleration was granted the Huguenots. Henry's great minister Sully reformed the finances and justice, and helped to destroy the power of the nobles, thus helping forward the aggrandisement of the Crown. Henry IV. was assassinated in 1610, and was succeeded by his son, Louis XIII. (1610-43). The regency was left in the hands of Marie de' Medici, the queen-mother, and the nobles began to gain power again. Finally Condé headed a rebellion which resulted in the calling of the states-general for the last time before 1789 (1614). The central figure of interest during the reign of Louis XIII. is Richelieu, who, from 1624 to 1642 dominated the policy of F. Richelieu's foreign policy was directed towards establishing F. as the greatest country in Europe; his domestic policy aimed at the aggrandisement of the Crown. The age of Louis XIV. is the logical conclusion of both the foreign and domestic policy of the cardinal. The great Thirty Years war broke out in 1618, and although F. was not directly concerned, nevertheless, in order to aim a blow at Austria and Spain, Richelieu supported Gustavus Adolphus of Sweden in his attacks against the Catholics. In 1635 he was forced to take an active part in the war itself, and although his policy seemed at first unsuccessful, it ultimately triumphed; the Sp. fleet was destroyed, and Portugal was able to proclaim her independence of Spain (1640). In his domestic policy Richelieu had been equally successful. He had crushed the right of private war, he had summoned no states-general, he had taken away many of the privileges of the Huguenots. The Parlement de Paris was subordinated to the royal will and the power of the Crown was centralised.

During the first eighteen years of the reign of Louis XIV. Mazarin was the chief minister, and followed in the footsteps of Richelieu, but he was unable to exercise the same firm control. Abroad the victory of Condé at Rocroi made F. the greatest military power in Europe, and this victory was followed in 1645 by the victory at Nordlingen. The result of these victories was that in the treaty of Westphalia, which was signed in 1648, F. was given Lorraine, the bishoprics of Metz, Toul, and Verdun, together with Pinerolo in Italy. At home, however, matters were in a state of disorder. Two civil wars broke out, to which the names First and Second Fronde are applied. The First or Parl. Fronde aimed at obtaining various concessions from the Crown. This war was ended by the treaty of Rueil. Immediately afterwards the Second or Aristocratic Fronde broke out. This was led by Condé, and was more successful immediately. It was aimed against Mazarin, and that minister had twice to leave the country. But the Crown and the minister triumphed, and in 1658 the Second Fronde was finally put down. The treaty of Westphalia, while it had ended the struggle between the empire and F., had, nevertheless, extended the war into Spain. In 1659, however, was signed the treaty of Paris, by which the Spaniards ceded some ter. on the Pyrenees.

A marriage alliance was arranged between Louis XIV. and Maria Theresa, the daughter of the Sp. king. This marriage was celebrated in 1660. In the following year Mazarin d. and Louis XIV. became his own Prime Minister. Louis realised that he could trust no power save that of the Crown, and resolved to be absolute. He adopted also Richelieu's foreign policy of territorial aggrandisement. To Colbert, who had charge of the finances of the country during the early part of Louis's reign, F. owed much. He fostered trade and commerce on a distinctly protective basis, and for the time being, at any rate, trade flourished. Colbert also realised that in order to help Fr. trade the colonies must be helped and developed; the E. and W. Indies were exploited, settlements were made in India, and the colonies in N. America were extended. To a great extent Louis XIV. owed the success of his foreign policy to the financial reforms and the increase of trade and wealth for which the wise administration of Colbert was responsible. But Louis also dreamed of becoming emperor, and placing the Bourbons on the throne of the empire. The war of Devolution broke out in 1667, just after the death of Philip IV. The extension of the power of Louis XIV. over the Netherlands, however, alarmed England and Holland, who formed an alliance with Sweden to prevent Louis from carrying out his aim. Louis, however, who had already agreed with Austria that when Charles II. d. the Sp. dominions should be divided, made peace and withdrew from the Netherlands (1668). His next war was with the Dutch (1672-78). This was purely a war of retaliation. The

Dutch struggled bravely, but in spite of the alliances which were made Louis was triumphant. The treaty of Nimègue was signed, and the Fr. made great gains in the N. Louis now turned his attention to acquiring the Rhine as the boundary of F. By means of chambers of réunion, he estab. claims to all Alsace, Lorraine, and Luxembourg, and by the treaty of Ratisbon (1684) he was allowed to keep what he claimed for twenty years.

But his policy of unnecessary aggression had raised up for him enemies all over Europe. The réunions had made the empire and Spain unfriendly; Holland was of course still hostile; and England, whilst up to 1688 it was servile, after that date, and with the accession of William III., became the centre of opposition to the ambitions of F. In 1685 he made a terrible blunder in his domestic policy in deliberately revoking the Edict of Nantes. The immediate result was that over 250,000 subjects (Huguenots) left F. Trade began to decline, and the Protestants of Europe were deeply offended by the policy. In the meantime the Catholic policy of James II. in England had brought on the revolution of 1688. Louis again here made a fatal blunder. Had he invaded or threatened Holland, William could never have crossed to England, but he invaded Germany, and William was able to sail. The appearance of a fugitive James II. at the Fr. court was a crushing blow to Louis. F. was now surrounded by enemies. The war of the Protestant Succession immediately broke out. The war was waged in Germany, where Louis cruelly laid waste the Palatinate; in Ireland, where the last hopes of the Jacobites were crushed; on the sea, where, by the battle of La Hogue (1692), the sea power of England was finally estab.; and in the Low Countries, where the war rapidly became simply a war of sieges. By the treaty of Ryswick Louis gave up all conquests, with few exceptions, gained since 1678. But the treaty was merely a truce. The king of Spain was dying, and the ambitious Louis turned to the definite estab. of Bourbon power in Europe. William III. and Louis signed two partition treaties, both of which, however, were broken, one by the death of the Electoral Prince Joseph and the second by the acceptance of the will of Charles II. by the Fr. king. The Spaniards were furious when they learnt of the partition treaties, and the Sp. king was only carrying out national policy when he left his dominions to Philip of Anjou, grandson of Louis XIV. England accepted the will also, but Louis immediately overran the Netherlands with Fr. troops, and when James II. d., recognised his son as James III. England immediately put herself at the head of the allies, and the war of the Sp. Succession broke out. It lasted from 1702 to 1713. The Fr. military power was broken by the great victories of the allies at Blenheim (1704), Ramillies (1706), Oudenarde (1708), and Malplaquet (1709), but the successes of the allies in Spain were but transient, and the capture of Gibraltar (1704) was the most

important event. The Fr. fought bravely, and by their rally at the end of the war, and also owing to the desire of the Tory party in England for peace, they gained terms at the treaty of Utrecht which their earlier performances in the war had certainly not justified. Philip of Anjou was given Spain, the Barrier was restored to Holland, and Austria was given the Sp. Netherlands, together with the It. possessions. Louis lived until 1715.

Louis XV., his great-grandson, succeeded him. Orleans became regent, and immediately a reaction set in against the policy of the late king. Orleans played for popularity. The young king's life was not of the strongest, and Orleans hoped that in the case of his death the Crown would pass, not to Philip V. of Spain, who was the nearest heir, but to him (Orleans). He therefore kept up a strict alliance with England, upon whose support he relied. It was not until after 1728 that the birth of a Dauphin finally dispelled the hopes of succession which Philip V. had, and drew together the Fr. and Sp. Bourbons into a family alliance. The early rule of Louis XV. was complicated by the Polish Succession war and the struggles of Austria and Russia against Turkey. F. was still true to her old policy of alliance with Turkey. Cardinal Fleury had just succeeded in retaining for F. a foremost place amongst the powers of Europe when the war of the Austrian Succession broke out. Whether England or F. was to be supreme in India and America was the question which had now to be solved. At first the war began as an attempt on the part of F. still further to injure the power of the house of Hapsburg in Europe, but after 1743 it became a struggle with England for the colonies. F. and Spain declared war against Austria and England. The war was fought in Germany, America, and India. In 1745 Fontenoy was won by the Fr. Frederick of Prussia withdrew from the war in 1746, and the peace of Aachen was signed in 1748. The peace was in truth but a truce, and restored simply the *status quo*. The period between the end of the war of the Austrian Succession and the outbreak of the Seven Years war was filled with dissensions in F. itself. The minister, Machault, attempted to break down class privileges, but failed. The power of the Church and of the nobles was increased, and it was only war that saved F. from revolution. By 1756 India had practically been lost by the recall of Duploix, and war was going on in America. In 1756 was accomplished that diplomatic revolution which united the interests of the Hapsburgs and Bourbons, and opposed them to England and Prussia. Such was the state of affairs when the Seven Years war broke out. The Fr. were successful in Europe and America up to 1758, but during 1759 the series of victories at Lagos, Quiberon Bay, and the Heights of Abraham (Canada) brought the power of F. down to the lowest level it had reached. Their power in India was overthrown by the surrender of Pondicherry. In Europe she had been almost equally unsuccessful.

and the great victory at Rossbach broke the military power of F. until the revolution. By the treaty of Paris F. ceded Canada and N. America to England. Minorca passed into Brit. hands, and she had to compensate Spain with Louisiana. Between 1763 and 1774 F., under the ministry chiefly of Choiseul, was engaged in internal reform and also in an attempt to raise afresh the strength of the navy for a renewed struggle with Brit. power. At home a struggle was also going on between the Jesuits and the minister, supported by the Parlement de Paris, both of whom held Jansenist views. The Society of Jesus was abolished in F. in 1762. F. maintained her alliance with both Austria and Spain, and in 1770 Marie Antoinette, archduchess of Austria, married the Dauphin. Before the end of the reign (1774) Choiseul had been dismissed, and F. left in a weakened state, the monarchy was weakened, the nobility privileged and hated, whilst the Church was distrusted and disliked. It remained now only for Louis XVI. (1774-93) to attempt reforms. The influence of Marie Antoinette during this period was pernicious. The reforms of Turgot were frustrated by her, whilst Necker was dismissed in 1781, after having attempted to manage the finances of the country for six years. During the Amer. War of Independence F. supported the colonies. Her minister, Vergennes, directed her policy with such effect that her intervention won the Amers. recognition of their independence, and restored to F. much of the lost prestige.

After the Amer. war Fr. ministers tried various means of reform, but finally public opinion in F. became so strong that the king was obliged to call the states-general for May 1789, and to restore Necker as his minister. The literary influences which had operated to bring about the revolution were many. The writings of Montesquieu, the Encyclopédistes, Voltaire, and Rousseau had concentrated public opinion on the feudal abuses of F., and, most important of all, the *Contrat Social* of Rousseau had been widely read and as widely influenced the Fr. people. The states-general met on May 5, 1789. The third estate immediately demanded that the assembly should meet together and not in its three orders. In June they adopted the title of the National Assembly and banded themselves together by an oath to make a new constitution. The king, unnerved by the tendency of events, concentrated his troops round Paris. Mirabeau demanded the disbandment of the troops; the king refused and dismissed Necker; the National Guard was formed by the people, and the Bastille stormed and taken (July 14). The fall of the Bastille led to the recall of Necker, whilst all over the country it influenced the formation of national guards and attacks on the castles of the feudal nobility. The assembly now debated the Rights of Man, and proceeded to abolish all feudal privileges. The gov. was to be by means of a single chamber, and the royal veto was only potent for six months.

In Oct. the assembly moved to Paris, whither the king had been conducted by the mob. In June the king attempted to flee the country, but was captured at Varennes and brought back. In 1791 a new constitution was promulgated. The assembly then passed a self-denying ordinance and dissolved itself (Sept. 1791). The new assembly met in Oct. It was composed chiefly of Girondists (the Moderate party) and Jacobins (or Extremists), led by Robespierre, Danton, and Marat. The question of the action of the *émigrés*, as the nobles who had fled the country were called in Austria and Prussia, led, after the death of the Emperor Leopold, to the declaration of war with Austria (1792). The ill success of the Fr. arms at the beginning of the war infuriated the mob, who on Aug. 10 stormed the royal palace, slaughtered the Swiss guards, and overthrew the monarchy. A new ministry at once came into office, the war was pursued with more vigour, and Dumouriez won the battle of Valmy (Sept. 20). The National Convention declared F. a republic, and Gemappes overthrew the Austrians. European war was imminent. England had up to this time taken no active part in the affairs of F., but the policy of F. was irritating and wearying, and in Feb. 1792 F. declared war against England and Holland. F. now found herself opposed by Spain, Portugal, and Austria, together with England and Holland. The Sept. massacres of 1792, the work of the Jacobins, were condemned by the Girondists, who, however, were finally outvoted by the Jacobins, who tried and executed Louis XVI. (Jan. 1793). In July of the same year the Girondists were overthrown, and the Committee of Public Safety was instituted. F. was now in the grip of the Jacobin and a reign of terror. The Jacobin policy was successful both at home and abroad. La Vendée was crushed, the allies were overthrown, and F. was free from invasion; but the Jacobins quarrelled amongst themselves, and Robespierre himself was guillotined. After the death of Robespierre affairs in F. quietened down. In 1795 the Directory was formed. This was the first attempt to set up a reactionary gov.

The gov., opposed by the forces of the Moderate as well as the Extremist party, was faced with another revolution. When putting down the insurrections by means of Napoleon's famous 'whiff of grapeshot,' it estab. the constitution of the year III., and set up a republican form of gov., which consisted of fifty directors and two councils. The policy of the Directory was successful at home and abroad; the reaction of the Royalists, who were in the majority in the councils, was put down, and the It. campaign ended in the peace of Campo Formio (1797). England was now left alone to fight F. and Napoleon left Europe to fight in Egypt; his campaign there is given in more detail elsewhere (see NAPOLEON I.). When he returned he found that a second coalition had been formed against F., and the Fr. had been

driven out of Italy. But F. was on the verge of civil war when Napoleon, aided by Sieyès and Barras, carried out the revolution of 19 Brumaire (1799), destroyed the Directory, and set up the consulate. Napoleon estab. himself as first consul. He then undertook the It. campaign, where, by the victories of Marengo and Hohenlinden, he forced Austria to accept the peace of Lunéville (1801). The armed neutrality of the N. was initiated to overthrow the power of Britain; but even this failed, whilst the Dan. fleet was destroyed at the battle of Copenhagen, and the accession of Alexander I. withdrew the Russians from their

overthrow the power of Britain, but ultimately failed, because he saw that he could not do without Brit. supplies himself (see CONTINENTAL SYSTEM). Finally, when Napoleon emerged from the Russian campaign, he was plunged into the War of Liberation (1813). The battle of the nations (Oct. 16-18, 1813) saw Napoleon's forces utterly defeated by a combination of Gers., Austrians, and Russians. Still Napoleon refused to make peace, and the allies entered F. from the N., whilst Wellington routed the Fr. in the S., and proclaimed Louis XVIII. Napoleon abdicated, and was exiled to Elba, whilst the first treaty of Paris was signed (1814).

'THE CORONATION OF NAPOLEON' (1801), BY DAVID

Louvre

Fr. alliance. England and F. made peace by the treaty of Amiens. During the short interval of peace Napoleon reorganised the central gov., estab. a good system of education, and healed the schism in the Church by his famous concordat with the papacy. He also reduced the Fr. law to order by means of the famous Code Napoléon. In 1804 Napoleon was declared emperor by the Senate, and crowned himself at Notre Dame. In 1803 the war broke out anew, and the life of Napoleon is the hist. of Europe. (A more detailed account of the campaigns of the time will be found under NAPOLEON I.) Trafalgar was fought in Oct. and Austerlitz in Dec. 1805; Austria was forced to make peace at Pressburg (1805); Germany was split up and divided into states such as the confederacy of the Rhine; Prussia was destroyed at Jena and Auerstädt; and Russia reduced to terms by the victories at Eylau and Friedland (treaty of Tilsit, 1807). Napoleon, by means of the continental system, tried to

The settlement of Europe was still under discussion when Napoleon escaped from Elba, landed in F., and rallied the Fr. around him. The campaign known as the Hundred Days took place, and Napoleon, finally defeated at Waterloo (June 18, 1815), abdicated, surrendered to the Eng., and was exiled to St. Helena, where he d. in 1821. F. settled down for a time under the gov. of Louis XVIII. On the whole, the system of government had been improved by Napoleon. Almost immediately there was a Royalist reaction in F., but for a time liberal ideas carried all before them. In 1820 the murder of the duc de Berri, however, swung the pendulum in favour of the Royalists, who remained in power practically until the revolution of 1830. The reactionary ordinances of Charles X. led to the revolution of Jul. 7, and the Bourbon monarchy fell in F. for ever. Louis Philippe was declared king of F., and the policy of the Fr. ministry under him was most liberal in tendency. England, F., Spain, and

Portugal united together in the Quadruple Alliance, which was brought to a close by the Near E. problem, in which Thiers, whilst nominally allied to Britain, worked against her interests in the Mediterranean.

Gulot succeeded Thiers, and remained in office until 1848. Although he acquired Algeria, he did much to foster bad feeling between England and F. The question of the marriage of the queen of Spain brought open rupture between the two countries, and F. found herself practically isolated in Europe. The party of reaction was overthrown by the revolution of 1848, when Louis Philippe abdicated, and a republic was set up. Finally a constitution which gave universal suffrage and a president elected by the people was established. In 1851 Napoleon carried out his *coup d'état*. A new constitution was issued. The president was to be elected for ten years; there was to be a senate (nominated by the president), and a legislative council (elected by the people). In 1852 Napoleon III. re-established the empire and proclaimed himself emperor. In 1854 England and F. in alliance fought the Crimean war. In 1856 the treaty of Paris ended the war, and declared the Danube free and the Black Sea closed to warships, but nevertheless neutral. Turkey was to carry out various reforms, but the most important result was the prestige which it gave Napoleon. But there was still much opposition to Napoleon from the Republicans, and this opposition was met by repressive measures which really weakened Napoleon's power. In 1858 he went to war in alliance with Italy against Austria, but having defeated the Austrians at Solferino he withdrew from the alliance and made peace, leaving the question of It. unity to be settled later by Cavour and Garibaldi. The Prussian-Austrian war was viewed at first with equanimity by Napoleon, but the victory of Prussia and the knowledge that Ger. unity was a probability of the near future, filled him with dismay. F. was again isolated in Europe. The succession question in Spain and the putting forward of a candidate of the house of Hohenzollern (who was, however, speedily withdrawn) led to the Franco-Prussian war. The Fr. were unprepared, and after gaining a small victory were defeated at Worth and Sedan, when Napoleon III. was taken prisoner.

The empire in F. fell, and under the gov. of national defence tried to oppose the Gers. Metz, however, where Bazaine was holding out with 170,000 men, surrendered, and Paris was besieged. In 1871 Paris capitulated, and peace was signed. A huge war indemnity was demanded, and Alsace and E. Lorraine ceded. The Commune was set up in Paris, and the prov. gov., under Thiers, had difficulty in obtaining possession of that city. For the next two years Thiers ruled F., and succeeded in establishing order and restoring the finances. Much quarrelling ensued, however, as to the constitution which F. ought to adopt, and Thiers was driven by opposition from a conservative

position to an extremist one, and was then driven from power (1873). He was succeeded by MacMahon. The period of the Third Republic was definitely inaugurated by the decree of Jan. 1875, which organised the republic under what was called the constitution of 1875. MacMahon, however, was conservative and Bonapartist in sympathy. In 1879 he was succeeded by Grévy. The Republican party after this victory split into divergent groups—the Democratic Liberals, the Radicals led by Gambetta, and the Radical-Socialists of whom Clemenceau was spokesman. In opposition the Monarchists, Bonapartists, and Clericals formed a coalition, and exploited the ambition of Gen. Boulanger (*q.v.*) to overthrow the republic. Grévy resigned in 1887, and was replaced by Carnot. Boulanger was charged with high treason, and fled. The Moderate Republican party hoped for the support of the Catholics, but gov. prestige was weakened by the scandal connected with the bankruptcy of the Panama Company, 1893. Meanwhile, Socialism was becoming an organised force, and Jaurès was elected to Parliament in 1893. In the next year Carnot was assassinated. A wave of anti-Jewish feeling surged over F. during the Dreyfus affair, 1897-1900, which acquired so great a political significance that the very stability of the republic was threatened, while the influence of the army became wellnigh supreme (see DREYFUS AFFAIR). The Waldeck-Rousseau ministry settled this affair with Loubet as president in succession to Faure, the anti-Dreyfusard. The next problem confronting Waldeck-Rousseau and his successor, Combe, was that of the Church, and resulted in 1905 in the separation of church and state.

One feature of pre-1914 Fr. politics was the growth of syndicalism, especially within the *Confédération Générale du Travail*, formed in 1895. The Clemenceau ministry of 1906 was faced with extreme labour troubles, and fell in 1909, a new Cabinet being formed by Briand (*q.v.*), who continued in office until the elections of 1910. Fr. foreign policy to this date had been one of colonial expansion, which in Tunis provoked a dispute with Italy (1881-83), in the Congo, and in Egypt with England, especially the Fashoda (*q.v.*) incident in 1898, and in Morocco with Germany in 1905 and 1911. The conquest of Tunisia caused Italy to form the Triple Alliance with Germany and Austria (May 1882), and this was countered by the Dual Alliance between F. and Russia in 1891. Fr. politics in the early twentieth century were divided over reconciliation with Germany, advocated by Caillaux, or *rapprochement* with England. The latter policy, supported by Clemenceau, resulted in the Entente Cordiale between F. and England (1904). The Agadir incident of 1911, which F. regarded as an attempt to establish Ger. influence in a Fr. sphere, nearly led to the outbreak of hostilities. The elections of 1910 had been fought over proportional representation, and electoral reform was

accepted by the Caillaux Cabinet of 1911. In 1912 Caillaux was defeated over his policy of reconciliation with Germany, and in opposition a Poincaré ministry was formed. In 1913, however, Poincaré was elected president in succession to Fallières, who retired at the end of his period of office (Feb. 1913). The first ministry under the new president was formed by Briand. After Briand resigned the same year over the issue of proportional representation, his successor, Barthou (*q.v.*), introduced a scheme of restoring a third year of military service. The Barthou ministry fell as soon as the scheme became law, but the repeal of the law by Viviani, who formed a Radical ministry, was prevented by the outbreak of the First World War (*see* EUROPE; WAR, FIRST WORLD). The prospect of war found F. neither morally nor materially ready for war. The elections of 1914 had been fought over the issue of three years' service, and public attention was diverted by the political murder of Calmette (*q.v.*), March 16, 1914. With the Austro-Serbian crisis and the murder of the Archduke Ferdinand (*see* FRANCIS FERDINAND) at Sarajevo on June 28, 1914, war became imminent. President Poincaré visited the Tsar Nicholas II. at St. Petersburg in July, and immediately after his return Austria presented Serbia with an ultimatum which was followed by a declaration of war on July 28. Russia had been forced into partial mobilisation by Austria's attitude, and Germany demanded Russia's complete demobilisation without putting similar pressure on Austria. Russia refused, and Germany declared war on Russia on Aug. 1. The Ger. mobilisation was directed against F. and Germany declared war on Aug. 3. England had been unable to announce solidarity with F. and Russia over the Serbian question, but Grey (*see* GREY OF FALLODON, LORD), the Eng. foreign minister, had made strenuous efforts at mediation, at the same time promising F. naval support in defending the N. coast. The Ger. invasion of Belgium caused England to declare war on Germany on Aug. 4. The Fr., who had organised their defensive on the Lorraine frontier between Germany and F., were not prepared for the violation of the neutrality of both Belgium and Luxembourg. The Ger. concentration on the W. Front amounted to seventy-two divs., of which twenty-eight were in reserve, and ten divs. of cavalry. The Fr. forces, commanded by Gen. Joffre, numbered seventy divs., of which twenty-five were in reserve, two colonial divs., ten cavalry, and twelve territorial divs. The Fr. mobilisation numbered 3,781,000 men, and of these 157,000 were in N. Africa and 935,000 in the interior. In Paris a truce was called to party politics by a *union sacrée*, and Viviani reconstructed his Cabinet. Millerand became minister of war, Ribot of finance, while Delcassé, whose policy of alliance was justified by the war, returned to the Foreign Office.

Paris was threatened by the Ger. advance, and on Sept. 2 the gov. withdrew to Bordeaux. Gen. Gallieni (*q.v.*), mili-

tary governor, was left in control of Paris, and by dispatching the 'army of Paris' to the front in taxi-cabs he contributed to Joffre's success in the battle of the Marne (Sept. 5-12). The hist. of F. for the next four years is essentially that of the war. Fr. industries were concentrated in the N. and N.E., and the Ger. occupation crippled their activity. Nearly all the iron and half the coal resources were also under Ger. control, but F. developed her industries in the unoccupied regions with amazing energy. In Dec. the Fr. Gov. returned to Paris. Italy, although a member of the Triple Alliance, had already by secret accords (1900 and 1902) agreed not to attack F. in the event of a Ger. invasion. The treaty of London, April 26, 1915, brought Italy into the war on the side of the Entente. In Oct. Delcassé, the foreign minister, resigned, as he no longer supported the proposed expedition to Salonika, owing to the hostility in Greece to the policy of Venizelos (*q.v.*). The fall of the Viviani ministry followed upon the failure of allied diplomacy in the Balkans, and on Oct. 28 a new ministry was formed by Briand. Gen. Gallieni succeeded Millerand (*q.v.*) as minister of war. The Briand Cabinet was reorganised in Dec. Gen. Lyautey became minister of war, but resigned in March 1917. Under a new ministry formed by Ribot, who succeeded Briand, Painlevé was made minister of war. Painlevé continued the Balkan policy of supporting Venizelos. In Sept. he could not reconstruct the Cabinet owing to the refusal of the Socialists to co-operate, as they had been forbidden passports to the International Conference at Stockholm. Malvy (*q.v.*), the minister of the interior under Ribot, nevertheless encouraged the Socialists who agitated for peace by negotiation. Clemenceau's criticism caused Malvy to resign, and in Sept. the whole Cabinet was reorganised, Painlevé becoming Premier. Defeatism at this time was assuming serious proportions, being encouraged by Duval, editor of the *Bonnet Rouge* newspaper, by Humbert, owner of the *Paris Journal*, and by Rolo Pasha (*q.v.*), financier and adventurer. The scandal that these men, and more especially Caillaux (*q.v.*), former Premier of F., were actually or alleged to be in the pay of the Gers., brought about the fall of the Painlevé Gov. on Nov. 16, 1917, and Clemenceau was invited to become Premier and minister of war. Energetically he fought defeatism and became virtual dictator (*see* CLEMENCEAU). By the treaty of Versailles, June 28, 1919, F. recovered Alsace-Lorraine (*q.v.*), but failed in the desire to fix the Rhine as the Ger. frontier, although the Rhineland was to be occupied by Fr. and allied troops for fifteen years. F. was also given a mandate for Syria, and, in addition, acquired Togoland and part of the Ger. Cameroons (*q.v.*). With the Fr. realisation that the treaty was giving them neither the security nor the reparations on which they had counted, Clemenceau became unpopular, and in the 1919 elections he was superseded by Millerand, who formed a Conservative

bloc national Moreover, not Clemenceau, but Deschanel was elected to the presidency when Poincaré retired in 1920. At the conference of San Remo (April 1920) and Spa (July 1920) Millerand was chiefly concerned with maintaining the supremacy of F. He gave Poland military aid against the Bolsheviks and saved Warsaw. When Deschanel fell ill, Millerand was elected president. Leygues became Premier for a short time, but at the beginning of 1921 he was succeeded by Briand (see BRIAND).

the exploitation of the Ruhr. On Jan. 11 Fr. and Belgian troops were moved from Düsseldorf to Essen (for the Fr. occupation of the Ruhr see under RUHR). In the elections of 1924 Poincaré was defeated over the financial question. The *bloc national* gave way to a *bloc des gauches*, with Herriot (qv) at its head. Poincaré's retirement rendered Millerand's position as president untenable, on June 11 he resigned, and was succeeded by Gaston Doumergue (qv), who, in 1931, was followed by Doumer (qv). Herriot,

D McLeish

THE PALACE OF VERSAILLES, SCENE OF THE TREATY OF JUNE 28, 1919

The problem before Fr. statesmen was that of the reconstruction of F., and it was hoped to effect this by making Germany pay, as Germany had made F. pay in 1871. Out of a total of 7,500,000, Fr. casualties numbered 4,506,600 (i.e. 1,335,300 dead, 2,675,000 wounded, and 446,300 missing). One-tenth of the country had been laid waste. The cost of reconstruction was reckoned at about 2250,000,000. At the Paris Conference of 1921 the amount to be paid was reduced to 226,000,000,000 gold marks. Owing to Germany's default in payment, Briand initiated the method of territorial sanctions. The Brit. Gov. supported him, and Düsseldorf, Duisburg, and Ruhrort were occupied. Loucheur, Briand's chief adviser, was attempting to compromise with Rathenau, the Ger. representative at the conference of Cannes (Jan. 1922), at which reparations were discussed (see REPARATIONS). Briand was recalled to Paris on Jan. 11, 1922, on the assumption that he was not protecting Fr. interests, and was succeeded by Poincaré, who had stimulated the conviction in F. that Germany should be made to fulfil her treaty obligations to the letter. At the London Conference (Aug. 1922) he demanded 'productive guarantees' as a condition for allowing Germany a moratorium. These guarantees included

the new Premier, found himself in agreement with MacDonald, Prime Minister of Britain, and the Entente Cordiale was re-established. At the London Conference, July 16, 1924, the Dawes plan (qv) was accepted. In Aug. a ministerial crisis was averted in F., and Herriot gained the consent of the minister of war and of Marshal Foch to a military evacuation of the Ruhr within twelve months. The evacuation was completed by July 31, 1925. Herriot played a foremost part in the framing of the Geneva protocol (qv) at the League of Nations Assembly in Sept. 1924, and although the protocol was not ratified, it led the way to the Locarno Pact, which was negotiated during 1925 by Briand, Fr. foreign minister, with Austen Chamberlain, and Stresseman.

Although the Herriot ministry brought a new spirit into international affairs, it was forced to resign over the financial question. The Radical bloc resigned, and with the suspension of party feuds Poincaré formed a ministry to stabilise the franc. He set up an autonomous fund commission to deal with the floating debt, and in 1926 the budget was balanced for the first time since 1913. The value of the franc was increased by 100 per cent and fluctuations were prevented. In Oct. 1927 the Radical Socialist party

withdrew its support of the gov., but in the April elections the following year the Poincaré ministry was returned to office with an increased majority. In domestic affairs the Poincaré Cabinet withstood repeated attacks from the Radical Socialists, while in foreign affairs the Briand-Kellogg Pact was concluded in Aug. 1928 (see KELLOGG PACT), and the following year Poincaré secured ratification of the Young plan, together with the Churchill-Callaux Accord with England and the Mellon-Borenger Accord with the U.S.A. in respect of the Fr. debts. On July 26 Poincaré resigned through ill health, and Briand continued as Premier of the Poincaré Cabinet until defeated in Oct. Briand had been forced to make concessions to England at The Hague Conference in Aug., and had agreed to the evacuation of the Rhineland before the proposed Fr. E. frontier fortifications were begun. Briand, however, remained as foreign minister in the new gov. formed by André Tardieu. The defeat of Briand by Doumer for the presidency was regarded in Germany as a rebuff for the policy of disarmament, but, on the other hand, Fr. electoral methods do not necessarily reflect the opinion of the country.

Briand now moved as foreign minister under Pierre Laval (q.v.), who nine years later was destined to prove F.'s evil genius. His pro-Ger. sympathies were shown even in 1931 when he and Brüning, the Ger. chancellor, planned a joint economic committee. Laval was again Premier in the following year, but he was soon succeeded by Herriot. Meanwhile Briand had d. and Doumer, the president, had been assassinated and succeeded by Lebrun. Herriot had no longer a tenure than customarily falls to the lot of a Fr. Premier and, at this time, F.'s obligations to America and disarmament problems made things more than usually difficult. Paul Boncour, Daladier, the future ill-starred friend of Britain, and Sarraut followed each other in quick succession in 1933. In 1934 Europe was startled by the Stavisky scandal, which may have been symptomatic of moral decadence in F. That it should lead to street riots is at least comprehensible, for the scandal, which involved the flotation by Stavisky in the name of the municipal credit estab. of Bayonne, of a very large sum in bogus bonds, plainly revealed much political corruption. To restore political stability Doumergue was recalled to office, with Barthou at the Quai D'Orsay. Barthou, however, fell, with Alexander of Yugoslavia, at the hands of a Czech assassin, an event which brought back Laval as foreign minister. Always equivocal in his policies, Laval now entered into an agreement with Mussolini guaranteeing the integrity of Austria. But F.'s main preoccupation at this time (1935) was Ger. rearmament in defiance of the Versailles Treaty. At the Stresa Conference the Brit. delegate tried to secure the return of Germany to the League of Nations, but the Fr. representative made that course

impossible through striving to enhance his country's security by inducing the League Council to denounce Germany's violation of the treaty, a course that might have been justified had the council followed up its resolution by using the full machinery of the League covenant, even by the use of force, to stop Ger. rearmament. In the result Germany, having rejected the league's resolution and denied its jurisdiction, demanded air parity with F. and full equality of status with other sovereign powers. Fr. ministers naturally assumed that Germany's object was to drive a wedge between F. and Britain and therefore refused to consider the 'peace' plan, which Hitler put forward in 1936 after having denounced the Locarno treaties.

At this time F. was beginning to lose the dominating position in Europe which she had held after the First World War—a position, however, which was buttressed by a system of alliances with the E. European states. After the Nazis had seized the helm in Germany, F. for long abstained from open opposition to Germany's policy of rearmament and expansion, though, prior to Hitler's rise to power, she had successfully opposed an understanding between Germany and Austria whether in the guise of a trade agreement or otherwise. But, in 1936, internal dissensions wrought havoc in her councils. The so-called 'front populaire,' formed by Communists, Socialists, and Radicals under the leadership of the wealthy Socialist, Léon Blum, exactly reflected the mutual class jealousies which stultified Fr. policy in the ensuing years. This gov. at once carried out a number of social reforms, including the nationalisation of the arms industries and the adoption of a forty-hour week; but, faced with economic difficulties, its influence soon declined, especially when its counterpart in Spain was defeated, partly through lack of any effective help from F. to counteract the aid given to Franco by Germany and Italy. The Popular Front in F. disappeared in 1938 when Daladier, supported by a radical and right-wing majority, succeeded Blum. Under Daladier the forty-hour week and other reforms were abrogated and the Fascist politicians representing the Fr. Social Group—notably Laval, Bonnet, and Flandin—all defeatists—pursued a policy of appeasement, apparently in harmony with that of Neville Chamberlain, Daladier being in Sept. 1938 a party to the Munich agreement which left F.'s ally Czechoslovakia to the mercy of Hitler. After this the position of F. in Europe deteriorated rapidly. Mussolini, emboldened by Fr. weakness, advanced impudent claims to Corsica, Tunis, Nice, Savoy, and Djibouti. But even then none in Britain believed that F. was really the decadent nation which Ger. propagandists described her to be. None doubted when, in Sept. 1939, she took up arms with Britain in defence of Poland against Ger. aggression that she would display her traditional valour and resourcefulness. Daladier's administration, governing by emergency

decrees, now began to manifest a more emphatic right-wing tendency, and both social and political reaction found its pretext in war conditions. The Communist party, which was conducting anti-war propaganda, was suppressed, while some sections of the governing classes, with Fascist leanings, actually cherished the illusion of a *modus vivendi* with the Nazis. These and other developments naturally operated to disrupt F.'s war effort and, though the Fr. armies offered a brave resistance in the opening stages of the offensive on the W. Front, a total collapse followed late in June 1940. (See EUROPE, History; WAR, SECOND WORLD, Western Front.)

It will be necessary to examine in greater detail the causes of the downfall of F., though in some respects these are not entirely free from doubt.

The military collapse of F. came as a thunderbolt to her Brit. ally and, indeed, to the Brit. general staff. Probably the whole neutral world was still thinking of Fr. arms in terms of the dramatic Fr. resistance on the Marne, the Chemin des Dames, and at Verdun in the previous war. But the probability is that, while the Fr. soldiers of 1940 were in no way inferior to their predecessors, the faults of the Fr. general staff were almost incredibly grave. They seem to have learned little of the character of a modern war. Despite the object lessons of Spain and Poland, they obtusely refused to consider the heavy 60-75-ton tank and aeroplane as anything but auxiliary arms; and after the battle of Belgium in the summer of 1940 they did nothing to fortify F. with anti-tank traps or to cover the land with pill-boxes or other defences in depth. In short, after the gap torn in the Fr. lines at Sedan they never made any real show of resistance. The heaviest defeats, and a general position as grave as it could be on the W. front, were alike sedulously hidden from the Fr. people by their military censorship and even at the moment when all was wellnigh lost, the people still believed that at the eleventh hour some miracle, like the battle of the Marne, would save them.

An exhaustive explanation of the Fr. collapse would occupy much space, for the causes of this historic tragedy are numerous and have their roots in tendencies operative over many years; nor, again, would it be easy to assign to any one or more of these causes the greater weight of responsibility. But, apart from the political and social weakness of F. in the period before June 1940, the completeness of the military defeat supplies the essential factor in the tragedy. It is beyond doubt that the nation was divided against itself, that its constitution was defective and that the corruptibility of many prominent Fr. politicians sapped the country's vitality. Yet even the most united and best organised nation could hardly have withstood the tremendous military odds which confronted F. in May 1940. While Germany for at least a decade previously had concentrated on perfecting a modern military machine, combining weight and

mobility for offensive use against the defences that had defeated her in 1918 and in formulating a scientific strategy, F. worn out by the previous war, staked all on the Maginot line. There is a strong element of truth in the charge that the 'Maginot mentality' wrought the ruin of F. The idea of a purely defensive strategy reflected the pacific and war-weary mind of the Fr. people and made it impossible for the Fr. high command to appreciate the change which modern scientific advance had brought about in the art of war. This unprogressive attitude was aggravated by the innate Fr. distrust of youth and the consequential devolution of all power in the hands of old men steeped in outworn traditions. When Marshal Pétain, in the hour of his surrender to Hitler, said that F. was defeated because she had too few children he would have been nearer the truth had he said that she had too many old men in high places. The conservative tradition of the *levée en masse*, borrowed from the principles of 1789, had made it difficult, if not impossible, to create a smaller but highly mechanised modern Fr. army. For Fr. politicians were ever haunted by their fear of a military *coup d'état* or even of domination by a military caste, while, for their part, the Fr. people, wedded to the idea of *égalité* even to the detriment of state organisation, demanded that every able-bodied man be conscripted. Moreover, even had her general staff been alive to modern military progress, it is doubtful whether they would have obtained before 1939 the enormous financial credits without which adequate mechanisation of the army could not have been achieved. It has been well said that it is one inevitable weakness of a democratic state that it never finds sufficient money for self-defence until too late. It is true that money was found to build the Maginot line but this, as implied above, was money spent on a static defensive strategy and therefore in accordance with the defeatist attitude engendered by belief in the practicability of collective security under the League of Nations, an idea which obtained quite as firm, if not firmer, hold in Britain. One fatal military defect in the Maginot line was that it was not continued to the sea (see also under FORTIFICATIONS), and yet, even had it been so prolonged, the result would have been to exclude the Belgian Gov. from the Fr. sphere and to force it into the arms of the Nazis or Belgian Fascists and eventually into the power of the Nazi Gov. In this manner F. suffered an annihilating military defeat. Against the 60- and 70-ton Ger. tanks and dive-bombers the traditional bravery, *elan*, and resourcefulness of the Fr. soldier were powerless. The defeat was enhanced by the ludicrously severe restrictions on news imposed by the Fr. censors, a factor which ultimately hastened the moral collapse of F.; for the mass of the people of Paris had no conception of the gravity of the situation, and when the city was raided by some 300 Ger. aeroplanes and the imminent advance on it of the Ger. tanks

could no longer be concealed, every road issuing from the metropolis was choked with an unending stream of refugees in cars, carts, and on foot, hampering hopelessly all military activity and leaving in the city only settled despair.

Political and social weaknesses also contributed to the defeat of F., though they were by no means the essential cause of that defeat. This is not to say that the whole episode of the Fr. collapse merely exposes the fundamental rottenness of democracy, for all hist. refutes this totalitarian argument. The people and the politicians were not responsible for the faulty tactical ideas of the Fr. general staff, and when the crisis came it was not pressure from Parliament or the electorate that determined the action of the gov. Reynaud, who had succeeded Daladier as Premier, was not defeated in the chamber; he was dismissed by the president, and his successor, Pétain, and associates never consulted Parliament on their disgraceful armistice, the terms of which were hidden from the Fr. people until it was too late to protest. In short, it was not the people, not even the army, but the generals whose morale was destroyed, and the clear lesson to be drawn from this is that democracy's true strength lies in an unmuzzled Parliament and press. The past records of the rulers of unoccupied F., the men of Vichy—after the armistice the Fr. Gov. which had fled to Bordeaux moved to Vichy—showed beyond a doubt that they were united in wanting peace at almost any price and the Fr. publicists who supported Gen. de Gaulle's organisation of 'free Frenchmen' in England were agreed that men like Laval and Baudouin had long harboured dreams of wielding absolute Fascist power in F. This deliberate preference of some Fr. politicians, ex-revolutionary Socialists, for disarmament, even if it were Ger., over Liberal or Socialist democracy, even if it were Fr., played its part in the Fr. collapse, aided by the now familiar 'fifth column' (q.v.) tactics. For decades past there had been many circles of Fr. politics whose patriotism had been scorned, because it implied loyalty to the hated Third Republic. In this respect F. was much weaker than Britain, for with the Brit. people it is the right that has built the State and which largely runs it; but even in the Fr. case it would be a crude over-simplification to suggest that the right seized control and betrayed the nation; for there were many men of the right whose courage remained undimmed, while even the Bordeaux Gov. included Socialists. It has been said that successful resistance was possible even at the last moment. Officers like Gen. de Gaulle thought so; so did politicians of as opposite complexion as Reynaud, Mandel (colonial secretary under Reynaud), Herriot, Louis Marin, Léon Blum, and Jeanquency. It was still possible to proclaim a state of siege, *la patrie en danger*, to call people to arms—*la levée en masse*—even though the year was 1940 and not 1793. The people could have been mobilised and set to work preparing

anti-tank traps, sowing land-mines, and so forth. But this kind of appeal to the people would necessarily have assumed a quasi-revolutionary character and corresponded too closely to the Republican instinct of the country. Dispassionate critics are entitled to believe that such a movement would never have commended itself to Gen. Weygand, now generalissimo of the Fr. armies, and his colleagues. These men and their Fascist political supporters were much more afraid of a popular movement than of success for Ger. arms. For however extraordinary the fact may appear, these men never understood the real character of the Nazis, and appear to have supposed that army officers would always in the long run each understand each other. But in any case in their inward souls many of them preferred the Hitler regime to a popular movement, and that was precisely how a whole section of Fr. capitalists felt, although b. in F. of Fr. parents. The inference cannot easily be avoided that a large proportion of the Fr. bourgeoisie were in full decay and since many years previously undermined by the 'fifth column.'

The part played in the collapse of F. by the association of economic groups, though remoter than the causes outlined above, was none the less a very real one. Fr. mining and manufacturing interests were in association with leading politicians in the development of Franco-Ger. relations. The many politico-financial scandals in which, at different times, such prominent politicians as Péret, Rouvier, Tardieu, Berthelot, and Laval were involved, proves the close connection resulting from the combination of capitalist enterprise with national prestige policy, held together by an all-powerful if decadent bourgeoisie. The links between economic groups, the political press, lawyer deputies, civil servants, and Cabinet ministers make an estimate of the relative influence of different factors hard to determine in their effect on Fr. nationalism, but there can be no doubt that both nationalism and capitalism, viewed as a combination of 'patriotism, power, and profits,' were effective forces in determining the direction of Fr. foreign policy. But the association above described could not be permanent. The crisis and tragedy of modern F. in 1940 was essentially a social crisis produced by the dissolution of this association: 'The political machinery, weakened by dissension and corruption, could no longer contain the more powerful economic groups which, with the well-paid help of their professional politicians, came to pursue their own policy, even at the price of the destruction of the Fr. national state. A bewildered class of civil servants came to follow whoever presented himself as leader in a disintegrating state, provided the appearance of loyalty and obedience could be preserved, and while that part of the bourgeoisie, which, as financiers, industrialists, or parl. politicians shaped Fr. politics, became deeper and deeper involved in

international machinations detrimental to the nation, the sound and solid core of Fr. nationalism, the peasant farmer, the shopkeeper, the *petit bourgeois*, became tired and resigned.' (See W. Friedmann, *The Crisis of the National State*, 1942, and Schuman, *War and Diplomacy in the French Republic*.)

Daladier's administration was followed by that of Reynaud in March 1940. In the May crisis the aged Marshal Pétain and other pro-Fascists were brought into the gov. When Paris fell in mid June Reynaud, after vainly appealing to President Roosevelt for immediate help, discussed with the Brit. Gov. the question of a separate armistice, the existence of a Franco-Brit. agreement forbidding such course. In reply Mr. Churchill offered common citizenship between the two nations, emphasising that cost what it might Britain would continue the fight. When this offer was refused the Brit. Gov. agreed to consider the release of F. from her obligation provided the Fr. fleet were prevented from falling into Ger. hands. But the danger of this last contingency was enhanced by the overthrow of Reynaud and his replacement by Pétain as Premier. Pétain surrendered unconditionally to Hitler and left the Gers. in occupation of the N. part of F. and of the entire coast to the Sp. frontier. The Gers. were thus free to use the Fr. coast and its ports as bases against Britain. Mr. Churchill, however, acted swiftly against the Fr. fleet, which was now ready to act under Ger. dictation, and many of its battleships were either brought into Brit. ports, sunk, or damaged, while a number of other warships were put out of action (see NAVAL OPERATIONS IN SECOND WORLD WAR). The immediate consequence of this operation was that the Pétain Gov. broke off relations with Britain, and moving from Bordeaux to Vichy became the puppet of the Ger. Gov., its most influential member being not the aged Marshal Pétain, but his deputy, the treacherous Pierre Laval. A rump Chamber of Deputies voted for the promulgation of a new constitution to be founded on the strange basis of 'work, family, fatherland' in place of the Republican 'liberty, equality, fraternity.' President Lebrun resigned, and Pétain assumed the title of chief of state. Gen. de Gaulle, the one general in F. who had striven to mechanise the Fr. Army, and who had made good his escape to Britain, formed a Fr. National Committee in London to continue the war effort. The Brit. Gov., however, while continuing to recognise the Vichy Gov., accorded every assistance to de Gaulle, who, assuming the title leader of all free Frenchmen, began to organise a Fr. Army and Navy in Britain. Soon afterwards Fr. Equatorial Africa and the Chad region transferred its allegiance to him, but his projected expedition to Dakar was a fiasco, largely owing to the inexplicable escape of two Fr. warships through the straits of Gibraltar to Dakar.

Thus perished the Third Fr. Republic. The constitutional laws of 1875, which

were the basis of the republic, were formally abrogated in Aug. 1940. Only in the unoccupied zone and the African colonies governed from Vichy did the ghost of the old republic still linger on. Gradually Hitler disembodied the nation from the state: Alsace and Lorraine were administered from Berlin as part of the Reich, the 'prohibited zone,' nearest Britain, was governed by the military authorities from Brussels, occupied F. was misgoverned from Paris. Captive F., in the shape of 1,500,000 prisoners of war, was kept in slavery in Germany. 'Free France,' which by the end of 1941 had a territorial basis in Syria, and Fr. Equatorial Africa, as well as in London, eschewed the mantle of the discredited Third Republic. Marshal Pétain alone remained direct heir of Thiers. In his regime the ghost of the republic survived in two forms: the chief of state exercised his legislative functions in the council of ministers pending the formation of new assemblies, and both senate and deputies were to remain in being until the new assemblies were formed. But even after their formation the chief of state was empowered 'in the event of tension from abroad or grave internal crisis' to wield legislative power by himself, and he alone could declare a state of siege. In Feb. 1941 a *conseil national* was set up to assist the chief of state in a purely consultative capacity, and its sessions were secret; but the avowed scheme was to create a corporative state somewhat on the It. model. The larger industrialists were given in practice if not in theory wide powers of control over economic life. The exigencies of collaboration with Germany and the dislocation of economic life made necessary a high degree of state control of industry. This tended to operate through trusts, so that the externals of a corporative state were convenient to conceal the tyranny of the trusts, and to provide some measure of eventual political control. Many senators and deputies were appointed to the *conseil national*, and showed themselves, at least as individuals, far from supine in resisting the totalitarian tendencies of the Vichy Gov. In Aug. 1941 Pétain banned all political parties, all public or private political meetings. He hinted that the existing *Legion française des anciens combattants* should become the nucleus of the single-party state, which, however, seemed to imply that his own earlier efforts to form the *rassemblement pour la révolution nationale* for the same purpose had failed. In fine, if the totalitarian tendencies of the men of Vichy were evident enough, their ability to carry them out was much less certain even at this time, because it was conditioned by Fr. public opinion, and this seemed to change according to the vicissitudes of the war. Thus the victory of Britain in the battle of Britain and the continued resistance of Russia (as at Dec. 1941), when defeat had seemed almost certain, provided both stimulus and focal point for Fr. opinion. Based on the assumption of total defeat and the death of Fr. national consciousness, the

Vichy Gov. at the end of 1941 found that defeat was not certain, and that the national consciousness was reawakening, and having equipped F. with all the machinery of a Fascist regime it now failed to find the totalitarian party to drive the machine.

The re-emergence of the traditional spirit of F. was dramatically reflected by the scuttling of the Fr. fleet at Toulon (Nov. 27, 1943) soon after the allied landing in Fr. N. Africa. This act was the climax of increasing Ger. pressure and spoliation. Laval had returned to office in April 1943 as 'head of the Government with special powers,' superseding Darlan (q.v.), who was appointed commander of all the forces. For the time being Laval was Hitler's agent. He proclaimed his desire for a Ger. victory, and was prepared to go to any lengths to ensure it. Assuming dictatorial powers, albeit under Ger. patronage, he undertook to hand over skilled Fr. labour to Ger. war factories against the release of a small number of Fr. prisoners-of-war, invoking Germany's own heavy losses on the Russian front as a reason why Fr. labour should 'volunteer' to supply Ger. deficiencies in man-power. The Gers. demanded 150,000 skilled workmen, a number which would have enabled them to set at least 1,000,000 unskilled or semi-skilled men and women to work; but the 150,000 were not handed over—a temporary victory for Fr. labour. Laval was more successful in destroying the last vestiges of the parl. system, by abolishing the offices of president of the Senate and the Chamber. But throughout these violations of Fr. liberties sabotage and the killing of Ger. soldiers continued, notwithstanding the dire penalties which followed, and scores of hostages faced the Ger. firing squads. It was in the same defiant spirit that the Fr. fleet sacrificed itself at Toulon. When the Anglo-American forces landed in Fr. N. Africa, the Gers. at once overran Vichy F. Hitler, to gain time, designated Toulon a special area which Ger. troops were not to enter. His real intentions were shown on Nov. 27, when the Gers. began to march in. The many warships were then either scuttled or damaged—an act of immolation which restored Fr. honour and reasserted Fr. sovereignty. Under an arrangement with Gen. Eisenhower (q.v.) Darlan assumed responsibility for the civil administration in N. Africa as a temporary measure. Till then he had been both advocate and architect of collaboration with Germany, and his pretensions naturally aroused the strongest resentment among the allied powers, not least among the adherents of Gen. de Gaulle, whose Free Fr. movement, for political reasons, had recently been renamed Fighting Fr. On Christmas Eve, however, Darlan was assassinated in Algiers and Gen. Giraud (q.v.), who had opposed compromise with the Gers., was appointed his successor. The brave stand which Gen. de Gaulle and his colleagues had sustained since the days of capitulation in June 1940 assumed a wider and more corporate form after the

landings in N. Africa; and Gen. Giraud, who enjoyed esteem among his compatriots for his legendary escape from a Ger. fortress and among the Allies for his military reputation, was confronted with a complex and eventually impossible task. Moreover the inhab. were Vichy-ridden and, like the ill-equipped army, dispirited. It was soon realised, not least by the Brit. Gov., that no improvement was to be expected so long as Gen. Giraud's regime and Gen. de Gaulle's Fighting Fr. movement were at cross purposes. Through the efforts, however, of Gen. Catroux an agreement was reached on June 3, 1943, for the setting up of a Fr. Committee of National Liberation to direct the Fr. share in the campaign of reconquest, and also of a consultative assembly in Algiers and a unified administration for the Fr. Empire, soon wholly in the war on the allied side except for Indo-China, the possession of which Vichy had allowed to pass to Japan without a fight—a betrayal which bore bitter fruit in the Viet-Nam revolt in 1946-47. Gen. de Gaulle and Gen. Giraud shared the co-presidency of the committee for a time, but the anomalous duality was soon terminated, and Giraud devoted himself to the duties of commander-in-chief of the Fr. forces; these now included the Fr. fleet at Alexandria, which had joined the Allies on May 31, 1942, after having been neutralised since 1940. At this time too the forces were receiving adequate modern equipment from America and Britain. The committee's international status was not yet, however, recognised by the allied powers. More and more the administration in Algiers responded to the inspiration of the metropolitan movement, which continued to look upon Gen. de Gaulle as the guardian of its cause. Notwithstanding savage repression by the occupying Gers., and the apathy of Vichy, resistance inside F. grew. Wreckings increased, Gers. were shot, and traitors struck down. A remarkable enterprise was launched when thousands of young men, scheduled for deportation to Germany under an arrangement between Laval and Sauckel, Hitler's director of man-power, took to the maquis and maintained a sacrificial fight for freedom. Under the fraudulent label of *relève*, however, many hundreds of thousands of Fr. workers, men and women, were transported to Ger. war factories, an outrage which was destined to react later on Laval with fatal consequences. By now Laval, though still expressing hopes of Ger. victory, had no real belief in such a result, while Pétain, at best a tragic figure, was compelled either by his captors or by force of circumstances to take less and less interest in the nation's affairs. Probably he had at last realised that the heart of the people was in the resistance movement. On March 19, 1943, Gen. Catroux, the Fr. delegate general in Syria, proclaimed the restoration of the free constitution of the Lebanon; but soon afterwards a crisis arose over conflicting views on the continuing validity of the Fr. mandate and the dispute was

only settled at the end of the year. Both this incident and the equivocal attitude of the assembly in Algiers reflected the indisputable fact that at this time the Allies were still paying the costs of the comparative success of Ger. policy in F. If, however, the Gers. dreamed that they could win the Fr. people over to collaboration, that policy failed almost completely, and at the end of 1943 this bankruptcy of Ger. policy was so evident that even the Gers. hardly troubled to conceal the fact. Again if the Gers. believed that they could create in F. a

whom the Brit. and the Amer. Gvs. still recognised. Thus a legal fiction was involved, and an important one; for it justified on one side an excessively cautious approach to Fr. problems by the Brit. and Amer. Gvs., and it made necessary, on the other side, reluctance to commit a future F. at an inconvenient moment. The very fact that Gen. de Gaulle and his colleagues in Algiers regarded themselves as trustees for Fr. rights and Fr. sovereignty, but did not regard themselves as a sovereign gov., was one of the problems which created the

'New York Times' Photos

THE LIBERATION OF PARIS AUGUST 25, 1944

pseudo-gov. which could be used as a cloak for controlling the Fr. Navy and Empire, and using them against Britain, that also failed. But Ger. failure was not complete, for the gov. of Vichy, if always feeble, did represent a Ger. success, however limited. For the creation in F. of a gov. which professed to accept Ger. leadership in Europe, and which professed to be able to protect Fr. interests outside Europe by its own diplomacy and its own arms, was a real success. It confused the issue inside F., inside Europe, and over a great part of the world, notably in the U.S.A., and for a time the national committee and the assembly did not claim to be a sovereign gov., and were, in fact, not recognised as a gov. at all. Yet it was quite certain that the committee had more authority inside F., and more serious chance of being the gov. of a liberated F. than had one or two of the exiled govts.

Lebanese crisis, or at least aggravated it. It had become evident that the Fr. national committee and the assembly were the spokesmen of a highly organised revolutionary movement, the resistance movement, and the Allies' recognition of the international status of the committee was therefore ultimately inevitable. (Prof D. W. Brogan.)

The following year (1944) saw the liberation of F. through the invasion by the Anglo-Amer. forces under Gen. Eisenhower, which were landed in Normandy on June 6. By early Sept. these and other allied forces landed in the S. had overrun most of F. and expelled the Ger. Armies (see under WESTERN FRONT IN SECOND WORLD WAR). In many ways the political recovery of F. matched in swiftness and sureness her military rescue from the Ger. thrall. When in Dec. Gen. de Gaulle went to Moscow to sign a

treaty of alliance and mutual assistance with Marshal Stalin the act showed how far F. had advanced towards re-establishing herself as a great power. But the path had not been an easy one; and even up to the moment of the allied assault in Normandy Amer. and Brit. recognition of the Fr. Committee of National Liberation was still withheld, and the principles of the arrangements for the exercise of civilian authority in the liberated parts of F. remained to be settled. The consultative assembly in Algiers now adopted the title of Provisional Gov. for the Committee of National Liberation, and the National Council of Resistance, representing all sections of the patriotic movement inside F., issued an appeal for recognition of Gen. de Gaulle's administration. Two important changes took place: the first was that the Communists decided to be represented in the committee; the other was the supersession of Gen. Giraud as commander-in-chief and the assumption by Gen. de Gaulle of responsibility, Giraud being offered the post of inspector-general, which he refused. With the Allies firmly established in Normandy it was at once apparent that the authority of Vichy was not acknowledged by any large section of the nation. On the other hand, the resistance movement emerged as a vigorous fighting force commanding popular support. The movement was recognised by the allied supreme command as a regular combatant army and named the Fr. Forces of the Interior, and it co-operated with considerable effectiveness in the allied campaign in Normandy. The question of civil administration was not so easily settled; but after visits by Gen. de Gaulle to London and Washington an agreement was reached for the transfer of authority to the Committee of National Liberation, although in practice this had been done from the first day of the landings. The Fr. people gave Gen. de Gaulle a fervent welcome, and in Paris, where he was popularly acclaimed, he took firm control of affairs, and M. Lebrun, president at the time of the armistice, formally resigned. On Oct. 23, 1944, Great Britain, the U.S.A., and Russia recognised Gen. de Gaulle's administration as the Provisional Gov. of the republic. At the same time the greater part of F. was declared no longer a combat zone and was transferred to Fr. authority. The leaders of the Vichy regime disappeared into Germany or into hiding. As the Gers. and their Vichy collaborators saw their power ending in F. terrorism was intensified, and in four months, from June to Oct., hundreds of men, women, and children were massacred (see ORADOUR-SUR-GLANE). An official estimate of the total number of Fr. shot by Ger. firing-squads or killed in cold blood during the occupation is 29,660. After the liberation, a matter which gave rise to some protest, mainly from the Communists, was the decision to dissolve the *milice patriotique* and other forms of the resistance movement. The gov. stood by the principle that the only armed groups must be the army and the state police.

Paris was physically undamaged in the war, but, on the other hand, no Eng. city, with the possible exception of Coventry, was smashed like Brest, Rouen, Lorient, Havre, and Caen. If Paris escaped other parts of F. paid a heavy toll in destruction. Unlike Britain, F. fed herself before the war, except for such luxuries as came from her colonies. During the war they were still able to feed themselves, theoretically, but the Ger. requisitioning and interference with transport resulted in the amount of food available for the people of F. being considerably less than the people of Britain received. The greatest physical suffering in Paris was due to the lack of coal. There was no private heating in Paris for four years. The average family was limited to a single small stove per apartment, in which they burned on the worst days such wood, charcoal, or low-grade peat as they could secure. Every one to some degree bought food and other things in the black market, where the prices were so high that the money had to come out of savings. People had to spend capital to maintain daily existence, with the result that the economic situation of the average Fr. person (excluding profiteers) was extremely poor, and Paris in 1944 was in the midst of an inflation which was tantamount to the liquidation of the middle class. Up to the time of the Anglo-Amer. invasion of F. the discipline of the Ger. Army was high, and the attitude of the Fr. people towards the Gers. was reserved and correct. But they hated the Gestapo, whose excesses and sadism were undeniable, and their greatest hatred was reserved for the 30,000 to 40,000 Fr. people who were active agents of Germany. The militia formed by Darmand as an auxiliary to the Ger. police was relentlessly pursued when the Fr. secured the upper hand.

A Constituent Assembly charged with the duty of drawing up a constitution for the Fourth Republic was elected in the following year (1945). The assembly's powers and authority were laid down in a law on which the people—women voting with the men for the first time in a general election—were required to give their judgment. The law was vigorously opposed by the Communists, who, apprehensive of Gen. de Gaulle's personal rule, wished the assembly to be unrestricted. The election, and the simultaneously held referendum, resulted in a vote of confidence in Gen. de Gaulle. The Communists, returned as the strongest single party, closely followed by the Socialists and a new political organisation known as the Mouvement Républicain Populaire (M.R.P.). This last party drew its main driving force from the men and women who were in the resistance, and from Catholics who favoured large social and economic changes in the State; but it also derived support from the older parties of the right, which saw no political future in isolation. The prestige of the M.R.P. was enhanced too by its close association with Gen. de Gaulle himself. When the Constituent Assembly met, Gen. de Gaulle

returned to the people the powers he had exercised and, having been given a new mandate, formed a gov. drawn from the three main parties and pledged to a far-reaching programme.

Gen. de Gaulle resigned in Jan. of the following year (1946). His provisional gov. had denounced the constitution of 1940, and restored the Third Republic and its constitution, as in force in 1939. This *modus vivendi*, however, did not reflect the views of the majority of the people of F., and throughout 1946 F. was in quest of a new constitution. The reconciliation of a sovereign legislature with a stable executive was the stumbling block, though the seriousness of the country's financial position clearly pointed to the need for a strong gov. A first Constituent Assembly entrusted the task of devising a draft constitution to a representative committee, which produced proposals reflecting advanced democratic thought. They contained a preamble extending the revolutionary declaration of the Rights of Man, and set up a single sovereign chamber, flanked by two advisory bodies, the one political and the other economic; but though this draft was approved by a majority of the assembly it was rejected on a referendum (May). A second assembly was elected whose revised draft modified the more stringent provisions of the first draft. Under this constitution, which was approved in a referendum in Oct., a second chamber, the Council of the Republic, with members chosen by indirect election, was given a voice, though not a decisive one, in the legislation; while the president was to be elected by the two Houses in joint session. There were also provisions for revision of the constitution by adequate majorities, for the possible dissolution of the assembly, and for the political organisation of the Fr. Union—the new term for F.'s colonial empire.

In the Nov. 1946 elections, which created the first National Assembly of the new republic, the Socialists suffered severe losses, and fell to the third place among the three leading parties. The Communists were still the strongest single party, but the majority in the assembly was strongly anti-Communist. Both the Communists and the M.R.P., successively, failed to form a ministry, neither being able to do so without Socialist support and collaboration. Thus it seems that, in a parl. republic committed to extensive socialisation, the party of Jean Jaurès by some inherent logic succeeds to the natural leadership of F. Paradoxically when the Socialists dropped from second to third place, they strengthened their tactical position; for in the new conditions of equipoise between Communists and the M.R.P. they secured the vital position in the middle of the political see-saw, and it was in these circumstances that, on Dec. 16, the aged Léon Blum formed a purely Socialist gov., which he was able to do because neither of the other parties dared to jeopardise further the new constitution which they had combined to produce between them. Continued deadlock would, in their view, have played into the

hands of Gen. de Gaulle and right-wing elements who were incessantly demanding revision. That is why Léon Blum's single-party ministry received 675 votes. Thus fortified his stop-gap gov. launched a decisive attack on the price rise and on financial instability; sent out M. Moutet to attempt final settlement of the Indo-Chinese imbroglio; and, coming himself to London, went far to reach agreement with Great Britain on the settlement of W. Europe; and, above all, laid the foundations of a new Anglo-Fr. entente. Thus in six short weeks he had conspicuously justified the soundness of his political diagnosis in his study *La Réforme gouvernementale* (1936)—F.'s weakness of party discipline and lack of unified direction and leadership in Parliament and Cabinet. In short, he showed the difference between homogeneous cabinet-gov. and the old methods of *gouvernement d'assemblée*, or parl. dictation—the latter being equally denounced by Gen. de Gaulle. On Jan. 16, 1947, despite popular indifference to the choice of the first president of the new republic, the assembly, still in a mood of indulgence towards the Socialists, installed in office Vincent Auriol, a close friend and colleague of Blum and author of *Hier Demain* (1945), which expresses similar political views to those of Blum himself.

Blum resigned for reasons of health and was succeeded by Ramadier (also Socialist). The change of gov., however, did not interfere with the negotiations for a treaty of alliance with the United Kingdom and the treaty was eventually signed at Dunkirk (March 4). Ramadier's gov. was a coalition of nine Socialists, five Communists, five M.R.P., three Radicals, and four others. He rejected the demand of the Communists for the key portfolio of national defence, giving them the air portfolio only. The main features of the first four months of the year were the formation of the *Rassemblement du Peuple Français* (R.P.F., Rally of the Fr. People), the deterioration of the economic situation, and the deepening div. in the gov. between the Communists and the rest of the ministers. These three factors explain the development of political events during 1947. The R.P.F. was an organisation fostered by Gen. de Gaulle as a nation-wide movement of national union, and though he was attacked by the left, especially the Communists, of favouring the reactionary or Fascist elements, the movement constituted a new and popular force which materially affected the political balance in F., achieving a sweeping victory in the municipal elections. But meanwhile the economic situation was growing steadily worse and strikes broke out (Feb.) in the public services. Decrees were then issued reducing the prices of many articles and foods and special allowances were granted to workers; but the bread ration had to be reduced and meat could only be bought on the black market. The political situation was further weakened by the refusal of the Communists to vote the military credits required for operations in Indo-China and to suppress a revolt in Madagascar. This

div. of opinion, added to the social unrest, with strikes in the state-controlled industries, led to a wider split in the Cabinet, but Ramadier obtained a vote of confidence, except from the Communists, and new ministers replaced the latter. Though the most serious of the strikes now ended for the time, the task of keeping down prices and pegging wages remained, and in the summer, when the gap between wages and prices had grown still wider, strikes broke out which affected the railways and vital industries. Following negotiations between the gov. and the trade unions it was agreed (June 12) to resume work on the railways, but on June 19 bank employees came out. At this time the Treasury deficit stood at 126 milliard fr. Extreme measures were necessary and Schuman's plan to balance the budget included the abolition of all subsidies, except for coal, the reduction of gov. staffs to the 1938 level, a reduction of military credits, increases in taxes on capital and luxuries, including tobacco. This programme and the rising cost of living led to a fresh outburst of strikes, notably in the coal and iron industries, which were settled by the gov. announcing higher wages and a bonus on output for the miners and steelworkers. Ramadier secured a second vote of confidence, though both the Communists and the right-wing Parti Républicain de la Liberté (P.R.L.) voted against him—an odd collaboration between bitter opponents designed to thwart any measure introduced by a Socialist or Popular Republican minister. Political complications, however, further aggravated the difficulties of the gov., whose members collectively tendered their resignation to the Prime Minister. Ramadier then formed a new gov. of seven Socialists, three M.R.P., two Radicals and an Independent, which obtained a vote of confidence by a very narrow margin. Meanwhile strikes again broke out in essential industries, while Gen. de Gaulle denounced the Communists as 'separatists' who must be ousted from the Fr. community. The task of the gov. and the middle parties was to keep the balance between the Communists and Gen. de Gaulle's party and to that end they tried to create what they called the 'Third Force.' This was soon severely tested. A strike broke out in Paris and spread to Marseilles, paralysing all work in the S. and leading to serious riots. Further strikes then began in the N. coal-fields and among dockers and railway workers and by Nov. 24 nearly 2,000,000 workers were out. But the gov. handled the situation firmly, and many returned to work. While the crisis was reaching its climax the gov. resigned and Schuman (M.R.P.) succeeded Ramadier, with a Cabinet of six M.R.P., five Socialists, and two others. The new finance minister, Mayer, adopted drastic measures to check inflation, which included a super-tax on all incomes over 750,000 fr. This was adopted by the assembly (Dec. 24) by thirty-two votes only and the budget was balanced at nearly 900 milliard fr.

There were three changes of gov. between Jan. and Sept. in the ensuing year, showing that the country was more sharply divided than ever between Communists and non-Communists and that the 'Third Force' evoked by the Socialists and the M.R.P. had ceased to exist as an effective political factor, despite their majority within Parliament. This weakness of Parliament made the search for social and economic stability increasingly difficult.

The first gov. of Schuman fell on July 19. Like his predecessor Ramadier he was a victim of inflation. André Marie's (Socialist Radical) gov. lasted only a month, or just long enough for his finance minister, Paul Reynard, who had not been in office since 1940, to propose fiscal reforms which neither the Socialists nor the extreme right would accept. Schuman's second Cabinet (Aug.) lasted only a week and was succeeded by a coalition under Henri Queuille (Socialist Radical). Strikes for higher wages kept pace with the rising cost of living. A mining strike in the spring was followed in the summer by an outbreak of serious disorder among factory workers at Clermont Ferrand. In Oct. the coal-miners declared for a national strike of unlimited duration and were accompanied, at the beginning, with varying degrees of enthusiasm, by steelworkers in Lorraine and dockers. The coal-strike was evidently intended by the Fr. Communists, who continued to hold the loyalties of the workers in heavy industry, as a challenge to the gov. and to the success of the Marshall aid plan. Mines were occupied by the strikers who barricaded themselves to resist the police. The minister of the interior thereupon mobilised 40,000 conscripts, brought well-armed contingents of troops and police into the mining districts, and ejected the miners from the pits. Many ugly incidents occurred. While the Communists were manoeuvring their forces among the workers Gen. de Gaulle emerged as an open challenger to the republican regime in its present form. Some damage, however, was done to his cause when a few of his followers used firearms against Communists in a demonstration at Grenoble. But in Nov. his party was highly successful in election to the second chamber, the Conseil de la République. Meanwhile events abroad were overshadowed by the widespread fear in France that W. Germany, with Marshall aid, might appear once more as a dominant member of the European community. The recommendations on W. Germany and the Ruhr made by the six-power conference in London early in the year were received with many misgivings and Bidault, then foreign minister, was able to secure the assembly's approval only by 300 votes to 289, and then only with strong reservations. These misgivings were again voiced when the Brit. and Amer. Govs. announced (Nov.) that the ownership of the Ruhr industry would be handed to Ger. trusteeship; but the Fr. Gov. of Henri Queuille, which had assumed office in Sept. pronounced itself satisfied with the results of the Dec. conference on

international control in the Ruhr, and agreed to the Statute of the Ruhr authority, and to the Occupation Statute for W. Germany. In co-operation with Britain and America negotiations with Russia continued. Progress in agric. and industrial recovery was steady in 1949, and departmental elections showed confidence in the Queuille Gov. (See further under EUROPE, History).

It may be pointed out here that representative democracy has never worked smoothly in F. In the early period of the Third Republic the demand for a

The right wing asked for a revision of the constitution; President Doumergue, André Tardieu, reactionary leagues, spokesmen of the managerial *élite* of big business, stressed the shortcomings of the Fr. system, and urged a strengthening of the executive. But at that time, 1934-36, the left looked upon any attempt to change the constitution as an effort of the right to perpetuate its own power; Radical-Socialists fighting in the name of civil liberties and anti-clericalism, Socialists and Communists fighting on the ground of class opposition, joined hands to defeat

D. McLesh

THE HOSPICE OF GREAT ST. BERNARD

revision of the constitution had come from the left wing. Radicals like Clemenceau attacked the Senate, some members of which could not be removed and which was the guardian of the decaying *élite*, made up of the Catholic hierarchy, the landed aristocracy, the army, and the old monarchist and imperial bureaucracies. They demanded drastic constitutional changes. But these republicans came to perceive that they could achieve their own ideals within the existing framework; they succeeded in democratising the Senate, in strengthening the chamber, and in submitting the executive branch to the relentless and sometimes tyrannic control of the local political machines, and of the parl. committees. The gov.'s power of dissolving the chamber, misused by President MacMahon, was practically abolished; and at the beginning of the present century the Chamber of Deputies emerged as the most powerful organ of Fr. democracy. Following the First World War the attitudes were reversed.

the so-called Fascist plots. Issues of political techniques were overshadowed by personal hatreds and group antagonisms. After the Second World War all parties wanted a revision of the constitution as it stood in 1939. But the new constitution, as passed in Oct. 1946, satisfied none of the parties completely. The Communists, and the Socialists tended to follow them, objected to the limitations imposed on the complete sovereignty of the National Assembly. The M.R.P. would have preferred stronger guarantees against possible excesses of the assembly's sovereignty. The parties who voted against the constitution altogether stood outright either for a system of checks and balances, or for a stronger executive. Gen. de Gaulle's criticisms were in line with those of the opposition, and he was also unequivocally in favour of the separation of powers after the model of the Amer. constitution. The central task before parliamentarians to-day is to shake off the traditions and ways of

thought which they have inherited from the Third Republic sufficiently to create, from the new material of strongly disciplined parties, a new type of parli. gov., which shall yield a stable and coherent administration.

Germany's plan provided for a swift defeat of France which would enable her to transfer an

adequate number of troops to her E. front and overwhelm Russia whilst that country was still in process of mobilisation. The destruction of the Fr. forces was to be accomplished by the envelopment of their left flank and, as this would probably require the passage of a large force through Belgium, the violation of that country's neutrality (of which Germany herself was one of the guarantors) was duly provided for in Germany's plan. Such were the military factors which operated to make F. and F. the W. front during the First World War.

Germany declared war on France on Aug. 3, 1914, and it being early evident that the Gers. would violate Belgian neutrality, the Belgian Army was deployed to resist the invasion. On Aug. 4 Ger. troops crossed the border into Belgium and commenced an attack on the fortresses of Liège. This violation caused Great Britain to declare war on Germany, and the Brit. mobilisation was ordered at once. Gen. von Emmich (*q.v.*) was in command of the Ger. invading force, the Belgians being under the command of Gen. Leman. The Gers. could make little progress against the Belgians until they brought up their heavy howitzers. These quickly pounded the fortifications, which were unprepared for projectiles of such weight (*see* FORTIFICATIONS). Nevertheless the retarding effect on the Ger. force destined to envelop the Fr. left wing of the gallant Belgian defence contributed in no small measure to the eventual success of the Allies' cause in that it gave Great Britain time to transport her army to France and take up its position on the left of the Fr. line near Mons. By the third week in Aug. the Ger. Armies had overcome the Belgian obstruction and, pouring through unopposed, were threatening the Fr. left. Whilst the operations in Belgium were in progress, the Fr. and Ger. Armies had deployed, facing each other along the frontier. As a set-off against the Ger. advance on his left wing, Marshal Joffre (*q.v.*), the Fr. commander-in-chief, tried on Aug. 20 to penetrate the Ger. line on his right flank, about Sarrebourg and Morhange. The Fr. were defeated with heavy loss and driven back to the frontier. About the same time the Fifth Fr. Army, under Lanrezac, also sustained defeat at the hands of von Bülow (*q.v.*) commanding the Second Ger. Army at Charleroi.

Von Kluck's Enveloping Manoeuvre.—With Metz as the pivot, the whole of the Ger. right wing was now making a great sweeping movement to envelop the Fr. left. As soon as Belgian opposition had been disposed of, the First Ger. Army, under von Kluck (*q.v.*), advanced rapidly and, by Aug. 23, was in a position which imposed a hasty retreat on the allied left wing to enable it to escape attack by overwhelming odds. At this time, however, thanks to the Allies' counter-espionage service, von Kluck was unaware that the Brit. expeditionary force (B.E.F., *q.v.*), under the command of Gen. Sir John French, was in position on the Fr. left; nor was this fact known at Ger. G.H.Q., where all were watching with feverish

excitement and premature joy the success of their plan as represented by von Kluck's movements. The B.E.F. was actually in the perilous position of having both its flanks exposed to an overwhelming adversary; for not only was von Kluck threatening its left, but, owing to the retreat of Lanrezac's Army, under pressure by Bülow and Hausen, its right was also 'in the air.' Notwithstanding these difficulties the Brit. 2nd Corps, under Gen. Sir Horace Smith-Dorrien, faced the Gers. at Le Cateau (*q.v.*) on Aug. 26, and not only held up von Kluck's victorious march, but also inflicted great loss on the Gers. A few days later Lanrezac checked von Kluck at Guise, but the vast superiority in numbers of the Gers. compelled the B.E.F. and Lanrezac's Fifth Army to retreat rapidly to avoid annihilation—a movement which exposed Joffre's left wing to attack. In order to avert this threat, Joffre threw back the whole of his line from Nancy to the left, and created a new army under Gen. Maunoury on the extreme left about Paris.

One of the decisive features of the war occurred when von Kluck's right flank reached the R. Somme about Amiens. Being under the impression that the B.E.F. had been annihilated, and in ignorance of Maunoury's new army about Paris, he changed his direction from practically S.W. to S., in order to envelop the Fr. left wing. When he arrived at the R. Oise he again changed to S.E., thereby leaving Paris some miles away on his right flank, which was exposed to attack by Maunoury and the troops of the Paris defences. As the envelopment of the Fr. left was now regarded as a certainty, the Gers. endeavoured to 'roll up' the right flank also and thus complete the destruction of the entire Fr. Army. To this end Prince Rupprecht tried to break through at Nancy but was heavily repulsed.

Battle of the Marne.—During the preceding few days Joffre had also formed another army under Foch, also towards his left flank, to fill up the gap in the retreating Fr. Armies. Joffre now waited until von Kluck had crossed the R. Marne, and then gave the famous order for a counter-offensive to begin on Sept. 6. Maunoury, whose Sixth Army had been rushed to the front in vast numbers of taxi-cabs and every other kind of vehicle, attacked von Kluck on his flank and rear, and forced him to recross the Marne precipitately and to face W. to meet this unexpected assailant. Foch held up von Bülow and Hausen. On Sept. 8 the B.E.F. pressed forward towards the Marne (*see* MARNE, BATTLE OF THE) in the gap between von Kluck and von Bülow, compelling the latter to retreat towards the Aisne. Von Kluck was ordered to conform to Bülow's movements, for otherwise he would have been completely isolated. This retreat was the deathblow to Ger. hopes of enveloping the Fr. armies. Eminent authorities on both sides consider these the most fateful days of the war, and it seems extraordinary that, although the Gers. were always given the greatest credit for possessing a wonderful

organisation for espionage, they knew nothing concerning the two most important features which led to the frustration of their plans, viz. the presence of the B.E.F. at Mons and the formation of Maunoury's army on their right flank.

During these early movements in the First World War the direction of the Ger. armies was under Gen. von Moltke, chief of the general staff; but his weakening of the Ger. right wing (by withdrawing from it troops to go to E. Prussia) before it had completed its task proved that he was not equal to the great name he had inherited, and he was removed from his appointment and succeeded by Gen. von Falkenhayn (q.v.).

opposite flank, but the Gers. countered this by bringing up reserves which completed the line to the sea. They also planned a 'break-through' in N. France in order to gain the Channel ports (q.v.), which would provide submarine and aircraft bases within easy striking distance of England. The Allies' line in this region was also strengthened, while offensive operations to test the strength of their opponents were maintained by both sides until Oct. 9, when the Gers. began the first battle of Ypres. This battle continued until Oct. 31, when the Gers. made a supreme effort to break through at Gheluvelt. Here the allied line was strung out to breaking point, but the

THE MENIN GATE

The gate erected in 1927 as a memorial to British soldiers killed in the Ypres salient during the campaigns in Flanders. It replaced the old gate reduced to ruins by German artillery.

Although the Ger. invasion had been arrested, and their right wing forced back, on the remainder of the front their line seemed immovable. The Belgian Army was still holding out at Antwerp (q.v.), to which it had withdrawn after the fall of Liège, and being in rear of the Ger. right, was, although small, a force to be reckoned with as calculated to interfere with the Ger. communications. It therefore imposed upon the Gers the necessity of detaching a force sufficient to guard against any offensive action it might be capable of taking. During its occupation of Antwerp the Belgian Army was reinforced by Brit. naval and royal marine brigades. The tn. fell on Oct. 9; the Brit. garrison reached Ostend, where it embarked for England, and the remnant of the Belgian Army escaped along the coast and eventually joined some Fr. marines holding the Yser at Nieuport.

The Race to the Sea. *First Battle of Ypres.*—The Gers, having been pushed back on his left, Joffre now intended to carry his counter-offensive round their

situation was saved by the Worcestershire Regiment, who filled a gap made by the Gers., and drove them back with great bravery, a feat which drew high praise from Sir John French. Although these operations, culminating in the first Ypres battle, virtually destroyed the *Hut* of the Ger. Army, they also saw the end of the original B.E.F., the world-famed 'Con temptible Little Army.'

1915. Trench Warfare.—Up to this point the campaign had been conducted on the lines of open warfare or war of movement; but thenceforward it resolved itself into trench warfare, somewhat reminiscent of the Crimean war. During the winter of 1914-15 both sides were occupied in repairing their losses and preparing for the ensuing spring campaign. In Great Britain Lord Kitchener had become secretary of state for war, and had begun forming the new armies, the first of which he intended for dispatch to France by the spring of 1915. The W. front was therefore comparatively quiet after the first battle of Ypres.

British Attack at Neuve Chapelle.—*Poison Gas Used.*—The successes gained by the Russians on their S. front against Austria caused Germany to transfer troops from the W. to the E. front, and this circumstance led Joffre to decide to attack the enemy in Artois (q.v.). Sir John French launched an attack against Neuve Chapelle between March 10 and 13, 1915; but beyond improving the morale of the troops, which had been impaired by the period of stalemate during the winter, it achieved little. A month later an Anglo-Fr. attack was made about Ypres, in which the Gers. sprung a surprise by using poison gas for the first time. The gas was a mixture of phosgene and chlorine, the inhalation of which resulted in a painful death. The gases were released from cylinders and carried to the Allies' lines by a favourable breeze. Later they were enclosed in shells fired by artillery, a method which was clearly in contravention of The Hague Declaration of 1899. On this occasion the troops chiefly affected were the Canadian Div. and Fr. territorial and colonial troops.

Second Battle of Ypres.—Foch was in charge of the allied operations in this region, and another offensive was commenced on April 22, lasting until May 25 (known as the second battle of Ypres), but it failed to achieve any other result than to inflict enormous casualties on the Brit. forces, owing to their being massed in a sharp salient. The allied spring offensive proper or general offensive commenced on May 9 with the Brit. attack on the Aubers ridge. Here the Ger. defences were very formidable and no progress was made. Further S. the Brit. had also commenced the battle of Festubert (q.v.), and although the main objectives were gained, further allied action was held up by a shortage of shells, a circumstance which directly led to a political crisis in Great Britain and to the formation of a ministry of munitions. In the autumn further attacks were undertaken for political reasons in Artois, Champagne, and about Loos. These attacks were launched against the definite advice of Gen. Sir Douglas Haig, commanding the First Army (Brit.), there being, in his opinion, not sufficient ammunition available.

The Battle of Loos.—The mining centre of Lens was the final objective of the Loos operations, the main attack of which was along a 7-m. front about La Bassée. It opened on Sept. 25, following an artillery bombardment and a discharge by the Brit. of asphyxiating gas. One of the most violent operations was that connected with the capture of the famous Hohenzollern redoubt, situated just S.W. of La Bassée. The final result of the battle was that the allied line was advanced to the E. of Loos, thence N. to just W. of Hujloch. The Fr. attack in the Champagne (q.v.) was launched on Sept. 25; the Ger. positions were penetrated on a front of about 20 m. between Auberive and Ville-sur-Tourbe. Fighting in this region continued until the end of Nov. These gains in ground, however,

were not commensurate with the great losses in men, the Brit. casualties alone, in the battle of Loos, being 50,000. One of the chief reasons why the Allies obtained no decisive result in this fighting was the lack of available reserves at the critical moment. The year 1915 was throughout a black one for the Brit. forces, who suffered over 280,000 casualties. The Fr. losses were not less severe, and it is small wonder that the Allies, as a whole, were in a despondent mood over the result of the year's operations.

Sir John French Superseded.—In Dec. Sir John French, who had fulfilled his difficult command with no little ability, resigned his appointment, the military authorities being dissatisfied with the progress made, and he was succeeded as commander-in-chief by Gen. Sir Douglas Haig (see HAIG, EARL). The magnitude of Sir John French's task was, however, enhanced by inadequacy of munitions, the lack of guns of heavy calibre, and the disparity between the numbers of his troops and of those opposed to him. During his command the Fr. military authorities had been responsible for the formulation of plans for the prosecution of the war on the W. front, the Brit. commander conforming thereto, and this system was maintained on the change of command. The distribution of Brit. troops was also in the hands of the Brit. authorities as theretofore.

Results of 1915 Campaign.—Generally speaking the Gers. were on the defensive during 1915, so that in the matter of defensive works and in experience in all things appertaining to defence they were considerably ahead of the Allies at the commencement of 1916. The provision of labour for unskilled work in and behind the lines was also an important factor; for, whereas the Gers. could call on the Belgians and inhab. of the occupied Fr. ter. to do forced labour in connection with their defences, thereby saving their troops such arduous and monotonous tasks, the Allies employed exclusively military labour, so that their combatant ranks were to a great extent depleted on that account.

In Dec. an inter-allied conference, presided over by Joffre, passed a resolution to the effect that a decision could be obtained only on those fronts where the greatest number of enemy troops was employed, a resolution inspired by the disastrous termination of the Gallipoli campaign (q.v.). The W. front was naturally one of these, and plans were accordingly made for an allied offensive on the Somme as soon as the new Brit. Armies (composed of 'service' or Kitchener battalions) were ready to take their place in the line.

1916. Battle of Verdun.—The first operation of consequence in 1916 was the battle of Verdun (q.v.). Von Falkenhayn, giving the reasons for the Ger. attack on this famous fort, states (see his memoirs) that in the first place it was hoped to deal an effective blow against England's chief ally, and secondly to improve the Ger. strategical position in this area. His

opinion was that, as Verdun was situated at the angle of the Fr. N.E. and E. frontiers, and was less than 12 m. from the Ger. communications, it formed a powerful *point d'appui* for any action of the Allies against those communications, which if broken would render untenable the whole Ger. front in France and Belgium. Another important consideration was that such an attack would forestall the Allies' projected attack on the Somme. Twenty-five divs. were employed by the Gers., but even this colossal force proved insufficient to carry the forts. The Allies had early intimation of the intended move. The imminence of a Ger. attack at Verdun became apparent in the middle of Jan., and Gen. Hertz, the Fr. local commander, reported that he considered the defences to be inadequate to withstand the strain. Gen. de Castelnau (*q.v.*) (chief of the staff) immediately went to Verdun to make a personal reconnaissance, and gave orders for certain works to be carried out which would strengthen the defensive area. There was not time, however, for these orders to be completed before the Gers. launched the attack. This was at 6 p.m. on Feb. 21, and on that day they gained Haumont wood and on the 23rd the whole of the first position was in their hands. On the 25th the Gers. occupied Fort Douaumont (*q.v.*), which the Fr. had failed adequately to garrison in spite of the importance which Joffre attached to it. Gen. Pétain was then placed in command of the operations at Verdun, with twelve divs. at his disposal. The first Ger. attack on the l. b. of the Meuse began on March 6, and although operations were continuous for nearly a fortnight they made but little progress. On the r. b. the Gers. were making desperate efforts to capture Fort Vaux to facilitate their general attack on the second line of defence; but in spite of the employment of unprecedented artillery bombardments and the use of liquid flame (*Flammenwerfer*) they failed to take the fort. In April Gen. Nivelle assumed command of the Fr. troops on the r. b., and the spirit of the offensive now imbued the Fr. A month later Nivelle was promoted to the chief command of the army of Verdun. Exasperated by recent reverses at the hands of Berthelot and Mangin (*q.v.*) the Gers. increased their efforts to secure victory on the l. b., but made no appreciable progress after practically a whole month's fighting.

The imminence of the Allies' Somme offensive was now beginning to weigh with the Ger. high command, and, in order to prevent Fr. reserves from being transferred to the Somme, the offensive against Verdun was intensified. The first week in June saw vigorous attacks launched against Fort Vaux, which resulted in its capture on the 7th. Another great Ger. onslaught commenced on June 23, and although active operations were maintained until Aug. 8 little advantage was gained. On Aug. 29 von Hindenburg succeeded von Falkenhayn as chief of the Ger. general staff, and he ordered all

offensive operations at Verdun to cease. On the Fr. side, however, Gen. Mangin had been largely responsible for the recent Fr. gains on the r. b. of the Meuse, and he at once planned the recapture of the lost forts. Operations were begun in Oct., and by the end of the year nearly all the lost ground had been regained. Verdun had an important bearing on the campaign; it was a great victory for the Fr. and a correspondingly disastrous defeat for Germany, whose armies could not repair the enormous losses sustained, in the abortive attacks, from the fire of the celebrated Fr. 75-mm. guns and mitrailleuses and, indeed, the influence of this crushing failure was felt by Germany to the end of the war.

The First Battle of the Somme.—The year 1916 also saw the great battle of the Somme (or first battle of the Somme) (*see also SOMME BATTLES*) which had as serious consequences for the Gers. as those of the Verdun battle. As previously stated this Somme offensive had been decided on at the end of 1915, but it could not be launched until the Brit. forces had been adequately reinforced. The object of the offensive was to obtain a military decision at one colossal blow. The offensive failed of its purpose; yet it effected much in exhausting the Ger. military resources. As succinctly stated in a pub. issued by the Ger. war records office, 'It would be erroneous to measure the results of the battle of the Somme by mere local gain of ground. Besides the strategic objectives, the Brit. and Fr. followed out a definite plan of exhausting the power of the defenders by the employment of great masses of artillery in constantly repeated attacks.' In addition to wearing down the Gers., it was necessary to arrest their progress at Verdun, and this could only be achieved by compelling them to transfer their reserves to some other and dangerously threatened point. But it would be erroneous to regard the Somme battle as a mere large-scale 'sympathetic' action; it was projected before the battle of Verdun, and without relation to the threat in that quarter: it was indeed hoped to secure by this sustained and co-ordinated advance on a 30-m. front a result which should have really decisive consequences. The relief of the situation at Verdun was a secondary and later consideration. The battle of the Somme saw two important innovations: (1) the invention of the 'creeping barrage' (*see also BARRAGE*) of artillery fire by Gen. Horne, and (2) the employment of tanks (*q.v.*). It is also worthy of remark that the work of the allied air forces was of the greatest importance in this battle, in destroying enemy aircraft and in taking photographs of enemy positions.

The tactical objective of the Allies was the ridge N. of the Somme, extending through Thiepval, Pozieres, Bazentin-le-Petit and Morval, beyond the Ger. line, for this ridge dominated the country towards Bapaume, and from it the allied artillery could command an extensive area. The general plan was to administer a succession of hammer-blows, alternately

Brit. and Fr., in order to distract the enemy, so that he might not know at what point to expect an attempt to pierce the line. The battle was carried out in three main phases. The first phase commenced on July 1, with an attack by the Brit. Fourth Army, under Gen. Rawlinson, between the Somme on the right and Gommecourt on the left. Although the attack was preceded by an artillery bombardment of unprecedented weight—shells being almost unlimited at this period—some of the Ger. defences were subsequently found to be still intact and many proved fully equal to the extraordinary pressure to which they had been subjected. This was due to the fact that the Ger. line here having been stationary for over eighteen months, the Gers. had spared neither time, labour, nor ingenuity in strengthening the positions. Localities which in 1914 were nothing more than scattered farmhouses and small vils. had evolved into formidable fortresses, so that at every step forward the Allies found evidence of the remarkable advances which science had made in field defences. On the left of the line attacked (i.e. from the Ancre to Gommecourt) the Allies made very little progress; but between the Ancre and the Somme, where the Ger. artillery were in less strength, a definite hold on the enemy positions was obtained in many places. The fighting on both sides was of the fiercest character, and the constant bringing up of fresh troops kept the tension at high pitch throughout the whole operation. The difficulties of supply, transport, communications, and evacuation of casualties were increased for the Allies the further they advanced, because, although their artillery fire had done its work effectively, it had at the same time destroyed the roads and other routes. After three days' fighting a 16-m. breach was made in the Ger. line, such places as Montauban, Mametz, Fricourt, and La Boisselle falling into Brit. hands. On July 7 the Leipzig redoubt was captured, and four days later Contalmaison and Trônes wood fell. The attack was renewed on the Bazentin-le-Petit and Longueval front a few days later: then on July 16 Ovillers was captured and the Australians stormed Pozieres on the 23rd. A few days afterwards Delville wood (q.v.) was captured, and on the 27th, after a tremendous effort and at great sacrifice on both sides, the first phase was concluded with the capture of Longueval. The Allies had broken through the first and second Ger. defensive systems, and between the Ancre and the Somme the allied line formed a great salient to the N.E.

The second phase began with an advance by the Fr. on the Somme coupled with determined efforts by the Brit. to improve their tactical position near the Ancre, about Thiepval and Pozieres. The strenuous resistance of the Gers. had stopped the advance at this point, thus making a sharp angle in the Brit. line and also preventing the use of the Albert-Bapaume road. Moreover, guns at this point could enfilade the new Brit. line

about Bazentin and Longueval, so that a rectification here was essential to any advance further E. The highest point of the ridge had not yet been reached, so that visibility from the ground was still somewhat restricted, and although the Allies had gained the supremacy of the air in this region, security could not be assured until the ridge was wholly in their possession. A general advance was made by Brit. troops from Guilleumont to Thiepval on Aug. 18. From the outset the fighting was desperate, particularly round Guilleumont, which did not fall until Sept. 3. On the left of the line the Gers. tenaciously defended Thiepval, and many heavy counter-attacks were launched in their anxiety to hold this position at all costs. Ginchy was also the scene of much bloodshed, but eventually, the Brit. advance prevailed, and the place was captured on Sept. 9. Being now in possession of Guilleumont, Ginchy, Delville wood, and Longueval, the Allies were on an equality with the Gers. from the standpoint of visibility and in a position to command Combes on their right and enemy positions about the Albert-Bapaume road on their left. The Fr. had, in the meantime, gained Cléry and Le Forest, and were winning back from the invaders their own ter.—a fact which heightened the morale of the troops. The Ger. resistance, however, N. of the Ancre was still not only sustained, but most costly to the attackers, who, in consequence, suspended the advance in this area.

The third phase commenced on Sept. 15 with an advance on a 6-m. front from Ginchy to Courcellette. It was on that day that tanks were first employed in battle, and, speaking generally, they proved a failure at this stage of their development largely through foundering in the mud. They came, however, as a complete surprise to the Gers. although their construction and trial had been proceeding for some months previously. But if their performance on this occasion did not fulfil the expectations of those who, in the teeth of opposition, had advocated their manufacture, they gave great assistance to the infantry by breaching up machine-gun nests and small posts which either had not been or could not be touched by artillery fire. This advance once launched it was found that the Ger. resistance was weakening; for many batches of prisoners were taken without a fight. On the left the Gers. were still holding stubbornly to Thiepval, but even here cracks were becoming noticeable in the defence, and when Pozieres fell, and the victorious Brit. troops advanced beyond it, threatening Thiepval from the E., the Ger. line broke. On the right Combes was gradually becoming surrounded by the Brit. on the N. and the Fr. on the S., and by Sept. 26 the Fr. were in possession of the place. By the end of July the very definite angle at Thiepval had been flattened out, and the Allies' line ran along the lower N. and E. slopes of the ridge, so that their tactical objective had at length, but at great cost, been gained.

Battle of the Ancre.—In Oct. and Nov.

further offensive operations were undertaken by the Allies in order to realise more fully such advantages of position as were gained in the Somme battle. As previously stated Sir Douglas Haig could make little impression on the Gers. N. of the Ancre, about Gonnecourt and Beaumont Hamel. He now decided to advance in this particular area—an operation known as the battle of the Ancre (q.v.). The Ger. defences, which had proved so formidable when tested the previous July, had been further improved as a result of experience gained in the course of the Somme battle. The Brit. began operations on Nov. 11 with two days' terrific bombardment, and on the 13th captured their first objectives. Steady progress continued to be made until bad weather brought the operations to a close on Nov. 19, by which time the Brit. line ran E. from N. of Beaumont Hamel and to near Grandcourt, Le Sars, Gneudecourt, and Sallv-Saillvel, where it joined the Fr. whose line ran S. to just N. of Péronne.

In contrast with 1915 the year 1916 ended on a note of optimism and confidence for the Allies. Their successes at Verdun and on the Somme, albeit costly and, in the nature of modern warfare, inconclusive, had, in the far towards establishing a definite superiority over the Ger. war machine and to hold out a prospect of ultimate victory.

Marshal Joffre Superseded.—In Dec. 1916 it had been agreed that in view of the appreciable gains on the Somme the Gers. should be given no rest throughout the winter and that the Somme battle should be 'continued' in Feb. 1917. Marshal Joffre advised that the Brit. troops should, in such event, be required to take an even larger share in the operations than heretofore. When this advice became generally known in the Fr. Army it provoked resentment, being interpreted as an aspersion on their valour, in the sense that the honour of taking the major part in military affairs in their own country was thenceforward to pass from the Fr. to the Brit. Army. The extreme tension in France at this time, coupled with the fact that the Fr. Army is never divorced from politics, affords an explanation of the readiness shown by many Fr. politicians during these deliberations to criticise Joffre's leadership and in that regard to find in this, his latest expression of opinion, grounds for discontent which they were not slow to exploit. The upshot was his supersession on Dec. 16 by Gen. Nivelle, who had become a popular figure by reason of his success at Verdun. That the moment was opportune for the resumption of the Somme operations would seem evident from the statement of von Ludendorff that the Gers. 'were completely exhausted on the Western Front' after the Somme battle, and were 'in urgent need of a rest' (*War Memories*). At the Ger. headquarters there was apprehension lest the battle should be renewed at points which would give them no time whether for recuperation or for the accumulation of material.

But although, as already stated, it had been agreed among the allied commands that the enemy should be given no rest throughout the winter, this agreement was now ignored. The relations indeed between the allied higher commanders were not at this time the most cordial. Nivelle had prepared a plan which presupposed that Haig should be placed under his orders. To his astonishment Haig found that this plan had been acquiesced in by the Prime Ministers of both Great Britain and France. It was, however, eventually agreed that the Brit. Army should be 'regarded as allies and not subordinates by Nivelle.' This agreement was not reached until the middle of March, with the result that the enemy obtained the respite of which he was in such sore need. During this valuable interval the Gers. had been preparing a new defensive system from La Fere on the R. Oise to Arras on the R. Scarpe—a line which gained notoriety among the troops as the Hindenburg line (q.v.). This new line was some miles in rear of the area covered by the Somme offensive of 1916, a point which is to be borne in mind in the light of subsequent events, and particularly Nivelle's supersession by Pétain.

1917. German Retreat to the Hindenburg Line.—The operations on the Ancre, which were brought to a close in Nov. 1916, were opened again in Jan. 1917. The Gers. fell back from the commencement, and Gen. Sir Hubert Gough (q.v.), who was in command of the Brit. troops in this area, ordered the attack to be pursued with all possible speed. On Jan. 11 the Brit. captured a spur N.E. of Beaumont Hamel, which enabled them to command the entire Beaumont valley and the W. slopes of the spur beyond the valley, from Grandcourt to Serre. Operations were at once begun to clear the remainder of the valley S. of Serre hill, and to push the line forward to the crest of the spur. On the night Feb. 3-4 an important Ger. line on the S. slopes of this spur, forming part of the enemy's original second-line system N. of the Ancre, was captured after desperate fighting, and by Feb. 5 Gen. Gough had gained his objective. On Feb. 7 the Gers.' great withdrawal to the prepared Hindenburg line began. In some cases the were evacuated without any fighting, but in others key positions were defended with the enemy's usual tenacity. By Feb. 17 Miraumont, N. of the Ancre, and Ballecourt farm, S. of the riv., were taken. On Feb. 25 the Gers. fell back about 3 m. on an 11-in. front, leaving Serre, Pys, and Warlencourt in Brit. hands. On Feb. 28 the strong Ger. pivot of Gonnecourt was captured. By March 10 the important position of Irles fell, and three days later the enemy abandoned his main defensive position on the Bapaume ridge. Here the Brit. drove in his rearguards and occupied Gréville and Loupart wood. Bapaume fell on March 17, and by the 18th the Gers. were in full retreat from Soissons to Monchy. A rapid Brit. advance gave them Nesle, Chaulnes, and

Péronne, while further S. the Fr. captured Damery and Noyon. The Ger. retreat was a confession of defeat and of inability to withstand the allied artillery, which had now gained a definite ascendancy; but all the arts of the propagandist were employed in Germany to interpret the retreat as the most masterly of strategic movements. The methods of destruction which accompanied the retreat betrayed the characteristic savagery or ruthlessness of the Ger. military doctrinaires. Almost every building and tree was destroyed; mines and every kind of death-trap were prepared with inhuman ingenuity. Such devices delayed the pursuit, and it was not until the allied armies had reached the Hindenburg line, and the pressure became general, that they could develop plans for the future conduct of the campaign.

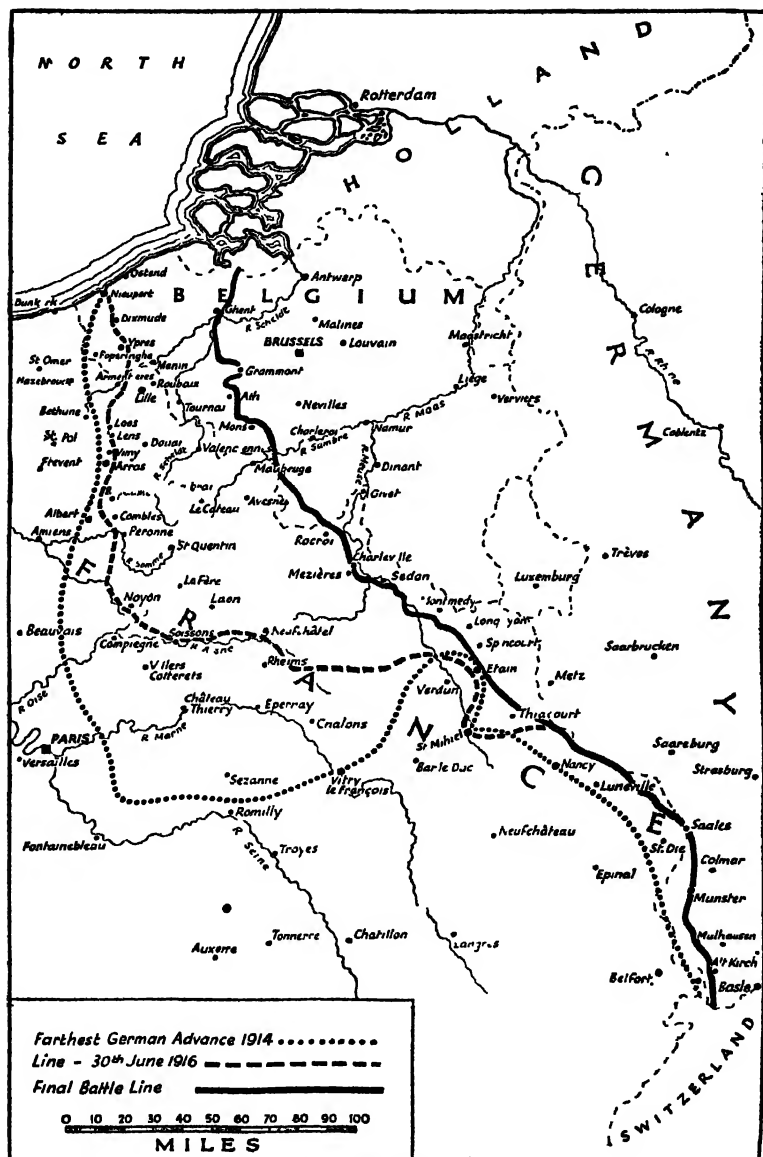

In Nivelle's original plan for an offensive he had allotted to the Brit. forces a front which included the area from which the Gers. had withdrawn. It was naturally expected that the Ger. retreat would necessarily profoundly modify this original plan; but Nivelle decided to make no change. This decision raised misgivings over his capacity for leadership and, coupled with his failure to break through with the Fr. Army on the Aisne between April 16 and 20, practically decided the Fr. Gov. to supersede him. This was effected on May 13, when Pétain became commander-in-chief of the Fr. Armies. At this time the morale of the Fr. troops was not at its highest: the failure on the Aisne had brought about widespread dejection; defeatism (see *CALLAIX*; *EUROPE*; *MALVIN*) was preached everywhere, and mutinies broke out in sev. places. Pétain set to work to eradicate these evils, and through manifest defects in the Ger. military intelligence their existence was never suspected at Ger. headquarters. In order to keep the Gers. occupied while the reconditioning of the Fr. Army was in progress, Gen. Haig was asked to continue the battle of Arras, which had been commenced on April 9 (see *AURAS*, *BATTLE OF*).

Battle of Arras.—The battle of Arras had for its purpose the removal of pressure on the Fr. in Champagne, so that Nivelle's plan for breaking through the Ger. line could be accomplished. The original objectives were the Vimy ridge and Douai. The ridge was brilliantly captured by the Canadian troops and, generally, the advance was successful at all points during the first few days. The bitter struggle for Lens opened on April 14, the environs being reached only after the sternest fighting. After a short pause the battle was resumed on April 23, on both sides of the Scarpe. E. of Arras. Here the pressure increased owing to the bringing up of Ger. reserves. Progress E. of the Vimy ridge was also made between April 28 and May 3. On the latter date, following a great spurt, the Canadians captured Fresnoy. By the beginning of July the Allies' line had been advanced in this region to just W. of Lens, thence S. to Chérisy. The battle of Arras had already begun on June 7,

the signal for which was the explosion of nineteen huge mines under the Ger. line. Gen. Plumer's Second Army carried out the attack, which was launched at 3.30 a.m. The Messines-Wytschaete ridge was stormed, and, before noon, both Messines and Wytschaete were captured. In the afternoon Oosttaverne was taken, together with its rearward defences over a 5-m. front, and some 5000 prisoners. Further progress was made on June 12 E. and N.E. of Messines.

Third Battle of Ypres.—*Passchendaele.*—On July 31 a series of operations commenced known as the third battle of Ypres, which had for their primary purpose the driving of the Gers. from their bases on the Belgian coast so as to thwart their submarine campaign. The secondary purpose was to ease the pressure on the Fr. further S. Progress was made S.E. of Ypres, and particularly on the N., where St. Julien and Pilckem were captured, thereby depriving the Gers. of the ridge from which they commanded Ypres. After the first onset, however, bad weather set in, which made movement impossible. The attack was resumed on Aug. 9, and in the first week the Brit. captured Langemark. The Fr. troops on the left had also made some progress and had captured Graschten. General progress continued E. and N.E. of Ypres until Aug. 27. Three weeks later the battle was resumed along the Menin road, and particularly heavy Ger. counter-attacks were repulsed on Sept. 22. A few days later the Brit. cleared Polygon wood and stormed Zonnebeke. Again the Gers. heavily counter-attacked, but were repulsed with the heaviest losses. On Oct. 4 another push was made from E. of Ypres to Langemark, where all tactical objectives were gained. On Oct. 9 a great combined Franco-Brit. attack was made N.E. of Ypres between Passchendaele and Houtulst forest. The Canadians gained the rising ground S. of Passchendaele by the 20th, and the Fr. advanced along the Bixchoot-Dixmude road and captured Luyghem. After very gallant fighting the Canadians captured Passchendaele on Nov. 6, and the protracted battle closed with the Franco-Brit. positions well advanced N., E., and S.E. of Ypres. Over 20,500 prisoners were taken, together with 55 guns.

British Attack at Cambrai.—The Gers. were given very little respite before the Brit. Third Army, under Gen. Byng, attacked them on Nov. 20 near Cambrai. The Gers. had at this time been pressing hard on the It. front with troops drawn from the W. front, and the battle of Cambrai was designed to stop the transfer of Ger. troops to that front. The battle is particularly noteworthy for its novel opening, in that the usual artillery bombardment was dispensed with, tanks being employed instead (see *CAMBRAI*, *BATTLE OF*). This new method had the advantage of not apprising the enemy beforehand at what point or when the attack was to be made. This revolution in tactics was completely successful, and a deep penetration was made into the

FRANCE AND FLANDERS, 1914-18

strong Ger. positions for 5 m. on a 10-m. front. The prisoners taken numbered over 10,000. Among the places captured were La Vacquerie, Fleesquères, Marcoling, Havrincourt, Graincourt, Anneux, and Ribécourt. The next day the Brit. line was advanced S. and S.W. of Cambrai. The important position of Bourlon wood still remained in Ger. hands, and owing to its strategic value, in dominating as it did the battlefield in this area, its capture was of the first importance. Hence on Nov. 23 a large number of tanks, supported by infantry, were launched against it, and by nightfall it had been taken, although the vil. still remained with the enemy. Heavy Ger. counter-attacks, however, succeeded in regaining Bourlon wood for the enemy, and the Brit. were withdrawn to a less exposed line. Over 11,000 Ger. prisoners and 145 guns were taken, the Ger. casualties being in the neighbourhood of 100,000.

Results of 1917 Campaign.—Thus ended the year 1917 on the W. front, where the allied armies had not only made deep inroads into the Ger. line, but far deeper into their man-power. Nevertheless, owing to the Russian Revolution and the elimination of the Russian armies as a fighting force, the Gers. were rapidly building up their forces on the W. front with accessions of troops from the E. France had reached the limit of her reserves, and Great Britain was approaching that point. The U.S.A. had, however, declared war on Germany, and it was to this source that the Allies looked with confidence for that necessary increase of strength which would bring the war to a victorious conclusion. The control of the war on the Allies' side entered a new era when, as a result of the defeat of the Its. in Oct. 1917 (see CADORNA; CAPORETTO), a conference of allied ministers took place at Rapallo on Nov. 8, at which it was decided to set up a supreme war council at Versailles with military representatives to advise it. Gen. (later Marshal) Foch was appointed president of the military representatives, and was given executive power. Difficulties, however, arose at once, as the new council was not popular with the commanders-in-chief. The Brit. were asked to take a larger section of the front from the Fr., and, in spite of protests from Sir Douglas Haig, the Brit. front was increased.

1918. German Preparations for Final Offensive.—As in the winter of 1916-17, so now a change of command brought misunderstanding and delay in offensive action, during which interval the Gers. were preparing for their great and final offensive in the spring of 1918 on the W. front. Their most important consideration was at any cost to defeat the Allies before the Amer. troops arrived to reinforce them. As early as Nov. 1917 Ludendorff had decided that 'the British must be beaten' and schemes were formulated to achieve that end. The most extraordinary precautions were taken to ensure secrecy, for success depended on surprise. No change was made in the troops holding the front nor were they told of the pro-

jected offensive. Troops for the assault were assembled well in rear of their line, and all large movements were carried out at night. A number of officers were detailed for the special duty of ascertaining from aircraft whether any signs, common to preparations for an offensive, were likely to be observed by the Allies. In this they were aided by weather conditions, which were such as to preclude the taking of photographs from the air for some weeks prior to the launching of the assault on March 21, 1918. On this day the Gers. attacked on a wide front from La Fère on the S. to Arras on the N. They employed over sixty divs., two-thirds of which were opposed to Cough's Fifth Army, which was covering Amiens, the remainder being launched against Byng's Third Army, which prolonged the line northward. The Fifth Army was widely strung out, and being opposed by such overwhelming numbers, was forced to withdraw. On the other part of the front the Gers. met with such obstinate resistance that little progress was made.

Second Battle of the Somme.—The Gers. attacked in massed formations, and their casualties were on a colossal scale. Before the offensive had opened the Brit. and Fr. commanders-in-chief had come to an agreement that if one were attacked and not the other, the latter would send reinforcements to the former. Although the attack was launched with the object of 'beating the British,' Ludendorff changed the whole plan as soon as he learned that his Eighteenth Army (von Hutier) had gained a tactical victory over the Brit. Fifth Army, which was in touch with the Fr. He now wished to exploit this victory and separate the Brit. and Fr. Armies by driving in a wedge between them. He proposed to do this by rapid advances on both sides of the Somme. He ordered the Fourth, Sixth, and Seventh Armies to attack the Brit. N. of the Somme 'in order to drive them into the sea'; and further ordered that, 'S. of the Somme, the operation was to be carried out offensively against the Fr. by a wheeling movement into the line Amiens-Montdidier-Noyon, followed by an advance south-westward,' direct on Paris. Whilst the Allies were thus being separated the Ger. Second Army was to march on Amiens on both sides of the Somme. In view of the threat to Amiens, it was found impossible for Pétain to carry out his promise to Haig, although the latter was heavily attacked on a 50-m. front. This lack of co-ordination between the Fr. and Brit. in their efforts to resist the Gers. was calculated to lead to the most serious consequences, and it was in these circumstances that Foch was given the necessary powers to co-ordinate these operations. He at once began to exercise his personal influence over the various commanders, and to such good effect that the Gers. were brought to a standstill on the line Oise-Arras by April 4, and touch between the two armies was maintained. This masterly strategy unquestionably retrieved a most menacing situation. Before this date, however, the original scope of the

Ger. attack had been widened again so as to include the terrain as far S. as the Aisne. In this connection it may be noted that Gen. von Kuhl, in a report to a committee of inquiry set up by the Ger. Gov., says categorically: 'The offensive power of the Gers. was no longer sufficient for all these tasks, as was soon proved.'

The Battle of the Lys.—The Threat to Amiens.—The second Ger. offensive was launched against the Brit. on the Lys. For some time it had been apparent that an attack was in course of preparation in this area, the evidence being gathered mainly from air photographs. According to Gen. von Kuhl the ultimate decision to attack at this point was not made until April 1. Final intimation of the coming blow was not received until April 7, when, through a Ger. prisoner it was learned that the attack was timed to commence on April 9 (Ludendorff's birthday), which proved to be the correct date. This warning was very opportune to the Brit., for it gave them time to move their reserves into a selected position. Compared with the first or Somme offensive it would seem that the Ger. high command did not intend this later offensive to be on so large a scale, as they employed only seventeen divs. Prince Rupprecht was in command, his objective being Armentières in the Ypres sector, as a stepping-stone to reaching the Channel ports. It was therefore essential for the Brit. to defend a *outrance* every foot of ground. The Ger. pressure was, however, as overwhelming as in their first offensive, and gradually they gained ground, although at great cost. One very important gain was Kemmel hill, which they took on April 25, but all attempts to pierce the Ypres defences were vigorously repulsed. Further S. the Gers. made desperate efforts to reach Amiens, but their way was barred at Villers-Bretonneux by the Australians, who fought with great gallantry. At Givenchy and Festubert, on the left of the Lys offensive, the Gers. suffered a severe reverse. In his memoirs Ludendorff significantly states: 'On the left at Givenchy and Festubert we were held up. The result was not satisfactory.' This occurred on the day the offensive began. On the Brit. side this part of the line was held by the 5th (W. Lancashire) Div. of territorial soldiers, and the attacking troops were the 4th Ersatz Div. The tactics employed by the Gers. were those of the successful infiltration type. A divisional order of the Gers. stated that their artillery would prevent the Eng. from using their reserves. It also contained some contemptuous observations on the fighting qualities of the Brit. troops holding the line, by way of stimulating the attacking troops. However, in the result not a yard of the Brit. position was lost, whereas over 750 Ger. prisoners and seventy machine guns were taken. The Ger. reserves were crowded three-deep in trenches just in rear, and these were killed almost to a man by Brit. artillery. Fresh reserves sent up in support could not find cover in the trenches already filled with their dead comrades, and so met the same fate above

ground. So confident of success had the Gers. been that they had their bands with them, and musical instruments littered the field for weeks afterwards. The Brit. had held their ground by small self-contained posts, organised for all-round fire with intervals well laced with barbed wire. Independent platoon counter-attacks had completed the Ger. confusion. This system of defence was found to be the most effective counter-move to the Ger. system of infiltration tactics. As a set off against this disaster the Gers. had occupied the Messines-Wytschaete ridge and the outskirts of Armentières and Meriville. It was during these fateful operations that Sir Douglas Haig issued his famous order: 'Words fail me to express the admiration which I feel for the splendid resistance offered by all ranks of our army. With our backs to the wall, and believing in the justice of our cause, each one of us must fight to the end.' Foch had been made commander-in-chief of the allied armies in France and Flanders on April 14 with power to direct their strategic movements, but not their tactical handling. During the third week of April the Ger. supply system became faulty, and Prince Rupprecht asked for permission to break off the battle, to which Ludendorff agreed. It was later discovered that Ludendorff was losing heart because 'the second grand attack had not brought the hoped-for decision.'

Final German Offensive Ended.—On April 30 all movement came to a standstill. In March and April the Brit. Army had suffered terrible losses, their casualties amounting to 303,000, including over 28,000 killed. None the less, Foch's confidence in the Brit. Army remained unimpaired.

The third phase of the last Ger. offensive of the war was now being considered. Ludendorff was still of opinion that the Brit. must be beaten, but he could not do this until the allied reserves had either been destroyed or attracted elsewhere. It was therefore decided that the Fr. should be attacked by the Crown Prince William on the Chemin des Dames (q.v.) in order to draw off the allied reserves from the Brit. front. In the operation order of May 1 Ludendorff stated: 'The object of the attack is to loosen the present united allied front opposed to Crown Prince Rupprecht's group of armies and to create thereby a renewed possibility of a successful continuance of the offensive against the British.' Although the Gers. had plenty of ammunition, they were feeling the want of men both in quantity and quality. Thirty divs. took part in this attack, twenty-six of which had already been employed in previous assaults. The attack opened on May 27 between Rheims and Soissons. It took the Fr. entirely by surprise, and was completely successful, penetration being made on an 18-m. front, and within a few days the Marne was reached between Dormans and Chateau Thierry. Designed merely as a diversion, it had become a great battle. It was, however, brought to a standstill on

June 5, but not until it had, in the words of von Kuhl, 'gone fatally too far,' for nothing more than a great salient had been created in the Ger. line. They had, however, captured 50,000 Fr. prisoners and 500 guns. On June 9 the Gers. launched an attack against Metz, but owing to stubborn resistance it soon subsided.

The topographical result of these offensives of 1918 was the creation of deep salients in the Ger. line, and there were divided counsels at Ger. headquarters regarding the further action to be taken. Some thought it advisable to go back to the positions held before the first offensive on March 21, but before any scheme could be finally decided the Allies had seized the initiative and launched the counter-offensive which brought the war to a close.

The Final Allied Offensive or Advance to Victory (July 15 to Nov. 10).—In the great allied offensive battle of 1918, or rather series of battles, two periods may be distinguished: the first (July 15–Sept. 26), during which the allied high command baffled the enemy's attacks, began to strike in its turn, and forced the enemy to put himself on the defensive; the second (Sept. 26–Nov. 10), when the Allies passed to the general offensive, hit the enemy without respite on the entire front from the sea to the Meuse and so exhausted him that he was compelled to ask for an armistice in order to escape the disaster which the next succeeding attack would have brought on him without hope of being in a position to reply.

The first period comprises the second battle of the Marne; the battle of Picardy. The second, the battle of Champagne, the battle of Cambresis, the battle of Flanders.

The nomenclature of these battles is that of the Fr. general staff. In Eng. records the prin. battles fought during this period by the Brit. Armies are known as the battle of Amiens, Aug. 8–12; battle of Bapaume, Aug. 21–31; battle of Arras, Aug. 26–Sept. 3; battle of Epéhy, Sept. 18–19; battle of Cambrai–St. Quentin, Sept. 27–Oct. 10; battle of Ypres, Sept. 28–29; battle of Courtrai, Oct. 14–31; battle of the Selle, Oct. 17–25; and the battle of Maubeuge, Nov. 1. The last Ger. offensive, as already indicated, was in the middle of July, when the Gers. began an assault on the Fr. on a front of 55 mi. E. and W. of Rheims, their right wing operating on the line of the Marne. From the Fr. side the right of the attack stretched from the vil. of Prunay, E. of Rheims, to the hills known as the Malu de Massiges, just W. of the Argonne forest in the Champagne. The left extended from Fossey vil., S. of the Marne and E. of Château Thierry, to Coulommès vil., S.W. of Rheims.

As far back as June 12 the rush of the Ger. Armies on Villers-Cotterets on the one side and on Compiègne on the other was stopped. But everything led the high command to suppose that the enemy, after a period of rest for reconstituting his reserves and supplies, would undertake a fresh and powerful effort. Foch

was of the precise strength of the Ger. Army, to follow its progressive wastage, and to adapt his decisions according to the enemy's situation. At the end of June the Ger. Army was estimated to comprise a total of 207 divs.: 130 in line, seventy-seven in reserve, of which thirty-one were fresh, twenty-six reconstituted and twenty fatigued. It was at first believed that the enemy would attack on the Brit. front, and that the attack would be before the beginning of July; but by July 10 it was clear that the prin. assault would be in Champagne. The Fr. Army, reinforced by divs. of young Amer. soldiers, awaited in confidence the expected attack, and Foch already saw in the 'attack for Rheims' a favourable occasion for turning to the offensive.

From the opening days of July Foch decided to deliver a counter-attack on the front between the Aisne and the Ourcq, this counter-attack to be combined with a second attack on the opposite side of the Château Thierry 'pocket', some to close this pocket, or at all events to compel the enemy to evacuate it. At the same time a counter-offensive in E. Champagne was contemplated, to be delivered on the E. flank of the main Ger. attack in the event of the Gers. making progress southward. With this end in view, forces were concentrated to the S. of the Argonne. On the same day that the Ger. divs. set out towards the starting points of their assault, allied divs. were concentrating to attack them in flank. This was the first time the Allies had acquired the initiative over the Ger. command. Thenceforth they kept it throughout.

On July 11, of the eighty-one divs. of the enemy thirty were disposed behind the troops in the sector from Château Thierry to the Argonne; and on the morning of July 15 they too combined in the assault.

In the Champagne the Ger. attack gave way in front of the foremost Fr. positions; between Rheims and the Marne it was repulsed in front of the second positions; to the S. of the Marne it secured a foothold on the heights between Jaulgonne and Dormans, forming a pocket from 6 to 8 kms. in depth. Throughout July 16–17 the enemy's whole effort was directed towards Epéhy; but, counter-attacked without cessation, the Gers. could make only slight progress. From the evening of July 17 their advance was completely held up. Instead of breaking the Franco-Amer. front and forming a vast pocket in Champagne and Brie, the enemy's attack resulted in nothing better than tactical successes of a purely local character, successes which in no way compensated him for his heavy losses. Moreover, the situation, as a whole, of the Fifth and First Ger. Armies, was not improving; the troops which had crossed the Marne were in a precarious situation; for they were threatened with the chance of being flung back across the riv. at any moment, while their supplies could only be brought up over bridges which were being incessantly pounded by the allied artillery and airmen.

The French Offensive begins on the Marne.—On July 18 the Ger. command began to be conscious that they were defeated. It was at this precise moment that Foch launched the offensive with the Tenth and Sixth Fr. Armies. (The enemy was fearful of this offensive and there are in the possession of the Fr. general staff numerous documents establishing this apprehensiveness.) The Tenth Army at one rush reached the approaches to the road from Soissons to Château Thierry. The result of this success was that the knot of roads from Soissons, the branch railroads from Nassy-sur-Aisne over which

were continually compelled, by reason of the extraordinary tenacity of the allied attacks, to engage new units. From July 18 the high command had to call for reinforcements from all parts of their front—Gen. Gallwitz had to dispatch three divs. and the crown prince of Bavaria six. This was not sufficient, for the tired divs. which had delivered the attack in Champagne on July 15 were called upon for a fresh effort, while orders were given to countermand the attack projected against the Brit. in Flanders. (This appears from a secret order of the Fourth Ger. Army dated July 22.)

Topical Press

LORD HAIG, GENERAL WEYGAND, MARSHAL FOCH, AND KING GEORGE V.
ON A VISIT TO THE BATTLEFIELDS AFTER THE WAR

were passing the supply columns for the masses of enemy troops congested in the Aisne-Marne loop, fell under the fire of the Fr. guns. The Fifth Army, assisted by the 11. Army Corps, took up the offensive between the Marne and Rheims, in liaison with the operations of the Tenth and Sixth Armies. Thus both flanks of the enemy's line were shaken, and the Ger. high command saw that they could no longer engage battle in the pocket, where their communications were threatened. Yet the exigencies of the conflict compelled them to fling fresh divs. into it every day. Thus the Ger. command, who but four days previously were rushing to the attack, found themselves constrained to submit to the will of their adversaries, and, in these circumstances, ordered the retreat.

The Beginning of the German Retreat from the Marne.—The retreat was slow and methodical, but was very costly, by reason of the fact that in order to save the great accumulation of material and stores between the Marne and the Aisne the Gers.

On July 19 the Gers. had recrossed the Marne. Before the incessant attacks of the Fr. and Amer. troops they were falling back by the 27th on the Oureq; and on Aug. 4 they were on the Vesle. Things had therefore gone directly contrary to the Ger. plans. The Ger. front, instead of forming a threatening salient in Champagne and Brié, had been pushed back on the Aisne and Vesle; while the Fr. reserves, far from being employed exclusively in stopping up the gaps in the allied front, had assumed a brilliant counter-offensive; and only a very small part (two divs.) of the Brit. reserves had up to this time been employed in the battle. The reserves of the Bavarian crown prince, on the other hand, were perforce rushed down precipitately from Lille towards the Aisne. Finally the Ger. command had to renounce its cherished plan of an offensive in Flanders, and it was thenceforth open to the Allies to assume the initiative in a new battle between the Oise and the sea.

The Battle of Picardy.—Marshal Foch, in order to retain the initiative and to

leave the enemy no opportunity of recovery, perfected his plans for delivering separate attacks in as rapid succession and with as large an element of surprise as possible, to the end that he might bring about the progressive disorganisation of the enemy's armies—and to continue in this manoeuvre until such time as he should order a general attack upon the whole Ger. front. Having verified the fact that, as from July 12, the enemy was maintaining in line between the sea and the Oise tired troops of poor quality, Marshal Foch meant to derive every advantage from this weakness by undertaking important offensive actions; and he accordingly directed the attention of F.-M. Haig to the Festubert-Robecq front, an attack on which would allow of the liberation of the mining basin of Bruay. He planned, in addition, a joint and simultaneous operation by the Fourth Brit. Army (Gen. Lord Rawlinson) and the First Fr. Army on the Amiens salient in order to free the Paris-Amiens railway; and finally he arranged for the Amer. attack for the flattening out of the St. Mihiel salient. So that the counter-offensive of the Marne was hardly organised and set in motion before three other distinct operations, each on a large scale, were in course of preparation.

On July 23 the Fourth Brit. and First Fr. Armies attacked on a 15-m. front astride the road from Amiens to Roye and between Albert and Moreuil. In forty-eight hours they had advanced over 10 m., reached the outskirts of Chaumes and Quesnoy and were threatening to outflank the Eighteenth Ger. Army from the N. On Aug. 10 the Ger. Army began to fall back on the 1917 positions between Chaumes and the Oise, but, surprised by a sudden attack by the Third Fr. Army, it executed the movement in disorderly haste. By Aug. 15 the Ger. troops were back once more in their 1917 positions on the Chaumes-Ribécourt front, and thus, within the space of a month, the Allies had reduced the two biggest salients of the enemy's line—the one towards Paris, the other towards Abbeville—the two great objectives of the Gers. in 1918.

A serious drain had now been made on the Ger. Armies, but the Amer. Army was not ready to attack at full strength. Hence Foch, instead of pressing the Albert-Oise front, where the enemy had not been sufficiently shaken in his solidly organised positions, carried the attack on the Ger. wings and notably on the N. wing, where the enemy's reserves were known to be diminishing. Whilst the First and Third Fr. Armies were tenaciously engaging the enemy to prevent him from drawing men from his centre, the Tenth Army was ordered to attack in the direction of Chauny so as to outflank the massif of Noyon-Guiscard-Tergnier, the Third Brit. Army (Gen. Byng) prepared to attack in the direction of Bapaume and Péronne to outflank the Somme defences and constrain the enemy to a more accentuated retreat; and the First Brit. Army (Gen. Horne) was to attack still further N. Between Aug. 18

and Sept. 20 these three attacks were all in full motion. As to the first, by Aug. 26 the Tenth Fr. Army had reached the Oise and Allette Rts.; the Brit. Armies had broken the Ger. front between Croisilles and the Somme; and the Eighteenth Ger. Army was falling back on the Canal du Nord. As to the second, the Tenth Fr. Army, crossing the Allette, had reached the Hindenburg line, and the enemy was withdrawing to the Aisne. The Brit. First Army in the space of 48 hrs. had carried the Drocourt-Quéant (q.v.) switch, and, by rendering the Siegfried line untenable, compelled the Gers. to retreat between Arras and the Oise towards the Hindenburg line. As to the third, which began on Sept. 18, the Third and Fourth Brit. Armies, supported by the First Fr. Army, carried the outposts of the Hindenburg line, between Cambrai and St. Quentin, and gained their point of departure for the next attack on that celebrated line of defence. Finally, while these last phases of the battle of Picardy were in progress, the Amer. Army in the West had brilliantly executed its first big attack, reducing the entire St. Mihiel salient between Sept. 12 and 15 (see also ARGONNE).

General Offensive of the Allies.—The Battles of Champagne, Cambresis, and Flanders (Sept. 26 to Nov. 10).—Marshal Foch, from the end of Aug., concluded that the time was approaching when the disorganisation and fatigue of the Ger. Armies were such that a general attack would bring about their final defeat. He therefore planned three great converging attacks, to be begun simultaneously or at all events at intervals of a few days only. These were (1) *In Flanders*, where the attenuation of the Ger. line from the Lys to the sea, their fatigue and lack of reserves, were offering a favourable situation for exploitation by the Allies. This operation, begun by the Belgian Army supported by Fr. and Brit. divs., had for its first tactical objective the capture of a *point d'appui* or starting point, by carrying the front Clerken forest-Houthulst ridge-Passelun ndaleu-Gheluvelt-Comines; and, for its second objective, to follow this up at once by an attack on Bruges to free the coast, and, by another attack eastward in the direction of Thiliet and Ghent. (2) A central operation in which the Brit. Armies and the left of the Fr. Army should attack in the direction of St. Quentin and Cambrai, in order to force the Hindenburg line before the enemy should have time to organise, while simultaneously the Fr. centre should carry on energetic operations to drive the enemy beyond the Aisne; and (3) an operation in the Argonne in the direction of Mézières, in which all the available Amer. troops should attack between the Meuse and the Argonne, supported on the W. by the Fourth Fr. Army, which later should attack between the Argonne and the Souain road.

The various attacks comprised in this general plan were to set aflame at least two-thirds of the Ger. line on the entire front from the sea to the Meuse, and they

were to begin about Sept. 25. In fact the battle of Champagne began on Sept. 26, and after a struggle lasting a week the enemy was compelled to fall back on the Aisne and the Aire, which latter positions were reached by the Allies on Oct. 12. The battle of Cambrai began on Sept. 27; the First and Third Brit. Armies attacked in the Cambrai region; and on Sept. 30 the battle had extended as far as the Oise by reason of the coming into line of the Fourth Brit. and First Fr. Armies. By Oct. 9 the Second and Eighteenth Ger. Armies had lost the Hindenburg line—a line which their leaders deemed impregnable—and were forced to fall back on the whole front between Douai and St. Quentin, and take up new positions behind the Selle R. and on the Bohain-Bernot line. While these two armies were falling back the Seventh Ger. Army further S. was evacuating the massif St. Gobain-Laon, which, as a result of the allied advance in Champagne and Cambrai, now formed a vast salient, and was retreating to the Serre and taking up positions beyond the Sissonne marshes. (These positions were known as the Hindung line.) This movement was followed by a fresh retreat by the Second and Seventeenth Armies, which, hard pressed by Franco-Brit. attacks on Oct. 15 and 19, were retreating across the Oise and the Sambre Canal. The battle of Flanders, begun on Sept. 28, gave the Allies the hills to the E. of Ypres and threw open in two days the Roulers-Menin road. After a short interval it was resumed on Oct. 14 and from the 17th the enemy was compelled in the N. to evacuate the whole Belgian coast and fall back on the Terneuzen Canal, and, in the S., to evacuate the regions of Lille and Lens and to retreat to positions beyond the Scheldt and the Canal du Nord.

In short, between Oct. 10 and 20, the enemy's retreat had become general on the whole front. Foch, with the full knowledge that the wastage and exhaustion of the enemy were such that he could not for any appreciable period of time resist an attack of any importance, gave orders for a prompt renewal of the general offensive from the sea to the Meuse so as to dislodge the enemy from his last defensive organisations (viz., the Hindung and Hermann defences and those of the Lys). On this line Foch calculated that the final battle would be fought. Accordingly simultaneous and converging attacks by the Allies—namely, by the Belgians and Brit. in the direction of Brussels, by the Brit. between the Sambre and Scheldt, by the Fr. Armies in the direction of Liège, and by the Franco-Amer. Armies in the direction of Mézières and Sedan, began early in Nov.—forced the enemy line into a general retreat between the Scheldt and Meuse. On Nov. 9 this retreat had stretched northward, and the enemy was abandoning the course of the Scheldt between Oudenarde and Tournai. So that on Nov. 11, the day of the Armistice, all the Ger. Armies between the sea and the Meuse were in full retreat.

The British Victories.—The principal battles fought by the Brit. Armies in the

course of these operations achieved the results indicated:

Battle of Amiens (q.v.) (Aug. 8-12).—Froed Amiens and the Paris-Amiens railway. The attack was then transferred to the N. in the *battle of Bapaume* (Aug. 21-31), which, outflanking the Ger. position on the Somme, obliged the enemy to withdraw to the E. bank of the riv. The new Ger. positions were then turned from the N. by the *battle of Arras (q.v.)* (Aug. 26-Sept. 3) by which the Drocourt-Quéant (q.v.) line was broken and the enemy forced back on the outer defences of the Hindenburg line. As the direct result of these three battles the Lys salient was evacuated by the enemy, and Lens, Merville, Baillieu, and Kemmel hill were regained, and Hazebrouck and the railways in that vicinity were freed. At the *battle of Epéhy* (Sept. 18-19) the Brit. broke through the outer Hindenburg defences and took up positions for attack on the main line in the *battle of Cambrai-St. Quentin* (Sept. 27-Oct. 10), the biggest Brit. victory of all. At the close of some ten days of victorious fighting the attacking troops broke through the last and strongest of the enemy's fully prepared positions—positions manned by the very best of his troops. This now opened the way at last to a war of movement and an advance on the Ger. main lines of communication. The Ger. prisoners taken in this battle were more numerous than in any other engagement in the war. This was really the psychological moment of the great campaign of 1918 in the truest sense, for the Ger. morale never recovered from the blow. The resistance of the Ger. troops most perceptibly fell away, and Ludendorff was warning his gov. of the probable results. The victorious Brit. now stormed the Canal du Nord and advanced on Cambrai, turned the formidable defences of St. Quentin, and developed all these successes by delivering a general attack on the last of the solidly organised defences in rear of the Hindenburg line. In this, the *second battle of Cambrai*, that St. Quentin was evacuated by the enemy, who then took up fresh positions on the Selle R., the Brit. having in the battle retaken the double railway line from St. Quentin to Cambrai and the important railway junction of Douai. These great victories had their repercussion elsewhere, for Ludendorff (Ger. White Paper, July 1919) feared that the attack would extend to the front in Alsace, and it seems that the lessening severity of the fighting from this point in the remaining allied victories and the steady withdrawal of the enemy's forces after actions of comparatively brief duration were due to the difficulty of the Ger. high command in the matter of reinforcing their line in Alsace.

Even before the close of the first battle of Cambrai the Brit. Second Army, together with the Belgian Army, were forcing the enemy back from Ypres, and driving a salient into his lines which threatened his coastal positions (Sept. 28-29). This success had its sequel in the *battle of Courtrai* (Oct. 14-31), which

forced the Gers. to abandon the Belgian coast, and with it their submarine base of Zeebrugge. With Courtrai, Menin and Halluin also fell, and the stretch of road between Ypres and Menin—that veritable mausoleum of Brit. dead in the previous four years of fighting—had now for ever ceased to haunt the life of the Brit. soldier and the waiting people at home. The great salients formed to the S. by the second battle of Cambrai and to the N. by the battles of Ypres and Courtrai led indirectly to the evacuation of Laon and the loss of the famous massif of St. Gobain (captured by the Fr. Armies). The penultimate of the great Brit. victories was at the battle of the Selle (Oct. 17-25), and this was speedily followed by the battle of Maubeuge (Nov. 1-11), in which the triumphant armies of Gens. Hornic, Byng, and Rawlinson broke the last important lateral communications, turned the Scheldt positions, and sent the enemy in rapid retreat from the vicinity of Courtrai. The strategical aim of the great series of battles was now accomplished, for the enemy's line was now split into two parts, one on each side of the great natural barrier of the Ardennes. The pursuit of the beaten enemy all along the line was only stopped by the armistice.

France and Germany Star was instituted for operational service on land from June 6, 1944, in France, Belgium, Holland, or Germany, until May 8, 1945. The ribbon is in the red, white, and blue of the Union flag, and these colours are also used as a symbol of France and the Netherlands. The 1939-45 star must be earned by six, or for air crew two, months' service in operations before a candidate can qualify for the F. and G. S. The star is not awarded in addition to the Atlantic Star (g.v.) or the Air Crew Europe Star (g.v.). If a candidate qualifies for all three stars or two of them the star first earned is awarded.

France, Île d', see MAURITIUS.

Francesca da Rimini, daughter of Guido da Polenta, lord of Ravenna. She was given in marriage about the year 1275 to Giovanni the Lame (Ghiaciotto or Sciancato), son of Malatesta, lord of Rimini,

when peace was concluded between the houses of Ravenna and Rimini. The elder brother of Giovanni, Paolo the Handsome, was sent to Ravenna to fetch Francesca, and the two fell in love with each other. Giovanni found them together (c. 1285), and killed them both. The story, which has many modifications, is treated in Dante's *Inferno*, and also in literature by Leigh Hunt, Silvio Pellico, Stephen Phillips, and Gabriele d'Annunzio; and in art by Ingres, Ary Scheffer, G. F. Watts, and Cabanel.

Francesca, Piero della, see PIERRO.

Francesco dei Rossi, see SALVIATI.

Francesco di Paola, or **St. Francis of Paola** (c. 1416-c. 1507), founder of the order of Minimites, b. in Calabria, and at an early age entered a Franciscan monastery, and later became a hermit. He was joined by sev. others, and in 1386 erected a chapel. In 1474 the community, with Francis as its superior, was confirmed by Pope Sixtus IV. as the Hermits of St. Francis of Assisi, the name being changed to the Minor Hermits of St. Francis of Paola by Alexander VI. He attended at the death-bed of Louis VI. of France, and Charles VIII. built him convents at Plessis and Amboise. See life by C. Robert, 1915.

Franche-Comté, old prov. of E. France in Rhone basin. It corresponded to the co. of Burgundy and comprised what now forms the depts. of Doubs, Haute-Saône, Jura, and a portion of Ain. Its cap. was Dole. A rich land, varying in character from the rich, grain-producing valleys of the Doubs and Saône, through vine-clad terraces, to the thickly wooded heights of the Jura Mts. Its possession has been much disputed. Early in its hist. it formed a part of the kingdom of Burgundy; under the Carolingians it belonged to that of Arles; it then passed from hand to hand, being for a short period a possession of the Fr. king, and at length, on the marriage of Mary of Burgundy to Maximilian, became a part of the empire. Charles V. gave it to the Sp. branch of his family, but it ultimately became Fr. ter. under the treaty of Nijmegen. After the revolution the old prov. was broken up. The inhab. of the F.-C. earned a reputation for themselves as hardy and independent people. Colonies of emigrants from the prov. were to be found in Rome, Milan, Madrid, and other European cities.

Franchet D'Espèrey, Louis Felix Marie François (1856-1942), Fr. general who gained a reputation during the First World War. After the battle of Charleroi (Aug. 1914) he was appointed to the command of the Fr. Fifth Army. In Sept. 1914, in co-operation with Foch, he brought to a standstill the Ger. counter-attack from the valley of the Sulphe. In June 1918 he was appointed commander-in-chief of the allied forces in Macedonia, and he at once infused his characteristic vigour into the operations on that front, which hitherto had been regarded as stagnant. He organised an offensive against the Bulgarians and in the autumn attacked and broke up their army as a fighting instrument. This success, which

threatened Constantinople and hastened Turkey to conclude an armistice, undoubtedly influenced the general collapse of the central powers.

Franchise: 1. As used synonymously with liberty, F. means a royal privilege conferring exemption from ordinary jurisdiction, e.g. the chancery court, of the Co. Palatine of Lancaster, or any other prerogative right granted by the king, such as the right to a manor or lordship, to hold a fair, to have a forest, warren, or fishery, treasure-trove, waifs, and estrays. Such Fs. often arise by prescription assumed to have been founded on some original and lost royal grant. All such Fs. belong to the class of incorporeal hereditaments (q.v.). 2. The right of voting for a member of Parliament or councillor of some municipal body. (For the qualifications of co. and bor. electors see ELECTIONARY, ELECTIONS.) Generally speaking an action for damages lies for every wilful interference with the exercise of a F., and it is immaterial whether the defendant acted in good faith or under a mistaken notion of duty or not. The historic case of *Ashby v. White* decided that an elector was entitled to sue a returning officer for refusing his vote.

Francia, or **Francesco Raibolini** (c. 1450-1517). It is later, b. at Bologna; originally a goldsmith and engraver of dies for medals, and became mint-master at Bologna, not taking up painting till middle age, when he made the acquaintance of Mantegna. He was much influenced by Perugino and Raphael. Among his works are 'Virgin enthroned, with Augustine and five other saints' (Bologna Gallery); 'Virgin and Child and St. Anna,' and 'Pieta' (National Gallery, London); 'Virgin' (Munich); 'St. Peter, Martyr' (Borghese Gallery, Rome), and the frescoes in the church of St. Cecilia, Bologna. See G. C. Williamson, *Francia*, 1901; A. Venturi, *La pittura del cinquecento*, 1925.

Francia, José Gaspar Rodríguez da (1757-1850), dictator of Paraguay, b. at Asunción, of Portuguese origin, his father, García Rodríguez Francia, being a native of Brazil who came to Paraguay to manage a tobacco plantation for the gov. He studied theology at the univ. of Córdoba de Tucumán, and took his doctor's degree, but later turned to the law, and for thirty years was an able and successful jurist and public official. In 1810 the revolution against Spain broke out at Buenos Aires, and though Paraguay at first opposed the movement, it declared its independence in 1811, and F., who had been a leading revolutionary, was made secretary of the national junta. In 1813 he was made joint consul with the Gaucho general, Fulgencio; in 1814 he secured his own election as dictator for three years, and at the expiration of that period obtained the dictatorship for life. He was far from being a mere figure-head and, like Louis XIV., might well have said 'L'état c'est moi.' The accounts of his administration show him to have been a remarkable blend of ability and caprice, of far-sighted wisdom and reckless infatuation and,

withal, a man who, while seeming to aspire to the highest ideals, would yet violate the most elementary principles of justice. His life was one of extreme simplicity, yet he punished with Draconian severity the slightest want of respect. His economic policy was to sacrifice foreign commerce and encourage domestic industries. In eccles. policy he was a bitter adversary of the Church, and abolished both the Inquisition and the College of Theology. Much that was apparently arbitrary in his actions was, however, due to his being strongly influenced by the principles of the Fr. Revolution, and despite all his real or apparent contradictions of character and arbitrary conduct his death was much regretted by his countrymen, who forgot his extravagance and remembered only his merits. See T. Carlyle, *Critical and Miscellaneous Essays*, vol. iv., 1840; R. F. Burton, *Letters from the Battlefields of Paraguay*, 1870; and C. A. Washburn, *History of Paraguay*, 1871.

Francis, of Assisi, St. (1182-1226), Rom. Catholic saint, founder of the Franciscan order. He was b. at Assisi in the upper middle class, his father, Pietro Bernardone, being a prosperous merchant of that city. As a youth he was a prominent leader of nightly revels, and fought with great spirit in a petty feud between the ins. of Assisi and Perugia. Assisi was defeated, and F. was taken prisoner in 1201, and remained a captive till the following year. The rest enforced by a serious illness in his twenty-second year made him dwell upon his mode of life. On his recovery he attempted to take up arms once more, but was struck down by a second illness at Spoleto. For a time he threw himself half-heartedly into the pleasures of his fellows, though the spiritual conflict was still waging within him. He determined to cast off his old life and to obey implicitly the commands of the N.T. He adopted the attire of a poor mendicant, took a vow of poverty, and devoted himself to prayer and to helping the poor. He went on a long pilgrimage to Rome, and on his return to his native place he worked among the lepers at Gubbio, and gave alms profusely. In spite of the angry remonstrations of his relatives, he continued to walk the streets dressed in the meanest garb, and was frequently pelted with mud by his former companions. At last, in 1206, his father disinherited him publicly, and F., having already united himself to 'holy poverty,' his bride, now renounced his earthly relatives and declared that 'henceforth he had but one Father, Him that is in heaven.'

While praying one day in the ruined chapel of Sta. Maria degli Angeli, known as the Portuncula, or 'little inheritance,' he was visited by a vision, which directed him to his vocation. Clad only in a rough woollen garment, girt with a hempen cord, he went out and preached to the poor of Assisi, though only a layman. By 1209 he had gathered round him eleven disciples, the first two being Bernard Quintavalle and Peter Cattano. In the following

year the band of twelve went to Rome where they obtained the sanction of Innocent III to their preaching and their mode of life his authorisation being formally granted in 1218. On his return to Assisi in 1213 he drew up the constitution of the order. He laid greatest stress on poverty, the other vows of the order being chastity and obedience. Great numbers of disciples flocked around him. He organised his men and sent them out in bands as missionaries to France, Italy, Spain, and Africa. In 1223 he himself went out to Egypt and obtained from the sultan promises of better treatment of Christian prisoners and the guardianship

of Flowers and the Life of St Francis). According to Sabatier the *Speculum* was the first of all the lives and was written in 1227 by Brother Leo of Assisi. F's favourite disciple while the *Legenda 3* Soc (the legend of his three companions) was a forgery. Thomas of Celano's lives, in Sabatier's opinion, were written in opposition to the *Speculum*. W. Goez, in a critical review of the whole ground, *Die Quellen zur Geschichte des hl. Francis von Assisi* (1901) refutes Sabatier's assertions and comes to the conclusion that the *Speculum* is a fourteenth century compilation and largely a forgery. The official life of 1 is St Bonaventura's

THE PORTIUNCULA ASSISI ABOUT THE TIME OF ST FRANCIS

This illustration is from a print in the *Colli e Radici* (1704). The large stiletto in the right of the chapel was the infirmary where St Francis died and the other buildings were added after St Francis's death.

for his order of the church of the Holy Sepulchre. He had to contend with opposition from Rome where new regulations had been forced upon his order and the vow of poverty which to him was so essential had been relaxed. On Sept 14, 1224, according to the legend told by his biographers, he received the stigmata of the very wounds of Jesus Christ upon his own person while praying on Monte Alverno near Assisi. Two years later, on Oct 4, feeling that death was drawing near, he was carried to the Portiuncula and died on the bare ground. Pope Gregory IX canonised him in 1228. The chief sources for the life of Francis and for the beginnings of the Franciscan order are two lives by Thomas of Celano (1228 and 1248), Eng trans by A G Ferrers Howell (1908), and the *Speculum perfectionis* (Mirror of Perfection), discovered by P Sabatier (ed in 1898, Eng trans by De la Warr, 1902, and in the Everyman's Library, in which issue are also included *The Little*

Legenda, pub by the Franciscans of Quaracchi 1893 (Eng trans in Everyman's Library, 1910).

The works of Francis including hymns, proverbs, sermons and letters, were printed in folio in 1731. An ed in Lat with an It trans was pub by B da Livizzano (Florence 1880). See A Butler, *The Lives of the Saints* 1756-59. Brother Leo of Assisi *Saint Francis of Assisi* (trans by S Evans) 1899. A Brune, *S. Francis d'Assisi et la légende de ses trois compagnons*, 1901. Francis Borgia, St., see BORGIA, FRANCESCO.

Francis of Paola, St., see FRANCESCO DI PAOLA.

Francis of Sales, St. (1567-1662), Rom. Catholic saint and devotional writer, b. of noble family at the castle of Sales, near Annecy, Savoy. After studying at the colleges of La Roche and Annecy, he entered the school of Jesuits in Paris (1578) and subsequently studied civil law in Padua (1584-91). Soon after taking orders he went on a missionary expedition to the Calvinists of Chablais, and met with great success. Sev. attempts to murder him were frustrated. He was appointed to the bishopric of Geneva in 1602. He founded a congregation of nuns of the order of the Visitation, of which his friend Madame de Chantal became first superior. His chief work, *Introduction à la vie dévote*, pub. 1609, has been trans. into most European languages. He also wrote a *Traité de l'amour de Dieu*, and *Entretiens spirituels* (pub. posthumously). See the ed. of J. P. Migne, 1861; Mrs. Lear, *Christian Biographies*, 1877; also lives by C. A. do Sales, 1631; A. J. Hamon, 1856; H. Bordeaux, 1921; F. Scrowski, 1928; J. Leclerc, 1928; and F. Ehrenborg, 1937.

Francis I. (1708-65), head of the Holy Rom. Empire, the eldest son of Leopold, duke of Lorraine, b. at Nancy. He succeeded to the dukedom in 1729, but in 1735, at the end of the Polish war of Succession, he received Tuscany in exchange for Lorraine. In 1736 he married Maria Theresa, who succeeded her father, Charles VI., to the dominions of Austria in 1740.

Francis II. (1768-1806), head of the Holy Rom. Empire, and as Francis I. emperor of Austria (1806-35), the son of Leopold II., b. at Florence in 1764. Succeeded 1792. By the peace of Campo Formio (1797) he exchanged the Netherlands and Lombardy for Venetia and Dalmatia. In 1804 he assumed the title of emperor of Austria, which was confirmed by the Confederation of the Rhine in 1806, when he abandoned the title of Holy Rom. Emperor. By the treaty of Vienna (1809), Austria lost further terrs. to France, but was victorious at the battle of Leipzig (1813), and by the treaty of Vienna (1815) her position in Europe was firmly estab. See Baron J. A. Helfert, *Kaiser Franz*, 1867; and H. Meynort, *Franz I.*, 1871-73.

Francis I. (1494-1547), king of France, the successor of his uncle and father-in-law, Louis XII., and the son of Charles, comte d'Angoulême, b. at Cognac. He married Claude, daughter of Louis XII., in 1514, and succeeded him on the throne Jan. 1, 1515. Immediately after his accession he recaptured Milan, and in 1516 signed a concordat with the pope by which the Fr. Crown acquired extensive church privileges lost only at the Fr. Revolution. On the death of Maximilian (1519), F. was a rival claimant with Charles of Spain to the imperial crown, and after the election of the latter, F. prepared for Henry VIII. the 'Field of the Cloth of Gold' (1520), but was unsuccessful in securing an

alliance with England. The Holy See, Venice, and the powers united to drive France out of Italy, and in 1525 F. was defeated at Pavia and taken captive to Madrid. War continued till 1529, when, by the treaty of Cambrai, F. lost his It. possessions, but retained Burgundy. Hostilities were renewed against Charles V. (1534), the war concluding with the peace of Crespy (1544). In social and intellectual results his reign was fruitful; for, if he condoned by his example licentiousness of manners, he gave a great impulse to refinement in taste and to intellectual

FRANCIS I. OF FRANCE

enlightenment by encouraging in France the lessons of the It. Renaissance. He was a patron of art and literature, and in 1530 founded the Collège de France; and, by the acquisition of masterpieces of It. painting and sculpture and in the superb structure of Fontainebleau, Chambord, and Amboise bequeathed a permanent influence on Fr. art. See G. Paris, *François I.*, 1858; and Julia Pardoe, *The Court and Reign of Francis I.* (new ed.), 1887.

Francis II. (1541-60), king of France, eldest son of Henry II. and Catherine de' Medici, b. at Fontainebleau. He married Mary Stuart, queen of Scotland (1558), whose uncle, the duke of Guise and cardinal of Lorraine, virtually ruled during F.'s brief reign. Ascended the throne in 1559.

Francis, John (1811-82), Eng. pub., b. in London. He entered the office of the *Athenaeum* as a clerk in 1831, and in two months became its business manager and publisher, which position he retained till his death. He was also business manager of *Notes and Queries* from 1872 to 1882. The 'John Francis Pensions' of the News-vendors' Benevolent Institute were founded to his memory. See life by C. J. Francis, 1888.

Francis, Sir Philip (1740-1818), politician, after being for some years in the civil service, he went in 1774 to India as a member of the council of the governor-general. There he was a bitter opponent of Warren Hastings, with whom in 1779

he fought a duel and was wounded. He returned to England in the following year with a considerable fortune, and entered Parliament. He still took an active interest in Indian affairs, and in 1787 assisted Burke and the managers of the impeachment of Hastings to prepare their charges. He is best known as the reputed author of the *Letters of Junius*, and he is to-day generally regarded as the writer of those papers, but there has never been produced any definite evidence as to the truth of the assumption. See JUNIUS, LETTERS OF.

Franciscans, or Friars Minor (Lesser Brethren), are a religious order of the Rom. Catholic Church founded in 1208 by St. Francis of Assisi. The order was founded, like all the early orders, on the threefold vow of chastity, poverty, and obedience. St. Francis laid special stress upon the vow of poverty, so that it was not only forbidden to individuals to possess riches, but also it was unlawful for the community to possess property. The vow of poverty was extremely stringent; the members of the order did not even possess the clothes they wore. The order grew rapidly, but the poverty enjoined occasioned much dissension. During the life of St. Francis his authority was sufficient to prevent any modifications of his rule, even after he had abdicated from the post of minister-general of the order. After his death his successor, Brother Elias, attempted to institute changes, but a reaction set in towards St. Francis's ideals. Many years of dispute followed, and the order was split into three parties. Under Pope Leo X. two separate divisions were made in the order; the Conventualists, who by a papal dispensation were released from the extreme poverty of the order as inaugurated, and the Observants, who were strict followers of St. Francis. In 1523 Brother Matteo formed a new div. called Capuchins, because of the peculiar peaked hood which they wore. The Capuchins claim to be the closest followers of St. Francis. The F. are under a democratic form of gov. The final authority is vested in the minister-general, who resides in Rome. Under him are the provincials, each presiding over all the brethren in a prov. The head of each monastery is called the 'custos,' or guardian.

The Conventuals, Observants, and Capuchins constitute the First Order. The Second Order consists of nuns, the nuns of St. Clare or Poor Clares, the Capuchin nuns, the Urbanist nuns, etc. The Third Order or Tertiaries consists of members who live in society, not taking the vow of celibacy, but are bound by the spirit of the rule of the order. More recently certain active congregations of men and women have adapted the principles of the Tertiaries to a conventual regime and are known as the Conventual Third Order. The F. have been foremost in foreign missionary work, and throughout all their internal dissensions they have faithfully continued St. Francis's work of ministering to the poor. There are many notable names in the order. Most of the great Eng. theologians were F., as for

example St. Bonaventura, Alexander of Hales, Duns Scotus, Wm. of Ockham. In the world of letters Roger Bacon was a prominent member of the order. Of the popes, Nicholas IV., Alexander V., Sixtus IV., Sixtus V., and Clement XIV. were F. The F. reached England in 1220. At the Reformation there were sixty-five monasteries in England. After the dissolution of the monasteries the order was restored by the foundation of an Eng. convent in Douay in 1617. There are now twelve houses in Great Britain, and seventeen in Ireland; statistics pub. in 1911 gave the number of 24,844 members in 2093 monasteries, in thirty countries of the world. See L. Wadding, *Annales Fratrum Minorum*, 1650; P. Gratien, *Histoire de la fondation et évolution de l'ordre des Frères Mineurs du XIII^e siècle*, 1928; A. Masseron, *The Franciscans* (trans.), 1931; V. D. Scudder, *Franciscan Adventure*, 1931; P. Cowley, *Franciscan Rise and Fall*, 1933.

Francis Ferdinand of Austria, Archduke (1863-1914), nephew of the former emperor of Austria, the son of Archduke Charles Louis, b. at Graz. After the suicide of Prince Rudolf (1889), he became heir apparent, but in 1900 the archduke made a morganatic marriage with Countess Sophia Chotek, created Princess von Hohenberg, and renounced the right of his future children to the thrones of Austria and Hungary. His assassination at Sarajevo on June 28, 1914, was the immediate cause of the rupture between Austria-Hungary and Serbia, which brought on the First World War. Very various opinions of his powers as an administrator are held. His education, like that of the sons of Archduke Otto and of the princes of the House of Hapsburg-Lorraine, generally was not of a kind to fit him for the task of government. But F. F. is credited with a quick grasp of essentials and a good memory, which helped to supply the defects of education. In his administration in Bosnia he showed at times extreme obstinacy, and at other times that he could be easily influenced. It is probable that he was fully alive to the importance of settling the S. Slav question and in a way which should commend itself both to Austria and to Hungary, for he would have gone as far as to postpone his own coronation as emperor of the dual monarchy until the two halves of the empire were in accord on this great question. High hopes had been entertained both in Austria-Hungary and in Germany in him. The Catholics favoured him for his piety, the Ger. people for his loyalty to the Ger. alliance, and his own people because his obvious patriotism and vigorous if unimaginative fulfilment of his administrative duties promised well after the aged Francis Joseph should pass away. But there is no doubt that he was intensely disliked by the Serbs and Bosnians. This is easily explained by the belief that he was the protagonist in a project to unite the Bosnian Serbs and Croatia-Slavonia with Austria and Hungary into a triple monarchy, a project which involved Austro-Hungarian opposi-

tion to any further territorial expansion of the two independent Serbian kingdoms lest such complications should thereby be introduced as would render the project impracticable. For this reason all patriotic Serbs and Montenegrins from 1908 to 1914 organized secret societies in the S. Slav countries and disseminated propaganda to further the object of severing all the S. Slav peoples from the Hapsburg empire. It is therefore not surprising that, the official Austrian investigation into the murder of F. F. and of his wife by youthful Serbian conspirators having established that the outrage was at the instigation of secret revolutionary societies and with the connivance of Serbian Gov. officials, intense indignation was aroused among both Ger. and Magyar elements in Austria-Hungary, who saw in the murder, and not without reason, a shattering blow at the very existence of the dual monarchy. Equally, however, the welfare of the Serbs appeared in those days to be bound up with that of Russia; wherefore the murder of a relatively obscure archduke gave rise to a crisis which was soon destined to lead to a world conflagration. See P. Nikitsch-Boullies, *Vor dem Sturm. Erinnerungen an Erzherzog-Thronfolger Franz Ferdinand*, 1925; monograph by V. Eisenm., 1929; and A. J. P. Taylor, *The Habsburg Monarchy*, 1947.

Francis Joseph (1830-1916), emperor of Austria, the eldest son of the Archduke Franz Charles, second son of the reigning Emperor Francis I., he was b. at Vienna (Aug. 18). He received instruction in the various languages of the heterogeneous Austrian monarchy and became emperor in 1848 on the abdication of his uncle, Ferdinand I. At this time Hungary was in a state of open revolt, and declared itself a republic in the course of the following year, with Kossuth as governor. However, aided by von Bruch, Francis inaugurated a series of fiscal and commercial reforms favourable to the interests of the middle classes. In 1853 the emperor tried without success to induce the Tsar Nicholas to abandon his designs against Turkey, and in 1859 he had to face a war with France and Sardinia, ending in the loss of Lombardy. It was at the conclusion of this war that F. J. began the necessary work of reform and abandoned his conservative policy. In 1866 began the disastrous seven weeks' war with Prussia, and at the battle of Sadowa the question of the headship of Germany was decided. It was inevitable that the relations of Austria and Hungary should be rearranged and a reconstruction of the monarchy on a dualistic basis was effected by the *Ausgleich* of 1867, the Emperor F. J. being crowned at Pest. This form of monarchy existed up to the time of the First World War. In spite of numerous difficulties, and discouraging political conditions, the emperor, by his personal influence, succeeded in holding his dominions together. F. J. married Elizabeth of Bavaria in 1854, but she, refusing to be stifled by the harsh court ritual which her husband imposed, left him and after many years' wandering in

Europe, was assassinated in 1898. Their eldest son, Rudolph, dying in 1889, the Archduke Charles Francis Joseph became heir presumptive. (See CHARLES I. (KARL FRANZ JOSEF)). With an innate stubbornness he always held on and towards the end he took the fatal step of attacking Serbia, after the murder of his nephew, Francis Ferdinand, in 1914 (see preceding article). It may be conceded that he strove in his long reign to maintain a constitutional and parl. regime in Austria-Hungary; but, though he reigned for sixty-eight years, the longest effective reign of modern times, memories of this aged emperor faded away with astonishing rapidity as events in the First World War followed one another in swift succession. Cold, impersonal and surrounded by reactionary advisers, he

THE EMPEROR FRANCIS JOSEPH

was by no means popular, and it was often prophesied before the First World War that, on his death, the last hour would also sound for his empire. His last illness overtook him in the palace of Schonbrunn near Vienna at the beginning of Nov. 1916, as the Austro-Hungarian and Ger. armies, fresh from victory at Cronstadt and Hermannstadt, were overrunning Rumania. Yet even when it was clear that his days were numbered, his sense of duty compelled him to perform his daily work as though he were in his customary good health. He lingered thus for some ten or eleven days, and even when it seemed he could scarcely outlive the day, the dawn of Nov. 21 found him seated once more before his writing table. But by evening of the same day he was dead. In the expectation of a crisis the Archduke Charles had been recalled from the Rumanian front, but no crisis occurred, and Charles, grand-nephew of F. J., was crowned with every mark of popular acquiescence. The collapse of the empire, however, was a reality less than two years later. See H. de Weindel, *The Real Francis Joseph*, 1909; E. Glaise-Horstennau, *Collapse of Austria-Hungary*,

1930; and A. J. P. Taylor, *The Habsburg Monarchy*, 1941, 1947.

Francis Xavier, see XAVIER.

Franck, César Auguste (1822-90), Belgian composer and organist, b. at Liège, on his father's side, of a family which had lived for generations at Gemmenich; his mother was a Ger., and came from Aix-la-Chapelle. He became a naturalised Frenchman in 1873. After an academic career of unusual brilliance, he began an arduous life of composition and teaching, a life which, although uneventful, was destined to bear great fruit. He was organist at Notre-Dame de Lorette, then at Saint-Jean-Saint-François, and finally

E.N.A.

CÉSAR FRANCK

at Sainte-Clotilde—where he had been choir-master since 1858. This rendered his financial position more secure, besides enabling him to establish his reputation as a soloist. His improvisations on the organ left an impression of something unique and profoundly moving. He gathered together a circle of young, eager students, including such names as d'Indy, Chausson, Lekeu, Borély, and Duparc, and with them pursued the study of polyphonic and symphonic music; he may, indeed, be called the father of modern Fr. music. His compositions abound in rich and beautiful harmonic innovations, and (except for some early insincere works which are fortunately forgotten) are imbued with a spirit of deep reverence and mysticism, particularly the oratorio *Les Béatitudes* (1870), and the D minor symphony (1889). His orchestration and treatment are masterly; and the concerted works for piano and orchestra are full of poetry and romantic charm. In chamber music, besides the famous piano quintet (1880), and the string quartet in D (1889),

he has left the superb violin and piano sonata in A (1886). His own domain is lyricism, pure and simple, the outward projection of his innermost dreams, and in this he is almost without equal. Pianists and organists are also indebted to him for sev. fine solo compositions. Yet during his lifetime he was very little appreciated except by a select public. Later, opinion changed so completely that he is now venerated as one of those inspired master-minds who have inaugurated fresh eras in the hist. of music. Other works include *Les Éolides* (1876); *Psyché* (1887-88); *Thïsèle* (1888-90), lyrical drama; *Ilvilda* (1882-85), opera. See E. Destrange, *L'Œuvre lyrique de César Franck*, 1897; and lives by V. d'Indy, 1906, 1930; M. Emmanuel, 1928; C. Tournemire, 1921; and N. Demuth, 1949.

Franck, or Frank, Sebastian (1499-1542), Ger. writer, b. at Donauworth. He took priest's orders and held a curé in 1524 near Augsburg, but soon after became a follower of Luther. In 1528 he pub. *A Treatise against the Horrible Vice of Drunkenness*. This work was very popular. He soon, however, drifted away from the school of Luther, and was banished from Strassburg in 1531 because he advocated religious toleration in his *Chronica*. In 1532 he settled at Ulm as a printer, and was banished from this city on the pub. of his *Paradoxa* in 1534. He also wrote *Wellbüch* (1534), a supplement to his *Chronica*. See A. Rehnann, *Sebastian Franck als Geschichtsschreiber*, 1922; and a monograph by W. E. Peuckert, 1943.

Francken (sometimes Franck). Flemish family of painters, in four generations, beginning with *Nicolaes* (? 1520-96). His three sons who painted were *Hieronymus I.* (1510-1610), *Frans I.* (1542-1616), and *Ambrosius I.* (1544-1618). The next generation was three sons of Frans I., viz. *Hieronymus II.* (1578-1629), *Frans II.* (1551-1642), and *Ambrosius II.* (d. 1632). The generation after that supplied *Frans III.* (1607-67) and *Hieronymus III.* (b. 1611), sons of Frans II. The list is completed by *Constantius* (1661-1717), son of Hieronymus III. The foremost in fame is Frans I. All the family, except Constantius, painted biblical scenes chiefly—Constantius painted sieges and battles. They were all b. in or near Antwerp. Frans I. learned at the school of Frans Floris; his father Nicolaes also is said to have learned there; and the rest of the family painted very nearly in the same style. Ambrosius I. had more faults (but also a livelier merit) than his more famous brother; and the latter is, besides, considered inferior to his own son, Frans II., called Don Francisco. The other Flemish painters named Francken belong to other families—the chief being *Sebastien P.* (or *Frans*) (1578-1647), who painted battles; and his son *Jan Baptist* (1599-1653), an exquisite painter of interiors.

Franco y Bahamonde, Francisco (b. 1893), Sp. dictator and leader of the Sp. rebel forces in the Civil war 1936-39. Spent most of his early military service in Morocco. At twenty-five he was the

youngest major in the Sp. Army. Being unpopular, he was sent to Oviedo on garrison duty instead of being given the command of his allotted battalion. He then volunteered for the *Tercio*, the foreign legion, which had just then been founded to fight beside Moors in the Moroccan war. Here he became the most successful and ruthless organiser and leader of the legionaries, who were more savage even than the Moors of the *Regulares*. Isolated by his rank and single-minded ambition from his coevals, F. now redoubled his studies in military science; war was his medium, and his one contact with life, and thus early he proved that he was as brave as he was callous. As commander of the legion, he rebelled, at Ben Tieb, against Primo de Rivera's decision to give up Morocco and the disastrous unpopular war for its conquest. This proved a successful move, for the dictator entrusted F., now a colonel (1926), with the control of operations, and the war was now fought to its end. F. now became director of the military academy. At this period the Sp. monarchy was breaking up, and in 1931 F. swore the oath of loyalty to the republic. A taciturn rebel against an anti-militarist democratic state, F. grew into a politician, imbued with the severe military logic of Clausewitz, to whom war is a continuation of politics by different means. In 1933 he was in command of the Balearic Is., and in 1935, became chief of staff of the Sp. Army. Later he was sent by the Leroux Socialist Gov. as governor to the Canary Is., whence he flew to Morocco to organise the military uprising, in July 1936, that led to the Sp. civil war. Assumed the leadership of the rebel forces after Gen. Sanjurjo, their original head, was killed in a plane accident. On Oct. 1, 1936, he proclaimed himself 'Caudillo,' or chief of the state and commander-in-chief. At the close of some three years of bitter fighting, in the course of which he received material help in men, planes, and munitions from Italy and Germany, he crushed the Republicans, who had received some support from Russia, and became master of Spain. Joined the Anti-Comintern Pact (g.r.) in 1939. At the outbreak of the Second World War in 1939 he declared Spain's neutrality, mainly, no doubt, because his country was too exhausted to sustain further warfare, but partly owing to the conclusion of the Ger.-Russian pact of Aug. 1939. When Italy entered the war in June 1940 F., yielding to the Falangists (g.r.) declared Spain to be a non-belligerent, with Axis leanings, but, in reality, his one great fear was that Hitler, for his own ends, might send Ger. armies into Spain. Throughout 1940 F.'s regime succeeded in retaining its precarious hold on the country in spite of a strong but somewhat inarticulate opposition. This year, too, promises to restore the monarchy did not materialise. In 1946 the General Assembly of the United Nations resolved by thirty-four votes to six, with thirteen govts. abstaining, to bar F.'s gov. from all United Nations functions, to call on

member govts. to withdraw the heads of their diplomatic missions, and to instruct the Security Council to take 'adequate measures' if the regime did not end in a reasonable period. In 1947, on the eighth anniversary of his seizure of power, F. announced that Spain was to become a monarchy again, with himself as chief of state. The Bill defining the new constitution, however, made it clear that there would be no restoration of a king until the death or disability of F. This manoeuvre of F. brought an instant objection, on constitutional grounds, from Don Juan, the Pretender, while Republicans and Socialists were content to ignore it. A referendum in July asking for support of the Bill resulted in an affirmative vote of nearly 90 per cent. After an agreement, made during a meeting at sea (1948), between F. and Don Juan, the Infante Juan Carlos, nine-year-old son of Don Juan, arrived at Madrid (Nov.) to pursue his studies. The existence of an agreement between Sp. Monarchist and Socialist leaders in exile to bring about a change of regime in Spain, announced by the Brit. Foreign Office (1948), was denied by the Monarchist leader (Señor Gil Robles).

Franco-German War, The. This famous war arose out of the candidature of a Hohenzollern prince for the throne of Spain, but was mainly due to the intense jealousy that was excited in France by Germany's rise as a military power, consequent on the defeat of Denmark in 1864 and of Austria in 1866. Though the Hohenzollern candidature was withdrawn, the Fr. emperor, Napoleon III., was not satisfied, and required his ambas. Benedetti to obtain an assurance from the king of Prussia that it would not be repeated. The interview between the Fr. ambas. and the king of Prussia was reported by Bismarck in such a way as to make it felt in France that a national insult had been received, and war was declared (July 15, 1870). Napoleon had hoped that the S. Ger. states would not support Prussia, and intended to advance into Germany in order to force them into neutrality. In spite of the assurance of the Fr. war minister that the army was ready, it was found that no adequate preparations had been made. On the contrary, the Ger. Army was in the highest state of preparation, and by the end of July more than 500,000 men had been mobilised on the Fr. frontier. The Fr. could only offer an opposition of some 250,000 men, inferior in artillery and equipment. The Ger. Army was divided into three corps, under Gen. Stummertz, Prince Frederick Charles, and the crown prince, respectively, while the Fr. formed two armies under Bazaine near Metz, and MacMahon in the E. Vosges Mts. The first fight was at Wissemburg on Aug. 4, and the Prussians rapidly gained the battles of Wörth over MacMahon and Forbach over Frossard, thereby preventing the junction of the two Fr. armies. Bazaine's army retired to Metz, where its further retreat was prevented by the battles of Rezonville, Gravelotte, and St. Privat, while MacMahon marched on Sedan, where he was defeated and

compelled to surrender, Napoleon being also taken prisoner. The Ger. armies then hurried on to Paris, which was invested on Sept. 19. In spite of the desperate efforts of the Gov. of National Defence under Trochu, Favre, and Gambetta, which succeeded the empire, disaster followed on disaster. Bazaine surrendered at Metz on Oct. 27 with 100,000 men. Gen. d'Aurolle de Paladines gained the battle of Coulmiers near Orleans over the Gers., but was subsequently defeated at Artenay, Loigny, and Patay. Gen. Chanzy succeeded in holding the Gers. in check around Le Mans, but Bourbaki's attempt to create a diversion by an invasion of Germany signally failed, and his army was forced over the Swiss frontier, where it had to lay down its arms. On Jan. 28, 1871, Paris capitulated, and peace was signed on May 10, at Frankfurt-on-Main, by which France ceded Alsace-Lorraine and agreed to pay an indemnity of 5,000,000,000 francs. The last stages of the war were marked by the revolutionary outburst of the Communists in Paris, quelled by the regular army on May 20.

Francolin, name given to birds of the genus *Francolinus*, which belong to the Pterodactylidae. They belong to the Ethiopian region, Arabia, Asia Minor, India, and S. China, and like the common partridge feed on insects and seeds. See **PARTING**.

Franconia, old duchy between Upper Saxony, the Upper and Lower Rhine, Swabia, Bavaria, and Bohemia, which has been regarded as the original home of the Franks. At the close of the fifth century it was conquered by Clovis, king of the Salian Franks, and at a later period came under the rule of Charlemagne. After the treaty of Verdun in 843 it was the centre of the Ger. kingdom, and was divided into counties, which were ruled over by counts. Conrad, who was duke in F. about 906 was chosen Ger. king in 911. Shortly afterwards F. became immediately subject to the imperial crown, and the region itself was split up into a great number of lordships, countships, and eccles. domains, these last belonging chiefly to the bishops of Wurzburg, Worms, Speyer, Bamberg, and Mainz. These bishops were very powerful, and in 1268 the bishop of Wurzburg successfully asserted his claim to the title of duke in F. In 1501 Maximilian I., when dividing the empire into circles, restricted the title F. to a circle which included Wurzburg, Bamberg, Eichstätt, the abbey of Schonthal, the dist. of Merгентheim, and the principalities of Bayreuth and Anspach. The name, however, fell in abeyance after 1806, but was revived in 1837 by Louis I., king of Bavaria, who gave the names of Upper, Middle, and Lower F. to the three N. portions of his kingdom.

Francs-tireurs (free-shooters), bands of Franchmen, mainly peasants, who took up arms against the Ger. invaders during the Franco-Ger. war. They indulged in guerrilla warfare and were not recognised by the Gers. as regular combatants, being summarily shot when captured. Towards the close of the war Gambetta organised

them, when they were treated by the Gers. as regular combatants.

Franeke, tn. in the prov. of Friesland, Holland, 5 m. from Harlingen. It was the seat of a univ. from 1585 to 1811, and possesses a tn. hall dating back to 1591. The chief industries are silk-weaving, ship-building, and the manuf. of woollen goods and pottery. Pop. 8000.

Frank, Hans (1900-46), Ger. jurist and administrator. A member of the Reichstag from 1930, and head of the legal dept. of the National Socialist party. Reich commissioner for justice 1933-35. Minister without portfolio, 1934. Appointed head of the civil administration in conquered Poland, 1939. His name became a by-word for sadistic cruelty there. One of the major figures tried at Nuremberg after the war. Found guilty on two counts: war crimes, such as murder and ill-treatment of prisoners of war, deportation of inhab., killing hostages, etc., and crimes against humanity, including murder, extermination, etc. (see **NUREMBERG TRIAL**). Executed Oct. 16, 1946.

Frank, Sebastian, see **FRANCK**.

Frank-almogne, or **Free-aims**, name given to a system of tenure in A.-S. times whereby a religious corporation held land. The ordinary feudal conditions were not imposed, but those who held land in F. were bound before God to make prayers, orisons, and masses for the souls of their grantor. See **TENURE**.

Frankau, Gilbert (b. 1881), Eng. novelist, son of Julia F. ('Frank Danby'), also a novelist. Among his novels are *Peter Jackson*, *Cigar Merchant* (1919); *Master-son* (1926); and *Michael's Wife* (1948). He has also written some verse. His daughter Pamela (b. 1908) is also a novelist.

Frankel, Benjamin (b. 1906), Eng. composer, b. in London. He was early apprenticed to the watch-making trade, but his success in winning a scholarship at the Guildhall School of Music decided his future career. He studied composition there and the violin at the Trinity College of Music. He then continued his studies abroad at Cologne and Berlin. Launched on a musical career he specialised in light music and acquired a reputation as an expert in jazz and comedy music. He wrote the scores for a number of London musical shows, his greatest success being in *Under the Counter* (1945). His earliest venture in writing music for films was in *Radio Parade of 1935* for Brit. International Pictures. His reputation in the film world grew and now rests particularly on the music written for *The Seventh Veil* (1945); *The Years Between* (1946); and *Dear Murderer* (1947). Meanwhile in the sphere of chamber music his early work *Kleine Suite* for 'cello and piano showed great promise, since fulfilled by his later works, particularly his Trio for clarinet, piano, and cello (Opus 10) and his four string quartets, the second of which was selected for performance at the festival of the International Society of Contemporary Music at Copenhagen in 1947. His compositions have a lyrical and dramatic quality which has increasingly earned the

respect and attention of music critics. His musical powers also found expression in his setting for poems by Robert Schöcher, a work for voices, string orchestra, trumpet, and drums, entitled *The Aftermath* (Opus 17).

Frankenberg, tn. of Saxony, Germany, 7 m. from Chemnitz. It is noted as an industrial centre, and for extensive woollen, cotton, and silk manufs., calico printing, and dyeing works. Pop. 13,600.

Frankenhausen, tn. of Germany in Schwarzburg-Rudolstadt, situated on the Little Wipper, 27 m. N.N.W. of Weimar, and 36 m. N.N.E. of Gotha. A battle was fought here in 1525, when the peasants suffered defeat by the Saxon, Brunswick, and Hessian troops. It is noted for the manuf. of pearl buttons, cigars, and sugar; there are a salt mine and brine springs. Pop. 7,100.

Frankenstein (Polish Zabkowice Śląskie), tn. of Poland, situated on a trib. of the Nisse, 45 m. S.W. of Wrocław. Before the Second World War it was an industrial centre, with manufs. of hats, woollen, cotton and linen goods, chemical and salt works. Pop. 10,400.

Frankenthal, tn. of Rhineland-Palatinate, situated on the Isenach, 84 m. N.W. of Mannheim, and connected with the Rhine by a canal. It is known for its manufs. of machinery, printing presses, boilers, furniture, wooden ware, etc. Pop. 26,000.

Frankenwald, mountainous dist. of Germany, situated principally in the N.E. of Bavaria on the borders of the Thuringian states. It forms a link between the Thuringian Wald and the Fichtelgebirge range. In form it is an undulating plateau of about 2000 ft. elevation.

Frankfort: 1. City of Kentucky, U.S.A., and the cap. of Franklin co., and also of the state. It is situated on the Kentucky R., which is navigable for 40 m. from the city. The prin. manufs. are boots and shoes, twine, furniture, and carriages. Has a fine state capitol, state penitentiary, and a state normal school for coloured children. It is served by three railways. Pop. 11,400. **2.** Also the co. tn. of Clinton, Indiana, U.S.A. It is situated at the intersection of sev. railways, 40 m. from Indianapolis. There are large machine-shops and manufactories of agric. implements. Pop. 13,700.

Frankfort-on-Main, tn. of Hesse-Nassau, Germany, on the Main, about 23 m. from its confluence with the Rhine at Mainz. The name means 'ford of the Franks,' and it is said that this place was shown to Clovis, king of the Franks, by a deer, when he was leading an expedition against the Alemanni in 496. At any rate, the tn. is mentioned in a document as early as 793, and seems to have been of some importance, for Charlemagne, having crossed the riv. here when he was leading a campaign against the Saxons, built a hunting-seat, which was enlarged into a royal palace by Louis the Pious, who surrounded the tn. with walls in 838. After the treaty of Verdun in 843, it became the head of the E. Frankish empire, and from 1152 it was the place for

the election of the Ger. emperors. From 1815 to 1866 it was the seat of the diet of the Ger. Confederation. It is also interesting for its associations with Goethe, as well as the cathedral in which the Rom. emperors were formerly elected, founded in 852 by King Louis the Ger. Other notable buildings are the Römer, which contains the election chamber, where the Ger. kings were chosen, and the emperors' hall, where the coronation festival was held; the Saalhof, the oldest building in F.; the Thurn-und-Taxis palace, the place of meeting of the former diet; and the Haus zum Braunfels, or exchange. It also possesses an interesting bridge, Alto Mainbrücke, made of red sandstone, which dates back to the fourteenth century. The Main having been dredged affords heavy large traffic with tns. of the Upper Main and the Rhine. Before the Second World War it was an important inland port. The Rhine-Main-Danube Canal before the war was under reconstruction and there was a scheme for a waterway to the Weser, thus linking F. with Bremen. F. is connected by railway with all the important cities of S. and Central Germany, and is very important as a centre of trade. It was formerly the prin. seat of banking and exchange in Germany, and before 1939 only second to Berlin and still remarkable for the large business that was done in gov. stock. Publishing and printing and brewing are carried on in the suburbs of Sachsenhausen and Bockenheim, and the tn. was noted before the war as a centre for fancy goods, hats, machinery, soap and perfumery, ready-made clothing, leather goods, jewellery, and metal ware, and chemicals. Two large fairs were held in the tn., one in the spring and one in autumn. The *Frankfurter Zeitung* (q.v.) before the Nazi regime was an important Liberal organ. In 1914 the univ. was founded, also an academy of labour.

F. was bombed during the First World War sev. times and in 1920 was occupied by the Fr. for a short period. The city was the hapless victim of numerous raids in the Second World War. The earliest devastating raid was that of Dec. 20, 1943. As a centre more especially of chemical and engineering works and a source of aircraft components, it was a frequent target in the following year and, between Jan. 29 and Feb. 25 (1944) it sustained five major attacks. It was the objective of two day and two night attacks during March 18-24, including a massive 3360-ton bombing within a space of 30 min. on March 22. On Sept. 12 it was the target of the greatest fire raid theretofore delivered. On March 16 (1945), during the allied advance on the Rhine, the Amer. First Army cut the Ruhr-Frankfort road, thereby putting the city in imminent danger of capture. On the following day Gen. Eisenhower warned the two cities of F. and Mannheim that they would be destroyed from the air—a warning that was not without effect, for on the 26th of that month Gen. Patton's tanks entered the city. F., however had suffered

severely and the sixteenth-century house, No. 23 Grosse Hirschgraben (rebuilt in 1755), in which Goethe was b., was destroyed (rebuilding was commenced in 1948 with the help of old photos and drawings). All around this spot the damage was considerable. The museum close by was also demolished. The once fashionable shops along the Zeil were either demolished or bombed into empty shells. Southward the most anct. part of the old free city, with its narrow streets and quaint houses, lay in ruins. The

tn. is an important railway centre, and before the Second World War, had a large garrison. There are extensive coal-fields in the neighbourhood. Before the war its chief industries were the manufs. of tobacco, potato-starch, earthenware, machinery, metal ware, chemicals, paper, leather, sugar, and iron and steel goods. Captured by Russian forces under Marshal Zhukov in March 1945. See further under EASTERN FRONT or RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR. Pop. 72,000.

FRANKFORT

The old market-place and town hall (Römer).

cathedral suffered heavy damage, with the roof gone but for its framework. But its finest feature, the 310-ft. tower, begun in 1415, escaped with minor damage. Near by, the Römerberg, the picturesque old market-place, was encased by mounds of debris and rusting ironwork. The opera house lost its roof and its walls bore great gashes. The Adolf Hitler Haus was gutted. After the war F. became the headquarters of the Amer. zone of occupation, and later of the combined Brit. and Amer. zones and the W. Ger. civil administration. Pop. 550,000.

Frankfort-on-Oder, tn. in the prov. of Brandenburg, Germany, on the Oder, about 50 m. S.E. of Berlin. It contains the Evangelical Marienkirche (Oberkirche), built in the thirteenth century; the Rathaus, dating from 1607, and a monument to the poet Kleist, who was b. in this tn. The univ. of F., founded in 1506, was removed to Breslau in 1811.

'Frankfurter Zeitung,' Ger. liberal newspaper founded in 1855. Throughout its existence it wielded great influence in Germany. It was the undisputed leading daily authority in the Ger. language on finance, economics, and technology. Until Hitler's advent in 1933 the F. Z. was Jewish-owned, but was then immediately 'aryanised.' Ten years later it was ordered by the Nazis to cease publication. To the last it maintained a level of journalism far above that which was characteristic of Nazi Germany.

Frankincense, or *Olibanum*, gum-resin. It corresponds to the Arab *lubān*, the fragrant gum of the *Boswellia thurifera*, a tree plentiful in central and S. India. This aromatic gum-resin is yielded by various trees, though pre-eminently of the genus *Boswellia*, which grow on the Somaliland and Arabian coasts, whence it reaches Bombay. The chief gum-yielding species of *Boswellia*, besides the Indian

B. thurifera, are *B. Freereana*, *B. Bhua-Dajama*, and *B. Carteri*, all of Somaliland, and a variety of the last-named which grows in the Hadhramaut. *F.* was brought into Palestine by the Arabian merchants (Is. ix. 6; Jer. vi. 20.) and was among the gifts offered by the wise men (Matt. ii. 11). It occurs in round or oblong tears covered with a white dust, and is of a yellowish-brown colour, but some is colourless. It has a bitter taste, and smells like balsam when heated. It burns with a bright flame and fragrant odour, and is used in incense (Exod. xxx. 34, etc.), fumigating powders, and in the composition of stimulating plasters, etc.

Franking of Letters, term used for the right of sending letters free of charge. This privilege was claimed by the House of Commons in 1660, but it was not until 1764 that an Act was passed which made the practice legal. After this date every member of Parliament was allowed to send ten letters a day free of charge, and to receive fifteen. The privilege was abused, and was finally abolished in 1840, on the introduction of the penny postage. In the U.S.A. franking was instituted in 1776, and remained in force until 1873; was then abolished, but later restored.

Frankland, Sir Edward (1825-99), Eng. chemist, b. at Churchtown, near Lancaster. Worked under Bunsen at Marburg. In 1851 he was appointed prof. of chem. at Owens College, Manchester. He was lecturer in chem. at St. Bartholomew's Hospital for a time, and in 1863 prof. of chem. at the Royal Institution. He devised new methods of water analysis, publishing on this subject *Water Analysis for Sanitary Purposes*, and when appointed a member of the Royal Commission on the pollution of rivers, in 1868 did good work. He discovered the theory of valency, which theory played an important part in the subsequent growth of chemistry; and jointly with Sir Norman Lockyer was responsible for the conclusion that the external layers, or photosphere of the sun are composed of gases and vapours, as well as for the discovery of helium. The highest honour of the Royal Society, the Copley Medal, was awarded to him in 1894. He was knighted in 1897.

Frankland, Percy Faraday (1858-1916), Eng. chemist, b. in London. He was educated at Univ. College School, the Royal School of Mines, and Wutzburg Univ. He was demonstrator and lecturer in chem., Royal School of Mines (1880-1888); prof. of chem., Univ. College, Dundee (1888-94), Mason College, Birmingham (1894-1900), and Birmingham Univ. (1900-18). He was formerly examiner in chem. to the London Univ., and was made president of the Chemical Society in 1911. He did much research, and his memoirs—pub. in the *Philosophical Transactions Royal Society*, etc., dealing with chemical aspects of fermentation, the application of bacteriology to air, water, and the sand filtration of water, and the bacterial treatment of sewage—show in what direction. He also pub. *Agricultural Chemical Analysis* (1883); *Our Secret*

Friends and Foes (1894); *Micro-organisms in Water* (1894); *Life of Pasteur* (1897); besides many other articles on fermentation, etc.

Franklin, Benjamin (1706-90), Amer. statesman, b. in Boston, Massachusetts, on Jan 17. He was the fifteenth child in a family of seventeen, and after two years at school he was apprenticed to a printer at the age of twelve. He learnt his trade thoroughly, and at the same time became acquainted with the work of editing a newspaper. In 1725 he sailed for England, where for eighteen months he worked in a printer's office. On his return to America he started business as a printer. In 1729 he bought the *Pennsylvania Gazette*, and was so successful in editing the paper that three years later he brought

BENJAMIN FRANKLIN

Engraving by J. A. Thompson after the original painting by J. A. Duplessis.

out *Poor Richard's Almanac*, which he continued to issue for twenty-five years, and which became famous in the Amer. colonies for F.'s pithy maxims on the virtue of thrift and hard work.

About this period of his life he made many scientific investigations. He established the identity of lightning with electricity, by means of his famous demonstration with a boy's kite, and suggested the use of lightning conductors on large buildings. Amongst his scientific researches, two very useful pieces of work were the discovery of the Gulf Stream and of its course, and the discovery of the course of the storms that cross the continent of N. America.

He began to take a prominent part in the political life of Pennsylvania. In 1737 he was postmaster of Philadelphia and from 1751 to 1764 was a member of the colony's legislative body. As early as 1754 he was ardently advocating an inter-colonial union, the better to present their claims to the Eng. Gov. In 1757 he was drawn away from his scientific work by the urgency of the political situation in Pennsylvania. In that year he was sent to London to represent the grievances of the colony with regard to taxation. In

that mission he was so successful that in 1771 he was again sent, this time to protest against the Stamp Act. In 1775 he returned to America and helped to draw up the Declaration of Independence. During the war of Independence he represented the states in Europe. In 1778 he was recognised as minister of the U.S.A. by France. He brought about the treaty of Paris, and was instrumental in obtaining a good deal of help for the states. It was mainly through his diplomacy that France was brought into the war. At the close of the war he remained in Paris as minister of the states, and then returned to take part in framing the constitution of the new nation.

J. Bigelow has ed. a complete ed. of F.'s works. Except for his early journalistic writings and his famous autobiography these are mainly in the form of private letters. Even his scientific discoveries were made known to the world through his letters to his friends. His autobiography was ed. by John Bigelow and pub. in 1868. The 'Complete Edition' was produced by Bigelow in 1887-89, but the best ed. is the Centennial, by A. H. Smyth (10 vols. 1905-7). See W. C. Bruce, *Benjamin Franklin Self-revealed*, 1917; P. Russell, *Benjamin Franklin, the First Civilised American*, 1926; C. van Doren, *Benjamin Franklin: a Biography*, 1939; and Everyman's Library ed. of the *Autobiography*.

Franklin, Sir John (1786-1847), Arctic explorer, was b. at Spilsby in Lincolnshire. He entered the R.N. on board the *Porpoise*, and took part in the battle of Copenhagen in 1801. Two months later he was appointed midshipman to the *Investigator*, under Capt. Matthew Flinders, and showed remarkable ability for nautical observations on the voyage to Australia. He was present with Commodore Dance in his engagement with Lincolns in 1803, and took part in the battle of Trafalgar in 1805. Two years later he joined the *Bradford*, and sailed in that ship in the expedition against New Orleans in 1814, where he was wounded. In 1818 he was appointed to command the *Trent*, and accompanied Capt. Buchan in a voyage of discovery in the Arctic regions. In 1821 he was elected a fellow of the Royal Society. From 1825 to 1827 he was again occupied in exploring the Arctic regions, and on his return to England was knighted. From 1836 to 1843 he was governor of Van Diemen's Land (Tasmania). In 1845 he set out in the *Erebus* with Capt. Crozier in the *Terror* to discover a N.W. passage to the Pacific, and his ships disappeared into the unknown N., having last been seen near the entrance to Lancaster Sound. In the ensuing ten years over forty expeditions were sent to clear up the mystery of their fate, and only gradually was their tragic story pieced together (1851). After spending almost eighteen months in the ice near King William Is., F.'s party abandoned the ships and tried to march out to safety. Not a man survived. But F. left a name as the greatest single leader in the story of hazardous adven-

tures in the Arctic. He showed the existence of the N.W. passage, and his work resulted in the discovery of a second N.W. passage in 1850. He wrote *Narrative of a Journey to the Shores of the Polar Sea, 1819-22* (1823). See also ARCTIC EXPLORATIONS. See A. H. Hooley, *Franklin*, 1881; J. H. Skewes, *Franklin: the True Secret of the Discovery of his Fate*, 1889; H. D. Traill, *Life of Franklin*, 1896; and W. F. Rawnsley (ed.), *The Life, Diary, and Correspondence of Jane, Lady Franklin*, 1923.

Franklin, landowner of free but not of noble birth in fourteenth and fifteenth centuries in England. In status he was above the villeins. There is a F. in Chaucer's *Canterbury Tales*, and the word also occurs in Scott's *Ivanhoe*.

Franklin: 1. Tn. in Norfolk co., Massachusetts, U.S.A., about 27 m. S.W. of Boston. It has a public library containing books contributed by Benjamin F., in whose honour the tn. received its name. The chief manufs. are straw goods, felt, cotton, and woollen goods. Pop. 7300. 2. City in New Hampshire, U.S.A., about 95 m. from Boston, at the confluence of the Pemigewasset and Winnepesaukee Rs. to form the Merrimac. The rivs. furnish good water power, which is extensively used in the manufs. The chief are paper and pulp, and hosiery. Daniel Webster was b. here, and the house is used as a museum. F. was first settled in 1748 and incorporated as a city in 1895. Pop. 6700. 3. Tn., cap. of Venango co., Pennsylvania, U.S.A., about 35 m. from Erie. It is the centre of the chief oil region of the state, and manufs. boilers, engines, steel castings, and iron goods. Pop. 9,900. 4. Dist. in N. Canada, named after Sir John F., which includes Banks, Prince Albert, Victoria, Wollaston, King Edward and Baffin Land, Melville, Bathurst, Prince of Wales, and Cockburn Is. Its area is about 500,000 sq. m.

Franklin Institute, founded in 1824, and located in Philadelphia, Pennsylvania, U.S.A., is the oldest school in the U.S.A. for the study of the mechanical arts and applied sciences. It owns the finest technical library in the country. Its medals and certificates of awards to those who have done most to advance the physical sciences in their application to inventions are highly prized.

Frank-marriage, species of estate tail in old Eng. law whereby a freeholder granted land to his daughter or cousin or near blood relation on her marriage, to be held by her and her husband and the heirs begotten of their two bodies, free from all manner of service, except fealty to the donor or his heirs.

Frankpledge. From the earliest times in England there was a custom whereby a man's relations were responsible for his behaviour; out of this grew the principle of forming institutions for mutual security. A number of men formed an association in which they were answerable each for the others; if one committed a crime, the others were liable for his appearance to make reparation, and if he disappeared, themselves had to pay the penalty unless

they could prove their innocence. These societies were called *frithborhs*, or peace-pledges, and the Normans mistranslated the A.-S. words by F.

Franks, Sir Oliver Shewell (b. 1905), Brit. scholar and diplomatist, son of the Rev. S. K. F., author and lecturer on theological works. Educated: Bristol Grammar School, and Queen's College, Oxford Fellow and Praelector there, 1927-37. Tutor, 1933-37. Univ. lecturer in philosophy, 1935-37. Visiting prof., univ. of Chicago, 1935. Prof. of moral philosophy, univ. of Glasgow, 1937-45. Temporary civil servant at the Ministry of Supply, 1939-46. Permanent secretary, Ministry of Supply, 1945-46. Ambassador to Washington, U.S.A. from 1948.

Franks, The, name given to a confederation of Germanic tribes who inhabited the lower and middle Rhine valley during the third century A.D. The tribe may be divided into two main groups, the Salian F. who dwelt on the lower Rhine, and the Riparian F. on the middle Rhine. The chief tribes were the Atuarii, Sali, Sigambri, Chatti, and Bructeri. Towards the end of the third century they began to move W. About 350 the F. were defeated by the Emperor Julian and became a dependency of Rome, but when Clovis (481-511) became their king, the Roman yoke was thrown off. Clovis defeated the Alemanni round the R. Seine in 495, and by 501 obtained an ascendancy over the Riparian F., thus considerably extending his empire and forming the nucleus of the kingdom of France. During his rule, also, the F. adopted Christianity, but remained subject to their Saxon law. They obtained military supremacy in N. Gaul and founded the first dynasty of Fr. kings. By 597 they were divided into the Austracian and Neustrian F., who continually struggled for ascendancy over each other, the Merovingian dynasty being finally superseded (752) by the Carolingian. The F. were a democratic tribe. There were only two social grades, the free F. and the captive slaves taken in the fight. At the head was a king, who, with the help of his counts, saw to the execution of the laws drawn up by the great council. They were a martial race, but in time of peace tilled the soil. See L. Sergeant, *The Franks*, 1898; L. Schmidt, *Geschichte der deutschen Stamme bis zum Ausg. der Völkerwanderung*, 1941.

Frantz, Robert (1815-92), Ger. composer, b. at Halle. Suffered in early life from the opposition of his parents to a musical career, but eventually was allowed to go to Dessau to study organ-playing under Schneider. In 1843 he brought out a book of songs, which subsequently was followed by nearly fifty other books, containing altogether about 250 songs. The first book was highly praised by Schumann and Liszt, and F. became famous. The songs are mostly for mezzo-soprano voice, lyrical, and finished in execution. Unhappily deafness began to afflict F. before he was thirty, while, owing to a nervous disorder, he had to resign his post of organist to the city of Halle and his other offices. But his future was provided for

by the proceeds of a concert tour arranged by Liszt and others. In addition to songs F. ed. Astor's *Stabat Mater* and Durante's *Magnificat*. He also pub. an 'open letter' to the critic and bitter opponent of Wagner, Hanslick (1871), on his methods of editing the classics.

Franzen, Frans Michael (1772-1847), Swedish author, b. in Uleåborg, Finland. In 1798 he was prof. of literature, in 1801 prof. of hist., and in 1808 was elected a member of the Swedish Academy. On the cession of Finland to Russia he went to Sweden, and became in 1831 bishop of Harnosand. He was a writer of both poetry and prose, but his shorter poems are perhaps his best work, being very beautiful in their simplicity; his songs, too, were very popular, one of them winning the prize in the Swedish Academy in 1797.

Franzensbad, or Františkovy Lázně, tn. and watering-place of Bohemia, Czechoslovakia. It is situated between the spurs of the Fichtelgebirge, the Bohmerwald and the Erzgebirge, and possesses mineral springs which are much resorted to by sufferers from nervous disorders. The mineral waters are also exported in bottles, in normal times 300,000 a year. Pop. 4,000.

Franz Josef, see FRANCIS JOSEPH.

Franz Josef, or Lomonossov, Land, archipelago in the Arctic Ocean, situated about 250 m. to the E. of Spitzbergen. It is described as a lofty glacier-covered land reaching an elevation of 2100 ft., and is comprised of some sixty is. which are volcanic. It was discovered by Payer and Weybrecht in 1873, and was explored by Leigh Smith in 1881 and 1882. In 1894 Alfred Harnsworth (later Lord Northcliffe) fitted out an expedition under the leadership of F. G. Jackson. The party landed near Cape Flora, and spent the summer of 1895 exploring the coast to the N.W. They reached Cape Richthofen in 1896, and named the expanse of water to the N. Queen Victoria Sea. In June of the same year they met Nansen on his southward journey, and left him the *Hind* for his homeward voyage. In 1897 Capt. Robertson of Dundee made discoveries in F. J. L., and Wycho's Land was circumnavigated by Pike and Crossley. In 1898 an expedition under Wellman landed at Cape Tegethoff and defined the E. extension of the archipelago. In 1899 the duke of Abruzzi made his way to Crown Prince Rudolf Land and wintered in Teplitz Bay; the party reached 86° 33' N. lat., 240 m. from the Pole. In 1903 the Zeigler expedition went N. by this route. In 1928 F. J. L. was annexed by the U.S.S.R. and it was renamed Lomonossov Land. A meteorological observation post, the most northerly in the world, was set up in 1929, on Hooker Is.

Frascati, tn. of Italy in Rome, situated on the Alban Hills, nearly 1000 ft. above sea-level, and 15 m. S.E. of the city of Rome. It is a popular summer resort, and there are numerous beautiful villas, among which may be mentioned Aldobrandini, Torlonia, etc. It is noted for

its market gardens and its wine trade. F. is built on the site of the anc. Tusculum. In the Second World War the cathedral interior was wrecked and the façade pitted. The churches of S. Rocco and Gesù were half destroyed and all the other churches damaged; the Seminario was demolished, and the Municipio badly hit; and the villas Torlonia, Aldobrandini, Falconieri, Ruffinella, and Lancellotti were all seriously damaged, the first-named being Kesselring's headquarters. Civilians subsequently ransacked and wrecked the entire building of the Villa Torlonia and grounds. Pop. 10,000.

Fraser of North Cape and Molesay, Bruce Austin Fraser, first Baron (b. 1888), Brit. admiral, son of Gen. Alexander F. R.E. Educated at Bradfield School. Flag captain, E. Indies. Commanded the *Glorious* (see AIRCRAFT CARRIER); chief of staff, Mediterranean Fleet; Third Sea Lord and Controller, 1939-42. Second in command, home fleet, 1942; commander-in-chief home fleet, 1943-44. Admiral, 1944; of the Pacific fleet, 1945-46. Commander-in-chief, Portsmouth, 1947-1948. On Dec. 26, 1943, the great Ger. battle cruiser *Scharnhorst* (g.r.) was brought to action and sunk off N. Cape, Norway, by units of the home fleet under the command of F., which were escorting to Russia a convoy of exceptional importance. In Aug. 1949 he was appointed First Sea Lord in succession to Admiral of the Fleet Sir John Cunningham.

Fraser, Peter (b. 1884), Brit. statesman, b. at Fearn, Ross-shire, Scotland, and educated at a board school. Began political activities as a local officer of the Liberal party. In 1908 he joined the I.L.P. in London. Emigrated to New Zealand, 1910. Played a prominent part in the Labour movement there. Member of the House of Representatives for Wellington Central since 1918. Member of Wellington City Council, 1919-23 and 1933-36; and of Wellington Harbour Board, 1933-36. Minister of education, health, marine, and police, 1935-40. Prime Minister since 1940; also minister of external affairs and of Is. ters. of New Zealand since 1943. During the Second World War he attended meetings of the War Cabinet in London. New Zealand delegate to Empire Parl. Association Conference, 1935. Led the New Zealand delegation at the San Francisco Conference (g.v.), 1945, and again at the first meeting of the United Nations Assembly, 1946. In a general election at the end of Nov. (1946) F. was returned to office, but only by securing the four Maori seats, having divided equally with the National party. The result was interpreted as a rebuff to the Radical wing of Labour, and as giving a mandate to F. to pursue his humanitarian policies rather than any further extension of direct nationalization. In 1947 F.'s gov. passed sov. measures into law, of which the most important was one by which the State took over all insurance relating to workmen's compensation. An 'aid to Britain' conference was held at Wellington in Aug. and initiated a sub-

stantial programme of economy and increased production designed to help the United Kingdom in its financial difficulties.

Fraser, Simon, see LOVAT.

Fraser, chief riv. of Brit. Columbia, rises in the Rocky Mts. in the vicinity of the Yellowhead pass, and flows in a N.W. direction for 277 m. to Giscombe, where it makes a turn almost due S. through the centre of the province for 413 m. to Hope. Here it turns again and continues W. for 95 m. to empty at New Westminster into Georgia Strait. At Lytton, 65 m. N. of Hope, the riv. is joined by its largest trib., the Thompson, and from this point the lines of the Canadian Pacific and Canadian National Railways run along the banks to the coast. Scene of the earliest gold discoveries (1858) in the province around Quesnel and Williams Creek, the F. is now famous for its salmon fishery. The F. valley, which extends almost from Hope to the confines of Vancouver, is notable for its fertility, and supports a large farming and dairying population. In 1948, when the riv., swollen by melting snows from the Rocky and Cascade Mts., rose some 26 ft. above summer level, the valley suffered severely from flood. Named after Simon Fraser, who explored it in 1808, the F. has a length of 785 m. Its chief tributaries are the Morkill, Bowron, McGregor, Willow, Salmon, Nechako, Blackwater, Cottonwood, Quesnel, Chilcotin, Bridge, Thompson, Harrison, and Pitt.

Fraserburgh: 1. Seaport tn. in Aberdeenshire, Scotland, on the S. side of Kinnaird's Head, and W. of F. Bay. It is noted for its herring fishery, and has considerable export and import trade. It has a good harbour. Originally called Knithlie, the name was afterwards changed to F. in honour of its founder Fraser of Philorth. Pop. 10,200. 2. Tn., Cape of Good Hope, S. Africa, is the cap. of a dist. of the same name. Pop. of dist. 6500, of tn. 700.

Fraser's Highlanders, see under SEA-FORTH HIGHLANDERS.

Fraser Island, or **Great Sandy Island**, off the S. coast of Queensland, Australia, stretching from Wide Bay to Hervey Bay. There is excellent fishing.

Fraserville, or **Rivière du Loup en Bas**, watering-place in Temiscouata Co., Quebec, Canada, is near the junction of the Rivière du Loup with the St. Lawrence. The prin. industries are leather manufs. and tanning, and there are cotton mills. The Fraser Institute is situated here. Pop. 8000.

Fraternities, societies of students in nearly all the colleges of the U.S.A., with the object of promoting social intercourse, good scholarship, and athletic ability. There is little secrecy in their organisation beyond measures taken to protect their constitutions and mottoes. They are spoken of as Gk. Letter F., as Gk. letters are used to name each fraternity. Each fraternity has a distinguishing badge bearing symbols and monograms. F. are divided into chapters, one (but not more) of which is in each college. The first society, the Phi Beta Kappa, was organ-

ised at Wm and Mary College 1776 There are over forty mon's general F with a total membership of more than 2 500 000, twenty women's general F with a total membership of 50 000 There are also medical local and honorary F See Baird *American College Fratellites* 1898

of Assisi they refused to submit to the authority of the church and formed a separate organisation, professing poverty, and having no settled abode They were suppressed spasmodically by church and civil authorities in the fifteenth century at times the death penalty being inflicted on their leaders

11. General British Columbia

THE FRASER RIVER AT HILLS GATE

Fratellini, name of a famous family of clownes which has been called the dynasty of clownes Gustave I was the first of the family to work in a circus The elder of his sons who appeared in London in the first decade of this century had two sons who performed together with their brother-in-law as a trio of clownes Good though they were, they were eclipsed by the world wide celebrity of their cousins the family of Gustave's younger son This latter family appeared in England in C B Cochrane's revue *Dover Street to Dixie*, the three being Paul Albert and Francois E In Paris they were idolised and were almost an institution at the Cirque d'Winter Paul (d 1940) was the simple fellow with the larged nose who played the bombardon **Fratelli**, or **Frerots** (Little Brethren) name of certain misguided religious sectaries of the fourteenth century Claiming to be the true followers of Francis

Frates Arvdes, see ARVAL BROTHERS

Fraud legal term of such wide meaning that it may be said to be implied in every civilly or criminally wrongful act whereby one person is prejudiced by the deception of another To sustain an action of deceit or l the person aggrieved must prove (1) the statement was untrue in fact and made apparently or in reality with the intent that he should act upon it (2) the person who made it either knew of its falsity or was recklessly and consciously ignorant whether it was true or not and (3) he (plaintiff) acted upon it and in consequence, suffered damage It is not essential to an action of l that express words should have been used by the defendant, if by his conduct suggestions or active concealment of some thing material, he causes the plaintiff to be misled But a *suppression vera* (suppression of truth) is only regarded as tantamount to F where the withholding

of that which is not makes that which is stated absolutely false. Merely allowing a man to continue to act on an erroneous assumption is not defrauding him if the other person in no way contributed to such error. Generally speaking, however, F. implies a misrepresentation of existing fact. A principal is liable for the F. of his agent where committed in the cause of the principal's business and ostensibly for his benefit; a husband is liable for his wife's F., and a partner for that of his co-partner. A contract induced by F. is voidable at the option of the defrauded party, for *fraus vitiat omnia* (F. vitiates everything), and, besides rescinding the contract, he is also entitled to damages, but he may, if he choose, leave the contract subsisting and at the same time sue for any damage he has suffered. In accordance with the above maxim it has long been settled that F. in all courts and at all stages of any particular transaction, if proved, at once vitiates the transaction.

Formerly, false statements made negligently but without active deceit, or false statements made on insufficient grounds, were held to amount to what was called 'legal F.' But the rule now is that no false statement made with an honest belief in its truth can render the maker liable for F. In consequence of this ruling (which is to be found in the classic case of *Derry v. Peek*), the Directors' Liability Act, 1890, makes directors and promoters of a company liable in damages for innocent misstatements in a company prospectus, inviting the public to subscribe to shares where such statements were made without reasonable grounds for believing in their truth.

In the criminal law many offences necessarily imply F. (as to civil remedies for crimes see under CRIMINAL LAW), e.g. obtaining by false pretences, embezzlements (q.v.), and all unlawful appropriations by all manner of agents, trustees, and others entrusted with property. In a charge of falsifying accounts it is not necessary to show that any particular person was intended to be defrauded. As to rendering void fraudulent conveyance by a bankrupt as against his creditors, see under CONSIDERATION.

Frauds, Statute of, 1677. The object of this Act was the prevention of fraud, but it is a legal aphorism that it promotes fraud more often than it prevents it. The statute renders certain classes of contracts unenforceable unless evidenced by writing (as to the five classes see under CONTRACTS). Unless contracts of the classes in question are so evidenced they can only be enforced (where the circumstances allow) by the aid of the equitable doctrine of 'part performance.' That doctrine applies where one party to a contract, generally for the sale or purchase of land, including house property, seeks to compel the other party to fulfil his promise to buy or sell and has himself done something in fulfilment (part performance) of his side of the contract in the confidence that the other party would adhere to his promises. Equity in such a case looks upon such acts of part performance, if it is clear that they could

only be referable to the contract rolled upon, as evidence of the formation of such a contract in spite of the absence of writing. A case frequently cited as an illustration of the kind of acts of alleged part performance that would not be so exclusively referable is that of *Maddison v. Alderson*, where the plaintiff, a house-keeper, who had remained for long in the service of a certain gentleman, sought to make his estate liable after his death for an alleged gift of land to her in consideration of her remaining in his service. It was held that her service was not exclusively and unequivocally referable to the promised gift, and therefore not sufficient evidence of a promise in the absence of writing. Comments in the court of appeal by Lord Justice Mackinnon suggested that this ancient statute stands in need of amendment owing to the obscurity of its provisions and the injustices arising out of its application. The question whether legislation should be introduced to repeal the section (4) of the Statute of Frauds which remains outstanding, and the other legislation on the same matter formed the subject of a recommendation of the Law Revision Committee, and was under consideration when war broke out (1939). Further consideration of this complex question was postponed by war conditions.

Frauenfeld, cap. of the Swiss canton Thurgau, situated on the Murg. It has a tenth-century castle. The manufs. are cottons, silks, woollens, and iron and aluminium goods. Pop. 10,000.

Frauenlob, see HIRNICH VON MEISSNER.
Fraunce, Abraham (fl. 1587-1633), Eng. poet, the dates of whose birth and death are uncertain. He was educated at Cambridge, at the expense of Sir Philip Sidney, and, after studying law at Gray's Inn, was called to the Welsh Bar. He is chiefly remembered for his *Lamentations of Amintas for the Death of Phillis*—a trans. of Thomas Watson's version (1585) in Lat. hexameters of Tasso's pastoral drama *Aminta*, and other writings, the chief of which are *The Countess of Pembroke's Freychurch* (1591)—which consists of a reprint of his *Lamentations*; *The Countess of Pembroke's Emanuel* (1591), a poem on the Nativity, Passion, Burial, and Resurrection; and a third part to these, *Amintas Dale* (1592), which contains 'the most concerted tales of the Pagan Gods.' F. is of interest in the hist. of Eng. prosody because he belonged to the Cambridge group, including Gabriel Harvey and his brother Richard, which attempted to force upon Eng. poetry the classical metres; and all his poems are in hexameters.

Fraunhofer, Joseph von (1787-1826), Ger. optician, b. at Straubing in Bavaria. His father was a glazier, and he was apprenticed to a glass polisher, but he accidentally came into the possession of a sum of money which permitted him to start in business for himself. In his leisure he pursued scientific investigations in mathematics and optics. By the help of Utzschneider he obtained the position of optician to the mathematical institute at Munich, and succeeded in making

achromatic glass for telescopes of such excellence that his fame spread all over Europe. The great telescope at Dorpat was made by him: he also discovered the dark lines in the sun's spectrum which take his name. Conservator of cabinet of natural curiosities at Munich. See P. Lenard, *Grosse Naturforscher*, 1929.

Fraunhofer Lines, fine black lines crossing the solar spectrum, first observed by Wollaston in 1802, and later studied by Joseph von Fraunhofer (q.v.). The lines correspond to the wave-lengths of light absorbed in the reversing layer of the sun.

Fraustadt (Polish Wąsowa), tn. of Poland (formerly of Germany) in the prov. of Posnan, about 14 m. N.E. of Glogau. Here, in 1706, Charles XII. of Sweden gained a victory over the Saxons. The tn. is noted for its tanneries, sugar factories, and dye works. Pop. 7500.

Fraxinus, see *Asu*.

Fray Bentos, or *Independencia*, tn. of Uruguay, and cap. of Rio Negro. It is on the Uruguay R., about 170 m. N.W. of Montevideo. The tn. is engaged in the manu. of extract of meat and canning. Pop. about 5000.

Frazer, Sir George James (1851-1941), Scottish author, b. at Glasgow; educated at Glasgow Univ. and Trinity College, Cambridge. Elected to a fellowship at Trinity College in 1879. At first his studies were classical, but he took a new line in 1887 with a book on *Totemism*. In 1890 appeared *The Golden Bough* (2nd ed. 1900; 3rd ed. in 11 vols., 1911; supplementary index vol., 1914; abridged form, 1922), which instantly brought him fame. This masterpiece of anthropology and scholarship has profoundly influenced the modern outlook on belief in the supernatural and on religious ritual. Much of his other work was also concerned with the same anthropological interests. Went to Greece for the preparation of an ed. of Pausanias, the Gk. geographer, which appeared as *Pausanias's Description of Greece, translated with a Commentary* in 1898 (2nd ed. 1913), and *Pausanias and other Greek Sketches* in 1900. In 1907 he was appointed prof. of social anthropology to the univ. of Liverpool. Delivered his first Gifford lectures at St. Andrews in 1911, choosing as his subject *Belief in Immortality and the Worship of the Dead*. In 1912 he ed. a selection of *Couper's Letters* (with notes by J. E. Drayner). Knighted, 1914. O.M., 1925. Numerous honorary degrees. In 1920 he was elected a fellow of the Royal Society, having given up his Liverpool fellowship in 1919. His later work included a trans. of Apollodorus in the Loeb Library and an ed. of Ovid's *Fasts* in 5 vols. in 1929. Much charm invests his theories of kingship, magic, and tree worship, woven out of his fundamental belief in man's essential ignorance. With F. religious beliefs took their place among other natural phenomena as a subject for dispassionate investigation. Creed and mythology were but one manifestation among many of an all but universal cult, which originated neither in Judea nor in revelation, but in the earliest efforts of primitive man to

influence by magic the seasons and stars in their courses and the fecundity of nature. It has been well said that he did for our time what Lucretius did for his—emancipated us from the most crushing form of fear through idol-worship. F. felt himself to be a disciple of Darwin, but where Darwin traced the origins and evolution of our physical bodies, F. gave us the record of our mental growth. But his interest in ritual was always slighter than his interest in myth; and he ignored altogether the influence of economic motive in the evolution of primitive society. Only time can show how far his theories will enjoy universal assent. Already Rivers and the diffusionists have challenged the assumption which F. inherited from Tylor—that if the thinking and institutions of primitive societies the world over reveal remarkable similarities, the explanation must be sought solely in the identical working of the human mind. His other works include *Lectures on the Early History of the Kingship* (1905); *Adonis, Attis, Osiris: Studies in the History of Oriental Religion* (1906; 3rd ed. 1914); *Questions on the Customs, Beliefs, and Languages of Sarages* (1907); *Psyche's Task* (1909); *Totemism and Exogamy* (1910); *The Belief in Immortality*, etc. (1913); *Essays of Addison*, ed., (1915); *Folk-lore in the Old Testament* (1918); *The Worship of Nature*, 1. (1926); *Myths of the Origin of Fire* (1930); *Aftermath: a Supplement to the Golden Bough* (1936); *The Fear of the Dead in Primitive Religion* (1936); *The Gorgon's Head* (1937); and *Totemica: a Supplement to Totemism and Exogamy* (1937).

Frazer Island, or *Great Sandy Island*, see *FRASER ISLAND*.

Frechen, vil. of the Rhineland, Germany, 22 m. S.S.W. of Düsseldorf. Earthenware is manufactured here. Pop. 15,500.

Fréchette, Louis Honoré (1839-1908), Fr. Canadian poet, b. at Lévis, Quebec. He was called to the Canadian Bar (1864), but entered upon a journalistic career in Chicago. In 1874 he was elected to the Dominion Parliament, but was defeated at the election of 1878. He ed. *La Patrie*, made sev. trans. from the Fr., and wrote *Mes loirs* (1863), *La Voie d'un exilé* (1867), *Les Oiseaux de neige* (1880), and the two historical dramas, *Papineau* (1880) and *Félix Pontre* (1880). He was elected president of the Royal Society of Canada.

Fredegond, Fredegunde, or Fredegunda (c. 545-97), Frankish queen, first mistress and then wife of Chilperic, king of Neustria. She parted Chilperic from his first wife, Audovera, whose servant she had been, but he then married Galavintha. F. was suspected of murdering her in the same year (567), and became her successor. This caused war between Chilperic and his brother Sigebert of Austrasia, whose wife, Brunhilda, was sister to Galavintha. F. had Sigebert assassinated at Vitry (575), and made away with all who stood in the way of the succession to the throne of her own son, Clotaire II. After the murder of Chilperic in 584, she carried on war

against Brunhilda and her descendants, but failed to kill the queen, and d. during the campaign.

Fredericia, seaport of Denmark, on the S.E. coast of Jutland, at the N. entrance of the Little Belt and the Little Belt bridge. It manufactures chemicals, iron, silver, and other metals, condensed milk, soap, and toys; is an important communication centre (railway, telegraph, telephone), and has considerable shipping trade. The prin. exports are meat, fish, and eggs; imports: pottery, salt, and petroleum. The permanent buildings of the Dan. Industries Fair are situated here, and so is a college for the deaf and dumb. It has had an exciting hist. The fortress was stormed by Swedes in 1657. In 1849 the Dan. garrison broke a siege by the army of Schleswig-Holstein, but in 1864 the tn. was evacuated by the garrison after bombardment and siege by the Austrians. Pop. 23,000.

Frederick I. (c. 1122-90), head of the Holy Rom. Empire, 1152-90, surnamed **Barbarossa** or **Redbeard**. He was the son of Frederick II. of Hohenstaufen, duke of Swabia, and succeeded his father as duke of Swabia in 1147, and his uncle Conrad III. as king of Germany in 1152. He renounced Germany to order during the early years of his reign, and then proceeded to establish the imperial authority in Italy. At Pavia he received the Lombard crown, and in 1155 was crowned emperor in Rome by Adrian IV. Four years later began the long contest between F. Barbarossa and Pope Alexander III., Adrian's successor. Various struggles and treaties ensued; but at last, in 1177, F. made his peace with the pope, and was enabled to turn his attention to Germany, where he had to contend with Henry the Lion, duke of Bavaria and Saxony, head of the house of Guelph. He, however, succeeded by his energetic measures in crushing the Guelph power in Germany, and in 1189, having settled the affairs of the empire and established universal peace in his dominions, he resigned the gov. to his eldest son, Henry, and put himself at the head of the third crusade. He won two great victories over the Moslems, but was drowned in a small stream in Cilicia in 1190. On the whole the reign of F. was a happy and prosperous time for Germany. He encouraged the growth of tns. and took strong and successful measures to establish order. He is said to have taken Charlemagne as his model. His memory in Germany is cherished as that of the best and greatest of his race. See H. Prutz, *Kaiser Friedrich I.*, 1871-73; N. von Bunsen, *Leben und Thaten Friedrichs I.* 1872; V. Chevallier, *Répertoire des sources historiques du moyen âge*, 1901; and H. Wahl, *Kaiser Friedrich Barbarossa*, 1941.

Frederick II. (1194-1250), Holy Rom. emperor, son of the Emperor Henry VI. and Constance, heiress of Sicily, and grandson of the Emperor Frederick I., thus a member of the Hohenstaufen family, b. near Ancona in Italy. On his father's death he was crowned king of Sicily at Palermo (1198), and on the death of his mother in the same year, Pope Innocent

III. became his guardian and regent of Sicily. He was elected head of the Holy Rom. Empire in 1212 on the excommunication of Otto IV., and his coronation took place in 1215 at Aix-la-Chapelle. Three years later, on the death of Otto, F. became undisputed ruler of Germany, and adherents gathered around him. In 1228 he entered on a crusade, and set sail for Palestine, and by a treaty made in 1229 he secured the possession of Jerusalem, Bethlehem, Nazareth, and the surrounding neighbourhood, crowning himself king of Jerusalem. During his absence the new pope, Gregory IX., had devastated his possessions in Italy, but his efforts failed to arouse serious opposition in Sicily and Germany, and F., on his return, had no difficulty in driving back his enemies, and a peace was patched up between pope and emperor at San Germano. In the ensuing struggle, however, F. neglected his duties in Germany, and, aided by the Lombard cities and many Ger. nobles, the papacy at length won the day. F. was famed for his wide knowledge and learning, and his chief claim to fame is as a lawgiver. See G. Blondel, *Étude sur la politique de l'empereur Frédéric II. en Allemagne*, 1892; and K. Hampe, *König Friedrich II.*, 1935.

Frederick III. (1415-93), Holy Rom. emperor, b. at Innsbruck in the Tyrol, son of Ernest of Hapsburg, duke of Styria and Carinthia. In 1440 he was chosen Ger. king at Frankfurt under the title of Frederick IV., and in 1463 he united Upper and Lower Austria under his rule, taking the title of Frederick V., archduke of Austria. He had been crowned emperor at Rome in 1452. His reign covered a difficult period—Hungary and Italy were invaded by the Turks, and Vienna was occupied by the Hungarians. He, however, managed to dupe Charles the Bold, who wished to secure the royal title, and gradually reunited the family tns. of the Hapsburgs, the marriage of his son Maximilian with Mary, daughter and heiress of Charles the Bold, duke of Burgundy, rendering the Hapsburg family one of the greatest dynasties in Europe. F. was a listless and incapable ruler, though he had many excellent personal qualities. He had a real love of learning, and towards the end of his reign handed over the government of his lands to his son Maximilian, retiring to Linz, where he passed his time in study. See *Æneas Sylvius* (later Pope Pius II), *Historiarum Frederici*, 1685; and V. von Kraus, *Deutsche Geschichte im Ausgang des Mittelalters*, 1905.

Frederick I. (1369-1428), elector and duke of Saxony, surnamed 'the Pugnacious,' son of Frederick the Stern of Meissen. He won distinction as a soldier, and as a reward for his successes against the Hussites the Emperor Sigismund made him duke of Saxony, 1423. The Hussites crushed him, however, at Aussig three years later (1426). In 1400 he founded Leipzig Univ. See life by G. Spalatin, in *Scriptores rerum Germanicarum præcipue Saxonicarum*, II. (Menneke's ed.), 1728-30; C. Böttiger and T. Ffathe, *Geschichte des*

Kurslaates und Königreichs Sachsen, 1867-73.

Frederick III. (1463-1525), surnamed 'the Wise,' elector and duke of Saxony, succeeded his father, Ernest, in 1486. He exercised an enormous influence on Ger. politics of the sixteenth century. He founded the univ. of Wittenberg (1502), and called Luther and Melancthon to chairs in the faculty. He granted toleration to the creed of the reformers, but did not adopt it himself. On the death of Maximilian I. he refused the offer of the imperial crown (1519), warmly supporting Charles V. (then Charles I. of Spain). F. was succeeded by his brother John. See T. Kolde, *Friedrich der Weise und die Aufgabe der Reformation*, 1881; and P. Klrn, *Friedrich der Weise und die Kirche*, 1926.

Frederick I. (1657-1713), first king of Prussia, elector of Brandenburg as Frederick III. (1688-1701). He was the son of Frederick William, the great elector of Brandenburg. His name has become proverbial for vanity and extravagance, but he was loved by his subjects, and a patron of such men as Spener, Francke, Thomastus, and Leibnitz. He founded the univ. of Halle (1694) and the academy of sciences, and was also founder of the Order of the Black eagle. F. supported the League of Augsburg against Louis XIV., and helped William III. in the revolution of 1688 in England. The Emperor Leopold of Austria granted him the royal title on the eve of the war of the Sp. Succession in return for his support. In 1707 he was elected prince of Neuchâtel. See C. von Ledebur, *König Friedrich I. von Preussen*, 1878-81; H. Tuttle, *History of Prussia*, 1881-88; and W. Pierson, *Preussische Geschichte*, 1898.

Frederick II. (1712-86), known as 'the Great,' son of Frederick William I. of Prussia and Sophia Dorothea, daughter of George I. of England. He was king of Prussia 1740-86. His great wars occurred during the first half of his reign. On the death of the Emperor Charles VI., he invaded Silesia, and in the first campaign gained the victory of Mollwitz. He then allied himself with France, and after the victory of Chotusitz, the peace of Breslau (1742) was concluded, by which Austria ceded most of Silesia to Prussia. Two years later he reopened the struggle, and succeeded in effecting the treaty of Breslau, a repetition of the treaty of Breslau. In 1756 the Hapsburgs formed an alliance against Prussia with France, Russia, Saxony, and Sweden—England, as the enemy of France, siding with F. Then began the great Seven Years war, the outcome of which was the culmination of F.'s military career, but which taxed the kingdom to its utmost. By wise financial measures, however, F. soon placed Prussia on a sound basis, and was enabled to improve its agric. and industrial condition. F. looked upon his power rather as a trust than as a source of personal advantage; this he faithfully discharged according to his light. Throughout his reign he took the greatest

interest in the improvement of the Prussian army. His political career, character and ideas—as recorded by his letters and conversations in relations with Voltaire, and an analysis of his writings are clearly described by G. P. Gooch in *Frederick the Great: the Ruler, the Writer, the Man* (1947). See H. Tuttle, *History of Prussia under Frederick the Great, 1740-56*, 1888; F. Kugler, *Geschichte Friedrichs der Grossen*, 1846; T. Carlyle, *History of Frederick II. of Prussia*, 1858-1865; F. Longman, *Frederick the Great and the Seven Years War*, 1881; E. Lavisse, *La Jeunesse du grand Frédéric*, 1891; V. Thadden, *Frederick the Great*, 1930; and N. Ausubel, *Superman: the Life of Frederick the Great*, 1932.

FREDERICK THE GREAT

Engraved by E. Scriven from a painting by Carlo Vanloo

Frederick III. (1831-88), second Ger. emperor and king of Prussia (March-June 1888), son of William I. of Prussia (first emperor of united Germany), and known as Frederick William before his accession. He studied at Bonn Univ., and travelled widely. He married Victoria, princess royal of England, in 1858, and became crown prince of Prussia on his father's accession, 1861. F. fought in the war with Denmark, 1864; in that with Austria, 1866, being present at the battle of Sadowa. In the Franco-German war he fought successfully at Weissenburg, Worth, and later at Sedan. He took part also in the siege of Paris. F. greatly influenced the founding of the new Ger. Empire, though his plans often differed from Bismarck's. He wrote diaries of his travels, and of the wars of 1866 and 1870-71, and was popularly called by the army 'Unser Fritz.' During his father's illness in 1878 he became provisional regent. His eldest child was William II. His diaries (*Tagebücher*, 1818-66) were ed. by H. Meisner (1929). See lives by R. Rodd, 1888; G. Freytag, 1890; and W. Richter, 1938.

Frederick V. (1596-1632), elector palatine, son of Frederick IV. He married Elizabeth, daughter of James I. of

England, 1613, and was grandfather of George I. In 1619 F. headed the Ger. Protestant Union (Calvinists), and accepted the crown of Bohemia. F.'s general was utterly defeated by the Imperialists at the battle on the White Hill (near Prague), 1620, and he lost his hereditary possessions as well as Bohemia, and was obliged to go into exile. The electoral dignity was conferred on Maximilian of Bavaria, his cousin, the Catholic leader, 1623. F. was father of Prince Rupert. See A. Gindely, *Geschichte des dreissigjährigen Kriege*, 1869 80; J. Grosse, *Friedrich von der Pfalz*, 1870; and R. Krassnig, *Der Winterkönig*, 1881.

Frederick I. (c. 1471-1533), king of Denmark and Norway 1523-33. He succeeded his nephew Christian II., who was dethroned. He was joint ruler of the duchies of Slesvig and Holstein, with his brother John. He was an able ruler and granted many privileges to the nobility and the farmers. During his reign, the Lutheran faith spread to his dominions.

Frederick II. (1534-88), son of Christian III., and king of Denmark and Norway. His reign falls into two distinct periods—that of war, 1559-70; that of peace, 1570-88. The war with Sweden lasted seven years, ending in the triumph of F. at the peace of Stettin. Denmark-Norway had become a great sea power and at the entrance to the Baltic F. built Kronborg, the castle which Shakespeare made famous in his play *Hamlet*, *Prince of Denmark*. F. possessed the gift of discovering and employing great men, and no other Dan. king was ever so beloved by his people.

Frederick III. (1609-70), king of Denmark and Norway, son of Christian IV., becoming archbishop of Bremen, 1634. He succeeded to the throne in 1648. Hoping to regain ter. lost by the treaty of Bromsebro, 1645, F. and his senate declared war on Charles X. of Sweden, 1657. But Charles invaded Jutland and besieged Copenhagen, forcing the Dan. people to sign the unfavourable treaty of Roskilde, 1658. Hostilities were soon resumed, but F., aided by Brandenburg, expelled the Swedes from Jutland, forcing Charles to raise the siege of Copenhagen, 1659. A peace favourable to Sweden was concluded, 1660. The monarchy was made hereditary and absolute, instead of elective and limited, by a voluntary act of commons and clergy at a diet, 1660-61.

Frederick IV. (1671-1730), king of Denmark, from 1699, son of Christian V. He allied with Peter the Great and Augustus II., king of Poland, in 1700, against Charles XII. of Sweden, but was forced to sign the peace of Travendal on the latter's siege of Copenhagen. During the reverses of Charles in 1709, F. again made war, capturing Stralsund and Tönningen. Charles was killed at the siege of Frederikshald in Norway, 1718. In 1720 F. concluded the treaty of Frederiksborg with Sweden.

Frederick V. (1723-66), king of Denmark. He succeeded his father, Christian VI., in 1746, and married a daughter of

George II. of England. A wise and able ruler, he did much to promote commerce, industry, and science. F. sent Niebuhr and others on a scientific expedition to Egypt and Arabia, 1761.

Frederick VI. (1788-1839), king of Denmark and Norway, son of Christian VII., assumed the regency in 1784, owing to his father's insanity, until he ascended the throne in 1808. His rule was marked by many reforms, including the abolition of serfdom in Denmark and Schleswig-Holstein. F.'s chief minister was Bernstorff. In 1800 Denmark joined the armed neutrality of the N. against England. This caused hostilities with the Brit., and F. allied with Napoleon, 1808. In 1814 Norway was taken by the allies from Denmark and given to Sweden under Bernadotte. See —, Giessing, *Zur Regierungsgeschichte Friedrichs VI.*, 1851-1852.

Frederick VII. (1808-63), king of Denmark, son of Christian VIII., whom he succeeded in 1848. The chief events of his reign were the wars arising out of the revolt of the Slesvig-Holstein duchies against a common constitution with the kingdom of Denmark and the separation of Slesvig from Holstein. In 1849 F. signed the democratic constitution which has been the basis of political life ever since.

Frederick VIII. (1843-1912), king of Denmark, son of Christian IX., succeeded his father in 1906. He married Princess Louise of Sweden in 1869, and his eldest son, Christian, was b. in 1870. His second son, Charles, became king of Norway in 1905, under the title of Haakon VII. F. worked for the creation of a common policy for the Scandinavian kingdoms.

Frederick IX. king of Denmark (b. 1899) succeeded his father Christian X. in 1947. He married Princess Ingrid of Sweden in 1935, and has three daughters. In 1917 he joined the Royal Dan. Navy as a rating and attained by his own efforts the rank of captain. Later he was promoted in accordance with his increasing responsibilities as crown prince, and is now, as king, commander-in-chief of his navy, as well as of his army. At eighteen F. became a member of the State Council (consisting of the king and his responsible ministers), and for several periods before, but chiefly during the Ger. occupation of Denmark, he acted as regent. He has travelled widely, having visited Iceland and Greenland, the Far East, and, with the crown princess, U.S.A. and Canada in 1939. F. is an ardent lover of music and himself an accomplished conductor, having often played with the Royal Theatre orchestra, Copenhagen.

Frederick (1676-1751), king of Sweden, third son of the Landgrave Karl of Hesse-Cassel. He entered the Eng. military service, and in the war of the Sp. Succession commanded the Hessian corps. In 1715 he entered the Swedish service, and on the resignation of her claims to the throne of Sweden of his wife, Ulrica Leonora, sister of Charles XII., he became king.

Frederick Augustus I. (1750-1827), king of Saxony, son of the elector Frederick Christian, b. at Dresden. In the Bavarian Succession war he sided with Frederick the Great against Austria, and afterwards joined the league of Ger. princes. In 1806 he joined Prussia against France, but concluded a treaty of alliance with Napoleon after the battle of Jena, and during the subsequent wars of Napoleon he was a faithful ally of the emperor. See A. Bonneton, *Un Allié de Napoléon, Frédéric Auguste, premier roi de Saxe*, 1902.

Frederick Charles of Prussia (1828-85), nephew of the Emperor William I., known as the 'Red Prince.' He was educated at Bonn, and then entered the army, serving with distinction in the first Schleswig-Holstein war in 1848. He also took part in the Austrian war of 1866, and the Franco-Ger. war (1870-71), where his leadership was conspicuous. He gained distinction at the battles of Gravelotte, Thionville, and St. Privat.

Frederick Louis, Prince of Wales (1707-1751), eldest son of George II. and Queen Caroline. In 1730 he married Augusta, daughter of Frederick, duke of Saxo-Gotha, and had sev. children, the eldest afterwards becoming George III. Frederick, who led a very gay life, was always on bad terms with his father, and, forbidden the court, became the patron of the opposition which made Leicester House its headquarters.

Frederick William (1620-89), elector of Brandenburg, known as the 'Great Elector,' and son of the elector George William, b. in Berlin. He was educated at the univ. of Leyden. On his father's death in 1640 he became ruler of Brandenburg and Prussia, and immediately set himself to repair the damage wrought during the Thirty Years war, still in progress. In 1648, by the treaty of Westphalia, the area of his dominions was largely increased, and in the course of ten years, with the help of his able generals, he had created an army of 25,000 men, organised on the Swedish model. He reorganised the univ. of Frankfurt and Königsberg, and founded the univ. of Duisburg and the Royal Library at Berlin. He made the canal which still bears his name between the Oder and the Spree, and introduced a postal system. He encouraged the immigration of Huguenots who brought their culture and industries to his backward country. He greatly enlarged and beautified Berlin, leaving a large exchequer, a thoroughly well-organised army, and the beginnings of a colonial empire. His final act of statesmanship was to urge and back Wm. of Orange's Eng. expedition. He, not F. the Great, was the real founder of the Hohenzollern tradition, the Russian state, and therefore of modern Germany. See H. Tuttle, *History of Prussia, 1134-1710*, 1892; T. Carlyle, *History of Frederick the Great*, 1858; A. Waddington, *Le Grand Electeur et Louis XIV.*, 1905-8; and F. Schevill, *The Great Elector*, 1948.

Frederick William (1771-1815), duke of Brunswick. He was taken prisoner at

Lübeck after the battle of Auerstadt. Napoleon put up a veto on his accession to the dukedom at the death of his eldest brother, and in 1809 he joined Austria in the war against the emperor. At the defeat of the Austrians at Wagram he came to England, where he received an enthusiastic reception, and afterwards took part in the Peninsular war till his return, in 1813, to his dominions. After the return of Napoleon from Elba, F. W. joined the allies and fell at Quatre-Bras, June 16, 1815.

Frederick William I. (1688-1740), king of Prussia, son of Frederick I. (d. 1713), and father of Frederick the Great. He was passionately fond of military exercises, and noted for his eccentricities. Though he formed a large, well-disciplined army, he did not engage in any very important wars. In 1720 he won from Sweden the dist. of Pomerania between Rsn. Oder and Peene, including Stettin, Wollin, and Usedom Is. He founded a splendid administrative system, estab. a medical college, and various useful institutions in Berlin, and left a powerful and wealthy kingdom to his son and successor. See E. de Mauvillon, *Histoire de Frédéric Guillaume I.*, 1741; F. Forster, *Geschichte Friedrich Wilhelms I.*, 1835; and H. Tuttle, *History of Prussia, 1134-1740*, 1884.

Frederick William II. (1741-97), son of Prince Augustus William of Prussia and nephew of Frederick the Great, whom he succeeded in 1786. In 1792, with Austria, he entered into a war against the Fr. republic, to uphold the royalty, which lasted till 1795, resulting in the cession to France, by the treaty of Basle (1795), of the Prussian ters. W. of the Rhine. By the partitions of Poland, in which F. W. shared, Prussia received large accessions of ter. During F. W.'s reign, owing to his indolence and lack of political sagacity, Prussia declined. He was devoted to the arts, Beethoven and Mozart enjoying his patronage, but was without mental qualities of a high order. See Stadelmann, *Preussens Könige in ihrer Tätigkeit für die Landeskultur*, vol. iii., 'Friedrich Wilhelm II.', 1885; Pauls, *Friedrich Wilhelm II., sein Privatleben und seine Regierung*, 1896; and E. Meich, *Der Hof Friedrich Wilhelms II. und Friedrich Wilhelms III.*, 1914.

Frederick William III. (1770-1840), son of Frederick William II., b. at Potsdam. He became king of Prussia in 1797. In 1806 he was overthrown by Napoleon at Jena and Auerstadt, and on the annihilation of the Prussian Army, the Fr. overran the kingdom. The Russian armies then advanced to the aid of Prussia, but were overthrown by Napoleon at Friedland (1807), leaving Prussia at the mercy of the conqueror. The treaty of Tilsit completed the ruin of Prussia, and during the next few years she remained almost defaced as a European power. At the beginning of 1813, however, the Gers. rose against France, and F. W. entered into an alliance with Russia and Austria, and the Allies overthrew Napoleon at the battle of Leipzig. At the Congress of Vienna,

Prussia regained her lost ter. F. W. did much to advance the material welfare of his realm, and the customs union was established in his reign. See L. von Petersdorff, *König Friedrich Wilhelm IV.*, 1900.

Frederick William IV. (1795-1861), king of Prussia, son of Frederick William III. He began his reign with moderate measures, but was vacillating and infirm of purpose, with a marked tendency to mysticism. There was a revolutionary outbreak in Prussia and Berlin, 1848, caused in part by the Fr. revolutionists' triumph, and Frederick was forced to grant a constitution to his people. In 1849 he declined the offer of the imperial crown by the Ger. National Assembly at Frankfurt. They elected the Archduke John of Austria as lieutenant-general. His irresolution and neutrality in the Crimean war were severely censured. Owing to symptoms of insanity Frederick resigned the control of his kingdom to his brother William, 1858, and was succeeded by him as William I. in 1861. See L. von Ranke, *Biographie Friedrich Wilhelms IV.*, 1878; H. von Petersdorff, *König Friedrich Wilhelm IV.*, 1900; F. Hachfahl, *Deutschland Friedrich Wilhelm IV. und die Berliner Märzrevolution*, 1901, and *Die deutsche Politik: König Friedrich Wilhelm IV. im Winter 1848-49*, 1919.

Frederick William Charles I. (1754-1816), king of Württemberg, son of Frederick Eugene, succeeded his father as duke of Württemberg, 1797, and king, 1806. He married an Eng. princess, Charlotte Augusta Matilda. He became elector, 1803, and by alliance with Napoleon, 1805, gained lands and the title of king. Frederick joined the Confederation of the Rhine in 1806. His army fought on Napoleon's side in 1809, 1812, and 1813, but joined the Allies in Nov. 1813, the treaty of Fulda leaving him his kingdom on this condition only. The people seized this opportunity of his weakness to re-establish their old constitution, changed by Frederick for absolutism. See E. Hölzle, *Politische Geschichte Württembergs, 1789-1805*, 1931.

Frederick, co. seat of F. co., Maryland, U.S.A., 41 m. W. by N. of Baltimore. It has a Jesuit institution and a college. The manufs. include canning, brush-making, tanning, and flour-milling. Pop. 15,800.

Fredericksburg, tn. of Spottsylvania co., Virginia, U.S.A., situated on the Rappahannock R., about 55 m. S.S.W. of Washington. The riv. affords great water power, the tide ascending the riv. as far as F. During the Amer. Civil war a battle was fought here, in which the union forces under Burnside were defeated by the Confederates (1862). The tn. manufs. paper, leather, machinery, and has fine wheat mills. Pop. 10,000.

Fredericton, cap. of the prov. of New Brunswick, Canada, on the St. John R. It was originally called St. Anne's Point. It is an educational centre, with the univ. of New Brunswick and a teachers' college, and there is an Anglican cathedral. It has three shoe factories, a boat and canoe factory, two woodworking factories, and

is the centre of a large dairy industry and lumber industry. The prov. parliament buildings and prov. gov. offices are also situated at F. It is served by Canadian National and Canadian Pacific railways. New Brunswick military headquarters and the Royal Canadian Mounted Police headquarters for New Brunswick are at F. Pop. 18,000.

PARLIAMENT BUILDING, FREDERICTON

Frederiksberg, residential suburb on the W. of Copenhagen, Denmark, with a military college. Pop. 98,000.

Frederiksborg, Dan. royal castle built in 1602-20, situated about 20 m. from Copenhagen, Denmark. It was destroyed by fire in 1859, and, after being restored (1864-71), was utilized as an historical museum. The canton of F. has a pop. of 115,000.

Frederikshald (Halden), seaport and garrison tn. of Norway, in Smaalenene co., on the Ido Nord, 35 m. by rail S.E. of Christiania. Charles XII. was killed in the trenches of the fortress in 1718. There is a large export trade in timber, and marble of excellent quality is quarried. Pop. 11,000.

Frederikshavn, seaport and cap. of Jutland, in the prov. of Hjørring, Denmark, on the Cattegat, 36 m. N.E. of Aalborg. It has an excellent harbour, free from ice throughout the year. It is protected by the citadel, Fladstrand, which formerly gave its name to the tn. It has considerable trade in dairy produce. Prin. exports are fish and oysters. There is a regular steamship service running to Sweden, Copenhagen, and England. Pop. 8000.

Frederikstad, seaport of Norway, in Smaalenene co., at the mouth of the Glommen, 58 m. by rail S.E. of Christiania. It exports timber, manufs. bricks, and has shipbuilding works. Pop. 15,800.

Fredeswitha, St., see FREDESWIDE.

Fredonia: 1. Vill. of Chautauqua co., New York, U.S.A., 3 m. from Lake Erie. It

contains a normal school and the Darwin Barker public library. There are grape-vine nurseries, canneries, and patent medicine works. Pop. 5700. 2. Tn. of Colombia, in dept. Antioquia, S.E. of Medellin, with coal-mines. Pop. 11,000.

Free-alms, see FRANK-ALMOIGNE.

Freebench, Eng. law, the interest which a widow had in the copyhold lands of her late husband, so long as she remained unmarried. The amount to which she was entitled amounted in general to one-third of the lands held by her husband. Abolished by the Law of Property Act, 1927.

Free Church of England, small sect which broke away from the Established Church in 1844, as a protest against the influence of the Tractarian or Oxford movement. It maintains the episcopal organisation, and is said to have retained the apostolic succession. It is, however, strictly Protestant in doctrine, and seeks to promote evangelical and Reformation principles. Its first church was formed at the vil. of Bridgetown in Devon by the Rev. J. Shore. Its numbers are extremely limited. Government is carried on by an ann. convocation.

Free Church of Scotland, body of Scottish Presbyterians who at the 'Disruption' of the Church of Scotland in 1843 separated from the Established Church. It claimed, and still claims, however, to be the historical continuation of the National Church which was set up in 1560. It retains the 'Confession of Faith and the Standards of the Church of Scotland as heretofore understood,' that is to say the Westminster Confession and the Longer and Shorter Catechisms, but in 1892 the binding force of these was somewhat modified by a Declaratory Act, which classed some parts of the confession among things not to be considered as literally binding. This is quite in accordance with the Free Church Catechism issued soon after the disruption, in which the right of a church to alter its creeds and formularies without state sanction is reckoned as one of the essentials of its freedom. The disruption was caused generally by an entire difference of opinion on the whole question of estab. and the authority of the State over the Church. The proximate cause, however, was the question as to whether a minister could be forced on an unwilling congregation. It is important, however, to recognise that the leaders of the Free Church party in 1843 did not condemn all union of Church and State, but only such as infringed the Church's right of self-government, committed to her by Christ Himself, of whom the Westminster Confession declares 'the Lord Jesus as King and Head of His Church, hath therein appointed a government in the hand of church officers, distinct from the civil magistrate.' Since the 1688 revolution, however, the union between Church and State had been such that all of these eccles. regulations had been made part of the statute law. A case had arisen in which a minister presented to a living had been rejected by the congregation, and in 1834 the General

Assembly passed the Veto Act declaring it to be a fundamental law of the Church that no pastor should be intruded on any congregation contrary to their will. In 1838, in the Auchterarder case, the court of session, however, decided in favour of the presbytery, and in the next year the case came before the House of Lords. Here the civil power showed but scant respect for the Church's eccles. jurisdiction, and definitely stated the supremacy of the statute law in all cases, denying in fact that it is even possible that there should be such a thing as a conflict between the civil law and the eccles. courts of an estab. church. In 1842 the General Assembly formally refused to enter on the course of action which the recognition of this principle would involve, and threatened a separation from the State. In 1843 an attempt was made to secure a parl. inquiry, but this failing, at the meeting of the General Assembly (May 18, 1843) the major part of the Assembly made their protest and quitted St. Andrew's church. They proceeded to Tanfield Hall, Canonmills, and there was held the first Free Church Assembly, with Dr. Thomas Chalmers in the chair. By May 23, 474 ministers had resigned their benefices, homes, and incomes, and trusted themselves entirely to voluntary support. The financial system was organised quickly and most successfully, and a central sustentation fund furnished a reasonable income for all ministers. A committee was formed in 1863 to consider the proposal of alliance with the United Presbyterians, but the refusal of the Free Church to give an unqualified condemnation of estab. made it impossible. The proposals, however, were continually renewed, and on Oct. 31, 1900, union between the two was finally completed at Edinburgh, the newly formed body bearing the title of the United Free Church. A small body refused to accept this union, and claimed to be the continuation of the old Free Church. It, therefore, claimed the possession of all its emoluments, and the House of Lords decided in favour of the small body. The impracticable nature of the decision was immediately apparent and an Act of Parliament in 1905 altered this position. A div. of the property, etc., between the two bodies was made by a Royal Commission. To-day the F. C. of S. is quite a small body, strongest in the highlands and commonly known as 'Wee Frees.' The union of the Church of Scotland with the United Free Church of Scotland was effected at a joint meeting of the General Assemblies of both Churches on Oct. 2, 1929. Prior to this union of 1929, Scotland was divided into sixteen synods and sixty-six presbyteries. There have since been added the presbytery of the synod of England and the presbyteries of N. Europe, S. Europe, Spain, and Portugal, and a number of Indian and colonial presbyteries, making a total of eighty-six. The number of communicants on the roll (Dec. 31, 1928) was (prior to the union of the Churches) 759,787. The supreme court is the General Assembly, which meets annually,

in May, synchronously with the meeting of the General Assembly of the Established Church and of the remnant Free Church of Scotland. *See also* SCOTLAND, CHURCH OF. *See* C. G. MacCrie, *Church of Scotland, Divisions and Reunions*, 1901; W. L. Mathieson, *Church and Reform in Scotland*, 1916.

Free Churches, general name given to all those Protestant Christian bodies of England and Wales which are not established by the State. They include not only the large group which forms the Free Church Federation, but also many others not thus associated. The point in common between all these bodies is implied in the title. All hold that permanent union between Church and State is impossible, since it leads to the State imposing laws on the Church, and that, therefore, the two should exist separate, the Church being free to make its own rules and carry on its own system of government in matters spiritual. Most of the F. C. are democratic in form, and the governing body has the power of changing the conditions of membership, deciding on corporate expressions of faith, etc.

Freedom of a City, *see* BURGESS and FREEMAN.

Freedom of Speech. *See* PARLIAMENT—HOUSE OF LORDS, HOUSE OF COMMONS: *Composition, Officers, and Privileges*.

Freedom of the Press, *see* PRESS, FREEDOM OF THE.

Freehold. A F. estate or interest in land may be strictly defined as an interest which may continue for the period of some particular life or lives, whether limited to the duration of some person's life, or of some uncertain period included in such life, as, for example, to continue during widowhood, or until bankruptcy. The term necessarily comprises the larger interest, fee simple and fee tail estates or estates of inheritance, and indeed Fs. are frequently divided into those of inheritance and not of inheritance, the latter being Fs. for life. The term F. (*liberum tenementum*) comes from feudal times, and meant that the tenant held his land by some small services of an honourable as opposed to a base or servile kind. Such services are now long since abolished, and the only feudal incidents of a F. still surviving, or nominally surviving, are (1) escheat or devolution to the Crown on intestacy, there being no heirs; (2) an oath of fealty, never exacted; (3) relief, or a year's rent to the feudal overlord (if there is one) on succession to the deceased tenant; (4) a small chief or quit-rent. There were also other Fs. of an extraordinary or more localised kind, viz. grand serjeantry (q.v.), petty serjeantry (q.v.), burgage tenures (q.v.), gavelkind (q.v.), and frank-almoign or tenure by spiritual services, such as saying prayers for the parishioners, which were abolished in 1525. The learning in Fs. is for the most part academic, and at the present day it may be said to be mainly regarded as merely the direct antithesis of a leasehold interest, a F. being necessarily an estate for a certain period of uncertain duration, while a leasehold interest is

no more than one for a fixed term of years. The third principal form of landholding was that of copyhold tenure, which in its origin was a holding by villeins of a lord of a manor; but which in its later development became largely assimilated to F., and might on certain payments be compulsorily enfranchised (i.e. turned into a F.). All these old forms of tenure, however, disappeared with the passing of the Law of Property Act, 1927. *See also* COPYHOLD; ENTAIL; ESTATE, etc.

Free Imperial Cities. The *Freie Reichsstädte* of Germany were those medieval towns, which enjoyed either complete or partial autonomy. They may in their constitution be compared to the chartered towns of medieval England, the free towns of Spain (*see* FUKRO), and the Italian republican cities of the same period. In all or most of these cases the anomaly of such an *imperium in imperio* was due to the wealth and influence early acquired by towns through industry and commercial relations and consolidated by defensive leagues like the celebrated confederacy of the Hanseatic League. The number of F. I. C. varied from time to time by reason of the struggle to maintain their privileges in the teeth of ecclesiastical and secular opposition and royal jealousy. Mainz, the head of the Rhine confederated towns, became transferred to the episcopal see in the middle of the fifteenth century, while Chemnitz and certain other towns of that league were subsequently taken by the dukes of Saxony. Others were shorn of their privileges by successive emperors, and yet others were conquered by foreign enemies. At the end of the eighteenth century they numbered about fifty, divided into two benches, the Rhenish and Swabian, as two integral members of the Diet. At the beginning of the nineteenth century only six possessed any measure of independence, some having been assigned to France while the rest were deprived of privileges of which they had long since ceased to retain anything but the shadow. By the terms of the German Confederation only Hamburg, Lübeck, Bremen, and Frankfurt were recognised as F. I. C., but the privileges which the first three long preserved were, in later times, of no greater importance than those of various towns in England. *See* The German Free Cities (1914).

Free-lances, roving companies of knights and men-at-arms, who wandered about to different states selling their services to any lord who was anxious for aid in the constant feuds of the Middle Ages. They became most famous in Italy as *condottieri*. In Germany they were represented by the *Landesknechte* (land-troopers), mercenary foot-soldiers raised by Maximilian I. in 1487. *Landesknechte* were the men of the Austrian lands as opposed to the Swiss mountaineers, but are commonly confused with *Landknechte* (land-troopers). They won fame in the fifteenth and sixteenth centuries' wars, but after the Thirty Years war fell into disrepute. The term is now applied in general to all who own no fixed

party allegiance, or follow the methods of no particular school, but act independently (and sometimes capriciously).

Freeland, tn. of Luzerne co., Pennsylvania, U.S.A., 28 m. S.W. of Scranton. In the vicinity there are coal and anthracite mines. The bor. has breweries, silk mills, and foundries. Pop. 6,500.

Free Libraries, development of comparatively recent times, though the first was estab. by Chatham in Manchester, England, 1653. The modern library movement started in 1876 with the foundation of the Amer. Library Association. The name of Carnegie must always be associated with the growth of public libraries. He contributed enormous sums yearly for their foundation and this work is continued by the trusts which he founded. The tax-supported free public library ('municipal' or 'endowed') is ousting the circulating, subscription, and proprietary libraries. Free access to open shelves is now allowed in many libraries, and not only the reference but also the lending depts. are mostly free of charge. See also **LIBRARIES**. See T. Greenwood, *Free Public Libraries*, 1890; J. Ogle, *The Free Library*, 1897; L. R. McColvin, *The Public Library System of Great Britain*, 1942; and ... *Assurance, Modern Public Libraries*, 1946.

Free Lovers, see **BIBLE COMMUNISTS** and **PERFECTIONISTS**.

Freeman, Edward Augustus (1823-92), historian educated at Trinity College, Oxford. While at the univ. he began to devote himself to the study of hist. and architecture. His first books were *A History of Architecture* (1849), *An Essay on the Origin and Development of Window Tracery in England* (1850), and (with W. B. Jones) *History and Antiquities of St. David's* (1856). In the last year he pub. also *The History and Conquests of the Saracens*, his first contribution to hist. Some further books followed, and then came *The History of the Norman Conquest of England, its Causes and its Results* (1867-76), his most outstanding achievement. He wrote many other works, but it is as the historian of the Norman Conquest that he will be best remembered. While lacking the charm and the literary eloquence of Froude, he has the advantage over his contemporary of being thoroughly reliable and of following the authorities upon which he based his conclusions. He was regius prof. of modern hist. at Oxford from 1884 until his death. See W. R. W. Stephens, *The Life and Letters of E. A. Freeman* (with bibliography), 1895.

Freeman, one who possesses the freedom of a city, bor., or company. Prior to the Municipal Corporations Act, 1835, bor. freedom was regulated by the bor. charter. An admitted F. enjoyed many rights and privileges which varied in different bors. *Inter alia*, a F. generally had the parl. vote, immunity from co. jurisdiction, exemption from tolls, and a share in the revenue accruing from the corporate property. The Act of 1835 does not affect the rights of their admitted F., and the following are still entitled to be

admitted F. and to enjoy the above noted rights except exemption from tolls: bor. inhab.; wife, widow, son, daughter, son-in-law, of a F.; apprentices to F.; and those who before the Act would have been entitled to be admitted, otherwise than by gift and purchase, the two latter modes of admission being now abolished. Bor. councils may also admit persons of distinction or persons who have performed eminent services for the bor. to be honorary freemen. Freedom of a city is tantamount to that of a bor., the distinction between a city and bor. being merely eccles. Freedom of the London livery companies is a survival of the guild-merchant system. There are four ways of acquiring the freedom of a company: (a) apprenticeship to a F. either of the company or of the City of London; (b) patrimony, i.e. by reason of being the child of an admitted F.; (c) gift (honorary); (d) redemption or purchase, usually limited to members of the guild trade.

Freeman-Thomas, **Freeman**, see **WILKINGTON**, **VISCOUNT**.

Freemasonry, system observed by the secret associations of 'free and accepted masons.' Much ill-founded yet interesting conjecture has ever surrounded the theories concerning the origin of F., and no point of time in antiquity seems too remote for its genesis in the eyes of its more enthusiastic friends. Some trace it to the time of the erection of the Tower of Babel, others to that of Solomon's Temple. In a work entitled *Origin and Antiquity of Freemasonry* (1898) Albert Churchward endeavoured, with the aid of numerous cabalistic diagrams of a geometrical character and pictorial representations from a papyrus of Ani of Anst and Osiris seated on a Masonic square, to show the analogy of F. to the eschatology of the anct. Egyptians, as witnessed by the *Book of the Dead* and the Great Pyramid of Ghizeh, the first Masonic temple in the world. Dr. de Plougeon attempted to trace the origin of F. back to the sacred mysteries among the Mayas and Quiches 11,500 years ago, from data gathered from excavations in Yucatan in Mexico. More modest computations go no further than to place the introduction of F. into England in the seventh century, and the foundation of the Grand Lodge at York in A.D. 926. Others allege that F. came into existence at the time of the crusades, but in view of the almost atheistical character attaching to the freedom of Masonic religious conceptions, this seems improbable. But the most unbiased historians seem to concur in relating its origin to the purely utilitarian association of fellow craftsmen in a masons' guild or trade union. There is some warrant for this genealogy, because the art of Gothic architecture and its allegorical meaning were in no small degree the possession of the stone-cutters w.h. were employed by the abbots in eccles. buildings and repairs. The secret signs used by itinerant masons were devised for the purpose of mutual recognition of each other as experts in

their art and not mere impostors. Moreover, the twelfth century affords something like proof of the existence of an association of Bauhütten (literally 'wooden huts' of masons or stone-cutters) in various parts of Germany, bound together by common craft laws and trade customs, and acknowledging a common ceremonial and set of symbolic forms.

Whatever the origin of F., there is clear enough evidence that modern F. in England dates from the foundation of the Grand Lodge of England in 1717; that of Ireland being founded in 1730, and Scotland in 1736. But what particular processes were at work in the transition of 'operative' to modern or 'speculative' F. it is hard to say. The traditions of F. seem to warrant the assumption that in spite of the fact that medieval or operative freemasons were usually engaged in erecting or repairing church buildings, they had no marked reverence for the church doctrine, and that though the church was at first disposed to extend its favour to the association, it eventually grew hostile to it and supported the ineffective prohibition of F. enacted by the statute of 3 Henry VI. (1424). It is possible that freemasons, no less than other men, were affected by the spirit of the Reformation and the speculations of Bacon on the possibilities of natural laws in the satisfaction of human needs. Be the psychological connection what it may, F. received a fresh impulse towards the latter part of the seventeenth century, when a general assembly of masons resolved to extend Masonic privileges to other than operative masons, to adopt new symbols of fraternity, and, generally to revive the system of F. The antiquary Elias Ashmole is credited with being the first amateur or speculative member 'accepted' (1646), and the name of James Anderson, a Scottish minister, is commonly associated with the work of revival. The constitution of one grand lodge, composed of provincial or other smaller lodges, presided over by a grand master, dates from 1717 (see above), and it is from this time, too, that the prerogative of creating new lodges was vested in the grand master. Later, provincial grand masters were appointed, and the purpose of speculative F. tended more and more to become purely benevolent. Still later, the requirement in members of a knowledge of ordinary masonry was dropped, although even now the association, when laying foundation stones, does so with full masonic honours. Its members as a whole profess benevolence and charity rather than architectural or stone-cutting skill. 'The principles and tenets of our crafts,' says Churchward, 'are the highest principles of morality, charity, truth, and justice, which we have received as a sacred legacy from our forefathers, teaching us by sign and symbol those duties we owe to others and ourselves.'

F. is less popular on the Continent than in Great Britain. The pope issued a bull excommunicating freemasons in 1738, and F. was one of the errors condemned by

the syllabus of 1864. In France, however, F. was from its very inception early in the eighteenth century strongly favoured by the nobility, in spite of imperial censure and papal bulls. Notable Fr. masonic orders of the eighteenth and early nineteenth centuries were La Félicité, La Grande Loge Anglaise de France and La Grande Loge Nationale (afterwards the Grand Orient), and the Suprême Conseil; one at least of which was nothing more than a Jacobite combination. It is said that the general atmosphere of Fr. F. was low, and colour is given to this assumption by the fact that admission to membership could be purchased without any inquiry into character. Later, Fr. F. became infected with mysticism and the most grotesque 'degrés.' In France, as in Italy, Hungary, and elsewhere on the Continent, there was a strong tendency for F. to become involved in politics and, thereby, to incur the hostility of the state. For this reason, relations between Brit. and Fr. freemasons were never close. Prior to the First World War, the Grand Orient had some 400 lodges; but owing to their political activities, and still more on account of the exclusion from their rules of the familiar reference to the Great Architect of the Universe, the regular grand lodges later succeeded from the Grand Orient, and in 1914 there came into existence a new body which styled itself the Grande Loge Nationale Indépendante et régulière. In Italy, F. was dissolved by Fascist decree (see also ITALY). In Germany the advance of F. was furthered by the brilliant intellectual support of such men as Lessing, Herder, Fichte, and Goethe, but disappeared under the Nazi regime.

F. was introduced into the U.S.A. in 1730, when a deputation from the Grand Lodge of England appointed Daniel Cox Provincial Grand Master for Pennsylvania, New York, and New Jersey. In the U.S.A. masonry has flourished. The last official figures showed there were about fifty independent Grand Lodges in the U.S.A. having 16,600 constituent lodges on their rolls, with a total membership of 3,927,000. The total membership for Canada is over 200,000. The Amer. Grand Lodges are in full affiliation with all other Grand Lodges except those under the jurisdiction of the Grand Orient of France.

F. received a great increase in membership during and immediately after the First World War. Between 1914 and 1930 the total world membership increased approximately by 100 per cent. While it is difficult to ascertain the exact numerical strength of F., authorities put it down at round about 4,400,000, with particular strength in those parts of the globe inhabited by the Eng.-speaking races. Within the craft there has been a marked tendency of late to take a much greater interest than hitherto in the intellectual side of the subject: numerous study circles have been formed in the lodges and lectures have become increasingly popular.

Freemasonry (trans.), 1866; A. Churchward, *Origin and Evolution of Freemasonry*, 1920; H. F. Gould, *The Concise History of Freemasonry*, 1920; W. Williams, *The Meaning of Masonry*, 1922, and *The Masonic Initiation*, 1924; M. Johnson, *Beginnings of Freemasonry in America*, 1924; F. de P. Castells, *English Freemasonry, 1600-1700*, 1931; and A. Robbins, *English-speaking Freemasonry*, 1936.

Freeport, co. seat of Stephenson co., Illinois, U.S.A., on the Pecatonica R., 100 m. N.W. of Chicago. There are numerous manufs.—machinery, carriages, shoes, etc.—large railway shops, and dairies. A granite boulder commemorates the famous debate between Lincoln and Douglas, in which the latter maintained the so-called 'Freeport doctrine' on slavery. Pop. 22,306.

Free Port (It. *porto franco*), harbour where ships of all nations may enter and load and unload by paying a moderate and uniform toll. F. Ps. facilitate transit trade, and form a kind of foreign dist. within a state. They are employed as depots, where goods are first stored free of custom duty; and then the goods may be either re-shipped for export (on payment of transit duty), or admitted for home consumption when, of course, the usual full customs of the country have to be paid. F. Ps. have been estab. at Hong-Kong, Singapore, Copenhagen, and New-Orleans; and the coaling stations of Gibraltar, St. Helena, and Aden are nominally F. Ps., though not absolutely so.

Free Reed, see under **REEDS**.

Free Soil Party, The name given to a political anti-slavery party in U.S.A., formed in 1848, which lasted till 1855, and then became one with the Republican party. It was originated by a union of the anti-slavery Whigs and Democrats with the Barnburners (q.v.). It nominated Van Buren for the presidency, but he was defeated in 1848. It was really a combination of the political abolitionists, many of whom had been formerly identified with the more Radical Democratic party, the anti-slavery Whigs, and a faction of the Democratic party in the state of New York.

Free State, see **MARYLAND**.

Freestone, building stone that is granular in structure and can be split readily in any direction. The name appears to have reference to this even quality. Stones used as Fs. are usually sandstones or limestones. Though fairly compact in structure, they are free from irregularities, and there is no distinct cleavage. They may be quarried in large blocks, and dressed or carved in any fashion without risk of breakage. The Fs. of the N. of England are usually sandstones; those of the S. and W. are limestones. The limestones are called oolitic because the granules of which they are composed are egg-shaped.

Free thinkers, term used of all who reject belief in divine revelation, applied especially to the deistic writers of the seventeenth and eighteenth centuries in England. The name was accepted by the rationalists as expressing persons who

thought freely for themselves on all questions, including eccles. and theological subjects. See also **DEISM**. See G. Lechler, *Geschichte des Englischen Deismus*, 1841; and A. S. Farrar, *Critical History of Free Thought*, 1862.

Freetown, cap. of Brit. Sierra Leone, W. Africa, situated at the mouth of the Sierra Leone R., near the coast. It has a fine harbour protected by fortifications and is a Brit. coaling station. It contains wharves, gov. offices, barracks, the governor's residence, a cathedral, supreme court, a technical school, and Fourah Bay College. The chief exports are indiarubber, palm oil, resins, hides, and gold and silver filigree work which is made by the natives. The tn. is divided into two prin. parts, the negroes inhabiting one quarter, and the better part of the tn. being in the possession of the Europeans, immigrants, etc. Since the marshes have been drained F. is much healthier, and there have been few cases of yellow fever since the introduction of a piped water-supply more than twenty years ago. F. has a mean ann. rainfall of 174 in.

In 1893 the management of F. was put into the hands of a council of fifteen members, twelve of whom were elected by the people, and three appointed by the governor of Sierra Leone. The council elected a mayor from its members. The African pop. therefore controlled the government of the tn., but in 1926 the municipality had to be dissolved following a series of financial scandals; the ensuing commission of inquiry found that the council had no practical knowledge of the implications of satisfactory municipal services, and no standard of comparison by which to measure the success of their activities. It was replaced by a tn. council, with an official majority. There exists in F. a system of tribal control by headmen, whose authority over tribal groups living in the tn. is recognised by the governor. Until 1932 the headmen were empowered to make rules respecting indebtedness, poor relief, and education, subject to the approval of the governor and the tn. council, but to-day they retain only police powers, such as reporting births and deaths, and new arrivals. Pop. 60,000.

Free Trade, economic doctrine which advocates equality of treatment of all commodities for the purposes of taxation, irrespective of whether they are produced at home or abroad. Taxes levied on commodities purely for revenue purposes, without differentiation between the home produce and imported goods, are no violation of this doctrine. F. T. was first advocated by Adam Smith in his *Wealth of Nations* (1776). As the national wealth increases by allowing each individual freely to engage in that occupation most fitted to his capacity, and to exchange his product in order to procure whatever other commodities he requires, so the general prosperity of the world would be enhanced by each nation devoting itself to those branches of industry specially suited to it, and exchanging its commodities, without hindrance, with other

nations. The question of trade is, however, regarded from a national and not from a universal standpoint, and though it is seldom denied that universal F. T. would be advantageous, it is frequently upheld that from a national point of view the protection of home industries is highly necessary. Free traders assert that under F. T. articles are bought at the cheapest prices and therefore produced in the most economical way, involving saving of labour and capital. Moreover, as a country pays for its imports by its exports, to allow free importation is also to encourage corresponding production along other lines. Again, competition, by bringing the home producer into contact with foreign rivals, stimulates his commercial zeal and forces him to adopt every improvement of process. As a negative argument, it is urged that even though protection might theoretically be defensible, govts. are not sufficiently wise to apply it beneficially. The fact that protected countries have generally found it necessary to impose a constantly increasing tariff against foreign goods is held to prove that such tariffs do not act effectively. The argument for protection is necessarily urged from a national point of view. It is alleged that a system of protection renders possible the carrying on of those branches of industry which are crushed by foreign competition, thereby affording greater openings for home capital and labour, and also provides a means of raising revenue. These two claims are necessarily, to some extent, antagonistic, as the revenue would diminish in proportion to the cessation of foreign competition. It is also frequently stated that although F. T. is advantageous as a normal condition of industry, nevertheless, in certain circumstances, protection is justifiable. Thus, in a new country, protection is held to foster rising industries. Where a country possesses, but a limited stock of a valuable commodity, an export duty is advocated as a means of preventing its too rapid exhaustion. The contention is also made that a country which allows free imports is at a disadvantage in dealing with a country which does not do so. Hence the policy of retaliation, which has for its object the imposition of duties upon the goods of a certain country in order to force that country either to abolish or to reduce an unfavourable tariff. The dependence of Great Britain on foreign countries for its food supplies, which would prove prejudicial in case of war, and was demonstrated with unpleasant clearness in the First World War (and again in the Second World War), was held to be a reason for endeavouring to stimulate home food production by means of a duty. Great Britain held to the system of F. T. from 1860 until 1932. A campaign was started in 1903 by Joseph Chamberlain, then colonial secretary, for the institution of a system of Imperial preference (*q.v.*), based on the necessity of preventing the alleged decline of Brit. trade, and at the same time uniting the colonies more closely to the motherland by mutual commercial

interests. The latter part of the scheme involved the imposition of food taxes, which proved to be the least favoured part of the programme. The scheme was, however, accepted by the larger portion of the Unionist party, and gave rise to the fiscal controversy that animated Brit. political life from that date. The emergencies of the First World War necessitated a modification of Brit. F. T. policy, and in 1915 Mr. McKenna (*q.v.*) imposed duties upon certain imported articles (including motor cars, cinema films, clocks, musical instruments, plate-glass sheets) in order to restrict demands made upon cargo space in vessels needed primarily for the transport of food. In 1917 the gov. agreed to a scheme of 'Imperial Preference within the Empire,' with special reference to 'Key Industries.' In 1921 a rebate of duty on empire goods was granted. In the same year the Safeguarding of Industries Act (*q.v.*) was passed. The return of the Conservative party to power in 1924 saw a mild system of imperial preferences, notably in favour of empire sugar, dried fruits, tobacco, and wine. The McKenna duties were abolished by the Labour Gov. of 1924, but the succeeding Protectionist Gov. reimposed them for a period of five years. In 1926 the duties on foreign cars were extended to commercial cars, and a duty was levied on imported artificial and natural silk. Light duties were also imposed on imported gas mantles, cutlery, and a few other articles. After the First World War protection was carried to great lengths in every country, with the result that Britain was placed at a considerable disadvantage. Finally, in 1932, Britain abandoned her time-honoured F. T. policy and adopted a medium-high protective tariff, food, however, being for the most part only lightly taxed, or allowed to enter free. But until the Second World War Britain's fiscal policy remained essentially liberal, and even the much criticised Ottawa agreements involved only a low tariff system. Other pre-1914 F. T. countries were Belgium, the Netherlands, and the Scandinavian countries, all of which subsequently adopted moderate protective tariffs. Some reciprocal and mutually advantageous arrangements, directed to the substantial reduction of tariffs and other barriers to trade and the elimination of discriminatory treatment in international commerce, were made in the General Agreement on Tariffs and Trade concluded, after protracted negotiations, at Geneva (Nov. 17, 1917). The schedule to this agreement shows that, in spite of these relaxations, this is far from being a free-trade world; and the wide variation in the amount of protection afforded to different commodities is itself an indication that the duties reflected the fears and pressure of local producing interests. At the conference which resulted in this agreement the U.S.A., occupying the position that Britain occupied at the time of the industrial revolution as the world's workshop, was primarily concerned to push the idea of free trade and tariff reductions. Britain, on the other hand, having lost the mono-

poly of manufactured goods and the economic leadership is chiefly concerned to get a fair deal for her export trade; for if other countries are going to build up tariffs in order to keep Brit. exports out Britain must protect her home market. The U.S.A., on the other hand, emerging from the Second World War with an enormous industrial output far beyond domestic needs, were so far ahead of every other nation in their exportable surplus that they were anxious that tariffs everywhere should be cut down—including even Brit. Imperial preferences (though in the result 75 per cent of these latter were unaffected). The U.S.A. in fact wished that exports and imports should be completely free and untrammelled. Britain, moreover, owing to its peculiar dependence after the war on a flourishing export trade, stood to gain exceptionally from a revival of multilateral trading conditions and so now interest was awakened in a free trade policy, or, at all events, in one involving lower tariffs; but, owing to currency difficulties, it is necessary for Britain to supplement or qualify to some extent these multilateral or freer trading conditions by organising special bilateral arrangements. *See also* ECONOMICS; PROTECTION.

Bibliography. The F.T. position is given in F. Bastiat's *Sophismes Economiques*, 1844-48; H. Fawcett's *Free Trade and Protection*, 1881; Sir T. H. Farrer's *Free Trade and Fair Trade*, 1885; B. R. Wilson's *Industrial Freedom*, 1892. On the protectionist side, works to be consulted are Carey's *Principles of Social Science* 1858-59, and the work of Friedrich List, the Ger. economist. The modern fiscal controversy is dealt with in A. C. Pigou's *The Riddle of the Tariff*, 1903; W. J. Ashley's *The Tariff Problem*, 1904; J. W. Horrocks's *History of Mercantilism*, 1925; L. Robbins's *Economic Planning*, 1937; and *Proposals for consideration by an International Conference on Trade and Employment as transmitted by the Secretary of State of the United States of America to His Majesty's Ambassador at Washington* (Cmd. 6709), 1945.

Free Verse is considered by Robert Graves to be prose poetry broken up into convenient lengths, but with this many of his contemporaries disagree. Milton, in *Samson Agonistes*, achieved a form of Eng. F. V., although strictly he attempted to write Eng. poetry according to Gr. metrical laws. *Vers libre* was practised in France in the eighteenth century by La Fontaine, and in a different form in 1890 by the Symbolists. Walt Whitman invented his own F. V. measure, which contemporary poets do not claim to have used. It was before the First World War that F. V. began to be practised extensively. Poets who used it considerably were those who were known as the Imagists, and included Ezra Pound, H. D. (Hilda Doolittle), F. S. Flint, Amy Lowell, D. H. Lawrence, T. S. Eliot, and Richard Aldington. These poets believed F. V. to apply to poetry written in rhythms more marked and definite than prose, but not so violently accentuated as those used in regular verse, and felt that the

individuality of a poet could often be expressed better in F. V. than in the more conventional forms of poetry. The movement in favour of F. V. has now spread over Europe and N. and S. America. Quotations from Ezra Pound illustrate the method and attitude of a F. V. poet.

Go, my songs, seek your praise from the
young and from the intolerant,
Move among the lovers of perfection
alone.
Seek ever to stand in the hard Sophoclean
light
And take your wounds from it gladly;
and also:

Go, little naked and impudent songs,
(Go with a light foot!
(Or with two light feet, if it please you!)
Go and dance shamelessly!
Go with impertinent frolic.

Free Will, the question whether man is morally a free agent or a being whose actions are predetermined by past events beyond his control has always been one of the chief problems of philosophy. Descartes and Hume asserted the absence of contingency in human conduct, while Kant excepted the spiritual realm from the necessity which he observed in the material world. Later nineteenth-century philosophy, under the impulse of physical science, tended to deny human F. W., but at present it is in greater favour, albeit within a restricted field. St. Augustine laid down the principle of F. W. as a fundamental belief of the Christian Church. The doctrine of absolute predestination, however, advanced by Luther and Calvin, exercised a powerful influence on Protestantism at the time of the Reformation. *See also* under DETERMINISM and WILL.

Freezing, change from a liquid to a solid state. This is effected by cooling the liquid to a definite point of temp., which is invariable for the same substance under similar conditions of pressure. So well is this recognised that the freezing-point of water is one of the standard thermometric points, the other being the boiling-point of water. In the centigrade and Réaumur scales the freezing point of water is 0°, in the Fahrenheit scale it is 32°. The temp. at which a solid melts is theoretically the same as that at which the liquid form solidifies, therefore freezing-point and melting point are interconvertible terms. In practice, however, it is often possible to supercool a liquid, i.e. cool it to below the melting-point without freezing it. After a liquid has been brought down to its freezing-point by abstraction of heat, still further abstraction of heat must occur before it can assume the solid form. The amount of heat which is thus absorbed without change of temp. is called the latent heat of fusion. When a substance solidifies to an amorphous solid, the process of transformation is a gradual one; that is, the liquid gets more and more viscous, until it becomes solid throughout. When a substance solidifies to a crystalline state the change is sudden and solid, and liquid portions remain in contact; this is

the case with water. Some substances, after contracting through a long range of decreasing temp., expand just before the freezing-point is reached. Water behaves in this way; hence ice is lighter than water, and the effect of pressure on the liquid is to lower the freezing-point, as expansion is thereby retarded. The addition of an impurity, as salt or sugar, to water also lowers the freezing-point. When any portion of the water solidifies, the substance dissolved is separated out, and dissolves in the portion still liquid. This process absorbs heat, so that solidification is hindered. The liquid portion gradually becomes more concentrated until it is saturated, after which the salt or sugar appears in the solid mass. It is not, however, in solution, but is in the form of small crystals embedded in the mass of ice.

Freezing Mixtures, mixtures of substances which have an affinity for each other, such that heat is absorbed by their combination or solution. The commonest F. M. is ice and salt. The lowering of the temp. is caused by the affinity of salt and water; a solution is formed, both ice and salt being transformed into the liquid state, heat being abstracted from the mixture and surrounding objects to effect this. As long as there is still a supply of ice and salt, the process of solution goes on until a definite limit of temp. (-23°C) is reached, at which limit the two substances become solid together, forming a *cryohydrate*. Other F. M. are: powdered sodium sulphate, or ammonium nitrate with water, temp. -15° ; sodium sulphate, eight parts, hydrochloric acid, five parts, temp. -17° ; sodium phosphate, nine parts, dilute nitric acid, four parts, temp. -29° ; crystalline calcium chloride, ten parts, snow or powdered ice, seven parts, temp. -55° . A mixture of solid carbon dioxide and ether is a valuable F. M., while solid carbon dioxide itself ('dry snow') is used in the ice-cream and engineering industries. For very low temps., liquid oxygen, or even liquid hydrogen, may be used.

Fregenal de la Sierra, tn. of Spain, in the prov. of Badajoz. It is situated in a fertile valley and is well laid out with good streets. Its old castle was erected by the Templars. An ann. cattle fair is held here. The industries are woollen and balze manuf. and flour mills. Pop. 10,000.

Freiburg: 1. Tn. in Saxony, Germany, on the R. Münzbach, on the N. slope of the Erzgebirge, and 19 m. S.W. of Dresden by rail. Before the Second World War it was the seat of the administration of mines throughout the kingdom of Saxony and had a famous mining academy, formed in 1765. There were also large smelting works and foundries. F. had extensive manufs. of gold and silver, lace, woollen, linen, and cotton goods, iron, copper, and brass wares, gunpowder and white lead. It has many fine old buildings, one of the most interesting of which is the cathedral: the S. portal, or 'Golden Gate,' is a fine example of medieval Ger. art. It has a large organ built in 1714 by Gottfried Silbermann (1683-1753). Adjoin-

ing the cathedral (1484, restored 1893) is a mausoleum containing the burial vaults of the electors of Saxony from 1594 to 1694. In the neighbourhood are found gold, silver, and lead zinc, bismuth, nickel, cobalt, and arsenic. The tn. was occupied by Russian forces in April 1945. Pop. 36,400. 2. (Czech Příbor). Tn. in Moravia, Czechoslovakia, situated 40 m. E.N.E. of Olomouc. Pop. 4000.

Freiburg (Switzerland), see Fribourg.

FREIBURG CATHEDRAL

Freiburg-im-Breisgau, city and archiepiscopal see of Germany, in Baden, 40 m. N.E. of Basle, on the Dreisam, at the foot of the Black Forest range. It possesses a famous univ. founded in 1157 and attended by 2000 students. The cathedral is one of the most perfect specimens of Gothic architecture in Germany, cruciform in shape and built of red sandstone, and probably dates from between 1122 and 1252; the tower, 386 ft. high, is one of the finest in Europe. Among the other buildings are the palaces of the former grand duke and archbishop, the *Kaufhaus*, and the old tn. hall. The manufs. include surgical and musical instruments, buttons, chemicals, starch, leather, silk thread, and paper. Since 1821 it has been the seat of a Rom. Catholic archbishop. F. became a free tn. in 1120; it fell twice into the hands of France (1677-97 and 1744-48), played an important part in the Thirty Years war, and finally passed to

Baden in 1806. In the allied advance into Germany in the Second World War F. fell to the Fr. Army in April 1945. It is now cap. of the S. portion of the former Land Baden. Pop. 110,000.

Freienwalde, summer resort and watering-place in the prov. of Brandenburg, Germany, on the R. Oder, 23 m. N.E. of Berlin. Its forest and chalybeate springs make it a popular resort. Pop. 10,900.

Freight, originally the cargo of a ship, it has now come to mean anything carried for payment either by water or land, whence the term is used for the price paid to the shipowner for the transportation of goods. It was formerly considered that the total F. must cover the wages of the crew and the incidental charges and expenses of the shipping business as well as the interest and depreciation of the capital invested in the shipping. 'Freight was the mother of wages,' but this was modified by the Merchant Shipping Act, 1854. In recent years, owing to the general use of steamers and their increased size the cost of carriage has been considerably reduced, with a resulting great increase in trade. (See INTERNATIONAL TRADE.) Some bulky articles of cargo are sometimes carried at a very low rate because of their usefulness as ballast where a return cargo is sought.

Freilgrath, Ferdinand (1810-76), Ger. poet, b. at Detmold, son of a school-teacher. Apprenticed to a grocer and, by turns, a bank clerk and bookkeeper. Wrote verses for small Westphalian papers and, in 1838, pub. his first vol. of *Gedichte*. Their immediate popularity induced him to turn to literature for a living and he soon found himself one of the favourite poets of his time. Up to 1842 his poetry was free from politics, but his democratic opinions, expressed in the poem *Ein Glaubensbekenntnis* (1844) and the poem *Trotz alledem* (a trans. of Burns's *A Man's a Man for a' that*), *Die Freiheit*, and *England an Deutschland* led to friction with the gov. and he was forced to seek refuge in Switzerland. Here he prepared a vol. of *Englische Gedichte aus neuerer Zeit* (1846) containing trans. from Tennyson, Longfellow, Southey, and others, and a vol. of political songs entitled *Ca Ira!* The pub. of the last-named led to his flight to London, and in 1848 he was about to emigrate with his family to America to join Longfellow and other literary friends when he was allowed to return to Germany. He became leader of the Democratic party in Düsseldorf, but was imprisoned for publishing his poem *Die Toten an die Lebenden*. His *Neue politische und sociale Gedichte*, pub. in 1850, led to further arrest and a charge of lese-majesty, but he was acquitted and left for London. While again working as a clerk he pub. a trans. of *Hiawatha* in 1857 and also trans. of *Cymbeline* and the *Winter's Tale* for a Ger. ed. of Shakespeare, ed. by Bodenstedt. Following a political amnesty he returned to Germany and at Stuttgart pub. some songs, such as *Hurrah Germania!* and the *Trompete von Gravelotte*, which became very popular. From a literary standpoint his best poems are

Die Auswanderer, *Prinz Eugen*, *Moos-the*, *Die Blumenrache* (*Revenge of the Flowers*), and others, written before 1840. An ed. of his collected works was pub. in 6 vols. in 1870 and in 2 vols. in 1871 and since. There is also a Tauchnitz ed. The charm of F.'s poetry lay in its originality of subject and sentiment, while in a number of his poems, such as *Skating Negro* and *Revenge of the Flowers*, there is an element of the grotesque and eccentric. See G. Freilgrath, *Erinnerungen an F. Freilgrath*, 1889; L. Schröder, *Ferdinand Freilgrath*, 1907; E. G. Guddo, *Freilgraths Entwicklung als politischer Dichter*, 1922; G. W. Spink, *Freilgraths Verbannungsjahre in London*, 1932.

Freischütz (free shot), in Ger. folklore, a marksman who has obtained a number of magic bullets (*Freikugeln*) from the devil, six out of every seven of which always hit the mark, while the seventh is at the disposal of the devil himself. The legend, with various modifications was most prevalent from the fourteenth to the sixteenth century, but it first received literary form in Apel's *Gespenssterbuch* (1810) from which it was adapted by F. Kind for Weber's opera, *Der Freischütz*, 1821. See —, Grässe, *Die Quelle des Freischütz*, 1875.

Freising, or **Freisingen**, tn. of Upper Bavaria, Germany, situated on the Isar, 16 m. N.N.W. of Munich. It is of ant. origin, and supposed to have been founded by the Romans; it was made a bishopric in 724. In 1802 the see was united to the bishopric of Munich, then newly created. The cathedral is noted for its remarkable crypt. There are distilleries, breweries, saw-mills, dye-works, and manufs. of machinery. The tn. fell to the Amer. forces in April 1945. Pop. 17,200.

Fréjus (Rom. Forum Julii), tn. in the dept. of Var, France, 22 m. S.W. of Cannes. It has been an episcopal see since the fourth century, and has sardine and anchovy pickling works. The tn. was founded on the site of an earlier vil. by Julius Caesar, and contains many Rom. remains, including walls, a light-house, an amphitheatre, and an aqueduct. It is now a health resort. Pop. 12,900.

Fremanle, chief seaport of W. Australia, situated at the mouth of the Swan R., 12 m. S.W. of Perth. The harbour has 10,000 ft. of berthing space, and has mechanical aids for loading and discharging and the bulk handling of wheat. There are churches and recreation grounds. The prin. manufs. are leather, biscuits, flour, beer, lumber, soap, and iron and steel goods; and there are cold storage works and wool warehousing undertakings. Pop. 30,000.

Frémiet, Emmanuel (1824-1910), Fr. sculptor, b. in Paris, was the nephew and pupil of Rodé; he chiefly devoted himself to animal sculpture and equestrian statues in armour, singly and in groups, the best of which are 'Joan of Arc', 1874, in the Place des Pyramides, Paris; 'Condé', 1881; 'Joan of Arc', 1889, at Nancy; 'Velasques' in the Jardin de l'Infante at Paris. He also excelled in imaginary groups, chiefly of animals:

'Gazelle,' 1843, exhibited at the Salon; 'Gorilla carrying off a Woman,' 1887. He became a member of the Académie des Beaux-Arts in 1892. See life by Biez, 1900.

Frémont, John Charles (1813-90), Amer. explorer, b. at Savannah, Georgia. From 1842 to 1854 he explored Oregon, New Mexico, and California. In particular, he explored the S. pass of the Rockies, and estab. the practicability of an overland route; and the Great Salt Lake, and the upper reaches of the Rio Grande. He also rendered valuable service in the Mexican war. He came into national notice again in 1856 when the Republican party was founded. Although it had far abler men in its ranks, it nominated F. for president in the anti-slavery interest, but he was not successful. Without consulting the president, he issued a proclamation confiscating the property and freeing the slaves of all Missourians who took up arms against the gov. President Lincoln removed him from his post, but afterwards gave him a chance to serve in an important command. F. declined. He was ruined in later years in railway speculations and was governor of the ter. of Arizona 1878-81. He pub. *Memoirs of my Life* in 1887. See life by A. Nevins, 1928.

Freumont: 1. City of N. Ohio, U.S.A., and the cap. of Sandusky co. It is situated on Sandusky R., about 30 m. S.E. of Toledo, and 103 m. N.W. of Columbus, in the midst of a petroleum region. The chief manufs. are cigars, hunc, agric. implements, cutlery, hardware, paper, machines, boilers, etc. Pop. 11,700. 2. City of Nebraska, U.S.A., and cap. of Dodge co., situated on the Platte R. There are stockyards and packing-houses, and it is an important market for grain. There is a normal school situated here. Pop. 11,800.

French Art. Architecture.—During the Middle Ages were built the great Fr. cathedrals and churches, with their sculptured decorations, metal work and stained glass; while in the period of the Renaissance, many of the most notable châteaux were built. Amiens cathedral and St. Pol de Léon, Brittany, exemplify the elements and various phases of the Gothic style of architecture in France in the thirteenth century. Traces of the Romanesque tradition are revealed in such Gothic cathedrals as those at Bayonne, Toulouse and Perpignan. Fortified châteaux were also built in the early Gothic style. Famous examples are those of Carcassonne (thirteenth century), Avignon, and the abbey of Mont St. Michel. Famous, too, as an example of architecture of the Middle Ages are the few arches which remain of the bridge at Avignon (q.v.). The bridge of St. Etienne (Lamoignon), and the bridge at Cahors illustrate the work of Fr. architects in this field. In the fourteenth century the Gothic style shows changes notably in the development of window tracery and in the gallery. Evreux cathedral and St. Jean at Solsons exhibit these changes. A fine example of Gothic development in

civil buildings is the tower of the old tn. hall of Bourges. In the late fourteenth, fifteenth, and early sixteenth centuries Gothic art underwent further changes, especially in the way of complicated or flamboyant decoration. Among some of the most magnificent structures of the fourteenth century are St. Maclou at Rouen (q.v.), the church of Brou, and the cathedrals of Toul and Quimper. Fr. architecture of the Renaissance stems from Italy but was metamorphosed by Fr. architects and master-masons into something very different from its It. exemplars, revealing a high degree of skill in 'blending the attenuated grace of Italian ornament with the general lines of Gothic design' (André S. Blum). Fine examples are the châteaux of Châteaudun, Amboise, and Chambord. The main work of the early Fr. Renaissance architects is, however, to be found in house building, by such famous architects as Philibert de l'Orme and Pierre Lescot. Fr. seventeenth-century architecture is Palladian, tempered by a refined baroque. Mansard's (q.v.) dome of the Invalides and Versailles Palace are striking reminders that the state at this period spared no expense in emphasizing its own prestige. Interior splendour and great developments of formal garden art characterize the work of Jean Marot and Louis le Vau, the latter of whom designed the châteaux of Vaux-le-Comte, near Melun. Much of the later architecture of France is merely Renaissance revivalist, or a reproduction of classical elements.

Painting.—Miniature painting and illuminating were practised in the Middle Ages and some of the most famous illuminated psalters came from Paris. France contributed much to the formation of the Gothic style in miniature work. The illuminations of the fourteenth century were in realistic style and the Parisian school was noted for the brilliant work of Jean Pucelle. The stained-glass workers of Chartres, inheriting the traditions of St. Denis, contributed their beautiful mosaics to the decoration of eccles. buildings, and also highly decorative in tendency were the metal work and mural painting, which latter imitated the colouring of the stained glass. Early Renaissance painting in France was inspired by the work of its, summoned to France by kings and municipalities, though there were traces of a change in Fr. art, transforming the Gothic, even before the renaissance of the antique. Jean Fouquet (q.v.), the greatest Fr. painter of the fifteenth century (temp. Louis XI.) was also noted for his illuminated work; also notable was the miniaturist, Bourignon.

Fr. painting of the seventeenth century is represented chiefly by the work of Claude of Lorraine (1600-82) (q.v.) and Nicolas Poussin (q.v.) and also, though in much less degree, by the realistic work of Callot (1592-1635) (q.v.). Poussin was the originator of the classic landscape, in which gods and heroes are depicted in a natural environment. Claude of Lorraine was also a classic landscape painter

with a passion for light and he has often been compared to Turner. Of the same period are the portraits of women disguised as Olympian divinities, by Jean de Laigillière, the decorative work of Charles Le Brun (*q v*) (1619-90) and the graceful frescoes of Pierre Mignard (*q v*). The famous names in 18th-century painting are those of Antoine Watteau (1684-1721) (*q v*), Jean Baptiste Chardin (1699-1779) (*q v*), Jean Baptiste Greuze (1725-1805) (*q v*), and Honoré Fragonard (1732-1806) (*q v*). Watteau is famous for his *scènes galantes* depicting amorous couples in highly realistic landscapes. Youth gaily, in disreputable

Troyon, Ricard, Ribot, Cabanel, and Gustave Moreau. Prud'hon (1758-1827) (*q v*), an enthusiast for Greek beauty, is famous for his allegories of love. David (1748-1825) (*q v*) who strongly influenced the period, was a neo-classicist and may be said to have founded a school of historical painting. His greatest pupil was Jean Auguste Dominique Ingres (1780-1867) (*q v*) who however also derived much inspiration from Raphael. But the feature of the nineteenth-century period of French painting was the struggle between Classicism and Romanticism. The leader of the Romanticists' revolt was Delacroix (1798-1863) (*q v*), a place that might well

'SOUVENIR DE MORFONTAINE' A LANDSCAPE BY J.B.C. COROT 1796-1875)

the play of arms and hands all have their part in the seductive dreams of his terrestrial Olympus. Chardin was above all the painter of the *petite bourgeoisie* and the poet of still life. Greuze too is notable for his idyllic studies but today he is still more highly regarded for his pictures of demure-eyed maidens. Mythology, landscape and feminine studies are all subjects of Fragonard's vivacious work. Other names of this period are François Boucher (1702-1770) (*q v*), N. Ponce (1690-1743), Maurice Quentin de La Tour (1704-88), Jean Marc Nattier (1688-1766), Madame Vigée Lebrun (1755-1842) (*q v*) chiefly a portrait painter, and the battle painter Casanova de Seimhall (1730-1805) (*q v*).

Among the chief Fr painters of the nineteenth century are Jacques Louis David, Regnault, Veret, Sisley, Prud'hon, Ingres, Delacroix, Corot, Daubigny, Courbet, Manet, Gauguin, Degas, Monet, Renoir, Seurat, Pissarro, Millet, Daubigny, Théodore Rousseau, Constant

have been taken by Gérault (1791-1824) (*q v*) who died prematurely. A lyricist, Delacroix looks upon his art as a medium for the redemption of his own personality and temperament. Military painters who enjoyed a vogue in this period were Horace Vernet (1789-1863) (*q v*) and Paul Delarue (*q v*). Corot (1796-1875) (*q v*) was however, the great master of the new school of Fr painting. No other artist has been so imitated. He enjoyed, especially in his later years, an extraordinary popularity. He is famous for his 'poetic' landscapes—luminous and misty—and for the plastic mastery shown in his figure-pieces—often a girl reading or a reclining woman, and either a full or half figure. Somewhat opposed to Corot was the 'Barbizon' (*q v*) group or 'Bainbleau school'—a school of 'pure' landscape painters inspired by the Low Country painters, Holbein and Ruysdael. Fr painters of this group are Jean François Millet (*q v*), Daubigny (*q v*), Theodore Rousseau

(*q.v.*), and Constant Troyon (*q.v.*). Gustave Courbet (1819-1877) (*q.v.*) also reacted against the classicists, but, as a realist in nature painting, he also reacted against the Romanticists. Manet (1832-1883) (*q.v.*), may also be regarded as a realist, shocking the world, as he did, with studios inspired by Giorgione's 'Sleeping Venus.' Claude Monet (1840-1920) (*q.v.*) is famous as the head if the Impressionist school. He shows remarkable subtlety in painting the variations of atmosphere and light at different times and places. He began as a member of the Courbet group. One of his principles was that what the subject intrinsically is really does not matter, but only its appearance under light. Other painters of this school are Renoir (*q.v.*) and the neo-impressionist, Pissarro (*q.v.*). Hilaire Germaine Edgar Degas (1834-1917) (*q.v.*), a famous realist of the '50s and '60s, studied with the classicists and so tempers the new naturalism with a sense of structure and form. His themes are generally taken from contemporary Parisian life—particularly dancing girls, *modistes*, and washerwomen. Daumier (1808-79) (*q.v.*) began as a cartoonist and his paintings attracted only the discerning critics in his lifetime, yet to a greater degree than with most of his contemporaries they reveal the plastic vitality which is associated with the masterpieces of Cézanne. Cézanne (1839-1906) (*q.v.*) learned from Manet and Pissarro before his own revolutionary ideas made him a lone iconoclast, violating every law of representation as known to the realists and yet clinging to nature as source and inspiration. He is first among modern artists by reason of both spiritual leadership and achievement in his own art. From his work a new western aesthetic has been fashioned, schools of painting have derived their inspiration, and a revolution in practice has taken place. Among portrait painters of the nineteenth century may be mentioned Ricard, Cabanel, and Ribot. Puvis de Chavannes (1824-1898) (*q.v.*) is important in the technique of decorative painting. Paul Gauguin (1848-1896) (*q.v.*) reverted, for inspiration, to primitive art as illustrated by life in the South Sea Is. Henri Rousseau (1811-1910), also known as Le Douanier, painted scenes of everyday life in France and in Mexico, where he soldiered.

Famous twentieth-century painters are Georges Braque (b. 1881) (*q.v.*), Henri Matisse (b. 1869) (*q.v.*), and Pablo Picasso (b. 1881) (*q.v.*). Braque is notable for his cubist technique; Picasso is supreme as an experimentalist in a small field of abstract expression. The work of Matisse is masterly in its summary expression of form and rhythm and has much in common with E. painting. Seurat (*q.v.*) is a neo-impressionist expert in the *pointilliste* system. Symbolism, as in Fr. literature, has dominated the Fr. painting of the twentieth century. In painting it owes something to medieval art and to the work of Gauguin. The symbolists use form more as a formula for expressing their own emotions than for a self-

contained work of art. Also of the twentieth century are the *fauves* or 'wild men,' a group brought together as exhibitors in 1905, representing various degrees of unorthodoxy. Among them may be mentioned Matisse, André Derain, Maurice Utrillo, Raoul Dufy, Georges Rouault, Dunoyer de Segonzac, and others, all of whom would now be regarded as 'solid moderns.' (See also under individual names.)

Sculpture.—The art of portraiture in sculpture began in France in the late fourteenth century, the masterpieces of Gothic sculpture of the period being the sepulchral effigies at Dijon, effigies which gradually replaced the recumbent figures. A notable sculptor of the Renaissance period was Michel Colombe (1431-1512). Jean Goujon (*q.v.*), skilled in bas-relief, Germain Pilon (*q.v.*), and Jean Cousin (*q.v.*) are all well-known artists who succeeded in moulding the Florentine spirit to Fr. genius. The Renaissance in France also saw brilliant enamelling work, especially by Léonard and Jean Lamoussin (*q.v.*); the ceramics of Bernard Palissy (*q.v.*); and much fine work by Fr. goldsmiths. Themes from classical mythology were generally chosen by these Renaissance artists. In the earlier part of the seventeenth century Fr. sculpture was still mainly sepulchral, notable sculptors in this kind being François Augier (c. 1604-69), who modelled the due de Montmorency's tomb at Moulins, and Jacques Sarrazin (1588-1660), sculptor of Henri de Condé's tomb at Chantilly. Later in the century came Girardon (1628-1715), whose masterpiece is Richelieu's tomb in the Sorbonne church, and Coyssvox (1640-1720) (*q.v.*), whose portrait sculptures are remarkable for their vitality. In the same century a regular school of engraving developed at the Gobelins under Sébastien Leclerc and the industrial arts were enriched by the cabinet inlaid-work of Boulle (*q.v.*) and the incised *objets d'art* of the Fr. silversmiths. It is to be noted that most of the seventeenth century Fr. art of the reign of Louis XIV, whether in painting, architecture or sculpture was 'dictated' art, organised under the direction of Le Brun (*q.v.*), the king's chief painter, director of the Gobelins workshop, rector of the Royal Academy of Painting and Sculpture and Colbert's technical adviser; and the work of the artists so commissioned suffers to some extent from this official inspiration; but under Colbert's forceful administration Fr. artists of this, the classical period of the *Grand Siècle*, succeeded in profoundly influencing art throughout Europe.

Modern Fr. sculpture is represented pre-eminently by Rodin (1810-1917), though mention should be made of Rude (1784-1855) (*q.v.*) whose work translates the feelings of exaltation engendered by recollections of the battles of the revolution and empire. Rodin is the one world genius of sculpture between c. 1550 and 1910, i.e. between Michelangelo and Lehmbruck. Rodin, believing that the art of the sculptor had fallen on a

desert of invention, held aloft the torch of structural beauty as opposed to beauty in the abstract. Maillol (*q.v.*) and Despiau belong definitely to a period that is past and a period the formulae of which are past; but by the quality of their workmanship they have become part of the hierarchy of sculptors whose reputation will endure. Another notable sculptor is Antoine Bourdelle (*q.v.*), the best sculptor of the old school and an expressionist who eschewed academicism. Degas, the painter, was also a good a sculptor as painter. Other modern sculptors include Bartholomé and Mercié. **See also ART; IMPRESSIONISM; PAINTING, SCULPTURE.** *See A. S. Blum, A Short History of Art (trans.), 1926; A. Clutton Brock, An Introduction to French Art, 1931; S. Cheney, A History of Art, 1938; E. Cischia, La Sculpture en France depuis Rodin, 1945; J. Rowald, The History of Impressionism, 1947; and Joan Evans, Art in Medieval France, 1948.*

French Bulldog, *see under* BULLDOG.

French, Daniel Chester (1850-1931), Amer. sculptor, b. at Exeter, New York; studied at Boston and had studios at Washington, Boston, Massachusetts, Concord, Massachusetts, and New York. His best-known works are a statue of Gen. Cass at Washington; Rufus Choate at Boston Court House; John Harvard at Cambridge, Massachusetts; the Millmore Memorial, Paris Salon, 1892; statue of the republic at Chicago Exposition; four groups, Europe, Asia, Africa, and America, in front of New York Custom House; Abraham Lincoln at Lincoln, Nebraska.

French, Sir John Denton Pinkstone, see YPRES, EARL OF.

French and Indian War (1751-60), last of series of wars between France and Great Britain, the Fr. being assisted by sev. Indian tribes. The prin. events of it were capitulation of Washington and Fort Necessity, 1754; Braddock's defeat, 1755; capture of Oswego and Fort William Henry by Gen. Montcalm, 1756-57; capture of Fort Duquesne, 1758; and of Ticonderoga and Niagara, 1759; battle of Quebec, 1759; surrender of Montreal, 1760.

French Equatorial Africa (formerly French Congo), colony of France on the W. coast of Africa, between Cameroon and the Belgian Congo, bounded by the Mbomou, Congo, and Ubangi Rs., and stretching inland, northwards, to Lake Chad. The estimated area is 959,256 sq. m., with a pop. of 4,112,200 natives, and about 7800 Europeans. By decree in 1910 the name of the colony was changed to F. E. A., comprising the Gabon colony (92,218 sq. m., pop. 421,000; cap. Libreville); the Middle Congo (166,069 sq. m., pop. 628,000; cap. Brazzaville); the Ubangi-Shari-Chad colony, but now two separate colonies: Ubangi-Shari (238,767 sq. m., pop. 947,300; cap. Bangui), and Chad (461,202 sq. m., pop. 1,432,900; cap. Fort Lamy). All these colonies were put under the authority of the governor-general of F. E. A. Each colony had, however, its own administrative council under a lieutenant-governor. By a decree of 1934 F. E. A. was constituted a single

administrative unit under the governor-general, who is assisted by an administrative council, and a secretary-general, who acts as his deputy in the governor-general's absence. The headquarters of the governor-general are at Brazzaville. To the consultative assembly elected on Oct. 21, 1945, F. E. A. sent four delegates, two elected by Fr. citizens, and two by Fr. subjects. The boundary between the colony and the Anglo-Egyptian Sudan was defined in 1921. By the convention of Nov. 14, 1911, France agreed to cede certain parts of the colony to Germany in return for the recognition of her protectorate in Morocco; the amount ceded was about 107,270 sq. m. with a pop. of about 1,000,000. At the same time Germany ceded to France 6450 sq. m. of the Ger. Cameroons.

The low-lying coast extends about 200 m., broken by the mouths of the Gabun (estuary 10 m. wide), and Ogowe Rs. Behind the coast rise the Crystal Mts. (3000-4500 ft.), and a general plateau (3000 ft.) deeply cut by the riv. valleys. The climate is equatorial, but varies greatly in temp. on the coast and in the mts. In some districts, 120-130 in. of rain fall annually. Most of the colony is still unexploited, and there is undoubtedly an enormous quantity of valuable timber in the dense tropical forests. The tropical forests cover 300,000 sq. m., extending to the Gabun coast. The natives cultivate manioc, and the Europeans coffee, vanilla, and cocoa. The natural products include rubber, gold, diamonds, corundum, tantalum, copper, zinc, and lead. Wild rubber is the most important of the country's resources. Palm oil and coco-nuts are produced to some extent. Coffee, cacao, cotton, peanuts, and sisal are also cultivated, and beeswax, copal, and karite butter produced. Chad colony has large numbers of cattle, sheep, asses, camels, and horses, and ostriches, but no facilities for export. Ivory is an important article of export. Other exports are rubber, woods, palm oil and kernels, coffee, cocoa, and kola nuts. The trade of 1937 was valued at 240,000,000 fr. for imports and 257,000,000 fr. for exports. The chief industries are centred in a tapioca factory, an oil refinery, a tanning, and a match factory. There are more than 160 official schools attended (1946) by 17,000 native pupils, and religious missions have over 130 schools, also attended by some 15,000 native pupils. Brazzaville has primary schools and a secondary school for European children. The budget for the whole colony for 1946 balanced at 1,100,000,000 fr. Brazzaville is connected by rail with the Atlantic at Pointe Noire (318 m.), the line being completed in 1930; but many more railways are necessary before the rich potentialities of the region can be realised. There are some 8800 m. of roads. The main ports are Port Gentil, Libreville, and Pointe Noire (also the chief aerodrome). At Loango steamers have to anchor 3 m. off shore. The central African telegraph line connects Brazzaville with Pointe Noire, the terminus of the Fr. cable from Brest via

Dakar (q.v.) and Libreville, and is in communication with the Brit. Atlantic cable. Sev. wireless lines connect Brazzaville with the rest of the colony, and there are numerous radio stations. In the main post offices of the interior. Radio Brazzaville (1942) is one of the most powerful stations in the world, and broadcasts in numerous languages. There are over 3250 m. of telegraph line.

In the autumn of 1940, some months after the collapse of France, F. E. A., under the able coloured governor-general, Félix Eboué, declared for Gen. de Gaulle, leader of the Free Fr. and ally of Britain. The Brit. Gov. collaborated with the gov. of F. E. A. in the disposal of the Fr. colony's large surplus products. In 1940-1941 strategic roads were constructed by the Fighting Fr. administration from Duala (in the Cameroons), N.E. to Chad and thence E. to Darfur (Anglo-Egyptian Sudan), and from Duala E. to Bahr el Ghazal (Anglo-Egyptian Sudan). The former is joined at Fort Lamy by roads from Lagos and Takoradi (Brit. W. Africa). It was from Fort Lamy that Gen. Leclerc started out at the head of the Fr. expeditionary force which conquered the Fozzan. See under FEZZAN. See P. B. Du Chaillu, *Exploration and Adventures in Equatorial Africa*, 1861, 1915; F. W. H. Algeod, *Across Equatorial Africa*, 1923; A. Gido, *Voyage au Congo*, 1927, and *Le Retour du Chad*, 1929; M. Rondet-Saint, *L'Afrique Equatoriale Française*, 1930; G. French Gardening. see GARDENING. *Market Gardening, including French Marketing.*

French Guiana, or Cayenne. Fr. overseas dept. on the N.E. coast of S. America, separated from Dutch Guiana on the W. by the Maroni R., and from Brazil by the Oyapok and the Tumuc-Humac Mts. Other rvs. are the Aoua, Aprouagua, Cayenne, Sinnamaria, and Mana, all obstructed by falls. The country is divided into three natural belts: the rugged, mountainous, little-known interior covered in dense forest rich in valuable timber, the grassy savannah-land of the foothills, and a narrow belt of rich alluvial land along the coast. This last is very fertile, and here, though only about 8000 ac. have been cultivated, maize, manioc, rice, sugar-cane, coffee, cocoa, tobacco, and indigo are grown. There are two rainy seasons, and the rainfall frequently amounts to 135 in. in a year. The country is rich in animal and vegetable life. The minerals exploited include silver, iron, and phosphates, and, most important of all, placer gold. The prin. exports are gold, cocoa, phosphates, hides, woods, rosewood essence, balata, and spices, of which gold is by far the most important; and the chief imports are Fr. wines, spirits, and liqueurs, silk and cotton stuffs, hardware, flour, and cattle. F. G.

is administered by a governor assisted by a Privy Council. There is also a Council-General elected by Fr. citizens resident in the country. Primary education is free in lay schools in the coms. and many vils. There are also a college, founded in 1936, sev. Congregational schools, and private schools.

In the seventeenth century Bertrand d'Ogeron, buccaneer chief and governor of St. Christopher, won a foothold in Guiana, but was driven out again by the Spaniards. Michelieu harboured great plans respecting Guiana, and under his protection Chantall, from Lyons, left to explore Cayenne, and numerous Norman shipowners followed in his tracks. Pierre de Brétigny settled there, only to perish at the hands of the Indians. Later the Dutch seized Cayenne. Colbert drove them out and, under the provisions of the Black Code, organised the first convoys of man-power from Senegal to Guiana. In 1700 the Dutch again estab. themselves in Guiana, but two decades later, after the loss of Acadia, the Fr., under Choleuil, sent 8000 settlers to Guiana, but they were decimated by epidemics. Under the Restoration the Fr. freed the colony from a brief Portuguese occupation, but the emancipation of the Negroes ruined the colony. From 1853 to 1861 an attempt was made to found penal colonies in F. G., but proved disastrous. Since 1851, however, Cayenne has had a penal settlement, though no prisoners were sent there after 1927. In 1915 the pop. of the settlement was little more than 1500, and prisoners were gradually being sent back to France. There are also penal settlements on the Îles du Salut and on the Maroni R. In 1894 Capt. Dreyfus was confined on the Île du Diable. Cayenne is the cap. and chief port of the dept., which sends one deputy to the Fr. National Assembly. At Cayenne there are a court of first instance and a superior court of appeal, with jurisdiction elsewhere in the colony. St. Laurent-du-Maroni and Oyapok are the two other chief ports. The Pan-Amér. Airways system visits Cayenne weekly. The cap. is connected by motor-car services over secondary roads, with centres of pop. in the interior. There are wireless stations at the ports and at Ilegua. Cayenne has been colonised by the Fr. since 1604. Total area 31,740 sq. m. Pop. 28,500. The number of the native pop., which dwells in the forested interior, cannot be estimated.

The ter. of Inini includes the hinterland separated from F. G. by a decree of 1930. It is administered by the governor of F. G., who is assisted by a small consultative council. The area is 30,301 sq. m. and the pop. 5000. Maroni is the chief centre.

French Guinea, Fr. colony on the W. coast of Africa, formerly known as Rivières du Sud. It lies between Sierra Leone and Portuguese Guinea. The prin. products are rubber from the interior, palm oil and kernels on the coast; cotton is cultivated in the higher basin, and millet, sesame, rice, coffee, bananas, pine-apples, wax, and ivory are largely pro-

duced. Cattle, sheep, and goats are reared, and gold is found in some dists. The chief imports are cotton goods, metal goods, wines, tobacco, petrol, and salt. In normal times the export trade is worth over 70,000,000 fr., and the prin. exports (in 1938) were gold, hides, bananas, palm kernels, animal wax, and orange oil. At Camayenne, near Konakry, the cap. of the colony, is an experimental garden. The F. G. railway, 412 m. long, runs from Konakry on the coast to Kourassa on the Niger, and on to Kankan, and many good roads are being built to connect up with the railway. Konakry, which has a jetty over 1000 ft. long, is served by four shipping companies (three Fr. and one Brit.), and has a wireless station affording communication with Dakar, Bamako (Fr. Sudan), and Grand Bassam (Ivory Coast). F. G. is administered by a lieutenant-governor under the direction of the governor-general of Fr. W. Africa. Geographically the colony is divided into three dists.—a flat coastal plain, a series of lofty plateaux, and the mountainous dist. of Fouta Djallon, where cattle are reared. In 1824 Iténé Caille, from Senegal, reached Rio Nuñez and, disguised as an Egyptian, traversed the Fouta Djallon. Faidherbe sent missions there. In 1837 the exploration of the Gulf of Guinea solidly estab. the reputation of Bouet Willaumez, who travelled through the grain, gold, and ivory coasts. In 1882 the Brit. Gov. recognised the treaty France had concluded with the lord of Fouta Djallon, and a commission settled the Fr. frontiers and those of Sierra Leone. F. G. was made a separate colony from Senegal in 1891. In 1896, following disorders, Fouta was annexed and France appointed a governor of F. G., the boundaries of which were finally settled in 1899. Total area 96,800 sq. m. Pop. 2,125,000, of which under 3000 are European. The chief native tribes are the Foulahs, Sous-sous, and Timucos. See A. Arcin, *La Guinée française*, 1906; F. Rouget, *La Guinée*, 1908; and R. Gouzy, *Usages de l'Afrique*, 1939.

French Honeysuckle, see HONEYSUCKLE.
French Horn (Fr. *cor*, *cor de chasse*, Ger. *horn*, *waldhorn*), brass wind instrument, used in orchestral music, with a particularly soft tone, due chiefly to the funnel-like bore of the mouthpiece, but also to the length of tube and shape of bell. Originally it was employed in hunting from a very early period, but was introduced into the orchestra at the beginning of the eighteenth century, and now holds one of the most important positions, as it is the softest toned brass instrument used, and forms a fine contrast to the others. It is seldom used singly, two or four being the usual number in the orchestra. It consists of sev. spiral coils, with a funnel-shaped mouthpiece at the upper end and a bell at the lower end of the tube, the length of which is varied by the introduction of crooks of different lengths. There are also supplementary tuning crooks and a tuning slide. Music for the horn is always written in the G or treble clef, the notes actually sounded

depending on the crooks used. In 1770, Hampl, at Dresden, discovered the method of forming intermediate notes by hand-stopping, viz. introducing the open hand with fingers close together into the bell, and thus lowering the pitch by a semitone. Nowadays the horn is provided with valves which bridge over the intervals and render the hand-stopping unnecessary. The horn is a difficult instrument to play by reason of the number of open notes and frequent changes of pitch.

FRENCH HORN

French India. The Fr. possessions in India comprise the five provs. of Pondicherry, Karikal, Chandernagur, Mahe, and Yanam, each with its cap. of the same name. The chief crops are manioc, paddy, rice, and ground nuts; chief exports, oilseeds. There are cotton and jute mills. Total area about 196 sq. m. and a pop. of 396,100.

French Language and Literature. *Language.*—The Fr. language is one of the Romance tongues. It is not a direct outcome of classical Lat., but of the *lingua romana rustica*, the common language spoken by the Rom. legionaries and merchants. The original Celtic tongue of the inhab. of Gaul d. away except in Brittany, leaving extremely few traces. It survives in a few words such as *clochette*, *sac*, *heue*, *braie*, and influenced the form of some words of Lat. origin. The Franks who invaded Gaul during the fifth century

had more effect upon the language, and many words are of Frankish origin, as *guerre, fief, bûche*. The *lingua romana* took different forms in Fr. according to the races and environment. Two main divs. are easily made, in the S. the *langue d'oc* and in the N. the *langue d'oïl*, so called from the words used to denote affirmation. The line of div. would run approximately from La Rochelle to Grenoble, through Limoges, Clermont-Ferrand, and Lyons. Formerly it was customary to regard the *langue d'oc* as part of the Fr. language, but it is now held to be a distinct branch of the Romance group. Both languages were further subdivided into numerous dialects and patois. The prin. dialects of the *langue d'oc* were provençal, languedocien, dauphinois, auvergnat, and limousin, those of the *langue d'oïl* picard, burgundian, norman, poitevin, and especially that of the Île de France, which eventually became the main tongue. Its triumph was mainly due to the accession of Hugh Capet, duke of France and of Orleans, to the throne in 987, thereby making Paris the cap. of the kingdom. Even in Rome itself in classical times there were two sorts of languages. There were the Lat. of Cicero and Cæsar, taught and spoken by the educated, and the language of the middle and lower classes. The difference lay chiefly in the pronunciation and syntax. The tendency manifested itself to slur over and drop the unaccented syllables. Hence even in classical authors we find *æcūlum, vinclum*, instead of *seculum, vinculum*. This tendency also affected the syntax by obscuring grammatical endings, and led to the introduction of independent particles to denote grammatical relation, such as prepositions and auxiliary verbs. In Gaul classical Lat. was still learnt in the schools and affected by the higher classes, but the invasions of barbarians in the fifth century destroyed the culture of the country, and gave freer play to the colloquial tongue. The tendencies already remarked above were intensified. The kernel of each word was the accented syllable, which persisted, while the unaccented ones underwent modification or disappeared altogether. Vowels immediately preceding the accented syllable disappeared if short, but were preserved if long, as *claritatem, claritē; peregrinum, pelerin*. Vowels following the accented syllable disappeared, or were reduced to *e* mute, as *mortalem, mortel; tabulum, table*. A medial consonant separating two vowels of which the second is accented also disappeared, or was modified, as *doldre, dower; debere, devoir*. Words from the Lat. not following these rules are of learned origin imported at later date. The simplification of Lat. case-endings soon led in *lingua romana* to the reduction of the six cases to two for masculine nouns, the nominative and accusative, and to the accusative only for feminine nouns. Thus *rosam* and *rosas* were the feminine forms in Gaulish Lat. for both nominative and accusative in the singular and plural respectively, and gave the modern forms *rose* and *roses*. The masculine *murus*,

murum (singular), and *muri, muros* (plural), gave:

	Nom. Acc.	Sing. murs mur	Plur. mur murs
--	--------------	----------------------	----------------------

The nominative disappeared from use in the fourteenth century, leaving only the accusative form *mur* and *murs*. Traces of the nominative still remain, however, in *on*, besides *homme* from *homo*, *sire*, besides *seigneur* from *senior*, and in proper names *Jacques, Georges*, etc. The Académie Française, with its forty members called the Immortals, was estab. in 1635 and is the final authority on all matters connected with the Fr. language.

Fr. was the acknowledged language of diplomacy, of science, and of the cultured from the days of Louis XIV., but lost its position after the First World War. It is spoken by sev. millions of people outside the Fr. Union, in Belgium, Switzerland, and Canada. See Joachim du Bellay, *The Defence and Illustration of the French Language* (trans. by Gladys Turquet-Milne, 1939); 1549; A. de Rivarol, *Discours sur l'universalité de la langue française*, 1784; M. Darmesleeter, *Cours de grammaire historique*, 1891-97; F. Brunot, *Histoire de la langue française*, 1913; and W. von Wartburg, *Évolution et structure de la langue française*, 1946.

Literature.—As already stated, the Fr. language arose from the *lingua romana rustica*. In course of time the pure Lat. language became no longer recognisable by the speakers of the *lingua romana*, and various glossaries were compiled for the aid of those who wanted to read Lat. texts. Such glossaries afford the earliest monuments of the Fr. language. The glossary of Reichenau belongs to the end of the eighth century, and contains the Lat. words of the Vulgate with their Romance equivalents. Another glossary, that of Cassel, contains some old Ger. words with Romance equivalents. The earliest consecutive monument of the Fr. language is the oath of Strasbourg, made in March 842. The empire founded by Charlemagne was divided by his three grandsons, and two of them, Charles the Bald and Louis the Elder, swore to aid each other against their elder brother Lothair. Louis the Ger. uttered his oath in the Romance tongue in order to be understood by Charles's soldiers, and the form was as follows: 'Pro Deo amur, et pro Christian poble et nostro commun salvement, d'ist di in avant, in quant Deus savir et podir me dunnt, si salvarai eo cist meon fradre Karle, et in adjuha et in cadhuna cosa, si cum om per dreit son fradra salvar dift, in o quid il mi altresi fazet, et ab Ludher nul plaid nunquam prindrai qui, meon vol, cist meon fradre Karle in damno sit.' The Eng. trans. is: 'For the love of God and for the common safety of ourselves and the Christian people, from this day forward, as far as God gives me wit and power, I will defend my brother Charles both by help and by every means, as one should by rights defend his brother, on condition that he do the same for me, and I will make no pact with Lothair, which,

by my will, may be disadvantageous to my brother Charles."

The literature of the tenth and eleventh centuries consists of the *Séquence de Ste. Eulalie* and the *Vie de St. Leger* in assonanced verses. The latter poem also exists in versions reworked during the twelfth, thirteenth, and fourteenth centuries, and so enables the student to follow the course of the language. The first great achievement of Fr. literature was the production of the *chansons de geste* (q.v.). These are epic poems narrating the exploits of the heroes of the Frankish nation and celebrating chiefly the deeds of Charles Martel and his grandson Charlemagne. They originated with the Merovingians and were carried by minstrels from castle to castle. In the beginning they were assonanced, but from the thirteenth century they were rhymed. The most famous of all the *chansons de geste* is the *Chanson de Roland*, the earliest text of which is found in the Bodleian MS. at Oxford (1080), but we know that an earlier version was sung at the battle of Hastings (1066). All these *chansons* were gradually compiled by the addition of the work of one minstrel to that of his predecessors, so that they can hardly be said to have any original form. The *Chanson de l'Amal* has an historical nucleus round which grew a mass of mere legend. There is a vividness of action and a strength in the delineation of character which make the poem a masterpiece. The *Chanson de Roland* forms one of the cycle known as the *Geste de Charlemagne*, while other poems are grouped together into the *Geste de Guillaume d'Orange* and the *Geste de Doon de Mayence*. One of the best poems of the period is *Raoul de Cambrai*, which depicts the feudal conception of fidelity.

The *chanson de geste* gave place to the romances, which are distinguished from them by being the narration of exploits of entirely fictitious heroes, while the former, as we have seen, had always a certain historical content. The material for the romances was taken from the Celtic bards of Brittany, who sang the exploits of Arthur, the last of the Brit. kings and his knights of the Round Table. To this theme were added such tales as the quest of the Holy Grail and the unhappy love story of Tristan and Yseult. The romances were developed from short lays trans. directly from the Breton. The greatest writer of such romances was Chrétien de Troyes (d. 1195), who wrote *Tristan, Erec, Iliades, Lancelot* or the *Chevalier à la Charrée*, *Yvain* or the *Chevalier au Lion*, and *Perceval*. These poems are imbued with that feeling of chivalry and mysticism which has come to be associated with the knightly period, and were imitated throughout Europe. These romantic poems were further developed by the learned troubadours, who wished to display their learning by recounting the deeds narrated in the old Lat. historians. Their chief production is the *Roman d'Alexandre*, a poem of 20,000 lines of twelve syllables which have ever since been known as Alexandrines. Others of

the same school are the *Roman de Troie* (30,000 lines) in octosyllables, *Roman d'Enéas*, and *Roman de Thèbes*. As the simplicity of the *chanson de geste* yielded to the crudition of the later romances, so these in turn gave place to the elaboration of the allegory. The allegory is a form of didactic poem which presents abstract qualities as living personages. The most celebrated of these is the *Roman de la Rose*, of which the first part was written by Guillaume de Lorris about 1230. It represents in simple, elegant, and vigorous language the feelings of a diffident lover in courting his beloved. The second part is much longer, and entirely different in its inspiration. The author, Jean de Meung, simply uses the framework left by his predecessor as a vehicle upon which to depict his witty and satirical sketches of the society of his time. The range of subjects dealt with is encyclopaedic, and the influence of the poem was enormous.

One of the most characteristic forms of Fr. literature is the *fabliau*, which came into great favour in the thirteenth century. The *fabliau* is a short simple story in verse, full of pregnant reflections upon society, of wit, satire, and a certain pungent coarseness. Such poems are important as being a manifestation of the *esprit gaulois*, a term used to denote that quality of levity, raillery, satire, and gaiety which is to be found throughout Fr. literature. The *fabliaux* were preceded by collections of fables which bore the name of *ysopet*, from the celebrated *Aesop*. The best known of these was the *Roman de Renart*, a kind of humorous epic poem dating from the twelfth century, in which the animals are endowed with human characteristics, and the fox's cunning enables him to triumph repeatedly over his less sagacious rivals. The *Roman de Renart* has retained its appeal throughout the centuries, and was used by Goethe. Of the *fabliaux* the prin. are *Le Vilain Mire* (The Peasant Doctor), *Estula*, and *Les Perdrix*. They are extremely varied, full of local incident and colour, and of great utility in forming an idea of the social life of the period. The most celebrated writer of *fabliaux* was the poet Rutebauf (d. c. 1280), who wrote many mordant satires against women, mendicant friars, the univ., and other subjects. He is moreover worthy of note as being the first Fr. poet to introduce a deep personal tone into his poetry.

The lyrical poetry of medieval Fr. literature was an outcome of the popular song. It was to a great degree imitated from the S. nations, the Its., and the Spaniards, and from the troubadours of the langue d'oc. From these sources the *trouvères* of the thirteenth, fourteenth, and fifteenth centuries drew their inspiration. Lyric poetry developed upon two lines; as regards subject it sounded in an increasing degree the personal note; in form it became enslaved more and more to certain fixed forms (ballad, rondeau, chant royal, etc.). It is not until the fifteenth century that lyric poets of enduring reputation are found. Among them must be mentioned Alain Chartier (1340-1440),

called the *père de l'éloquence française*; Charles, duke of Orleans (1391-1465), whose poems are full of grave elegance and melancholy, and finally François Villon (1431-60), who gave expression to a new depth of feeling and emotion. His *Petit Testament* and *Grand Testament* relate the excesses of his life, and his *Ballade des Dames du Temps jadis*, with its refrain *Mais ou sont les Neiges d'Antan*, ranks as one of the finest examples of lyrical poetry.

The earliest historical works were written in it. Afterwards hist. was written in the form of verse such as *L'Épopée des Angles* and two poems by Wace, *l'Œuvre* (the hist. of the Bretons) and *Ren* (hist. of the Normans). The first important prose hist. is the *Conquête de Constantinople* by Villehardouin (1207), which is a narrative of the events of the fourth crusade. Written to vindicate the author for having been a party to turning the army of the crusaders from their real goal towards a more lucrative object, it yet gives a terse, clear account of events and a record of the conflicting counsels of the leaders. A hundred years after Villehardouin, Jean de Joinville, at the request of Jeanne de Navarre, wife of Philippe le Bel, wrote his account of the sixth crusade which affords a detailed and simple narrative of the doings of St. Louis IX., whose human and saintly qualities are described with such a lack of affectation that the book is one of the most sincere documents of the past. Froissart is a good deal less medieval in tone than Joinville. His *Chroniques*, written towards the end of the fourteenth century, deal with the events in England, France and Flanders between 1325 and 1379. He astonishes us by his wealth of detail and his care to gather all possible information upon the events described. Philippe de Commines was the historian of Louis XI. of France the Bold, duke of Burgundy, and of the expeditions to Italy under Charles VIII. His work takes us up to the year 1498. He is more than an historian: he is a politician and a thinker. In Louis XI. he had to portray a king who won his way more by diplomacy than by force of arms, and he draws a vivid picture of the characters whom he sets out to portray.

The drama of the Middle Ages took its rise from the Church ceremonies. The liturgy was developed by interpolation of Latin verses and canticles, and afterwards by recited pieces which finally became amplified into such liturgical dramas as *Les Pasteurs* and *Les Évoques sages et les évêques folles*. Here the Latin tongue gradually gave way to the native language, and as the scope of the pieces increased they were removed from the choir to the porch of the church. The *Drame d'Adam* (twelfth century) was the first piece played outside the church. In the thirteenth, fourteenth, and fifteenth centuries arose the miracle plays dealing with the lives of the saints, mystery plays concerned with scriptural subjects and certain epic events of profane hist., such as the siege of Troy and that of Orleans. These mysteries

often ran to enormous lengths, requiring as many as 100 performers, and sev. days for their presentation. In 1548 they were banned by the Parlement de Paris on account of their increasing profanity, but they lingered on elsewhere until the end of the sixteenth century.

The use of far comedy is very obscure. It appears to have developed from the *duos monologues*, and *débats* that the wandering minstrels carried from castle to castle and from town to town. The first known comedy is the *Jeu de la feuillée* by Adam de la Halle, played in 1262 in Arras, while another, *Robin et Marion*, by the same

ROUSSEAU (1724-89)

author, a pastoral play with a musical accompaniment, was played in Naples in 1285. In the fifteenth century many societies were formed for the presentation of farces, pantomimes, moralities and *soffies* such as *Les Clères de la Basoche* and *Les Enfants sans souci* in Paris. Of the farces the most celebrated is *L'Amour Latin* (1470), of unknown authorship which was modernised in 1872 and is still performed. Mention must also be made of the moralities, allegorical and didactic dramas which were produced until the middle of the sixteenth century.

The sixteenth century ushered in the Renaissance of French literature the chief causes of which were the discovery of printing (1450), the It. wars (1494-1515) which brought France into contact with a more cultured people and the humanistic movement, which led to the study of the anc. classical authors, and the Reformation, marked by Luther's rupture with the Catholic Church in 1521. The early Renaissance in French literature found its most complete expression in Queen Marguerite of Navarre. She was the author of *Heptaméron* (1558), an imitation

of Boccaccio's *Decameron*. Outstanding among the poets who enjoyed her patronage was Clément Marot (1497-1544), a courtier who produced some very elegant pieces and some *épîtres* which are of deeper inspiration. He also trans. thirty of the psalms with considerable success.

In 1549 appeared Joachim du Bellay's *Défense et illustration de la langue française*, which set out the tenets of the new reforming party of Fr. poets. These poets grouped themselves round Ronsard, and were known as the *Pléiade*. Besides Ronsard and du Bellay, they included Ball, Jodelle, Belleau, Pontus de Tyard, and Daurat. They endeavoured to give France a worthy literary language by imitating from the classics, by coining new words, and by borrowing from the various dialects. Unfortunately the less known poets and their imitators carried these ideas too far and brought ridicule upon the school, which led to the eclipse of the fame of Ronsard. Ronsard during his life was regarded as the greatest of Fr. poets, and his sonnets are of considerable merit. Later, however, he turned his attention to the epic, and produced *Franciade* (1572), in decasyllabic verse, which proved a complete failure. Du Bellay lacked the variety and force of Ronsard, but was more sincere in his verse. His best poems are contained in *Regrets*, *Antiquités de Rome*, and *Jour rustiques*. Belleau wrote pastorals in his *Bergeries*, and du Bartas, a disciple of the *Pléiade*, a pretentious work, *La Semaine*, describing the creation of the world, according to the biblical tradition. Agrippa d'Aubigné (1550-1630), another disciple of the *Pléiade*, a protestant, wrote *Les Tragiques* (1616), a succession of descriptive tableaux dealing with the misery and corruption of the world and with the final judgment.

François Rabelais (c. 1490-1553) is, like Jean Jacques Rousseau in the eighteenth century, a writer whose exact merit it is difficult to assess. B. at Chinon, he was first a monk and then a doctor. He led a very unsettled existence, residing at Lyons, Rouen, Metz, and elsewhere. His masterpiece is *Gargantua and Pantagruel*. They are two giants whose fantastic deeds are a burlesque of the Arthurian chivalry, and the vehicle of much sound, if pungent, philosophy. Rabelais's writings reflect the struggle of the Renaissance against the Church, and their improbability and disproportion are but a cloak to cover his attacks. His characters are simple and unrestrained. His doctrine may be summed up as advocating the development of both mind and body, and his rule of conduct was *Pay ce que vous devez*. The exuberant humour and rich epic life of his *Gargantua and Pantagruel* doubtless have a deeper meaning than appears on the surface and Rabelais himself tells the reader that he must 'break the bone in order to suck the marrow' if he wishes to find the hidden truth. In the same passage, however, he alludes to the 'doctrine obscure' and 'mystères horribles' in his story; but this bombast indicates plainly that he is jesting, particularly at

the mania of the Middle Ages of trying to interpret all things allegorically. Rabelais relates much merely out of love for his theme, especially the coarse jests and obscenities with which his work abounds, and those who seek some esoteric meaning here will seek in vain; and the opinion that Rabelais's book is a complicated puzzle cannot be too much guarded against. His style is racy and picturesque, full of original imagery, but his power of verbal invention beguiles him and then his language becomes a verbal feast of metaphors, neologisms, latinisms, synonyms, and proverbs jumbled together in indigestible confusion. Great writer as he is, Rabelais is quite devoid of any feeling for beauty.

The Renaissance led naturally to the trans. of the ancients, and Amyot's trans. of Plutarch (1539) is specially worthy of mention, serving both to enlarge the scope and to enrich the vocabulary of Fr. literature. Henri Estienne furthered the knowledge of Gk. and at the same time defended the language against the influx of It. words. Montaigne (1533-92) was among the first prose writers of his century. His *Essais* offer an inexhaustible wealth of information upon the varied customs of mankind. To the age-old teaching of Christendom he opposed scepticism based upon the conflicting hist. of the human race. With a pretence of impartiality he states his observations and arrives at his characteristic maxim, *Que sais-je*. His style is simple, unaffected, and spontaneous, and he will always retain his rank as one of the world's foremost essayists.

The drama of the sixteenth century did not show any strong individuality. It consists almost entirely of trans. from Gk., Lat., and It. sources. In 1552 Jodelle produced *Céladore*, the first original tragedy in Fr. Larive wrote some dozen comedies adapted from the It., but wholly Fr. in spirit; and he may be regarded as the forerunner of Molière. Among the historians of the period mention should be made of Brantôme (1544-1614), whose *Mémoires* contain 'Vies de hommes illustres et des grands capitaines' and 'Vies des dames illustres.' He wrote with vigour, wit, and cynicism. Blaise de Montluc (1502-77), one of the foremost soldiers of his time, was the author of the *Commentaires de Monsieur Blaise de Montluc* (1592) in which he describes his fifty years' service (1521-74). D'Aubigné, mentioned above, wrote *L'Histoire universelle*, a Fr. hist. from the Protestant standpoint from 1550 to 1601. Among religious works foremost is Calvin's *Institution chrétienne* (1541), the Fr. version of his Lat. work of the same title. It is important as being the first religious work written in the Fr. language. François de Sales's *Introduction de la vie dévote* (1608) also belongs to the sixteenth century by its style. *La Satyre Menippée* (1594), a pamphlet written by sev. collaborators, is well known, and was instrumental in reconciling the conflicting religious parties.

During the seventeenth century Fr. literature reached its zenith. The progress was not, however, greatly marked in

the realm of poetry, which was content simply to liberate itself from the excesses of Ronsard's followers. The outstanding figure is Malherbe (1555-1628), at first a disciple of Ronsard, but afterwards a zealous opponent of all exaggeration. He insisted upon the use of words of undoubted Fr. origin, and based his verse on the severest models, and thereby founded the classical school. He regularised the Alexandrines, held the caesura as essential, proscribed *enjambement* and hiatus, and advocated richness of rhyme. Unfortunately, he succeeded at the same time in banishing all lofty inspiration from Fr. poetry and left it formal and lifeless. His immediate disciples were Racan and Maynard, but he found many adversaries among the followers of Ronsard, e.g. Vanquelin de la Fresnaye, Desportes, Bertant, Mathurin de Rémier. The latter accuses Malherbe of being *faible d'invention, froid à l'imaginer, a mere regrattier de syllabes*. Be that as it may, Malherbe's influence grew until he was finally regarded, owing to Boileau's appreciation, as the founder of modern Fr. poetry.

The classical movement was helped by sev. causes. In 1637 Descartes pub. his *Discours de la méthode*, the first Fr. book upon a philosophical subject. Indirectly the work had a great effect upon Fr. literature. It gave to prose a solidity it had never had before. Its theories appealed to Fr. minds, and all the writers of the century were imbued with Cartesian tenets. Philosophy became the property of the ordinary man, after having been confined to the learned. From Descartes the great writers acquired a sense of truth and order, a regulation of their art that finds its highest expression in the classical school. The unity of the language was further promoted by the estab. of the Fr. Academy, which arose out of a small society of literary men who met at the house of Valentin Conrart and discoursed upon literary topics. Richelieu, with his zest for organisation, wished to give this society the prestige of an official assembly, and in 1634 the statutes of the Academy were drawn up. One of them required that the Academy should prepare a dictionary, a work which did not appear until 1694, followed by later eds. Another influence upon Fr. literature in the seventeenth century was the famous *salons*, prin. among which was the Hôtel de Rambouillet, where the most eminent men of letters used to meet with persons of rank and social influence. The result was a refinement of language, the rejection of all coarseness of expression, a striving after elegance, which subsequently degenerated into affectation or *préciosité*. Vaugelas (1583-1650), one of the early members of the Academy, who had the reputation of knowing his own language better than any one and whose decisions were looked upon as laws, pub. his *Remarques sur la langue française* in 1637—a work which served as a guide to his fellow members in their literary labours. He proposed first to make the language 'vraiment maîtresse chez elle' and to clear

it of the rubbish it had garnered; and secondly, he asserted that the test of correct language is the manner of speaking of the best part of court; but if he estab. the supremacy of court he never intended to exclude all development or change. Another prose writer of the period was J. L. Balzac, *le grand épistolier* (1594-1654), whose letters had a wide popularity and were regarded as models of style. His style is rich and vigorous, but somewhat heavy. He has been accused of being merely a maker of phrases, but his works abound in depth and beauty, and include some excellent pages of philosophy, religion, and criticism. Vincent Voiture (1598-1648), also a letter-writer, was greatly admired in his day, and was for some twenty years the leading spirit of the Hôtel de Rambouillet. His style is laboured, but he writes upon a wide range of topics and shows a keen wit. He also wrote poetry of artificial character, his most celebrated piece being the sonnet on Urania, which vied with Benserade's sonnet upon Job, and gave rise to the two factions of Uranistes and Jobelins in the Hôtel de Rambouillet.

The seventeenth century witnessed greater progress in drama than in poetry, and produced the three supreme dramatists of France, Corneille, Racine, and Molière. The glory of Corneille and Racine has faded, and their works have had no lasting effect upon European literature. Ger. dramatists, after following Fr. models for some time, finally turned to the Shakespearian drama, and it may be said generally that the Shakespearian form has finally triumphed over the Fr. classical drama. Neither Corneille nor Racine compare on terms of equality with the Gr. dramatists whom they emulated and whose rules they strove to follow. The fame of Molière, however, shows no diminution, and he is held to be the greatest of Fr. comedy-writers. His satires upon human weakness still retain their force and their appeal.

Before Corneille sev. types of plays rivalled each other for popular favour, principally the tragedy, the tragi-comedy, and the pastoral. The first dramatist of the century was Alexandre Hardy (1569-1630), a prolific writer who produced some 700 or 800 plays, of which forty have come down to us. Though not a great playwright, he nevertheless had a keen sense of dramatic effect, and knew how to marshal his scenes and to set off his characters. He shows greater freedom than do the classical writers in choice of subject, in range of action, and in the number of characters and scenes, and he might, with greater genius, have given a different turn to the drama. After Hardy came Jean de Mairet (1604-86), whose tragedy *Sophonisbe* is remarkable as being the first tragedy which strove to give effect to the unities of time, place, and action, which were to dominate the Fr. theatre for two centuries.

Pierre Corneille (1606-84), b. at Ronen, produced his first play, *Médée*, a comedy, in 1629, and it was an immediate success. In 1635 appeared his first tragedy, *Médée*.

In the meantime he had moved to Paris, where he became one of the five authors of Cardinal Richelieu, who drew up the plan of a play and handed it over to those authors to put into suitable form. Corneille had, however, no power of ingratiating himself with the great and was dismissed for lack of *esprit de suite*, or ability to conform with his patron's plans. In 1636 *Le Cid* was produced. Its success was immense, and surpassed that of any previous play. Nevertheless it met with great criticism in sev. quarters and Richelieu submitted the question to the newly formed Academy, which delivered its opinion in the *Sentiments de l'Académie française sur le tragi-comédie du Cid*. In 1640 Corneille produced two plays, *Horace* and *Cinna*, and in 1643 *Polyeucte* and *Pompée*, as well as a very successful comedy, *Le Menteur*. Between 1642 and 1652 he wrote *Rodogune*, *Théodore*, *Héraclius*, *Nicomède*, and *Pertharite*. The latter was a failure, and Corneille then ceased to write until 1659, when he produced *Œdipe* and sev. other pieces. In 1674 he wrote his last work, *Suréna*, which was a failure. After *Le Cid* Corneille always conformed to the three unities of time, place, and action, not, however, without a certain show of restraint. He chose his subjects from hist., particularly dealing with such episodes as illustrate the triumph of the will over the emotions. His characters show great firmness and heroism, and La Bruyère states that he portrayed men as they ought to be, not as they are. In giving the authority of hist. to his characters he made them appear more probable than they otherwise would have done. His style is oratorical and grave. He is poor in imagery, but strong in argument, full of well-stated maxims and brilliant dialogue.

Corneille was ultimately overshadowed by Jean Racine (1639-99), whose first piece, *La Thébaïde, ou les frères ennemis*, appeared in 1664, followed the next year by *Alexandre*, both of them imitations of Corneille's art. In 1667 he produced *Andromaque*, which achieved a great success, and between that date and 1677 sev. other tragedies, *Britannicus*, *Bérénice*, *Basile*, *Mithridate*, *Phèdre*, and *l'André*, as well as a comedy *Les Plaudits*. All these were successful, but in 1677 he ceased to write for the theatre owing to religious scruples. In 1689 he wrote, at the instigation of Mme de Maintenon, his tragedy *Esther* (which was produced by the young ladies of St. Cyr), and two years later *Athalie*. Racine, like Corneille, adhered to the unities, but he did so without effort. He presents not the moral qualities but the emotions and passions of his characters. The series of Racine's masterpieces was opened by *Andromaque* (1667), which was as successful as Corneille's *Cid*. The plot was taken from Book II of the *Æneid* and from Euripides' *Andromache*, with essential alterations regarding the heroine's character. The significance of the play was that it heralded the advent of a new tragic ideal, the very antithesis to that of Corneille,

the substitution of human passion and especially love, for the heroic crises of the will, and for that reason it was coldly received by the partisans of the older dramatist. But Racine's drama is more human and congenial than that of Corneille, and his harmonious and natural style appealed strongly to his audiences. Apart from his plays he wrote numerous lyrics, a *Histoire de Louis XIV.*, and an *Abrégé de l'histoire de Port-Royal*.

Fr. comedy before Molière was represented by *Le Menteur* of Corneille and works by J. Rotrou (1609-50) and P. Scarron (1610-80), imitated from the Sp. and It. Jean Baptiste Poquelin, *alias* Molière (1622-73), founded with the Béjart

family in 1643 *L'Illustre Théâtre*, but was forced by want of success to tour in the provinces from 1645 to 1658. In the latter year he came to Paris, where he produced *Les Précieuses ridicules* (1659), which estab. his reputation, and then successively *L'École de Maris* (1661), *L'École des Femmes* (1662), *Tartufe*, his masterpiece (1664), *Don Juan* (1665), *Misanthrope* (1666), *Le Médecin malgré lui* (1666), *Les Femmes savantes* (1672), and *Le Malade imaginaire* (1673). He was seized with illness whilst playing in the last-named piece, and d. shortly afterwards. Molière was a great playwright, and his best comedies are among the greatest that have ever been written. He expresses very happily the Fr. national spirit. His most powerful weapon is ridicule, his strongest aversion hypocrisy and affectation. *Les Précieuses ridicules* exposes the pedantry of the crude Fr. women. *Tartufe* is a type of the religious hypocrite. In *L'École* (1668) he portrays the effects of miserliness. His characters are taken from life, and are of great variety and interest. He is remorseless in his banter towards the failings and vices of humanity. He appealed from the pedants, the prudens, the *précieus*, the snobs, to the Fr. people, and won his way to their

hearts. He has been attacked for a want of style, but his defence is that his language is that of his characters. The influence of Molière in comedy has been immense, greater by far than that of any other writer developing this particular branch. All subsequent Fr. writers of comedy derive directly from Molière. Neither was his influence less in England—as witness the works of Fielding and Sheridan—indeed one may almost say that for two centuries Molière's comedy has determined the form of European comedy.

Blaise Pascal (1623-62) was one of the foremost prose-writers of the seventeenth century, and in reading him we feel that we have at length arrived at modern Fr. prose. He was a member of Port-Royal, the stronghold of Jansenism (q.v.). His first work, *Les Provinciales* (1656) is a series of letters against the Jesuits. After his death were pub. his *Pensées*, the fragment of an *Apologie de la religion*. He closely follows Montaigne in observing the variety and uncertainty of human endeavour, but concludes that the sole refuge for thinking persons is in an absolute faith in God. Pascal shows deep penetration and draws pregnant conclusions from his observations, and brings his mathematical and scientific mind to the aid of religion. His works are a model of clear, refined prose. The seventeenth century also marked the zenith of the sermon. The three great preachers are Jacques Bénigne Bossuet, bishop of Meaux (1625-1704), Louis Bourdaloue (1632-1701), and Jean Baptiste Massillon, bishop of Clermont (1663-1742). Bossuet was celebrated for his funeral orations, notably that on the prince de Condé. He was a great religious controversialist, and wrote *L'Histoire des variations des églises protestantes*, as well as combating the heresy of quietism. Another work from his pen is the *Discours sur l'histoire universelle*. Bourdaloue as a preacher was even more popular than Bossuet, while Massillon was also renowned for his harmony and elegance of style.

The increase of social intercourse called forth many works dealing with human manners and motives. Writers upon this subject are usually called moralists. The most celebrated moralist of the century was François de Rochefoucauld (1613-80), who pub. his *Mémoires* in 1662 and his *Maximes* in 1665. In the latter he tries to show all human actions to be inspired by self-interest and vanity. His style is terse and antithetical, but Jean de la Bruyère (1615-96) was less systematic than his predecessor; his *Caractères* (1688) show deep penetration and a considerable tinge of misanthropy. In some passages he speaks out with surprising vigour on behalf of the oppressed, thereby heralding the eighteenth century.

Of the great number of letter-writers of this period it suffices to mention Mme de Sévigné (1626-96), whose letters to her daughter, written in a sprightly and natural style, reveal to us not only her own emotions and sentiments, but the hist. of the period and the state of society and literature, and Mme de Maintenon (1635-

1719), second wife of Louis XIV., whose letters deal with the education of her young charges at St. Cyr. Memoir-writers are Mme de Motteville, who gives a simple and sympathetic account of the career of Anne of Austria, Cardinal de Retz, the historian of the Fronde, and St. Simon. The last named (1675-1755), misanthropical and disappointed as a courtier, has left an account of the court of Louis XIV., which is remarkable for the malignity of the portraits of his enemies. As a historian he is prejudiced and unreliable, but his descriptions are extremely vivid and his style eloquent and vivacious.

The novel of the seventeenth century was generally an affected tale of chivalrous adventure. Best remembered are Honoré d'Urfé's *L'Astrée* (1637), a pastoral romance, and Mlle de Scudéry's *Le Grand Cyrus* (1648).

The most typical Frenchman of the period was Jean Fontaine (1621-95). He pub. a book of *Contes* in 1661, and in 1668 the first six books of *Fables*. Though written at the height of the classical period these fables lack the restraint of classical literature. La Fontaine is the most *gauche* of all his countrymen. His fables are little comedies, written in sprightly polymorphic verses, narrating episodes between various animals and full of penetrating reflections upon human life. His verse is often of lyric character. La Fontaine never preaches. The moral of the fables is so ingeniously conveyed that it at once strikes home. Probably no writer has added more catch-phrases to the stock of common Fr. speech than this admirable fabulist.

Nicholas Boileau (1637-1711) was the apostle of classicism. His work is mostly critical, and for more than a century his opinions were regarded as authoritative. In his *Satires littéraires* he entirely discredited the inferior writers of his time, and ennobled Corneille, Racine, and Molière. His prin. work, *L'Art poétique*, codifies the usage of the great writers, and holds it up as a model to be followed. He recognises no Fr. poet before Malherbe, and contributed largely to the light esteem in which Ronsard was held. He holds reason to be the guiding principle of real poetry. He recommends fidelity to nature: "rien n'est beau que le vrai, le vrai seul est aimable"—and the imitation of the ancients as the best method of high poetical achievement. In this he was opposed by the modernists, who, led by Charles Perrault, maintained that the age of Louis XIV. had surpassed the finest achievements of ant. classical literature. Both sides in the dispute showed lack of critical and historical judgment, but the modernists, though seemingly worsted, gained the day, and classical influence gradually waned. François Fénelon (1651-1715), archbishop of Cambrai, is well known as a prose writer. His *Éducation des Filles* (1689) gives excellent advice upon the upbringing of girls. His *Télémaque* (1699) is a didactic work, written for his refractory pupil, the duke of Burgundy, and conveying the fruits of Gk.

literature. His *Explication des maximes des saints* embroiled him with Bossuet and led to his disgrace.

In the eighteenth century Fr. literature freed itself from court influence. Louis XIV. d. in 1715, and after his death began the struggle against central authority that ended in the revolution. *Salons* became very powerful in forming public opinion. A change came over the Fr. mind. Religion, enfeebled by the controversies of the previous century, lost its hold, and abstract branches of knowledge, as metaphysics and morality, were abandoned for the study of social and political questions. Literature as such made no great advance, the originality of the age being shown more in historical, scientific, and sociological research. The two connecting links between the old and new centuries are Bernard Fontenelle (1657-1747) and Pierre Bayle (1647-1706). The former became the populariser of scientific knowledge in his *Entretiens sur la pluralité des mondes* and his *Éloges des Savants*. The latter was the precursor of the encyclopedists. His *Dictionnaire historique et critique* (1697) was one of the indispensable handbooks of the eighteenth century among those who led the attack on religion. Charles Montesquieu (1689-1755) is the first great writer of the eighteenth century. His earliest work, *Lettres persanes* (1721), is a brilliant and piercing satire on Fr. society and institutions. His *Considérations sur les causes de la grandeur et de la décadence des Romains* (1734) is a work of real philosophic insight. *De l'esprit des lois* (1748) is an objective study of the various systems of legislation, a work no less stupendous in range than wanting in uniformity of plan, yet one of the most considerable works of the whole century. It is the sum total of his observations and reflections, with the deductions he drew from the facts and phenomena, historic, economic, and social, noted throughout his long life. Montesquieu is at once an inquirer and a reformer.

Georges Buffon (1707-88) wrote from 1749 till his death his *Histoire naturelle et Époques de la nature*. He had great descriptive powers, and was notable for his hypotheses, which anticipated later discoveries. His *Discours sur le style* (1753) is an eloquent expression of his opinion upon literary style.

The great name of the century is undoubtedly that of François Voltaire (1694-1778). Though his writings are not perhaps now widely read, his influence lives on. He was accepted by the world as the greatest man of his age, and his reputation was universal. He turned his attention to many branches of literature and stands high in them all. His poetical works include the *Henriade* (1736), an epic, and epistles, satires, and odes. He is sometimes happy in his light verse. His historical works are *Charles XII.* (1731), *La Siècle de Louis XIV.* (1751), and *Essai sur les Mœurs* (1744). His plays are modelled on Racine and Corneille. The prin. are *Édipe* (1718), *Brutus* (1730), *Zaïre* (1732), *Alzire* (1736), and *Mérope* (1743).

By making use of a wider range of characters, scenery, and action he extended the scope of the classical drama. He also wrote short novels and stories, *Zaïre* (1747), *Candide* (1759), *L'Ingénu* (1767), which served as a vehicle for social and political satires. Moreover, he left some 10,000 letters addressed to kings, princes, noblemen, and literary persons, which afford a wealth of information about this period. Though a believer in God he was violently opposed to all that did not agree with his religious opinions, and attacked the Church with a bitterness, keenness, and banter which did it lasting harm. He fought throughout his whole life against both gov. and eccles. oppression, and prepared the way for the revolution.

The *Encyclopédie* appeared from 1751 to 1772. Begun by Jean D'Alembert (c. 1717-83) it was taken up by Diderot, who enlisted the collaboration of many distinguished writers, and showed surprising versatility in his own contributions. Though the gov. attempted to hinder the work it was successfully publ., and contributed to the defence of political and intellectual liberty.

The theatre made little progress during the eighteenth century. Jolyot de Crébillon (1675-1762) wrote horrible but vigorous and immensely successful tragedies. Jean François Ducis (1733-1816) is noted for his trans. of Shakespeare, and Voltaire's plays have been mentioned above. Comedy was more favoured than tragedy. The Molière tradition was successfully continued by Jean François Regnard (1653-1709), Florent Dancourt (1661-1725), and Alain le Sage (1668-1747). The comedies of Pierre Marivaux (1688-1763) were of quite an original character, depicting the hesitant lover. His prin. plays are *Les Surprises de l'amour* (1722), *Le Jeu de l'amour et du hasard* (1734), *Le Legs* (1736), and *Les Fausses confidences* (1737). His analysis of character is very delicate, and he excels in portraying woman. He has a keen appreciation of comic situations. In style he is subtle, delicate, and dramatic, and was imitated by successors whose 'marivaudage' developed into over-refinement and affectation. Pierre Beaumarchais (1732-89) is famous for two plays, *Le Barbier de Séville* (1775) and *Le Mariage de Figaro* (1784), which were great successes. They are full of taunts at the nobility, and reflected exactly contemporary feeling.

After Voltaire the most influential writer of the century was Jean Jacques Rousseau (1712-78), whose peculiarities at length developed into the mania of imaginary persecution. His first work, *Discours sur les sciences et les arts* (1749), endeavoured to show that human degeneracy was due to civilisation. His *Discours sur l'origine de l'inégalité parmi les hommes* (1751) is the first manifesto of Communism. *La Nouvelle Héloïse* (1759) is a portrait of wifely chastity which had an instant success. *Le Contrat social* (1762) is again a plea for communism. *Émile* (1762), written in favour of a more natural system of education, is perhaps

his *chef-d'œuvre*. His *Confessions* (1781-1788) is a remarkably open account of his life, including his weaknesses and faults, but is not entirely reliable. There are passages in which the author appears in a far from creditable light. Rousseau's daring and original thoughts upon society and its comparison with *L'État naturel* directly influenced the revolution. His style is mixed, sometimes heavy and dragging, sometimes rhetorical and declamatory, but he brought eloquence and effect once again into the language, after the sober reign of classicism. His splendid descriptions of nature and his outpourings of personal feeling are among the prin. sources of that flood of romanticism which was to rise in the following century. His chief literary disciple was Bernardin de St. Pierre (1737-1814), who wrote a charming book, *Paul et Virginie* (1789), a touching story of boy and girl love, full of splendid pictures of nature.

The best novelists of the eighteenth century were Alain le Sage, Pierre Marivaux, and the Abbe Prévost. Le Sage wrote two works, *Le Diable boiteux* (1707), an imitation from the Sp., and *Gil Blas* (1715-35), an original novel whose scene is laid in Spain, and tells of the vicissitudes of a man of modest origin who reaches a high political position. It is long and complex, but true to life. Marivaux wrote the novels *La Vie de Marianne* (1731-41) and *Le Paysan parvenu* (1735-1736). They resemble his comedies mentioned above. L'Abbe Prévost is the author of *Manon Lescaut* (1732), a passionate love romance. He also trans. sev. Eng. novels.

Turning to lyric poetry we find it represented at the beginning of the century by Jean Baptiste Rousseau (1671-1741), who was held for some time to be the greatest Fr. lyrical poet. Ecouchard-Lebrun, nicknamed 'Lebrun Pindare,' wrote odes after the style of Pindar, notably *Le Vengeur* (c. 1800). André Chenier (1762-94), an unfortunate victim of the revolution, wrote elegies, bucolics, and idylls, which are modelled upon the Gk., and breathe the very odour of classical charm. His metrical innovations, although copied from his models, led him to be claimed as the founder of the romantic school, but he is more closely allied to the Parnassians.

In the nineteenth century sev. important movements manifested themselves in Fr. literature, the enduring properties of which cannot yet be accurately appraised. The first is the Romantic movement, which took place between 1815 and 1850. The underlying principle of romanticism is the expression of individuality. The personal note predominates. Authors utter their emotions, aspirations, beliefs, and ideals. They break down the arbitrary barriers of form created by the classical school, and prefer to seek their inspiration in the N. literatures than in the exhausted fields of classical and S. Europe.

First of the romanticists is François Chateaubriand (1768-1848), whose works, *Atala* (1801), *Le Génie du christianisme* (1802), and *René* (1805), abound in vivid,

subjective, natural description, in religious feeling, and in melancholy. Mme de Staël (1768-1817) brought Shakespeare into the ken of the Fr. nation by her work *Littérature* (1800), and turned Fr. thought into a new channel by *L'Allemagne* (1810). Alphonse Lamartine (1790-1869) was the first romanticist to develop the lyrical strain of poetry. His poems, with their deep religious feeling and acquiescence in the divine will, were well in keeping with the mood of a nation just recovering from the strain of Napoleonism, and the sense of crushing defeat. With true lyrical faculty he nevertheless errs on the side of prolixity and facility. Victor Hugo (1802-85) has greater claims to be held as the chief of the romanticists. Though his inspiration was not of the deepest, it was extremely varied, and he knew well how to give it form. He broke down the rigidity of the Alexandrine, and made it of surprising richness. He used every variety of metre, and revelled in an inexhaustible vocabulary. His chief collections of poems are *Odes et ballades* (1826), *Les Orientales* (1829), *Les Feuilles d'automne* (1831), *Les Chants du Crépuscule* (1835), *Les Vœux intérieurs* (1837), *Les Contemplations* (1856); and *La Légende des siècles* (1877, 1883). Hugo's attempts to revolutionise the drama were not successful. Cromwell (1828), Hernani (1830), Marion Delorme (1831), and *Les Burgraves* (1843), all show his lack of dramatic and psychological invention. The characterisation is bizarre, the historical sense is unconvincing, but the poetry is magnificent. His novels, *Notre-Dame de Paris* (1831), *Les Misérables* (1862), and *Les Travailleurs de la mer* (1865), are too crowded and exuberant, though of great descriptive power. Alfred de Vigny (1797-1863) is a poet obsessed with morbid pessimism. He writes of the cruelty of nature and the indifference of God. His best poems are *La Colère de Samson*, *La Mort du loup*, and *La Bouteille à la mer*. His complete works were pub. in 1883-85.

Alfred de Musset (1810-57) has a great hold upon Fr. hearts. His poems tell of the regrets of love, and are inexpressibly tender and sad. Best among them are *Les Nuits* (1835). His dramas rank high in the hist. of the Fr. stage. They are characterised by delicacy of feeling, and are written in a most lucid and charming style.

During the middle of the century arose the Parnassian school of poetry, whose leader, Théophile Gautier (1811-72), shrinking from what he regarded as the undue self-expression of the romanticists, formulated the doctrine of *l'art pour l'art*. Poems, like paintings or scenery, should appeal to our sense of beauty and not to our sympathies. Such a theory, if carried too far, leads necessarily to mere impersonality and frigidity. Gautier pub. his poems under the title of *Émaux et camées* (1852), which well characterise the style of his work. His prin. followers were Leconte de Lisle (1820-94), José de Heredia (1842-1906), and Charles Baudelaire (1821-67). Sully Prudhomme (1839-1908) was at first also a Parnassian,

but did not remain so. He is the most philosophic of Fr. poets, and has a very clear and smooth style. François Coppée (1842-1908) was the singer of mean life. Paul Verlaine (1844-96), with Stéphane Mallarmé (1842-98), founded the symbolist school of poetry, suggestive, capricious, and at times obscure.

Hist. and literary criticism showed great virility in the nineteenth century. The prin. critics were Abel Villemain (1790-1870), who inaugurated comparative and historical criticism, Augustin Saintou-Beuve (1804-69), author of *Port-Royal* (1840-60), *Portraits littéraires* (1844-52), and *Les Lundis* (1850-60), and Hippolyte Taine (1828-93). The chief historical work of the last is *Origines de la France contemporaine*. Among historians the most celebrated are Augustin Thierry (1795-1856), whose theory of the rivalry of race is propounded in *La Conquête de l'Angleterre par les Normands* (1825) and *Le Tiers Etat* (1853). His most picturesque work is *Récits des temps mérovingiens* (1840). François Guizot (1787-1874) studied hist. in a philosophic spirit and paid special attention to it as a social science. Adolphe Thiers (1797-1877) is extremely well informed, industrious, exact, and clear. His two great works are *L'Histoire de la Révolution française* (1823-1827) and *L'Histoire du Consulat et de l'Empire* (1845-62). Jules Michelet (1798-1871) is distinguished by the poetical quality of his historical writings, which, however, gradually got the better of his historical judgment. His *Histoire de France* (1833-1868) thereby loses in value after the first 6 vols. Fustel de Coulanges (1830-59) is the greatest representative of the scientific method of treating hist. His method is to arrive at facts, collate them, and analyse them, leaving the conclusion to be drawn from the personality of the historian. Ernest Renan (1823-92) is the historian, though from the dogmatic point of view hostile to the Christian religion. Educated for the priesthood, he abandoned it owing to inability to accept Christian dogmas. His *Vie de Jésus* (1863) (part of the *Histoire des origines du christianisme*) roused a great controversy, and is remarkable as an attempt by a sceptic to make a sympathetic study of Christ.

Of the writers of comedies Augustin Eugène Scribe (1791-1861) was the most prolific, producing some 400 pieces. He is an admirable constructor of plots and has a mordant wit. His best work is perhaps *Le Verre d'eau* (1840). Emile Angier (1820-89) distinguished himself as the defender of morality and the family. *Le Gendre de M. Poirier* (1854) is his best known comedy. Victorien Sardou (1831-1908) was a disciple of Scribe. Alexandre Dumas fils (1824-95) wrote paradoxical comedies, dealing chiefly with marriage and divorce. With Edmond Rostand (*Cyrano de Bergerac* and *Chantecler*) the comedy has again turned towards idealism and poetry.

As regards novelists, the names of Chateaubriand and Hugo have already been mentioned. George Sand (1804-76)

was a prolific female author, who wrote successively romantic, socialist, and pastoral novels, of which *Indiana* (1832), *Le Moine d'Angibault* (1845), and *La Mare au diable* (1846) are respective types. Stendhal, whose real name was Henri Beyle (1738-1842), wrote novels of a psychological and realistic character, such as *Le Rouge et le noir* (1831) and *La Chartreuse de Parme* (1839). Honoré de Balzac (1799-1850) is the greatest of Fr. novelists. He is the most fertile creator of types, and excels in delineation of character. His collection of works is called *La Comédie humaine*, divided into *Scènes de la vie privée*, *Scènes de la vie de province*, *Scènes de la vie parisienne*, etc. His best works are *Eugénie Grandet* (1833) and *Le Père Goriot* (1834). Gustave Flaubert (1821-80) originated what is known as the realistic or naturalistic school by his *Mme Bovary* (1857), which was followed by a historical romance, *Salammbô* (1862), a story of Carthage. The greatest writer of the naturalist school was Émile Zola (1810-1900), whose style is sometimes tinged with vulgar brutality is yet robust; his is the power of the demagogue. His chief disciple was Guy de Maupassant (1840-93), who besides writing novels excelled in the short story. Alexandre Dumas père (1803-70) wrote romantic novels such as *Les Trois Mousquetaires* (1844) and *Le Comte de Monte-Cristo* (1844-45), which are of considerable interest. Prosper Mérimée (1803-1870) wrote sev. novels in sober and concise style, best known of which is *Colomba* (1840), the story of a Corsican vendetta. Jules (1830-70) and Edmond Goncourt (1822-96) wrote in collaboration. They are scrupulously exact in their observation. Alphonse Daudet (1840-1897) is a humorist whose best character is the celebrated Tartarin of Tarascon.

Summary of French Literature of the period of the Third Republic (1870-1940).—The period of the Third Empire (1870-1940) may be said to have derived its literary outlook and atmosphere from Mallarmé and Verlaine. For from these writers it derived its symbolism, its mistrust of the intellect and motions, its belief in sensation unalloyed with intellectual processes. Also the best kind of Fr. literature, from Leconte de Lisle and Mallarmé to Marcel Proust (1871-1922) and Paul Valéry (1871-1944), had but little to do with politics; and in the domain of pure literature the Fr. nation during this disturbed period achieved much. One outstanding name in the period is that of Valéry who, in 1910, was the official poet of the Third Republic. From 1925 his pre-eminence is established, and concurs with that of Proust and André Gide. None of the younger men, whose work was published before 1910, could really contest their supremacy. Parallel with this 'modern' line, Mallarmé-Proust-Valéry, run sev. other lines: thus the naturalism of the previous period is still in full tide, and Zola's influence remained unimpaired till his death in 1902 and afterwards; and indeed the magnetism of the Flaubert-Zola tradition is perhaps

the most obvious development in the whole hist. of the novel. Romanticism, if diminished, was still sometimes in evidence, notably in the work of Edmond Rostand (1868-1918), Mme de Noailles (1876-1933), and Romain Rolland (1866-1944). Jules Romains and Georges Duhamel reveal various kinds of art skillfully blended; while the inimitable Anatole France (1844-1924) and Charles Péguy (1873-1914) may be said to derive from Voltaire and Bossuet. When the Third Republic was sinking to its doom some younger men appeared 'in a shouting and heroic mood' (Prof. Denis Saurat), men like André Malraux, Louis Aragon, Henri de Montherlant, André Chamson, and Céline. Summing up the period Prof. Denis Saurat says: 'No absolute master of supreme genius appeared: no Hugo, no Balzac, no Molière. But at no time had the nation thought so much about art and literature, nor produced such quantities of very good art and literature, among, of course, much of inferior quality.' Paul Claudel represented in this period the important Catholic revival, he having been himself converted in 1886, whereas Mallarmé and the symbolists hesitated on the brink. Claudel early shed his positivist doctrines for absolute orthodoxy free of the slightest scepticism or dubiety. His best poetry is moved simultaneously by the sexual and the spiritual impulse, and if his God seems somewhat cold and cosmic, the essence of the Claudelian dialectic is the part played by woman in frustrating or fulfilling his designs; and, in teaching the transfiguration of human love, Claudel is led from dichotomy to integration. This is illustrated by his play *Partage de Midi*, in which, as in *Antony and Cleopatra*, an adulterous love is transfigured by the approach of death. The failures of Catholicism became the subject of literary essays by Leon Bloy (1846-1917), Péguy, and Georges Bernanos (1888-1948); but the most reliable critics deny that a single great work of art came out of the Catholic revival, for Jules Lemaitre (1853-1911), Maurice Barrès (1862-1923), though Catholics in name, were really sceptics, while Charles Maurras and Ferdinand Brunetière (1849-1906) did not even make a pretence of believing. The deep movement was rather to be seen in Henri Bergson's (1859-1912) creative evolution towards true religious ideas, untempered by anti-clericalism, though the modern representative of the true Fr. tradition of Cartesian intellectualism is Octave Hamelin (d. 1907), for Bergson's criticism of the intellect is not in keeping with Fr. feeling. With the commercialisation of the novel came the limitations incidental to mass production and the search for popularity or suitability for humdrum minds. Among the best-sellers of the period in this kind were René Bazin (1853-1932), Paul Bourget (1852-1935), Abel Hermant, and Marcel Prévost. None of these, however, could write with the brilliant objectivity of Pierre Loti (Vaud) (1850-1927); and over all towered the figure of Anatole France, whose early novels were admirable

exercises in irony and compassion, the two moods that mark most of his work even to the last, *La Révolte des anges* (1914), the final masterpiece, in which love of justice and of liberty transcend the human plane (Saurat). Romain Rolland, who is nearer in spirit to Lamartine and Hugo than to his contemporaries, is important chiefly for one work, the 10-vol. novel *Jean Christophe* (1904-12), written as a direct reaction to Nietzsche's superman and ethic, and by way of an attempt to reconcile and unite France and Germany; but in this and in his plays on the Fr. Revolution his spiritual ego dominates the literary artist. It is true to say, however, that his work generally is a vindication of the deepest Fr. spirit, notably in the work *Charles Péguy* (1942).

ANATOLE FRANCE

Among literary critics of the period may be named Emile Faguet (1817-1916), notable for his works on the seventeenth century; Ferdinand Brunetière (1849-1907), one-time master of the *Revue des Deux Mondes*, and a scientific materialist; Jules Lemaitre; Remy de Gourmont (1858-1915), whose criticism is warped by his democratic ideology, though he was the guiding spirit of *Le Mercure de France*; Charles Péguy, known for his great work on - almost by way of rehabilitation of - Victor Hugo; Léon Daudet (1867-1911), and Charles Maurras, who together produced *L'Action française* but whose political theories destroy much of value in their work. Maurras's writings reveal passion, but not sentiment, while much of his work has found very real inspiration in his love of Greece. Essayists of the period include Emile Chartier Alain, who writes in the spirit of revolt against authority, as in *Mars ou la guerre jugée* (1921); Henri Bremond (1865-1939), whose *Histoire littéraire du sentiment religieux* (1916) put a new complexion on the age of Louis XIV.; Jacques Maritain, whose *Art et scolastique* (1930) is a classic of erudition; and Julien

Benda, the critic of Bergson. Fr. novelists of the twentieth century are so varied in their outlook that they can hardly be classified, though there are some similarities in their ideas, and Proust has his imitators whether avowed or not, e.g. Montherlant. Duhamel and Romains were estab. novelists in 1910, but only reached their best in 1930. Jules Romains, primarily a poet of the *groupe de l'Abbaye*, is chiefly famous for his remarkable 27-vol. novel, *Les Hommes de bonne volonté* (1932 ff.), the great feature of which is its truly epic presentation of war. Duhamel seems to belong to the tradition of Balzac, Flaubert, and Zola. André Gide, the Chateaubriand of the twentieth century, is, however, by no means a type of the average Frenchman, began with a lurid romanticism disguised as symbolism; but his *L'immoraliste* overdoes the anarchy of youth. But, as is shown by *Les Faux-monnayeurs* (1926), his only roman, he is a great stylist and a delight to read. Jules Supervielle is of the modern school, but whereas only pessimism characterises the thought of Proust, Gide, and Valéry, Supervielle represents all their modernist tendencies, but without their pessimism as is illustrated in his *Le Forçat inné* (1930). Pierre Hamp invented a new type of novel, the novel without a hero, but spun on an industrial theme, yet entirely human. Other names are those of Jean Richard Bloch; Eugène Montfort, who writes novels of life in the vein of Zola, but still more pronounced; Joseph Rosny, whose stories are really allegories; Alain Fournier, whose chief note is fantasy; Roland Dorgelès; Paul Morand, who exploits the amoral mentality of post-war life; Jean Giraudoux (1882-1912), writer of fantastic dramas; Jean Schlumberger, whose *Saint-Saturnin* (1931), a picture of the domineering family life of Normandy, is one of the best novels of the times; Marcel Jouhandeau, subtle and satiric in treatment; Jacques de Lacretelle; Georges Bernanos, known especially for his *L'imposture* (1928), the portrait of the inner soul of an unbelieving priest; and François Mauriac, novelist of the Catholic bourgeoisie and of the Christian problems of the soul. He depicts powerfully the present-day neurosis in terms of the conflict between good and evil. See G. Lanson and H. Tuffreau, *Histoire de la littérature française* (deals with Proust, Gide, and Valéry), 1932.

There are two main currents in modern Fr. thought: existentialism (q.v.) and personalism, which form, as it were, the intellectual background to the great struggle between the forces contending for the soul of distracted France - Marxism and Christianity. The present fashion in existentialism is but the modern expression of a very old moral problem, as is shown in his *Traité du caractère* (1946), by Emmanuel Mounier, who proves that Socrates, Epicurus, St. Augustine, and Pascal had already faced the questions the existentialists are now asking. Nor is there anything especially Fr. in their concern with the existence of man; it is to

be found in the novels of Dostoevski, Kafka, Hemingway, and Steinbeck, among many others, all of whose works have a considerable vogue in France. Between existentialism and communism, affirming at once man's personal qualities, and his sense of community, we find Christianity and its philosophic expression in personalism. Among the outstanding leaders of Catholic thought are Père Henri de Lubac, whose *Drame de l'humanisme athée* (c. 1946) is a most penetrating analysis of the godless philosophies of the times, and Gabriel Marcel, who has given us a Christian expression of existentialism. The recent work of the Abbé Mouroux, *Sens chrétien de l'homme*, is a characteristic example of the efforts Catholics are making to commit themselves to the realities of their age, and to face the problems of the modern world. Thus all the chief tendencies of Fr. thought have two main characteristics: they are concerned with the drama of human existence and the need to face its problems, and their philosophic discussions no longer deal with abstractions, but in concrete living things. These tendencies are reflected in modern Fr. literature. It is a *littérature engagée*, expressing a sense of commitment to the reality of life as seen through a particular philosophic conception. Though not avowedly existentialist, it is in the main a philosophy of despair, such as finds expression in the drama of Jean Anouilh, novels like *Les Bonnes* by Genet or *Si le sul s'effait* by René Roudel or the works of Sartre and Albert Camus. In his books *L'Univers concentrationnaire* (1946) and *Les Jours de notre mort* (1947) David Rousset describes, not an imaginary plague like Camus, but the real world of the concentration camps, sparing us none of the horrors, and writing with a complete absence of false pathos of the tortures and violence, and even the human grandeur he witnessed. Even in Fr. poetry we find a preoccupation with ideas - the revolutionary struggle with Aragon, mystic vision and spiritual meditation with Pierre Emmanuel and Lucette de la Tour. Emmanuel, in his admirable spiritual autobiography, *Qui est cet homme?* (c. 1915), explains the problems of poetic creation and their relation to mystical experience. All the most significant works of the modern Fr. writers, Anouilh's *Antigone*, Sartre's *Ilus clos* (1944), and Camus's *La Peste* (1947) come to the common conclusion that man is isolated and that he can do nothing to escape from his solitude.

The Théâtre Libre, directed by Antoine from 1887 to 1894, has had considerable influence on Fr. drama. Its main results were to bring new writers to the notice of the public and to foster naturalism in drama. François de Curel (1864-1928) is an important Fr. dramatist, many of whose plays were performed by the Théâtre Libre. Another theatre perhaps worth notice is Le Grand Guignol, which specialises in 'terror' plays. Verse plays, although not really popular, were considerably performed early in the twentieth

century, and since the First World War a play in free verse by François Porché met with great success. After 1918 there was in France, as in other countries, a flux of patriotic plays, but the only one of any real importance was *La Trumpe*, that was performed by the Théâtre Libre. The Théâtre du Vieux Colombeau, founded in 1913 by Jacques Copeau, closed during the war, to be reopened in 1919. The plays performed by Copeau since the reopening of the theatre have been of simple construction, aiming at truth and natural comedy. Summing up the Fr. theatre Prof. Denis Saurat says that, despite his dreariness, Henri Becque is occasionally revived, but that 'François de Curel, Hervieu, Brieux, Mirbeau, Bataille, Bernstein, Porto-Richo (le *Itacine juif*) are now mere names, which will soon be forgotten. Lavedan, Donnay, Capus, Courteline, Tristan Bernard, even Jules Renard, cannot fare much better, once their realism and their humour—very transient both—have evaporated. They really fall outside literary interests, and should be studied as a sociological phenomenon.' Some, if not most of the best modern Fr. poets—Valéry, Supervielle—and other writers—Gide, Cocteau, Claudel, Romain Rolland, and Giraudoux—have occasionally tried the drama, but with no greater success than a Byron or Browning.

See also BELGIUM, *Literature*; CRITICISM, LITERARY; PROVINCIAL LANGUAGE AND LITERATURE. For greater detail of Fr. drama see DRAMA.

Thibaudet, *Histoire de la littérature française, de 1789 à nos jours*, 1936 (the most complete book on the subject; extends as far as 1936).

French Music, see FRANCE, Music.

French Oceania, Fr. is. settlements scattered over a wide area in the E. Pacific. They consist of the following is. or is. groups: Society Is., of which the most important are Tahiti (600 sq. m., pop. 25,000) and Moorea (50 sq. m., pop. 2250); their chief products are phosphate and copra. Leeward Is. (or Îles sous le Vent), the most important being Huahine, Raiatea and Tahaa and Bora-Bora, Maupiti,

with a total pop. of 9500; Marquesas Is. (*q.v.*), area 480 sq. m., pop. 2400, the two largest is. being Nukahiva and Hiva-oa; the Tuamotu group, consisting of two parallel ranges of is. from King George's Is. on the N. to Gloucester Is. on the S., their total pop. being 5000; and the Gambier, Austral, and Rapa Is. Mangareva, the prin. is. of the Gambier, is 6 sq. m. in area, with pop. 1600. The total area of the Austral group is 115 sq. m., pop. 4000, the chief is. being Rurutu, Tabuai, Vavitu, and Makatea. The Rapa Is. lie far to the S. of the Austral. In 1944 the budget was 13,575,400 francs. Crops: coco-nut trees, covering 54,362 ac. Trade: 170,069 tons; value, 75,709,000 francs. Imports: 22,781 tons; value, 36,711,000 francs; exports, 117,288 tons; value, 39,968,000 francs. Navigation: 76 ships, 29,138 tons; value of goods, 311,710,000 francs. F. O. is administered by a governor with a privy council and a representative assembly of twenty members elected every four years. The is. are represented in the National Assembly, the Council of the Republic, and the Assembly of the Fr. Union by one deputy each.

The earliest only scientific exploration of the Pacific was that of La Pérouse, Capt. Cook's discoveries having inspired the Fr. Gov. to sponsor the voyage. In 1788 La Pérouse reached Australia but thereafter was lost. The Constituent Assembly sent d'Entrecasteaux to look for him, but without results; after visiting New Caledonia and sev. strings of is. round it, d'Entrecasteaux *d.* in the course of his expeditions. In 1825, during a cruise to Santa-Cruz, Dumont d'Urville learned that La Pérouse had perished there. Encouraged by the results obtained by Dumont d'Urville's voyage, Louis-Philippe decided to support Fr. missions in Oceania, which the Bourbon Restoration had created. These bands of fathers were struggling against the London Missionary Society, which had spread over all the ter. Thenceforward Fr. incursions became frequent, their avowed object being the protection of the Catholic missions in the E. Pacific ocean. Thus the Fr. estab. themselves in Tahiti, which Wallis, a Brit. subject, had explored before Bougainville (*q.v.*), who had preceded La Pérouse. It only became known later that Bougainville had taken possession of Tahiti for France and buried the authenticated deed in the ground. He named the is. New Cythera. It was in Tahiti that the Fr. friars were threatened with expulsion by Queen Pomare, who was encouraged by the energetic Eng. missionary, Pritchard. Adm. Dupetit-Thouars obtained the first agreement guaranteeing the safety of the Frenchmen on the is.; in 1843 he had to organise a new expedition to lay the foundations of a new protectorate and, in the end, had to proclaim the deposition of Queen Pomare (*see further under TAHITI*). The Fr. were, generally, unlucky in the Pacific. They left Hawaii at the suggestion of the U.S.A.; they gave up the Zulu Archipelago to Spain and New Zealand to England.

After a struggle which lasted for more than ten years, France retained only the Marquesas, Leeward Is., and the unimportant archipelago of Gambier. It has to be recognised that the Leeward Is. had been discovered by Cook (1769) and that Brit. missionaries had been estab. there. Only a century later, at the request of the natives, was the Fr. flag hoisted over these meagre possessions. Following the annexation of the Marquesas, Gambier, Society Is., Loyalty Is. (*q.v.*), and Clipperton, forty years later came that of Tuamotu, the Austral Is., and Rapa, which had been under Fr. protection, some since the time of Louis-Philippe and some since the Second Empire. *See J. Stern (former Fr. minister of colonies), The French Colonies Past and Future, 1944.*

French Revolution, see FRANCE, History.
French River, stream in Ontario, Canada; it empties Lake Nipissing into Lake Huron and enters Georgian Bay after a rapid course of 60 in.

French Shore, neutralised ter. between Capes St. John and Itay on the N.E. and W. coasts of Newfoundland, where the Fr. have the rights of fishing.

French Somaliland, see SOMALILAND; JIBUTI.

French Sudan, see SUDAN, FRENCH.
French West Africa, see FRENCH GUINEA, DAHOMEY, IVORY COAST, NIGER, SAHARA, SENEGAL, SENIGAMBIA, WADAI.

French West Indies comprise the is. of Martinique, Guadeloupe, Marie-Galante, Désirade, St. Bartholomew, and part of St. Martin in the lesser Antilles.

Freon, liquid compound known chemically as dichlorodifluoromethane, recently widely employed for the destruction of mosquitoes and other insects. For this purpose extract of pyrethrum flowers is dissolved in F. and the solution is used as a spray.

Frequency Modulation, see MODULATION.

Frere, Sir Henry Bartle Edward, first Baronet (1815-81), statesman, entered the Bombay civil service in 1834, and remained in India for thirty-three years, during which in various posts he rendered yeoman service to the country. During the mutiny he did invaluable work in connection with the relief of the Punjab, for which he was thanked by Parliament, and in 1859 appointed a member of the viceroy's council. Returning to England, 1867, he held various offices, and in 1877 was made governor of Cape Colony and high commissioner of S. Africa. Under his rule occurred the first Boer war and the struggle with Cetewayo. In 1880 he was recalled for having exceeded his instructions. He defended himself in *Afghanistan and South Africa, 1881*, and other pub. There is a biography by John Martineau, 1895.

Frere, John Hookham (1769-1816), Eng. diplomatist and author, son of John F., a distinguished antiquary. He was b. in London and educated at Eton and Cambridge Univ. Served in the Foreign Office, and, subsequently entering Parliament, was made under foreign secretary. In 1800 he was envoy to Portugal; ambassador to Spain 1802-4 and again 1808-9. He

was a contributor to the *Anti Jacobin*, to Ellis's *Specimens of the Early English Poets* and to Southey's *Chronicle of the Cid*. He also made some excellent trans. from the plays of Aristophanes, but he is chiefly remembered for a burlesque poem on *Arthur and the Round Table*, purporting to be by Wm. and Robert Whistlercraft. Scholarship and wit characterize all his work. See also CANNING, GEORGE.

Freret, Nicolas (1688-1749) Fr. scholar and historical critic b. in Paris. In 1714 he was admitted as pupil to the Académie des Inscriptions where he read his discourse *Sur l'origine des Français*. For his novel opinions expressed in this work he was confined in the Bastille on a charge of libelling the monarchy. In 1716 he was made an associate of the Académie des Inscriptions and in 1742 perpetual secretary. Among his other works are a treatise on the origin of the Greeks, *Observations on the Cynædia of Xenophon* and *Historical Researches respecting the Ancient Peoples of Asia* in which he expounds the theory of the fabulous antiquity of the Chinese.

Frere Town, or Kisauni, town of Brit. Africa situated 2 m. N.E. by N. of Mombasa. It is important as the headquarters of the Church of England Missionary Society in Brit. Africa.

Frerôts, see PRATIKITI.

GIROLAMO FRESCOBALDI

Frescobaldi, Girolamo (18th 1614) It. organist and musical composer b. at Ferrara. He first gained a reputation as a singer but later was known for his organ music. He was organist of St. Peter's, Rome 1608-24 and again from 1633 to 1643. He was an excellent teacher and numbered J. J. Froberger, the Ger. organist, among his pupils. His compositions include various forms of both instrumental and vocal music, his canzoni and madrigals (a collection was pub. at Antwerp in 1608) being especially noteworthy. See monographs by A.

Sostegni, 1929, I. Rouga, 1930, and F. Morel, 1941.

Fresco Painting, process of mural painting on plaster which is still fresh (it *fresco*) or wet. F. P. is executed on a brick or stone wall which must first of all be perfectly dry. The plaster to be applied is composed of lime and water prepared a year before it is wanted and then mixed with sand at the time of using. Several coatings of this preparation are applied but the first ones only the *arriccio* half an inch thick—to the entire wall at once. The two finer coatings the *intonaco*—are applied only to that portion of the wall which it is intended to paint in the day so that it may not be dry before receiving the pigments. The reason for this is that in the process of drying, a crystal surface of carbonate of lime forms over the plaster and it is essential that the pigments should be there ready to receive this coating, for it is protective to them and gives them cleanness. When the plaster has covered the portion of wall to be painted the painter superimposes his cartoon and pricks off the outlines with an instrument of wood or bone, or makes an impression of it by pouncing. The cartoon is then removed and the colours are applied. The fresh plaster becomes thoroughly impregnated by them and they are thus incorporated with the rock or stone of lime and sand which constitutes the plaster and are therefore as enduring as the stone plaster if the process is properly carried out. The colours, which are principally earths or minerals for these best resist the chemical action of lime, are ground up and mixed with pure water. They should be thin and transparent and darker than required for in drying they become paler. From its nature F. P. must be executed rapidly and its effects produced by single touches of the brush; therefore none but a master hand can exercise the craft with complete success. F. P. has sometimes been confused with the *tempera* and *encaustic* methods of painting which probably preceded it. The date at which it came into use cannot be fixed. It belongs to remote antiquity. Colossal figures painted *afresco* have been taken from ancient Egyptian palaces and temples and fragments have been recovered in Hieroglificum and Pompeii which had lain for centuries beneath masses of earth and ruins. These had preserved all their original brightness of colour. The best exponents of the craft are Giotto, Masaccio, Ghirlandajo, Michelangelo, and Linus Luskin says that F. P. seems to have been practised at Verona in absolute perfection in the fifteenth century. Among modern fresco painters are Bandinelli and Delacroix in France, and Cornelius, Overbeck, Veit, and Schadow in Germany. The attempt in our own time to introduce F. P. in London has not been successful owing to the large quantities of sulphurous acid gas in the atmosphere. See J. Ward, *Fresco Painting*, 1909, A. Böhmer, *Entwicklung und Werkstoffe der Wandmalerei*, 1926 and T. Borenius, *Florentine Frescoes*, 1930.

Freshwater, par. and seaside resort in the Isle of Wight, England, 10 m. W. of Newport. The acreage of the par. is 4836, and it forms the W. extremity of the is.; the greater part of it is enclosed by the Freshwater R. It is noted for its interesting caves and as the residence of Tennyson during the latter years of his life. Pop. 4000.

Fresh-water Herring, see COREGONUS.

Fresnel, Augustin Jean (1788-1827), Fr. physicist, b. at Broglie (Eure). He was an engineer of the École des Ponts et Chaussées, and served in the depts. of Vendre, Drôme, and Ille-et-Vilaine, but owing to his espousal of the Bourbon cause, lost his post on Napoleon's escape from Elba. Although he was reinstated he had turned his attention to physics in the interval. In 1819 he was appointed a commissioner of lighthouses, and was the first to construct the compound lenses instead of mirrors. His discoveries finally estab. the undulatory theory of light, which had first been advanced by Thomas Young. See D. F. G. Arago, H. de Senarmont, and others, *Œuvres complètes de Fresnel*, 1866-70.

Fresnes, tn., dept. Nord, France, 5 m. N.E. of Valenciennes. It has manufs. of woollens, glass, and beet-sugar, and there are coal-mines in the neighbourhood. Pop. 6700.

Fresnillo, tn. in the state of Zacatecas, Mexico, 7700 ft. above sea level, at the foot of the Cerro del Proano, and 37 m. N.W. of the city of Zacatecas, there are rich silver mines and some copper, and large amalgam works. Pop. 21,600.

Fresno, city and co. seat of the co. of F., California, U.S.A., in the San Joaquin valley, and 165 m. S.E. of San Francisco. It is a rich farming dist., producing grains and fruit, especially Shasta apples, and grapes for raisins and wine making. The chief industries are the preserving of fruits, lumbering, and mining; the F. petroleum field is one of the richest in the state. Pop. 60,700.

Fresnoy, Charles Alphonse du (1611-65), Fr. historical painter and writer, b. in Paris. His paintings show great correctness of design, and he was a good colourist, but his name is mainly remembered in connection with his writings, the chief of which *De arte graphica*, a Lat. poem, is a critical treatise on the practice of the art of painting.

Fretum Gallicum, see DOVER STRAIT OF.

Frotum Herculeum, see GIBRALTAR STRAIT OF.

Fretwork or Fretsawing, art of cutting exterior and interior patterns in thin material such as wood, sheet metal, composition boards, plastics, etc. Designs in the last century were for intricate ornamental articles. To-day designs and plans are pub. for F. which are useful for the making of models, toys, etc., and for architectural planning. The prin. tool is a long-armed metal frame with handle for control and guidance. A 5-in. thin blade with about twenty teeth to the inch is held by a clamp between the arms. Rapid up-and-down motion causes the teeth to bite and cut and turn in a very

small space. Holes are made for the tiny sawblade to be threaded through and re-affixed in the frame in order that interior frets can be undertaken; a special tool called the archimedian drill has a fine bit for the purpose of boring the hole necessary for the insertion of the saw. Fretsaw blades vary in number of teeth and thickness of blade from fine to coarse; metal-cutting blades have a much larger number of teeth. Full-size design patterns provided are pasted to the cutting material, or copied out on it. After cutting is completed the parts are cleaned with glass-paper (emery paper for sheet metal) and put together to make the complete article. F. in wood incorporates designs for pipe racks, wool winders, cigarette delivery boxes, wall plaques, etc. Treadle machines follow the same principle of cutting and leave both hands free to manipulate the work on the cutting table. Heavier and more ambitious work is thus possible. The most modern machine is a bench machine fitted with a fractional h.p. motor, driven from the lighting circuit; this is suitable for the amateur, but heavier machines are provided for the commercial user. See W. F. Chambers, *All about Fretwork*, 1948.

Freud, Sigmund (1856-1939), prof. of neurology, Vienna Univ., famous as an exponent of psychoanalysis (q.v.). He was b. in Freiburg, Moravia, May 6, and educated at the Sperl Gymnasium, Vienna, and Salpêtrière, Paris. His first serious studies moved from law to natural science. Later he worked under Brücke in the univ., Vienna, and in 1884 became assistant physician in the General Hospital. In 1885 F. became associated with Charcot, the Parisian neurologist, who taught that hysteria is of psychical origin and that ideas can produce physical changes, and F. returned to Vienna with his first inspiration to psychoanalysis. In 1895 he pub. with Breuer, *Studien über Hysterie*, outlining the theory that hysterical cases can be successfully treated while under hypnosis by freeing the pathogenic ideas from the unconscious mind. He discovered later that the cure was not lasting, and abandoned hypnosis for suggestion. From this point he progressed rapidly with his studies and consequent discoveries in psychoanalysis, and pub. successively *Die Traumdeutung* (1900), *Psychopathologie des Alltagslebens*, (1901), and *Drei Abhandlungen zur Sexualtheorie* (1905). *Die Traumdeutung*, the significance of dreams, embodies some of his outstanding discoveries, among them the claim that the interpretation of dreams is an important factor in psychoanalysis, that the recollected parts of dreams are symbols of the activities of the unconscious mind during sleep when the will is ineffective and conscious self-control is suspended. In *Psychopathologie des Alltagslebens* the revolutionary nature of his theories aroused great hostility, and on many occasions his statements during lectures to doctors were met with open ridicule. Moreover, public interest was increasing (the Eng. trans. of this work alone ran into ed. after ed.), and

when he crystallised his theories in the assertion that nearly all cases of neurosis were due to the repression of sexual desires a storm of criticism burst upon him. He possessed, however, a personality of unusual strength, and proceeded unmoved. He claimed to have made a further discovery in 1898, when he stated that sexual desires begin at birth rather than puberty. Coming at a time when any frank exposition upon sexual problems shocked the public idea of morality, the claim aroused still fiercer attacks. Informed observers, however, found much to interest them in the consequent doctrine that a disturbance in a child's sexual growth explains all cases of mental subnormality, and that under proper direction sexual impulses may be 'sublimated' into forces which can inspire the noblest achievements. Though he took great liberties with philosophy, and was himself a philosopher *malgré lui*, F. always wrote and spoke as a man of science. He did not claim to have invented his remarkable view of mental processes, but avowed that he had merely discovered it. F. was a greater man than his detractors are prone to admit. His influence has permeated the world to such an extent that it may be discerned to-day in almost every branch of thought, and particularly in education, while some of his phrases have become part of everyday language, e.g. 'inferiority complex.' A *Times* reviewer writes that 'the famous theory of dreams and the various "complexes" resolve themselves, when viewed as Freud meant them to be viewed, into observations of the activities of the "natural man" imprisoned and ignored yet always alive within us. This original sin, if denied, possesses, he believed, the power to "attach" itself to or "associate" itself with other, apparently good and innocent thoughts, lending them, thereby, its own passionate energy. Hence the innumerable "anxieties" and fears ("phobias") of the mentally sick; hence their strange apings of physical disease, their perverted ideas, their unreasoning prejudices. To resurrect this natural man and yoke his powers to fresh and useful enterprises was the life-aim of the physician' (see also *PSYCHOANALYSIS*). His *Autobiographical Study*, trans. by J. Strachey, was pub. in 1936. In 1903 he founded the Vienna Psychoanalytical Circle, and by 1906 branches were estab. in other countries. In 1908 his influence spread rapidly, and the first International Psychoanalytical Congress was held at Salzburg, Switzerland. In 1909 F. visited the U.S.A. and delivered a course of lectures at Worcester Univ. On his return the International Psychoanalytical Association was formed with the dual object of regulating propaganda and preventing its prostitution by insincere practitioners. See H. Sachs, *Freud, Master and Friend*, 1915; and E. Ludwig, *Der entzauberte Freud*, 1946.

Freudenstadt, tn. of Württemberg, Germany, in the Black Forest, 30 m. S.E. by E. of Strasburg. It lies among the mts., and parts of its anct. walls are

still standing. It was founded in 1599 by Duke Friedrich of Württemberg for Protestant refugees from Austria. It possesses a peculiar triangular church. Manufs. are woollen goods, knives, and nails, and has shops for cabinet making and spinning mills. Pop. 10,500.

Freund, Wilhelm (1806-94), Ger. philologist and lexicographer, b. at Kempen, Posen. He took an important part in the movement for the emancipation of the Prussian Jews, and was largely instrumental in the *Judengesetz* of 1847. His chief work is *Wörterbuch der lateinischen Sprache*, 1834-45, the chief basis of all subsequent Lat. dictionaries.

Frevent, tn. of France, in the dept. Pas-de-Calais, has manufs. of linen and woollen goods, and iron-works. Pop. 4800.

Frey, Friedrich Hermann, see GREIF, MARTIN.

High Commissioner for New Zealand
SIR BERNARD FREYBERG, V.C.

Freyberg, Sir Bernard Cyril, V.C. (b. 1890), Brit. soldier, b. in London; emigrated with his parents to New Zealand in 1892. Educated at Wellington College, New Zealand. Took part on Pancho Villa's side in the Mexican Revolution of 1914. Served with the Hood Battalion R.N.D. in the Dardanelles in 1915. Wounded nine times in the First World War in France, Belgium, and the Near E. V.C., 1916. Became at twenty-seven youngest brigadier in Brit. Army. Also awarded D.S.O. and two bars in that war. Major 1927, lieutenant-colonel 1929. Commanded 1st Battalion, Manchester

Regiment, 1929-31; colonel, 1931; assistant quarter-master general, S. Command, 1931-33; (I.S.O. (1) at War Office, 1933-1934. Commanded Grenadier Guards and Queen's Royal W. Surrey Regiment. In Second World War he commanded the 2nd New Zealand Expeditionary Force, 1939. Appointed commander-in-chief of the Gk. and Imperial forces in Crete, May 1941 (see CRETE, BATTLE OF). Appointed governor-general of New Zealand, 1946. There are interesting personal references to F. in Sir J. M. Barrie's *St. Andrew's Univ.* rectorial address, 'Courage' (1922).
Freyberg, see FREIBERG.

Freybourg, or Freyburg, canton of Switzerland, see **FRIBOURG.**

Freyonet, Charles Louis des Saulces de (1828-1923), Fr. statesman, b. Nov. 14, at Foix; educated at *École Polytechnique*, then entered gov. service as mining engineer. He was sent on a number of special scientific missions—among them one to England on which he wrote a notable *Mémoire sur le travail des femmes et des enfants dans les manufactures de l'Angleterre* (1867). On the estab. of the Third Republic in 1870 he offered his services to Gambetta, and was appointed prefect of the dept. of Tarn-et-Garonne; and in Oct. became chief of the military Cabinet. It was mainly his power of organisation that enabled Gambetta to raise army after army to oppose the invading Gers. He was a strategist of no mean order, but the policy of dictating operations to generals in the field was not attended by happy results. He entered the Senate in 1876 as a follower of Gambetta, but in Dec. 1877 became minister of public works in the Dufaure Cabinet. In 1879 he became president of the council and minister for foreign affairs; and in 1886 he became Premier. In 1888 he became minister of war in the Floquet Cabinet, the first civilian since 1848 to hold that office. His services to France in this capacity were the crowning achievement of his life. In 1890 he was elected to the academy. In 1893 he resigned from the War Office, somewhat under the shadow of the Panama scandals. He pub. his *Souvenirs* in 2 vols. (1911-13).

Freyonet, Louis Claude des Saulces de (1779-1842), Fr. navigator, b. at Montélimart (Drôme). In 1793 entered Fr. Navy; after taking part in sev. engagements against the Brit. he joined in 1800, with his brother, Louis Henri F. (1777-1840), who afterwards rose to the rank of admiral, the expedition sent out under Capt. Baudin in the *Naturaliste et Géographe* to explore the S. and S.W. coasts of Australia. Much of the ground covered by Flinders was revisited and new names composed by this expedition, which claimed credit for discoveries really made by the Eng. navigator. An inlet on the coast of W. Australia, in 26° S., is called Freyonet Estuary; and a cape near the extreme S.W. of the same coast bears the explorer's name. In 1805 he returned to Paris, and was entrusted by the gov. with the work of preparing maps and plans of the expedition; he also completed the narrative, and the whole work appeared

under the title of *Voyage de découvertes aux terres Australes, 1800-04* (1807-16). He also wrote *Voyage autour du monde, 1817-20* (1824-44).

Freyr, in Norse mythology, the god of the earth's fruitfulness, the giver of sunshine and rain, and all the fruits of the earth, and thus the source of all prosperity, the son of Njord. He was especially worshipped in the temple at Upsala in Sweden.

Freyre, Gilberto de Mello (b. 1900), Brazilian sociologist, b. at Recife (Pernambuco), Brazil. Educated by private tutors and at the Gilreath Amor. College in Recife. Was for a few years secretary to the governor of Pernambuco; then became prof. of sociology and social anthropology at the univ. of the Federal Dist. (Rio de Janeiro). He has been visiting prof. at Stanford, Columbia, and other Amer. univs.; but other commitments prevented him accepting invitations to become prof. of social philosophy at Yale in 1942, and prof. of Brazilian studies at Harvard in 1944. He is an honorary prof. on the faculty of philosophy of the univ. of Bahia. His great work, *Casa-Grande and Senzala* (New York) (1933, 1936, 1938, 1943) has been trans. (by Samuel Putnam) as *The Masters and the Slaves* (1946). It is a brilliant study in the development of Brazilian civilisation and the masterpiece of Brazilian sociology, and indeed it may be regarded as the greatest sociological book that has been produced in Lat. America. It is a great book because of the brilliant conclusions F. draws from a mass of carefully related details, and for the way in which he brings to life whole generations of masters and slaves on the great plantations of N. Brazil. Other works: *Sobrados e Mucambos* (1936) (a continuation of the foregoing work); *Nordeste* (Northeast), 1937; *Um Engenheiro Francez no Brasil* (A French Engineer in Brazil) (1940); *Região e Tradição* (Region and Tradition) (1941); *Brazil: an Interpretation* (1945); and *Sociologia* (vols. I. and II.) (1945).

Freytsingen, Otto of, see OTTO.

Freytag, Georg Wilhelm Friedrich (1788-1861), Ger. philologist, b. at Lüneburg. In 1819 he was appointed prof. of oriental languages at Bonn, a post he held until his death. He pub. *Darstellung der arabischen Wissenschaft, a treatise on Arabic versification: Hamass carmina; and Arabum proverbia*; but his fame rests chiefly upon his *Lexicon Arabico-Latinum* (1830-37).

Freytag, Gustav (1816-95), Ger. novelist and dramatist, b. at Kreuzburg in Silesia. Attended Gymnasium at Oels, then studied philology at univs. of Breslau and Berlin. In 1836 he took his degree with a remarkable dissertation, *De initis poeseos scenicae apud Germanos*. In 1839 he settled at Breslau as *Privatdozent* in Ger. language and literature, and devoted prin. attention to writing for the stage. He achieved success with his comedy, *Die Brautfahrt, oder Kunz von der Rosen*, in 1844. This was followed by a vol. of unimportant poems, *In Breslau*

(1845), and the dramas *Die Valentine* (1846) and *Graf Waldemar* (1847). He attained a prominent position by his comedy, *Die Journalisten* (1854), one of the finest Ger. comedies of the nineteenth century. In 1847 he migrated to Berlin, and the next year he took over, with Julian Schmidt, the editorship of *Die Grenzboten*, a weekly Jour. which, founded in 1841, now became the leading organ of Ger. and Austrian Liberalism. F. helped to conduct it till 1861, and again from 1867 till 1870, when, for a short time, he ed. the new periodical *Om neuen Reich*. His literary fame became universal in 1855 by the pub. of his novel *Soll und Haben*. This was trans. into almost all the languages of Europe. It was undoubtedly the best Ger. novel of its day. It was impressive by its stately realism, and it was in many parts very humorous. The main purpose of the novel was to show that the Ger. middle class was the soundest element of the nation. But it had a more directly patriotic intention, in the contrast which it draws between the reputed homely virtues of the Teuton, the shiftlessness of the Pole, and the rapacity of the Jew—views which the Gers. still hold to this day. As a Silesian, F. has no love for his Slavonic neighbours, and being a native of a prov. which owed everything to Prussia, he was naturally an earnest champion of Prussian hegemony over Germany. His powerful advocacy of this idea in his *Grenzboten* gained for him the friendship of the duke of Saxe-Coburg-Gotha, whose neighbour he had become on acquiring the estate of Siebleben near Gotha. At the duke's request, F. was attached to the staff of the crown prince of Prussia in the campaign of 1870, and was present at the battles of Worth and Sedan. Before this he had pub. another novel, *Die verlorene Handschrift* (1864), in which he endeavoured to do for Ger. univ. life what in *Soll und Haben* he had done for commercial life. The hero is a young Ger. prof., who is so wrapped up in his search for a MS. by Tacitus that he is oblivious of an impending tragedy in his domestic life. This book was, however, not so successful as its predecessor. Between 1859 and 1862 F. pub. in 5 vols. *Bilder aus der deutschen Vergangenheit*, a valuable work on popular lines, illustrating the hist. and manners of Germany. In 1872 he began a work with a similar patriotic purpose, *Die Ahnen*, a series of historical romances, in which he unfolds the hist. of a Ger. family from the earliest times to the middle of the nineteenth century. This series comprises the following novels, none of which, however, reaches the level of his earlier works: *Jago und Ingraban* (1872); *Das Nest der Zaunkönige* (1874); *Die Brüder vom deutschen Hause* (1875); *Marcus König* (1876); *Die Geschwister* (1878); and *Aus einer kleinen Stadt* (1880). Among F.'s other works may be noticed *Die Technik des Dramas* (1863); an excellent biography of the Baden statesman, Karl Mayh (1869); an autobiography, *Erinnerungen aus meinem Leben* (1887); and his *Gesammelte Aufsätze*, chiefly

reprinted from *Die Grenzboten* (1877-78). See monographs by H. Lindau, 1907; J. Hoffmann, 1922; and R. Koehner, 1926.

Friar (from Lat. *frater*, brother), Eng. name given to the members of the various mendicant religious orders, the chief of which were the Franciscans or Minors (Grey Fs.), the Dominicans or Preachers (Black Fs.), the Carmelites (White Fs.), and the Austin Fs. or Hermits. Besides those there were the Trinity or Red Fs., and the Crutched or Crossed Fs. The name has also been applied to individual members of the orders as a title, e.g. Friar Lawrence in *Romeo and Juliet*.

Friars Minor, see FRANCISCANS.

Friar's Balsam, **Wound Balsam**, or **Jesuit's Drops**, compound tincture of benzoin which is prepared by macerating benzoin with storax, tolu, and aloes in rectified spirit. It is used in the preparation of soaps and washes, as a medicine, and as a protective coating for wounds.

Friar's Crag, beauty spot in Cumberland, England, consisting of a rocky promontory on the N.E. shore of Lake Derwentwater. It is owned by the National Trust.

Fribourg, **Freiburg**, **Freybourg**, or **Freyburg**, Swiss canton, situated in the S.W. of the country with a tn. of the same name. The surface is hilly, the highest point being 7858 ft., and the chief rivs. are the Brole and the Sarine. Two-thirds of the inhab. speak Fr., and are almost entirely Rom. Catholic. It is essentially an agric. and pastoral canton, and is famous for its cheese (Gruyère) and cattle. Timber and peat are also important products, and there are manufs. of straw hats, watches, and chocolate at Broc. The tn of F. (Fribourg en Nidvalle), on the lt. Sarine, is about 20 m. from Bern, and is the cap. of the canton. It is the seat of the bishop of Lausanne, and manufs. sewing-machines, agric. instruments, and fertilisers. The prin. building is the collegiate church of St. Nicholas, with a nave dating back to the thirteenth century, a fifteenth-century bell-tower, 250 ft. high, and an organ with about 7000 pipes. Pop. (canton) 152,000, (town) 26,000 (1941).

Frick, Wilhelm (1877-1946), Ger. statesman, b.-at Alsenz; educated at Munich, Göttingen, and Berlin Univs. Took part in National Socialist *putsch* in Munich, 1923. Member of Reichstag, and head of the National Socialist section of the Socialist party, 1924. He was the first National Socialist to become a minister, being appointed minister of the Interior in Thuringia, 1930. Reich minister of the Interior in Hitler's Cabinet in 1933. Prussian minister of the Interior, 1934. F. was largely responsible for bringing the Ger. nation under the complete control of the National Socialist party; in large part he was responsible for legislation to suppress the trade unions, the press, and the Jews. He also knew of the atrocities committed in the concentration camps and, by implication, approved of them. As a former protector of Bohemia-Moravia he was guilty of further atrocities. He was among those major war criminals tried and executed at Nuremberg (see

NUREMBERG TRIAL), being found guilty on two counts—preparing a war of aggression, and committing war crimes and crimes against humanity. Pubs. included *Die Nationalsozialisten im Reichstag 1926–31* (1932); *Ein Reich* (1934); and *Freiheit und Bindung der Selbstverwaltung* (1937).

Friction (from Lat. *fricare*, to rub), resistance to motion occasioned by the fact that two bodies are in contact, or, more correctly, the tangential force that opposes the motion of one body over another. If a book (say) rests on a horizontal table the weight of the book is balanced by an equal and opposite force which the table exerts on the book. Both these forces act along lines normal to the surface of the table, and the force on the book is called the normal reaction. The normal reaction can be increased by placing a load, such as another book, on top of the first. If the book is now pushed gently from one end no motion occurs, and some other force must therefore be acting on the book to prevent it moving. This force is called the force of F , and since it just balances the push applied to the book, and this is parallel to the surface of contact between book and table, the F also must act in a direction tangential to the same surface. If the push applied to the book is slightly increased no motion occurs, so the F must also increase, and to just the extent required to keep the book stationary. When the applied push is steadily increased, however, a value is reached sufficient to cause the book to move, so there is a maximum force that the F can assume. This is called the limiting force of static F , and its value depends upon the normal reaction, as well as upon such factors as the roughness of the surfaces of book and table, and the natures of the materials of which they are composed. The limiting force of static F depends little or not at all upon the areas of the surfaces in contact, but for dry surfaces and within certain limits of loading, varies directly as the normal reaction, so that the ratio F /normal reaction is a constant typical of the materials in contact and their roughnesses; this ratio is called the coefficient of static F . For most dry and fairly smooth surfaces its value lies in the range 0.15 to 0.6.

If the book is kept in steady motion along the table the F opposing motion is called the kinetic F , and its value is found to be somewhat lower than the limiting force of static F . The ratio of kinetic F to normal reaction is also constant, and practically independent both of the area of the surfaces in contact and of the speed of motion, and is called the coefficient of kinetic F . The above facts may be better appreciated if the following simple experiment is performed. A long, uniform rod is balanced on the outstretched forefingers of the experimenter, a greater length of the rod being allowed to overhang at one end than at the other, and the two hands are brought closer together until the forefingers are in contact. The explanation of what happens is left to the reader.

More refined experiments than those described show that when one body slides slowly over the surface of another there is often a tendency for motion to occur in a series of short movements with intervals of rest between them, for example, by alternate slipping and sticking. The origin of the force of F is still a matter of debate. It has been suggested that the resistance to motion arises because tiny protuberances of one surface interlock with those of the other, so that slipping can only occur if these projecting parts become sheared off, or if one is lifted over the other. There is much evidence, however, to show that during sliding the heat generated at small local areas may be sufficient to raise the temp. there to a value sufficient to melt one of the solids, so that the sliding may involve alternate welding of the surfaces together; and disruption of the welded junctions.

When it is necessary to reduce F to a minimum, as in the moving parts of machinery, it is usual to lubricate the surfaces which are to slide over one another. This means that a film of liquid is kept between the solid surfaces, and holds them apart except when they have been left stationary for some time. Since the film of liquid is maintained by the continual dragging of fresh liquid into the required position by the moving solids, the liquid must be one that adheres well to the bearing surfaces. It must also have a suitable viscosity; that is, it must not be so mobile that it is readily forced out from between the solids and yet should not be so highly viscous as to resist the motion more than is necessary. With lubricated surfaces the F is nearly independent of the normal reaction, but varies directly as the area of the sliding surfaces, and increases with increase of the speed of motion. Another way of reducing the effects of F is to replace sliding by rolling, as is done by using wheels on vehicles, or ball or roller bearings in machinery.

Friday (A.-S. *frīge dæg*, being a trans. of the Rom. name of this day, *dies veneris*), sixth day of the week, and the Muslim Sabbath. It is regarded as a fast day throughout the year by both E. and W. Churches (unless Christmas Day occur on a F). In memory of the Passion, which is commemorated annually on Good F . According to the Moslems F was the day Adam was created and received into paradise, the day on which he was expelled from it, the day on which he repented, and the day on which he died, and it will be the day of the general resurrection.

Frideswide, or **Fredeswitha**, St. (d. c. 735), patroness of Oxford, the daughter of the ealdorman Dida. She refused marriage with a Mercian noble, Algar, choosing rather a religious life. She was canonised in 1481.

Fridolin, sometimes called **Tridolin**, or **Trudelin**, sixth-century Irish saint and patron saint of Glarus in Switzerland. He established a church on Säckenigen Is., in the Rhine, and is known as 'the first apostle to Allemannia.'

Friedberg: 1. Tn. of Hesse, Germany, situated 17 m. from Frankfurt. Noted

for manufs. of sugar, gloves, leather, and photographic chemicals. Pop. 12,900. 2. Small tn. in Upper Bavaria, with an old castle, about 4 m. from Augsburg. Pop. 4600.

Friedeburg, Hans von (d. 1945), Ger. admiral or 'admiral-general.' Was second in command of the U-boat fleet early in the Second World War. On the promotion of his chief, Adm. Donitz, to commander-in-chief of the Ger. Navy in Jan. 1943, superseding Adm. Raeder, F. became commander-in-chief of the U-boat fleet. When Donitz proclaimed the death of Hitler and his own succession as Führer, F. appears to have been again promoted into Donitz's former position. He emerged as commander-in-chief of the navy in the closing days of the war, and signed at Rheims the instrument of Germany's unconditional surrender in that capacity. A fortnight later he was taken into custody with other members of the Ger. high command in Flensburg, but at once committed suicide.

Friedland: 1. Tn. of Bohemia, Czechoslovakia, about 12 m. from Reichenberg. It is noted for its manufs. of woollen and linen cloth, but besides this has an old castle formerly owned by Wallenstein. Pop. 7000. 2. Tn. of the R.S.F.S.R. (formerly E. Prussia), on the Alle, 28 m. S.W. from Kaliningrad (Königsberg). It was the scene of the defeat of the allied Russians and Prussians by Napoleon in 1807. Pop. 3000.

Friedrich Wilhelm Victor Albert, see WILLIAM II.

Friedrich Wilhelm Victor August Ernst, (b. 1882), last of the crown princes of Prussia and princes imperial of Germany, was b. May 6 in the Marble Palace, Potsdam; eldest son of him who became Kaiser Wilhelm II. He entered the cadet school at Plön, April 1896. In 1901 he matriculated at Bonn. In 1903 he visited S. and E. Europe. On June 6, 1905, he married Cecilie, duchess of Mecklenburg (b. 1886), by whom he has had four sons and two daughters. In Jan. 1906 he was placed in command of the Leib-Eskadron of the Garde du Corps. From 1907 he studied at the Institute of Technology, Charlottenburg. He was frequently in England, and often conversed with Edward VII. In 1909 he travelled in India, visiting Russia before his return to Germany, where he was then placed in command of the 1st Life Hussars at Langfuhr by Danzig. He joined in the condemnation of Bethmann-Hollweg's weakness concerning Agadir (1911), and he took the army side in the Zabern affair of Nov. 1913, whereupon the Kaiser deprived him of his command. He commanded the Fifth Army at the beginning of the First World War, and in Sept. 1915 was (at least nominally) in command of the forces attacking Verdun. At the conclusion of the war he fled to Holland, where he occupied the personage of the *is.* of Wieringen until Nov. 10, 1923. He resumed residence at his palace of Oels, Silesia, on the 13th; and, as he undertook not to meddle in politics, he was left there undisturbed. He pub. *Aus meinem Jagd-*

tagebuch (1912); *Erinnerungen des Kronprinzen Wilhelm* (1922); *Ich suche die Wahrheit* (1922), and *Meine Erinnerungen aus Deutschlands Heldenkampf* (1923).

Friedrichroda, tn. and popular summer resort of Germany near Gotha in the Thuringian forest. The ducal hunting seat of Reinhardtsbrunn, built on the site of the Benedictine monastery (1085), is in the vicinity. Pop. 3500.

Friedrichsdorf, tn. in Hessen-Nassau, Germany, 3 m. N.E. of Homburg, on the slopes of the Taunus hills. Dye-works, tanneries, weaving, and tobacco are its chief industries. Founded by Huguenot refugees in 1687. Pop. 1600.

Friedrichshafen, tn. of Württemberg, Germany, on the E. shore of Lake Constance. The tn. is a favourite tourist resort. It was formed by Frederick I., who amalgamated the former imperial tn. of Buchhorn and the vil. of Hofen. Before the Second World War it had machine shops, boat-building yards, and manufactured leather, etc. N. of the station were the Zeppelin works, erected by public subscription in 1908. The ground floor contained the Zeppelin museum, with exhibits showing airship development. In 1924 the LZ126 flew from here to America. She was transferred to the Amer. Air Service in accordance with the treaty of Versailles, and named the *Los Angeles*. The Graf Zeppelin was constructed here in Oct. 1928, and flew to America, remaining aloft 112 hrs. F. was frequently and heavily bombed by the R.A.F. during the Second World War, including an attack on Germany's largest radio-location factory. Pop. 15,700.

Friedrichsruh, vil. in Schleswig-Holstein, Germany, 15 m. from Hamburg. It contains the mausoleum of Prince Bismarck, who d. in 1898.

Friendly Islands, see TONGA ISLANDS PROTECTORATE.

Friendly Societies. Despite occasional periods of financial instability, through which some of the smaller societies have passed, the social utility accruing from the almost universal institution of F. S. cannot be doubted. The participation in mutual advantages, on as sound an actuarial basis as small contributions will allow, combines the best principles of economy and collectivism, and the recognition of these facts may be said to have induced the State, almost from the earliest days of F. S., to render them assistance, especially by way of relief from taxation or other public burdens, and, ultimately, to recognise their elements of permanent value by adopting them as an integral part of the great scheme of insurance of 1911.

Voluntary associations for such purposes as the maintenance of members in sickness, old age, and poverty have existed even from early in the seventeenth century, and it is generally assumed that the genesis of the friendly society is to be sought in the burial club, an institution of a quasi-religious character. But the more complex organisations of to-day are by no means referable to any spontaneous creation, and are rather the outcome of a general social development. The more

concrete expression of their nature, purposes, and the different classes into which they may be divided, is due to legislative interference by way of regularisation and co-ordination.

Doubtless F. S. may be formed for almost any purpose of a philanthropic or charitable nature, but a more restricted classification of objects is to be gathered from the Consolidating Act of 1876, which enumerates the kinds of societies which may be registered as F. S. under the Act. The purposes of such societies as the Act specifically designates F. S. include the relief or maintenance of the members, their husbands, wives, children, or other relatives in sickness or other infirmity and old age; payment of burial expenses; insurances on birth of children; and relief in case of unemployment, shipwreck or other circumstances of distress; endowment insurance and insurance against fire of tools or implements to any amount not exceeding £15. Other classes of societies regulated by the Act are 'benevolent societies' for any benevolent or charitable purpose; 'working-men's clubs' to promote social intercourse, mental and moral improvement, and recreation; and 'specially authorised societies,' or societies whose purposes justify the extension to them by the Treasury of the provisions of the Act. The report of the royal commission of 1870 divided registered F. S. into thirteen classes, and gave them a nomenclature which has not found statutory expression. But the div., though only popular, brings out the distinctive characteristics of the various kinds of societies. Affiliated societies, like the great Manchester Unity of Oddfellows, the Order of Druids (*see under* DRUIDS, ANCIENT ORDER OF), and the Order of Foresters (*q.v.*) are those consisting of one central body and a number of independent branches variously called lodges, tents, or divs. Most of the lodges in existence before 1875 are now registered, but a society having a fund under the control of a central body, to which every branch must contribute, may be registered as a single society.

Two other important classes are the 'collecting' and 'dividing' societies. The former, which were so named from the fact that contributions were paid to collectors who went from house to house, were strongly animadverted on by the commission by reason of the undue proportion of expenses of management to the total contributions. They are societies whose membership is composed essentially of persons of the lower social strata, who from one cause or another are, or were, unable to check mismanagement by the collectors and other officers of the society. But as against this, the commissioners conceded that the benefits of life assurance were extended to a class of persons who could not have been prevailed upon to insure except by such personal canvassing. These societies, as above indicated, are dealt with in the Consolidating Act, the Collecting Societies and Industrial Assurance Companies Act, 1896. Under this Act members must be supplied

with a copy of the rules and a printed policy for a sum not exceeding one penny each. Default in payment of a contribution is not to cause forfeiture or a lapsed policy until continued default for fourteen days after written notice to the member of the amount due. Collectors may not be members of the committee nor hold any other office in the society or vote at meetings. Dividing societies are those which levy somewhat higher average contributions, and every Christmas time divide or 'share out' the surplus remaining after payment of sick allowances during the year. The above Act, as amended in 1908, regulates all F. S. (including 'Ordors with various branches; Benefit Societies; Deposit Societies and Collecting Societies'). Since that date, the work of the societies has expanded despite the growth of state relief, and although affiliation has reduced the actual number of societies, membership continued to increase. Most societies are, of course, approved societies for National Health Insurance purposes. In 1938 there were over 10,000 societies on the register of F. S., with a total membership of 8,491,000, and possessing total funds amounting to £151,613,000. There were also 119 collecting societies, with 25,738 assurances or policies and total funds of £81,837,000. During 1938 F. S. proper paid out about £5,400,000 in sickness benefit and £1,600,000 in death benefit, while payments of claims on death by collecting societies amounted to about £1,600,000.

A friendly society must consist of at least seven members in order to be registered. The advantages of registry are (1) Exemption from penalties under any of the provisions of the Unlawful Societies Act, 1714, and Seditious Meetings Act, 1817, so long as the business and meetings do not go outside the registered rules. The result is that a registered society may, but an unregistered society may not, require any unauthorised test or declaration from its members without incurring a penalty; (2) exemption from stamp duties; (3) power to obtain transfers of stock standing in the name of trustees by order of the chief registrar when the trustees are absent, dead, or otherwise incapable of making the transfer; (4) preferential rights over other creditors in the death or bankruptcy of officers of the society; (5) power to admit minors as members from the date of birth; (6) power to make loans to members or subscribers to the funds of any hospital, infirmary, charitable, or provident institution such sum as may be necessary to secure to members of the society or their families the benefits of such hospital or other institution; (7) power to invest in savings banks or with the National Debt Commissioners; (8) reduction of rates on death certificates; (9) officers of the society may be compelled to give security for the rendering of proper accounts and to account for and deliver up the property in their hands; and (10) power to proceed summarily against any one misappropriating the society's property. Every registered society must have a registered office, appoint trustees,

audit its accounts, send ann. returns to the registrar, make a quinquennial valuation of its assets and liabilities, and keep copies of balance sheets and valuations hung up in a conspicuous place in its registered office. Under a registered society an individual member's rights are better safeguarded than in the case of an unregistered society. He is entitled to inspect the books, have copies of the ann. return, and a copy of the rules on payment of not more than one shilling. In a registered society the limitation of an individual member's benefits, whether he belong to one or more societies, is a gross sum of £300, not including bonuses, or an annuity of £52. Surplus contributions of members, after payment of any assurance money, may be accumulated at interest. A member of a registered friendly society (other than a benevolent society or working-men's club) may dispose of any sum not exceeding £100 payable on his death by nominating any person he chooses to whom the money shall be paid at his decease. A registered society may invest its funds in any of the funds in which trustees generally are authorised to invest, or in a savings bank, or the public funds, or in the purchase of land, or in any other non-personal security where expressly authorised by its rules.

A friendly society may be dissolved either voluntarily or compulsorily. In the former case, the consent of five-sixths in value of the members, including honorary members, and of all in receipt of any relief, annuity or benefit, is necessary, unless their claims are provided for. In the case of an insolvent society, one-fifth in number of the members may apply to the registrar for a compulsory dissolution, and the registrar may make an award to that effect if on investigation that seems the best course.

F. S. were classified under two headings by the Industrial Assurance Act of 1923, as Life Assurance Societies and Collecting Societies, and changes were made in the control of these bodies. The most important of these was the appointment of a commissioner of F. S., in whom are vested very great powers of control, and against whose decision it is only possible to appeal to the high court. The commissioner can demand to be satisfied on financial and other subjects, and may return or refuse to pass balance sheets and other accounts, and can dissolve a society that defaults or fails to carry out its legal obligations. He has also the power to exempt bodies from the requirements of the Acts and is the authority to settle disputes, thus taking the place previously held by the Board of Trade. The Acts of 1923 and 1924 slightly varied the existent law on the insurance of children by making the limit for which a child can be insured £5 up to three years of age, £10 up to six years of age, and £15 up to 10 years of age, but this alteration was in view of the slightly changed purchasing power of money. The old principle was maintained that no child should be insured for a larger sum than the cost of a funeral. In this and subsequent Acts powers were given for

insurance in cases where the decease of the insured person might involve a liability on the insurer. The Acts of 1923, 1924, and 1929 made it an offence to issue illegal life policies. Up till this change, premiums were frequently paid where there was no insurable interest, and thus money lost to the insurer. In the new Acts it was provided that such a policy, issued in error, was to have a value bearing relation to the amount that had been paid, and this amount could be claimed in cash or as a paid-up policy.

War legislation affecting F. S. and their members' rights included the Industrial Assurance and Friendly Societies (Emergency Protection from Forfeiture) Act, 1940, which applies to any policy of life assurance (where there is a separate contribution) for a sum assured not over £50 (excluding bonuses), in force immediately before Sept. 1, 1939, subject to not less than two years' contributions having been paid. This Act prevents the lapsing of such assurances where failure to pay contributions was due to circumstances arising out of the war. The Societies (Miscellaneous Provisions) Act, 1940, enabled the chief registrar to give directions to authorise the suspension of meetings, appointment of officers, and the meeting or amendment of rules by the management committees of societies. The Act also empowered societies to set up a fund for the purchase, on behalf of their members, of national savings certificates, defence bonds, and such other securities as may be presented. Furthermore, the Act gave protection to members serving in the forces whereby they should not be deprived of their membership by reason of their discontinuance of the payment of their contributions whilst serving, and whilst benefit might be suspended until such time as the member resumed his contributions within three months of determination of his service (or of the emergency period), upon resuming contributions the member was to be placed in the same position as to future benefits as he would have been had he not ceased to pay his contributions. But the Act did not preclude societies from granting to their serving members better terms than the minimum statutory protection.

There can be no doubt that members of F. S. benefited financially by the first National Insurance Act, although in the course of previous legislation they were, on the whole, gradually adopting a more scientific financial policy. It is probable that the new comprehensive National Insurance scheme when in full operation—with its increased contributions to provide the 'cradle to the grave' benefits on a scale beyond any 1912 conception—will have repercussions on the voluntary F. S., but only time will show the extent of its effect on the numerical strength and potential income of these societies, with their various systems of sickness insurance and combined benefits tables based on a wide range of contributions scaled according to age and the extent and nature of the benefits provided. Since the insurance scheme of 1912 was introduced the volun-

tary societies have continued to grow in the face of keen competition, but their great expansion has naturally brought many societies to the point where they have already found it difficult to maintain a sufficient influx of new young entrants to replace membership losses due to death and other causes. As to how far the general body of members comprising the F. S. movement can afford to continue their *voluntary* insurances along with their higher State scheme contributions in future, it must be borne in mind that present day wage levels are appreciably higher for all classes of workers than in 1912, and the gov. has declared that continued *voluntary* insurance to supplement State benefits, wherever one's means permit, should be encouraged. In most societies the rules provide for (a) contributions at a uniform rate for all ages, together with an entrance fee varying according to the age of the entrant; or (b) periodical contribution at a rate varying with the age at entry. There are F. S. in many of the Brit. Dominions, notably in Australia, where there is a branch of the Anct. Order of Druids (q.v.). Fraternal Societies, as they are called, are also common in the U.S.A., but except in Germany and France the system does not prevail to a great extent abroad. See also FORESTERS, ANCIENT ORDER OF; ODDFELLOWS; RICHARDS. See W. T. Pratt, *Friendly Societies*, 1931, and F. B. Fuller, *The Law Relating to Friendly Societies*, 1926.

Friends of the National Libraries, see LIBRARIANS.

Friends, Society of (or Quakers), owes its rise to George Fox (1624-91), a native of Leicestershire. Although he had but little education, he was possessed of keen intelligence and spiritual power, and of a personality which won the affection of men and women of widely different sorts. In the demoralisation of Eng. life caused by the Civil war he found little help in his search for 'a principle that would overcome temptation,' and though he had a profound knowledge of the Bible, and set his life in the way of its teaching, he sought for spiritual assurance more fundamental than any external authority could give. He was driven to take his stand on his own conviction of the voice of God speaking within, shining in its own light or carrying its own evidence, i.e. not infallibly guaranteed by something more certain than itself. Thus he valued the Scriptures because in the light of God he recognised for himself that they were good. The religious thought of the day, taking its ultimate stand on the Scriptures, saw in this an under-valuing of them. This 'inner light,' or 'that of God in every man' was by the Quaker regarded as the light of Christ, who had always been active in the hearts of men, and whose outward appearance was a more eminent manifestation of himself than any other. This light was in the heathen, who were almost universally thought of as bound for an everlasting hell, but the Quaker asserted that for them there was salvation if they were obedient to such light as they had. He also repudiated the widely held

doctrine of predestination. In a time when extreme (often almost exclusive) stress was laid on correctness of doctrine, the Quaker, while not indifferent to this matter, put the emphasis on obedience to the light, insisting that it was *this*, not 'notions,' that showed the way to God. Throughout his life Fox called on Friends to bear themselves toward others in the way that was *most likely* to call forth the response of goodness to goodness, or, as he expressed it, 'answering that of God in every one,' even, in fact especially, in those who were doing evil. To a remarkable degree Friends lived out the truth that they had seen, but their exposition of it often lacked clearness and consistency, inasmuch as they were entangled in the spirit of their time more than they realised

GEORGE FOX

Nevertheless, although they might not have explicitly recognised the fact, it was from this central principle that their special 'testimonies' proceeded. The Quaker insistence on the unlawfulness of all war for the Christian is based not only on humanitarian grounds or even on passages of Scripture, but also on the conviction that more important than individual or national safety is the bringing of the evil mind to the light, whereas war deepens and multiplies the wrong. The Quaker pacifist position is no mean spirited yielding to evil, but is a way of standing up to it which has in it the possibility of changing the evil mind, perhaps even by reason of the suffering endured by those who take this way. The whole matter turns on the ultimate standard of value which is set up. In early days when their meetings were broken up with violence and Friends themselves were taken to prison, they did not put up a fight, and women did not call out to protect them, but men and women alike set themselves, sometimes successfully, by non-resisting endurance, to bring home to their persecutors a sense of their evil-doing.

The walking in the light led to a high standard of truthfulness, so that Friends in courts of law and elsewhere refused to confirm their words by oath, inasmuch as an oath lowers the value of ordinary speech. Not only did they quote Matt. v. 33-37 and James v. 12, but they also insisted that for a follower of Christ, the *Truth*, it was a lowering to attempt to confirm his word by something supposed to be more binding. 'People swear to the end they may speak truth; Christ would have them speak truth to the end they might not swear' (Penn). They were confirmed in their stand by seeing all about them the small regard for oaths paid by many who had solemnly taken them. This same principle led Quaker shopkeepers to break away from the custom of bargaining by asking for their goods a higher price than they intended to take. This they held to be insincere, but though their practice led to temporary loss of custom, the convenience of the fixed price was so obvious that it became the usual way of trading.

In their worship Friends give free play to the leading of the Spirit, and without arrangement of a service they wait before God in silence, not meeting merely as separate individuals but trusting that the fellowship of living silence shared together will 'naturally and frequently excite the worshippers both men and women to pray to and praise God and stir up one another by mutual exhortation and instructions' (Barclay). The times of silence are times of worship equally with speech.

The kind of meeting just described is that which is held on Sunday morning; in many places the evening is mainly occupied with an address dealing with some aspect of Quaker thought or activity. The Quaker way of worship had been practised by the 'Seekers', people whose needs were not met by any religious body and who were gathering by themselves in the way described. It was these in particular who were reached by the Quaker message, and whole companies of them came to Friends. Many of them had discarded the outward rites of Baptism and Holy Communion, and to this day Friends, not believing these to have been commanded as permanent ordinances for the Church, do not practise them. Nevertheless they lay great insistence on the reality which these rites are intended to convey or symbolise. A heightened conception of the light of Christ in every man has always rendered Friends keenly sensitive to outward conditions which put special difficulty in the way of obedience to it. From their beginning they have taken thought for the poor, having, even early on, some insight into the economic causes of poverty. Over a long period they have followed in the track of war, organising (from their own people and from outside) measures of relief for civilian sufferers. This was done on a large scale after the Franco-Prussian war of 1870-71, and on a much larger scale during and after the First and Second World Wars. In 1947 the Nobel peace prize was awarded

jointly to the Amer. Friends' Service Committee and the Friends' Service Council, in recognition of the society's work for international reconciliation.

Early in the eighteenth century Friends officially condemned trading in slaves, and eventually they joined with Wesley, Wilberforce, and others in the movement for its abolition, which came about in 1807. In 1833 they won their campaign against slavery in the Brit. dominions. In the eighteenth century, Woolnan, Benzet, and others induced Friends in America to give up slave-holding.

Fox's first recorded success in gaining converts was at Manchester in 1647, but the beginning of a Quaker Church was in 1652, when some hundreds of 'Seekers' were 'convinced' by him at Preston Patrick, near Kendal. After two years' activity in the N. of England, an organised campaign in 1651 carried the message all over England and Wales. About this time Friends' meetings began to be held in Scotland and Ireland. The glowing ardour, sometimes injudiciously manifested, of the preachers, and certain mannerisms, drew on them the attacks of the mob, sometimes led by ministers of religion, to whom the Quaker testimony against a paid ministry and the payment of tithes was naturally unpleasing. In 1650 Fox, when imprisoned at Derby on a charge of blasphemy, called upon Justice Bennett to tremble at the word of the Lord. The justice retorted by calling him 'Quaker', a word that had already been used of a certain fanatic sect, and the name stuck to the newly formed body because of its appropriateness, inasmuch as in some of their meetings a wave of spiritual emotion would cause a trembling to go through the company. After the restoration of the monarchy in 1660 the Conventicle Acts of 1664 and 1670 made illegal religious meetings of more than four persons (in addition to members of the family in whose house they met) held otherwise than in accord with the way of the Anglican Church. In many places other nonconformists gave way before the storm, but according to the testimony of their enemies, Friends held out to the end, often meeting in the street in all weathers when their meeting-house was closed against them, many hundreds of men and women being taken to prison. The refusal, for reasons above given, to take the oath of allegiance brought down on many Friends long terms of imprisonment, their bare promise and their statement that it was against their principles to be concerned in plots not being accepted. About 450 Friends d. in prison or directly in consequence of imprisonment. It was shortly before 1670 when, by reason of the death or imprisonment of leaders, the cause of Quakerism was at a low ebb, that Wm. Penn (q.v.) and Robert Barclay (q.v.) came to it, and by their worldly standing, their learning, and the depth of their spiritual life they powerfully reformed it.

The Toleration Act of 1689 gave liberty for nonconformist worship. For the next 150 years Friends settled down into

quietism, their 'testimonies' tending to become matters of ritual and tradition rather than of living conviction. They were marked off from the world by peculiarities of dress and speech, and they studiously secluded themselves from it except so far as they were mixed with it in business and as they answered the calls of philanthropy. Deservingly they gained a reputation for rigid honesty and for right living in general, but also for being almost a monastic sect not desirous of increase. In 1796 they opened the 'Retreat' at York, the first asylum in England, almost the first in the world, where the insane were treated with humanity and efforts made to cure them. Elizabeth Fry's work for prison reform, begun in the early nineteenth century, is well known. The fact that many Quaker conscientious objectors themselves suffered imprisonment in the First and Second World Wars has helped to keep alive the concern of Friends for penal reform, and they also work for the abolition of capital punishment.

The seclusion came to an end soon after the middle of that century, and from that time Friends have mixed in the world undistinguished in appearance from others. One result of this emergence was an interest in foreign missions and now (1949) Friends are working in India, China, Madagascar, Syria, and Pombia, and also maintain international centres in Geneva, Paris, London, etc., to promote international understanding. In their own country they have had a keen sense of civic responsibility, and very many of them, in proportion to their numbers, have taken part in the public life of their communities. John Bright and other Friends who entered politics in the nineteenth century were criticised for so doing by some of their fellow members, but that attitude has passed. There are at present (1949) ten members of Parliament who are Quakers. Excluding themselves for a large part of their life, from art and music and various forms of literature, they have found recreation in natural hist. and science, and in those branches of knowledge and in medicine the society has contributed to England a large number of eminent men. In philanthropic and commercial enterprise many of its members have been pioneers. Toward the end of the nineteenth century Friends were confronted with the new learning and thought of the time, and though for half a century they had leaned toward the 'evangelical' type of theology, the essential Quaker principle made it less difficult for them than for many others to receive new biblical and scientific knowledge. It became evident that in the absence of the regular minister they had suffered from lack of teaching, and in 1903 there was opened at Selly Oak, Birmingham, an institution, Woodbrooke, where, for longer or shorter periods, men and women, both Friends and others, may receive instruction in biblical, international, economic, and kindred subjects.

From its beginning the Quaker Church has needed an organisation; the present system is substantially the creation of

Fox shortly before 1670. In the Preparative Meeting a single congregation deals with its own affairs; sev. Preparative Meetings form a Monthly Meeting, the executive body; among other business it admits members and records withdrawals, it appoints elders and overseers, whose functions will be stated later, it carries through arrangements for marriage in the Quaker way, whether the parties are Friends or not; sev. Monthly Meetings form a Quarterly Meeting, concerned with the affairs of Friends in one or more cos., and a union of Quarterly Meetings forms a Yearly Meeting, the legislative body for its area. London Yearly Meeting comprises Great Britain; Dublin Yearly Meeting, Ireland; and there are others in the U.S.A., India, China, and on the Continent of Europe and elsewhere. Any Friend may attend any of these meetings and, in any of which he or she is a member, may take part.

Each meeting is presided over by a man or woman (aided by an assistant) who acts as secretary, and is called the clerk. Decisions are not arrived at by vote, but after discussion (free from noise of applause or dissent) the clerk records what he considers to be the judgment of the meeting. If on important matters there is considerable difference of opinion a time of quiet waiting or an adjournment almost always leads up to a conclusion which can be united in by most, if not by all.

The Meeting for Sufferings, estab. in 1675 to supply the needs of sufferers from persecution, is a representative assembly, meeting monthly in London. It is the executive body of the Yearly Meeting, and it also takes cognisance of the concerns of Friends for service in any part of the world; it is sensitive to the cry of suffering wherever heard, and it watches legislative and other movements which have special bearing on national and international righteousness.

Elders are appointed to care for the ministry, giving advice in the way of restraint or encouragement as is required. Overseers are appointed to have a special care for the congregation, to know who are in any way in need, who are making inquiries concerning Friends, who are needing counsel, to see to the education of children, etc.

The S. of F. consists of 20,817 members in Great Britain, and has 425 places of worship. There are, in addition, sev. thousand regular 'attenders' of meeting not in membership. The headquarters of London Yearly Meeting is Friends House, Euston Road, London, N.W.1., opposite Euston station. The Irish headquarters is in Eustace Street, Dublin. The total number of Quakers in the world is about 164,000.

The Society of Friends in America.—In 1636 Quakerism was taken to America by two women, and others followed, but the colonists, fearing them to be in league with witchcraft and the devil, subjected them to terrible persecution. Three men and a woman were hanged. Before long, however, Quakerism became a dominant

influence in Pennsylvania and other colonies both in religious and political life. A period of quietism set in, as in England, and shortly before 1830 Elias Hicks of Long Is. so far pressed the doctrine of the inner light as to result in a self-sufficient individualism independent of the scriptures or other outward aid. He was opposed with unsympathetic rigidity and a secession ('Hicksite') resulted. Those who remained again divided, the extreme conservatives separating from the majority, who were moving toward an undenominational evangelical type of theology. Philadelphia stood apart, its position now being that of Eng. and Irish Friends. Those from whom the conservatives parted are (with the exception of certain Fundamentalist Yearly Meetings) organised into the 'Five Years Meeting,' headquarters Richmond, Indiana. With few exceptions (Baltimore and others) they have given up the Quaker way of worship and meet under pastors. They retain the Quaker organisation and (for the most part) the position concerning war and the outward sacraments. The different sections are moving toward a sympathetic understanding of one another.

Friern Barnet, see under BARNET.

Fries, Elias Magnus (1791-1878), Swedish botanist, b. in Smaland. He was prof. of botany at the univ. of Lund (1824) and prof. of practical economy at Upsala (1834). In 1851 he was called to the chair of botany at Upsala, and was also appointed director of the botanical museum and garden there. He wrote *Noëtiæ floræ Suecicæ; Observationes mycologicæ; Flora Hollandica; Systema orbis vegetabilis; Elenchus Jungerum Lichenographia Europæa; Summa vegetabilium Scandinaviæ; and Monographia hymenometum Suevicæ*.

Fries, Jakob Friedrich (1773-1843), Ger. philosopher, b. at Barby, Saxony. He was prof. of philosophy and elementary mathematics at Heidelberg in 1806, and in 1816 was invited to fill the chair of theoretical philosophy at Jena, but was deprived of his professorship for participation in the democratic disturbances of 1819. He was, however, recalled in 1824 as prof. of mathematics and physics, and while at Jena wrote *Handbuch der praktischen Philosophie* (1817-32); *Handbuch der psychischen Anthropologie* (1820-21); *Die mathematische Naturphilosophie* (1822); *System der Metaphysik* (1824); and *Die Geschichte der Philosophie* (1837-40). Besides these he wrote the important treatise, *Die neue oder anthropologische*

Kritik der Vernunft (1807), in which he attempted to give a new foundation of psychological analysis to the critical theory of Kant. He is a link between Kant's system and the so-called historical school. See T. Elsenhans, *Fries und Kant*, 1906, and E. Gerde, *Die Religionsphilosophie von J. F. Fries und A. Gorland*, 1935.

Friesse-Greene, William Edward (1855-1921), Eng. inventor, b. at Bristol; educated at St. Elizabeth's Hospital School, Bristol. His patronymic was Green; he took the name of Friesse-Greene after his marriage in 1874 with Helena Friesse. At the age of fifteen he was apprenticed to a Bristol photographer, but after his marriage he set up a studio of his own in Bath. In 1880 he became associated with J. A. R. Rudge, the inventor of a form of magic lantern called the bio-phantoscope. With Rudge he built a primitive projector for showing twelve photographs on glass plates in quick succession. With this F.-G. gave the first demonstration of cinematography in England. This was at a meeting of the Photographic Society in 1885. He realised the need for using some other substance than glass, and after a number of experiments with sensitised paper he was one of the first to appreciate the advantages of celluloid film. In 1889 he was granted a patent for a camera made 'to produce a series of instantaneous photographs of moving bodies which may afterwards be combined to produce animated pictures.' This camera had many resemblances to the modern cine-camera, but was not put into practical use. F.-G. was compelled to sell the patent, and with the subsequent growth of the cinema industry his pioneer efforts were largely forgotten. He was also a pioneer with his experiments in colour photography, and was a profound believer in the possibilities of stereoscopic photography. A long list of patents stands to the credit of his inventive genius. He gained little financial recognition, however, and his costly experiments were paid for out of the proceeds of his work in studio photography in London, and later in Brighton. He was in very straitened circumstances at the time of his death, which occurred suddenly from heart failure during a meeting of film exhibitors. See R. Allister, *Friesse-Greene: Close-up of an Inventor*, 1948.

Friesland, or Vriesland, prov. of Holland, on the N.E. side of the IJsselmeer (Zuider Zee). The surface is flat, and the coasts are protected by dikes, much of the prov. being below sea level. The chief industries are cattle-rearing and the making of cheese and butter, and on the clay lands agriculture is also extensively practised. Woollens, fine linen fabrics, and sail-cloth are manufactured, and peat is dug in the higher fen district. The princ. towns are Leeuwarden, Sneek, Bolsward, Francker, Dokkum, and Heerenveen. Pop. 456,800.

Friesland, East, see AURICH.

Frieze, in classical architecture that member of the entablature immediately above the architrave and below the cornice. It is decorated in various ways according

to the style of the architecture. Its most notable feature in the Doric style is the series of *triglyphs*, features which project slightly from the regular face and which receive their name from the channels which run down them. The triglyphs are divided one from the other by spaces as wide as the height of the F., which are named *metopes*. These are often elaborately adorned with sculpture. The Ionic F. has no triglyphs and is but rarely adorned with sculpture, and this is true also of the later developed Corinthian order. In domestic architecture the name F. is given to the band of decoration which runs round the interior walls of a building immediately below the cornice.

Frigate, originally an oared sailing ship of the Mediterranean. Many such ships were built for the Brit. Navy in the seventeenth century; but it was only during the Seven Years' war that the first ship of the type technically known as a F. was built—a fast, full-rigged ship with upper deck, spar deck, and lower deck, carrying guns which by 1808 had increased in number to fifty.

Frigate Bird, or **Man-of-War Bird** (*q.v.*), marine bird belonging to the sub-order *Steganopodae* of the order *Ciconiiformes*, and a member of the *Fregatidae*. Its colour is black, strongly tinged with brown, while the pouch is scarlet. It is a large bird, having a long tail and wings, and a long hooked beak. It is essentially a sea-bird, and only comes to land during the breeding season. Its chief food is fish, and it has a habit of vomiting the prey which it has forced another bird to disgorge. The two species of this family *Fregatidae* are *Fregata aquila* and *F. minor*.

Frigga, see **FRIJJA**.

Frisled Lizard, see **CHLAMYDOSAUROS KINGI**.

Frimley, tn. in Surrey, England, 30 m. S.W. of London. It now forms an urb. dist. with Camberley. It is mainly residential. Pop. (with Camberley), 15,300.

Fringillidae, see **FINCH**.

Frinton-on-Sea, seaside resort in Essex, England, 7 m. N.E. of Clacton. A favourite centre for tennis tournaments. Pop. (with Walton-on-the-Naze), 9900.

Friol, com. in the prov. of Luza, Spain. Pop. about 9000.

Frisches Haff, lagoon of Poland (formerly E. Prussia). It is almost entirely separated from the Baltic by the Frische Nehrung, a strip of land about 40 m. long, its only means of connection with the sea being at Pillau, at its N.E. end. The Haff is nearly 60 m. long, and varies in width from 1 to 15 m. In 1915, in the Russian invasion of E. Prussia, there was protracted fighting in the vicinity of the F. II., Königsberg being the objective. On Jan. 26 Soviet troops reached the gulf of Danzig, and thereby cut off the E. Prussian garrison from central Germany. Elbing was taken on Feb. 10, Braunsberg fell after a severe struggle, but Pillau long held out, and Königsberg only surrendered on April 9.

Frisi, **Paolo** (1728-84), It. mathematician, was a native of Milan. At the age of fifteen he entered the Barnabites

order, and in 1756 was appointed prof. of mathematics at Pisa. In the year 1764 he received a similar appointment in Milan, and just after this time visited sev. of the countries of Europe. Among his works may be mentioned *Disquisitio mathematica* (1751); *De Causa electricitatis dissertatio* (1757); and *Cosmographia physica et mathematica* (1774, 1775).

Frisian Islands, series of is. situated in the North Sea and extending along the coasts of Holland and Belgium. See B. Schulz, *Die deutsche Nordsee, ihre Küsten und Inseln*, 1928.

Frisians, seafaring people of Teutonic stock, who in the first century of the Christian era inhabited the coast lands between the mouths of the Scheldt and the Ems. They were tributary to Drusus, and were made socii of the Rom. people, but in A.D. 26 broke out into revolt. They were, however, again subject to Corbulo in 47, but shortly afterwards all Rom. troops were withdrawn to the l. h. of the Rhine. In 58 they made an unsuccessful attempt to secure lands between the Rhine and the Yssel, and in 70 took part in the campaign of Claudius Civilis. After this they disappear from hist., for it is uncertain whether they took part in the conquest of Britain, but come again into prominence in the seventh century with the rise to power of the Franks. These people attempted to Christianise the F., but met with small success until Wilfred of York landed, and it is significant that both he and Willibrord, who came to Frisia in 692, found no difficulty in conversing with the inhab. The struggle between the Franks and the F. lasted for about 200 years, and although the F. made a stand for their freedom, they were compelled to cede the dist. from the Scheldt to the Zuider Zee to Pippin of Herstal after an unsuccessful battle at Dorstadt in 689, and in 734 to acknowledge the supremacy of the Franks in the N., being finally subdued in 753 in the days of Charles the Great. They were again in revolt under William of Holland, emperor 1248, and although W. Friesland was subdued, the inhab. to the E. of the Zuider Zee resisted all attempts to bring them to subjection, and the main body of the F. was still independent when the comitship of Holland passed into the hands of Philip the Good of Burgundy. He laid claim to the whole country, but the people called on Frederick III. in 1457 to protect their rights, and they were acknowledged as dependents of the empire, but in 1498 Maximilian, Frederick's son, detached the prov. of Friesland from the empire and gave it as a fief to Albert of Saxony, and in 1523 it fell with the rest of the provs. of the Netherlands under the rule of the Emperor Charles. From 1579 to 1795 it was one of the constituent parts of the republic of the United Provs., preserved its own dialect, and had a separate stadtholder, but in 1718 William IV. was made hereditary stadtholder of all the provs., and his grandson, in 1815, took the title of King of the Netherlands.

Language.—W. Frisian is spoken by about 320,000 people in the Dutch prov.

of Friesland, and on the is. of Terschelling and Schiermonnikoog; E. Frisian in Hanover prov. and the outlying is. of Oldenburg is dying out; and N. Frisian, spoken by about 15,000 people on Föhr, Sylt, and the coast between Tondern and Husum. But the language is being supplanted more and more by Dutch, *Plattdeutsch* in Germany, and Dan. See J. Jung-Diefenbach, *Die Friesenbekämpfung*, 1931.

Frith, or Fryth, John (1503-33), Eng. Protestant, b. at Westerham in Kent, and was educated at Eton and Cambridge. Being invited by Wolsey he went to Oxford, and on account of his zealous support of reformation principles he was imprisoned. He was, however, released, and he then retired to Marburg, where he collaborated with Tyndale in his literary work. On his return to England in 1532 he was condemned to death for heresy, and burnt at Smithfield. He wrote, among other works, *Disputacion of Purgatorie* (1531).

Frith, William Powell (1813-1909), Eng. artist, was a native of Aldfield, Yorkshire. He became a Royal Academician in 1853. His first attempts were subject pictures such as 'Othello and Desdemona' and 'Coming of Age in the Olden Time.' After 1853, however, he began portraying scenes characteristic of Eng. crowds. The grouping in these pictures shows great dexterity, and the types of people that he depicted testify to his observation and sense of humour. Among the best of these works are 'Derby Day' (Tate Gallery), 'Life at the Seaside,' and 'The Railway Station.' His *Reminiscences* were pub. 1887-48.

Frith, see FIRTH.

Frithiof's Saga, see FEGNTR, ERASIAS.

Frulli, dist. of Italy of about 3000 sq. m., comprising the prov. of Udine and the dists. of Gorizia and Gradisca in Austria. In medieval times F. was itself a duchy. Pop. 671,000.

Froben, or Frobenius, Johannes (c. 1460-1527), Ger. printer, b. at Hammelburg in Bavaria. He was educated at the univ. of Basle, and in 1491 founded a printing office in that city and issued about 300 works, among which may be mentioned his *Neues Testament* in Gk. (1510), which was used by Luther for his trans., and his eds. of St. Jerome, St. Cyprian, Tertullian, St. Ambrose, and Erasmus. Some of his texts are illustrated by Hans Holbein. It was largely owing to F. that Basle was the leading centre of the Ger. book trade in the sixteenth century.

Frobenius, Leo (1873-1938), Ger. ethnologist, b. in Berlin. Studied at Basle. Led ten scientific expeditions to Africa and Asia Minor between 1904 and 1932. During this period of active field work in difficult countries, he found time to write his monumental works, to contribute numerous monographs and memoirs to scientific jour., to deliver lectures, and to found his famous Institute of Culture Morphology at Frankfurt-on-Main in 1925 with his valuable material. From this unique foundation, devoted exclusively

to Africa and Oceania, Graebner and Wilhelm Schmidt were to found new schools of comparative anthropology in Vienna and elsewhere. F.'s work is of great importance to Africanists, and the fact that W. African art and culture became at all known and admired in Europe and the world was due to the scientific enthusiasm of Prof. F. See P. Hambruch, *Das Wesen der Kulturkreislehre*, 1924.

Frobisher, Sir Martin (c. 1535-94), Eng. navigator, b. in Yorkshire. He made his first voyage to Guinea in 1554, and in the following ten years went on yearly expeditions to the N. shores of Africa and the Levant. In 1576 he made his first voyage in search of a N.W. passage under the auspices of Ambrose Dudley, earl of Warwick, reaching Frobisher Bay, and in the following year, as admiral of the company of Cathay, sailed to the same region in search of gold, and explored S. of Meta Incognita and Jackman's Sound, bringing home 200 tons of gold from Kodlun-arn. In 1578 he made his third voyage, and discovered a new strait and the upper part of Frobisher Bay, and in 1586 was vice-admiral in Drake's expedition to the W. Indies. He was in command of the *Triumph* fighting against the Sp. Armada, and led one of the four newly formed squadrons, and the same year was knighted and put in command of a squadron of six ships to sweep the Narrow Seas. In 1590 he was vice-admiral to Sir John Hawkins, and in 1592 captured a large Biscayan ship with a valuable cargo of iron, etc. In 1594 he took part in the expedition for the relief of Brest and Crozon, and received a wound from which he afterwards d. at Plymouth. See F. Jones, *Life of Frobisher*, 1878, and P. F. Alexander (ed.), *The North-West and North-East Passages, 1576-1611*, 1915.

Froebel, Friedrich Wilhelm August (1782-1852), Ger. educational reformer, b. at Oberweissbach. The neglect he experienced in his youth led to his anxiety to promote the happiness of children. His mother d. in his infancy, and F. was apprenticed to a forester. In this position in the Thuringian forest, he applied himself to the study of nature. No training could have been better suited to strengthen his inborn tendency to mysticism. Unity of nature was the conception in him which dominated all others. With difficulty he got to the univ. of Jena, but his allowance was too small to support him, and his univ. career ended in an imprisonment of nine weeks for a debt of thirty shillings. In 1802, when he was twenty, his father d., and during the next few years he took up land-surveying, acted as accountant and private secretary, but all the time was conscious that he was meant to benefit humanity in some way, how he did not know. Whilst he was studying architecture in Frankfurt-on-Main the director of Pestalozzi's enthusiasm, persuaded him to take a post in his school. Later he retired from this post and educated three lads in one family. He obtained the

consent of the parents to his taking the boys to Yverdon, near Neuchâtel, and there formed with them a part of the celebrated institution of Pestalozzi. For two years he was qualifying to carry on the work begun by Pestalozzi. Taking the results at which he had arrived through the necessities of his position, F. developed the ideas involved in them, not by further experience but by deduction from the nature of man, and thus he attained to the conception of true human development and to the requirements of true education. F. now determined to continue the univ. course interrupted eleven years before, but again he was stopped, this time by the king of Prussia's celebrated call to 'my people,' so he enlisted in Lützow's corps and went through the 1813 campaign. Through his patriotism he met Langelthal and Middendorf. These two young men became attached to him on the field, and were ever after his faithful followers. Later he opened a school, starting with his own orphaned nieces and nephews as pupils. An educational institution was started by F. in Switzerland, but it proved a failure. The Swiss Gov., wishing to turn his presence to advantage, sent young teachers to him for instruction. He felt that till the school age was reached, children were neglected, and he schemed for small children a graduated course of exercises, modelled on the games in which he found them most interested. At Keilhau he opened the first kindergarten, in the near-by vil. of Blankenberg. This was in 1827. Self-activity was the keynote. The children were taught to do things; it was play, but as they played they learnt. F. wrote his *magnum opus*, *Die Menschen-erziehung* (The Education of Man), in 1826. He believed that 'all education not founded on religion is unproductive.' Pestalozzi taught the development of faculties through exercise, but F. postulated the function of education as the superintendence of inborn faculties by self- or voluntary activity. He held, with Comenius, that the knowledge of nature is the indispensable means of education; with Rousseau that each age has an organic and psychic completeness, but he added importance to the earlier stages. It was natural for him to devote himself, as did Pestalozzi, to the instruction of mothers. While Pestalozzi maintained that the child belonged to the family and Fichte declared categorically that he belonged to society, F. claimed that he belonged to both; he therefore instituted the kindergarten, in which educative play has a great part. See *Autobiography* (trans. 1903), and Emily Shirreff, *The Kindergarten*, 1876.

Frogbit, water-plant of the genus *Hydrocharis* (*H. morsus-ranae*), of the order Hydrocharitaceae. It is monocotyledonous and the leaves are ribbon-like. It is common in still ponds.

Frog-hopper, **Frog-spit**, see CUCKOO-SPIR.

Frogmore, see under WINDSOR CASTLE.
Frogs, name applied to the family Ranidae of the Ecaudata order, but in

common speech the term is loosely used to include other families of the Ecaudata order. The family Ranidae includes some 200 species. The differential characteristics of the family are the presence of cylindrical, transverse processes on the sacral vertebrae, of teeth in the upper jaw, and the vomer, the fixation of the tongue in front instead of behind, more or less marked webbing between the toes, and a horizontal pupil in the eye. The best known varieties of F. are the Brit. F. or *Rana temporaria*, the edible F. or *R. esculenta*, and the Amer. bull-F. or *R. catesbeiana*. There are also many very remarkable members of the family. For instance in W. Africa there is found a hairy frog, the *Trichobatrachus robustus*, on whose sides and hind limbs long villous

FLYING FROG

outgrowths are seen. Most of the tree-F. are now known to be more nearly allied to toads than to F., but the *Rhacophorus* of E. Asia, called by Wallace the flying frog, is a true member of the family Ranidae. It has markedly developed webs between the toes which it uses as parachutes in jumping from branch to branch. Other tree-F. make nests in the branches of trees which overhang water. The Brit. F. hibernate in holes in the ground. In the early spring they come above ground and mate. At this season a horny cushion appears on the first finger of the male frog. The eggs are laid in water, and are fertilised as they are laid. Nearly all F. desert their eggs, though there is one species in which the male places the eggs into hollows on the female's back, where they stay until they hatch out. The tadpoles hatch out from the eggs in about a fortnight. At first they are fish-like animals with external gills, and a long swimming tail, but no limbs. The first change to take place is the disappearance of the external gills, and the development of internal gills, which are still later supplanted by lungs. The hind legs appear before the front legs,

and the last change to occur is the diminution and final disappearance of the tail. The tadpole stage lasts about three or four months. At the end of this time the animal leaves the water and lives in grass. Some species such as the edible frog are always aquatic. The grass frog lives mainly on insects, small worms, etc., which it catches very cleverly with its tongue. By autumn the frog grows big and sluggish. It stores fat in a special gland in the abdomen, and this fat is what it lives on during its winter sleep.

Froissart, Jean (1338-1410), Fr. historian, chronicler, and raconteur. His own verses and chronicles tell the story of his life. He was curé of the vil. of Lestines, but there are no memories of him there; he made no mark on the inhab. No one can point to any house in Valenciennes, and say that he once lived in it. Even the time and place of his death are not certain, nor do we know his burial place. The church of St. Monegunde of Clunay claims to hold his bones. His forefathers were aldermen of Beaumont, near the R. Smabre, to the

DIAGRAM OF LIFE HISTORY OF A FROG, AFTER BRÜHM

1-3, developing ova, 4, newly hatched forms clinging to water weed, 5, 6, stages with external gills, 7-10, tadpoles during emergence of limbs, 11, tadpole with both pairs of limbs apparent, 12, metamorphosis to frog.

Frohschammer, Jakob (1821-93), Ger. theologian and philosopher. In 1847 he became a priest. His logical intellect would not allow him to yield the Church unquestioning obedience. In 1850 he pub. his *Beitrag zur Kirchengeschichte*, which was placed on the Index Expurgatorius. In 1855 he became prof. of philosophy. He went on publishing controversial works which gave offence to his eccles. superiors. He was denounced by the pope, and students were forbidden to attend his lectures. He was, however, accorded a public ovation, and the king gave him his support. In 1862 he founded the *Athenäum* as the organ of Liberal Catholicism. In 1871 he was excommunicated. His system is based on the unifying principle of imagination, which he extends to the objective creative force of nature, as well as to the subjective mental phenomena to which the term is usually confined. His *Autobiographie* was pub. in 1888. See A. Hinrichsen, *Deutsche Denker*, 1888, and G. Wüchener, *Frohschammers Stellung zum Theismus*, 1913.

W. of the forest of Ardennes. His father was a painter of armorial bearings. There is nothing to show that F. was, as a boy, unlike other boys. He loved games of dexterity and skill rather than sedentary amusements such as chess and draughts. All the splendour of medieval life was to be seen in his native city. Knights and soldiers, priests and artisans, crowded the streets. The churches were rich with stained glass, and the libraries were full of wonderfully illuminated MSS. There were festivals, masques, mummeries, and moralities. It was a time of plenty in which he lived. Quite early he loved a demoiselle. He remarked the beauty of her blue eyes, and became provided with that essential for knight, soldier, or poet, a mistress, one for whom he could write verses, but the lady was cold and the poet was sad. Not till the day he was leaving his native city did she grant him an interview. The conclusion of his only love adventure is simply told in his *Treille de l'espignette amoureuse*. The progress of the amour was rudely

interrupted by calumny, and this led to a complete rupture. Queen Philippa made him her secretary, and later King John of France made him his. He is said to have d. in great poverty. His poetry was mechanical and monotonous, but his *Chronicle* is universally admitted to be a great work. See J. Bouchier, Baron Berners (ed.), *Chronicles*, 1927-28, and F. S. Shears, *Froissart, Chronicler and Poet*, 1930.

Frome, mkt. tn. in Somersetshire, England, 107 m. from London and 24 m. from Bristol. It contains a fourteenth-century church, a market-hall, museum, school of art, and a free grammar school, founded under Edward VI. There are breweries, foundries, wire-card manufactories and edge-tool works. The woollen trade, formerly the prin. industry, is declining. Pop. 11,000.

Fromental, Jacques François, see HALÉVY, FROMENTAL.

Fromentin, Eugène (1820-76), Fr. painter and writer, b. at La Rochelle, son of a well-to-do physician. First put to study law in Paris, and there he discovered in himself a dual gift for writing and for painting, and there were the springs of his earliest work (1841), a long poem *Sur la peinture moderne*. Studied under Louis Cabat, the landscape painter. His first great success was produced at the Salon in 1847 by the 'Gorges de la Cliffa.' He was much influenced in style by Eugène Delacroix. His later work shows signs of an exhausted vein caused by physical enfeeblement. His writing showed another side of his genius. He wrote less than he painted, but he expressed himself more really in literature than in painting. F. did not find much recognition as a painter during his lifetime. Even after he had estab. himself as the 'African' master (he travelled extensively in N. Africa during the 1840's) and had received the First medal at the Salon, and also the Legion of Honour (1859), he was not given any official commissions and began to give up painting. His success, such as it was, was made by his two famous illustrated travel books—*Un Été dans le Sahara* (1837) and *Une Année dans le Sahel* (1859), which won the praise and friendship of Sainte-Beuve and George Sand. His fame was enhanced later by his books *Maîtres d'autrefois* (1876), an exposition of Dutch and Flemish painting, trans. as *Masters of Past Time* (1913); and *Dominique* (1863), and it is in them that his name has survived. *Dominique* indeed has an enduring place in the classical works of Fr. literature. He also wrote *Visites artistiques* (1852) and *Simplex Pélerinages* (1856). His most important pictures are 'La Placo de la brèche à Constantine' (1849); 'Enterrement Maure' (1853); 'Bateleurs noirs' (1859); 'Andonco chez un chailfe' (1859); and 'Berger kabyle' (1861). In 1876 he was an unsuccessful candidate for the Academy. See lives by L. Goussé, 1881; P. Dorbec, 1926; G. Assolant, 1931, and M. Revon, 1937.

Fronde (1648-53), name given to a civil war in France, and also to its sequel,

a war with Spain (1653-59). The word means 'a sling,' and it was used to describe this contest, because the windows of Cardinal Mazarin's followers were pelted with stones by the mob in Paris. Originally the object was the redress of grievances, but there was a factional contest between nobles and Mazarin, the former attempting to reverse the results of Richelieu's work and to overthrow Mazarin, his successor. In May 1648 a tax levied on judicial officers of the Parlement de Paris was met by that body not merely with a refusal to pay but also with a condemnation of earlier financial edicts, and even with a demand for the acceptance of a scheme of constitutional reforms, framed by a committee of the Parlement. This charter was influenced by contemporary events in England, but there is no real likeness between the two revolutions, the Fr. Parlement being no more representative of the people than the Inns of Court were in England.

Frontenac, Louis de Buade, Comte de (1620-98), Fr. colonial officer, descendant of an auct. Fr. family. Entered the army in 1635 and soon rose to be brigadier. After a brilliant army career he was appointed governor of the Fr. possessions in N. America in 1672. His restless activity was a source of strength and vitality to the colony, but it led him into difficulties with the other colonial authorities and with the home gov. His first quarrel was with Perrot, governor of Montreal, whom he caused to be put into prison. Then came a prolonged and acrimonious dispute with the intendant Duchesneau, each accusing the other of making illegal gains out of the fur trade. The king, becoming impatient at such continual discord, at length recalled both. During this, his first term of office, he built Fort F. (now Kingston, Ontario) to control the Iroquois, whom he treated with mingled kindness and firmness and among whom he was known as the great 'Onontio' (meaning the 'big mountain,' from Montmagny, the second Fr. governor-general of Canada). After Denonville, the eleventh governor-general, had been recalled in 1689, the Fr. king again turned to F., who, in spite of his seventy years, again assumed the burden of office. He returned to find that Denonville had ordered Fort F. to be destroyed and that the Iroquois tribes were imperilling the country-side. F. then planned an attack upon the New Englanders. The King, colonists, knowing that the Iroquois, their allies, were attacking Canada from the W., replied by attacking the F. settlements of New France by sea. But the preparations which the New Englanders had made for an attack on Montreal, with the help of the Iroquois, proved as great a failure as their attack on Quebec. In his second term F. so broke the power of the Iroquois that they were never again a terror to the colony. F. was the strongest ruler Canada had seen since the death of Champlain. See life by F. Parkmann, 1918.

Frontier College, Canada, organisation by which young men of good education

spend some part of the summer in the N. lands, doing manual work, and giving educational instruction. The scheme was begun in 1899, for E. Canada, and was extended to the W. provs. nine years later. The instructors are univ. graduates, students, or teachers, and their pupils are lumberjacks, miners, and navvies, with occasional settlers. During the past fifty years about 500,000 have received elementary education and taken part in discussions on public affairs, Canadian hist., etc.; in addition, many foreign-born workers have been taught the Eng. language.

Frontinus, Sextus Julius (c. A.D. 40-103), Rom. writer and soldier, was praetor in A.D. 70. He was governor of Britain in 75, and while holding that office distinguished himself by the conquest of the Silures. In 97 he was nominated *curator aquarum*, and d. about 106. He wrote *Strategematon libri ix.*, a book on the art of war, and *De aqueductibus urbis Romae libri ii.*, which contains a hist. and description of the water-supply of Rome, and other matters of importance in the hist. of architecture.

Fronto, Marcus Cornelius (c. A.D. 100-170), Rom. historian, was b. in Numidia. He came to Rome in the reign of Hadrian, became very famous as an orator, and was made tutor to Marcus Aurelius and Lucius Verus. Few only of his works are extant, and these fall far short of the writer's great reputation. A number of his letters, addressed chiefly to Antoninus Pius, Marcus Aurelius, and Lucius Verus, were pub. at Rome in 1823.

Frosinone, tn. of Italy in the prov. of Rome, 32 m. from Gaeta. Pop. 9600.

Frost, Robert Lee (b. 1875), Amer. poet, b. at San Francisco. His parents, who were of New England stock, returned to their home and F. was educated at Amherst College and Harvard. He worked his own little farm at Derby, New Hampshire, 1900-5, and taught Eng. at the local academy from 1905 to 1911. He then taught psychology from 1911 to 1912 at the New Hampshire state normal school, and from 1916 was prof. of Eng. at Amherst College. F. has identified himself completely with New England and its way of speech. He is not only a devotee of New England colloquialism and New England colour, but he is also a stern realist in his poems. He himself claims kinship with Emerson. But Emerson in his poems often celebrated the flora of New England. F. sings of the human beings—their isolation on their small farms, the weight of the long winters, the tasks to be done, the pessimism and madness that often come. His work has been crowned by winning the Pulitzer prizes for Amer. poetry. His best vols. are *North of Boston* (1911); *Mountain Interval* (1916), and *New Hampshire* (1923). His *Collected Poems* were pub. in 1930 and 1939; *A Further Range* (1936); *Selected Poems* (1937); *A Witness Tree* (1943); and *A Masque of Reason* (1949). See studies by G. B. Munson, 1927, and S. Cox, 1929.

Frost, that condition of climate when the temp. of the air is below the freezing-

point of water; the term is also applied to manifestations in the form of small crystals of ice. Under ordinary conditions of pressure pure water solidifies at 0° C. or 32° F. Water containing substances in solution freezes at temps. somewhat below this point. Water contracts as it cools down to 4° C., but below that point it expands for a decrease in temp., and as it solidifies in a crystalline form it takes up more space as a solid than as a liquid. Therefore water-pipes are likely to burst during a F., though the subsequent leakage is not discovered until the thaw, or period when the temp. has again risen above 0° C. The expansion of freezing water is also responsible for breaking off large pieces of rock when water has collected in cracks, and for the general disintegrating effects of F. upon soil and even vegetable structures. The general condition determining F. is diminution of temp. below 32° F., but in the Brit. Isles this does not obtain as an average condition, even through Jan., the coldest month of the year. There are therefore usually special circumstances connected with Fs. After the sun has set the earth gradually loses heat by radiation from its surface. Radiation is hampered by an abundance of water-vapour in the atmosphere, therefore Fs. occur on clear nights when there is neither cloud nor wind. These conditions are characteristic of anticyclonic periods, that is, when there is a high barometric pressure and the air gently flows outwards from the anticyclonic area. Anticyclones are associated with warm sunny days even in winter, and with clear frosty nights even in summer. As the likelihood of F. depends upon the freedom of the atmosphere from water-vapour, some indication of the probable night temp. may be gained from an examination of a wet- and dry-bulb thermometer; a good estimate is obtained by multiplying the difference between the wet- and dry-bulb readings by 2½ and subtracting the result from the actual air temp. (dry bulb). Sometimes the frequency of Fs. is affected by the nature of the land with regard to slope. On a calm night the heavier cold air tends to flow down the sides of hills to the valleys below, therefore plantations on the slopes of hills are not so liable to F. as those in the valleys. The effects of F. on agric. enterprise may be advantageous, or the reverse, according to the seasonableness of the low temp. Thus a F. in winter helps to break up the ground and checks the growth of plants at a time when too early development might be dangerous. On the other hand, spring Fs. often do great damage by destroying blossoms and fruit buds. The destructive action of F. on vegetation is due to the formation of ice on the outside of the cells, from which the water has been squeezed by the contraction due to low temp.; if the ice thaws rapidly the water cannot be reabsorbed by the cells in time, and either runs off and causes the plant to dry up, or collects in intercellular spaces and causes decay. As Fs. do not often occur in our climate when the air is humid, attempts are some-

times made to prevent a threatened F. by flooding the soil. This causes a bank of mist to rise up and serve as a blanket for the prevention of over-much radiation. A bank of smoke has the same effect; therefore it is the custom to light fires in such positions that the smoke will drift over threatened orchards, etc. Small areas may be sufficiently protected from a light F. by coverings of straw, paper, etc. See R. Bush, *Frost and the Fruit Grower*, 1943.

Frostbite, consequence of the action of great cold on parts of the body for some time. Limited areas of the body may be frozen briefly, as in surgical operations, with impunity. But when larger portions are frozen for considerable periods, especially when the circulation returns too soon, more outlying parts—say, the fingers in the case of a frozen hand—may perhaps die, and be severed by gangrene from the parts which are alive. It is stated to be specially apt to occur in persons given to the use of alcoholic drinks, whose blood-vessels are prone to lose their vital condition and cause sluggish circulation. If circulation does not return the part affected may simply shrivel up and turn black and gangrenous. But if the injury is less severe circulation returns as the part thaws, and the vessels become swollen, red, and painful, sometimes with inflammation and subsequent gangrene. The condition is preventable by adequate covering of hands and feet, etc., when there is extreme cold; also by maintaining the circulation with movement, and (it is stated) by avoiding alcoholic drinks. But when F. has occurred the patient should be put in a cold room, and the parts affected should, in traditional practice, be rubbed with snow or covered with somewhat cold water. Sometimes the pain can be relieved by lifting the limb. Later there can be gentle rubbing with oil, but the longer the part has been exposed to the cold the more gradual must be the course of treatment. When the circulation has returned the part may be lightly wrapped in cotton-wool. A dressing of butter, charcoal, and camphor relieves the pain.

Symptoms.—Here are some of the symptoms described by the vivid pen of the Amer. Rear-Adm. R. E. Byrd, in *Alone* (1939). Byrd experienced F. in its most virulent form, near the S. Pole in 1934. 'Times when the temperature was in the minus fifties or sixties, a wind would come rustling out of the cold, edged with a breath so sharp that it fairly sliced the skin from the face. (He had chemical heat pads in his sleeping clothes, and under his furs in the daytime.) Maybe my toes would first turn cold, and then dead. While I was dancing up and down to flex them and restore the circulation my nose would freeze, and by the time I had attended to that my hand would be frozen. The wrists, the throat where the helmet chafed, the back of the neck, and the ankles, pulsed and crawled with alternating fire and ice. Freezing to death must be a queer business. Sometimes you feel simply great.

The numbness gives way to an utter absence of feeling. You are as lost to pain as a man under opium. But at other times, in the enfolding cold, your anguish is the anguish of a man drowning slowly in fiery chemicals.'

Treatment.—It must be pointed out that there is difference between orthodox medical tradition and the treatment advocated by the explorer, V. Stefansson, who, in *My Life with the Eskimo* (1913), says: 'One of these superstitions is that, when your face or any other part of your body begins to freeze, you must thaw it out with an application of snow. Few things could be more absurd. Any high-school pupil could tell us offhand what would happen if liquid air were applied to a man's cheek or nose; of course the part would freeze instantly. The same would be true of the snow of carbon dioxide, and the same is true of snow or water, except, of course, that the freezing would not be so nearly instantaneous.' Stefansson's treatment was brief application of a warmed hand to the part affected.

Frostburg, tn. in Maryland, U.S.A., in the Alleghany co. It is a popular summer resort, and lies in the midst of the coal region of the state. It has foundries and manufs. fire-bricks, and is the seat of a state normal school. Pop. 7600.

Frost Figures, or Ice-flowers, curved aggregations of ice-crystals, produced when hoar-frost is formed on a cold surface. The atmosphere contains a varying amount of water-vapour diffused in it. The amount of water-vapour depends on the physical configuration of a country, the prevailing winds, nearness to the sea, etc., and the capacity of the air for holding gaseous water increases with its temp. and pressure. When no more evaporation is possible the air is said to be saturated, and any decrease in temp. when this condition is estab. causes the deposition of the excess of water on any available surface. When the condensation of water-vapour occurs high in the atmosphere, the water is deposited around a dust-particle as nucleus; when it occurs at the surface of the earth, the water is deposited on the ground in the form of dew. Should the temp. drop to below 32° F. the water-vapour may be deposited as ice without passing through the intermediate liquid stage. In these circumstances small crystals of ice are formed, belonging to the hexagonal system of crystals. They have the habit of twinning; that is, two crystals may have a common face, but their axes may not be parallel. This phenomenon, when continued with crystal after crystal, produces a pattern of gradual curves, whose interpenetration and divergence produce a remarkable similarity to beautiful foliage.

Froude, James Anthony (1818-94), historian, was educated at Westminster and Oriel College, Oxford. After a distinguished career at the univ. he devoted himself to the composition of his *History of England from the Fall of Wolsey to the Defeat of the Spanish Armada* (1856-70). This was his greatest work, and brought him much renown; but, though most

SOME TYPICAL FRUITS

1 Cypselis—Head of *Oleaster*; 2 Cypselis—Single parachute seed of same; 3 Glans or Nut—Sweet chestnut cupule open showing the three nuts; 4 Glans—Longitudinal section of nut of same; 5 Glans—A single nut of same; 6 Glans—Section of young fruit; 7 Capsule of *Euonymus europaeus*; 8 Capsule of same open and empty; 9 Capsule of same open, with seeds in position; 10 Samara—Single samara of Elm; 11 Samara—Double samara of Ash; 12 Samara—Section of half of same, showing enclosed cotyledonous leaves; 13 Legume—Pod of Broom, closed; 14 Legume—Pod of Broom, open; 15 Berry—Wild Goose berry; 16 Berry—Section of same (transverse); 17 Berry—Section of same (longitudinal); 18 Carcerulus—Fruit of *Phlox fruticosa*, with

admirably written, as a hist. it is not to be relied upon, F. being inclined rather to endeavour to support his own theories than to follow the facts elucidated by the documents from which he worked. Among his other books were *The English in Ireland in the Eighteenth Century* (1872-1874); *Orcana* (1886); *The English in the West Indies* (1888); *The Life and Letters of Erasmus* (1893); and *English Seamen in the Sixteenth Century* (1895). His friend Carlyle appointed him his sole literary executor, and in that capacity he pub. Carlyle's *Reminiscences* (1881); *History of the First Forty Years of Carlyle's Life* (1882); *Letters and Memorials of Jane Welsh Carlyle* (1883); and *Carlyle's Life in London* (1881). His biography of Carlyle was vigorously attacked, and gave rise to a controversy, which was revived in later years. F. was editor of *Rassell's Magazine* from 1860 for fourteen years. He was rector of St. Andrews from 1868, and regius prof. of modern hist. at Oxford, 1892-94. See A. Cooper, *James Anthony Froude* (a lecture), 1907; G. P. Gooch, *History and Historians in the Nineteenth Century*, 1913; W. H. Dunn, *Froude and Carlyle: a Study of the Froude-Carlyle Controversy*, 1930; and L. Strachey, *Characters and Commentaries*, 1933.

Fructidor (fruit-month), twelfth month in the Fr. calendar inaugurated at the time of the revolution. The period extended from Aug. 18 to Sept. 16. The 18th F. of the year V. (Sept. 1, 1797) is celebrated as a day in which the republic was saved from the machinations of the Royalists.

Fructose, or Laevulose (fruit-sugar), discovered by Dubrunfaut in 1847. A ketose (see SUGAR), $\text{CH}_2\text{OH}(\text{CHOH})_4\text{COCH}_2\text{OH}$, contained in most sweet fruits, honey, and starches together with dextrose. Obtained pure by boiling inulin—a starch contained in dahlia tubers—with water, and together with glucose by the inversion of cane sugar. It is also obtained by hydrolysing sucrose with sulphuric acid. F. crystallises from alcohol, and has a melting point of 95°C . It is less easily fermented than glucose, is a powerful reducing agent, and is laevo-rotatory (see STEREOCHEMISTRY). It is sweeter than cane sugar and is more easily assimilated. It can be obtained as a syrup or as a granular crystalline. It is used instead of cane sugar by sufferers from diabetes. It was synthesised chemically in 1897.

Frugoni, Carlo Innocenzio Maria (1692-1768), lt. poet, b. at Genoa. At the age of fifteen he was sent to a monastery, and, though the act was repugnant to him, made to take monastic vows. In 1716 he was prof. of rhetoric at Brescia, and

afterwards taught at Rome, Genoa, Bologna, and Modena. He became poet laureate to the duke of Parma, and was released from his monastic vows by the pope. His lyrics and pastorals are remarkable for their facility and elegance, and he was also a very successful writer of Lat. poetical epistles, and of It. poems in the style of Ariosto.

Fruit, in the popular acceptance of the term, is a word of uncertain significance. In ordinary phraseology a plum, a strawberry, or an apple is called a F., whilst a pea-pod or a poppy-head is not so designated. When the structure of these plants is examined it is found that the latter are as true Fs. as the former. Botanically a F. may be defined as the fertilised gynoecium of a flower, together with those other adherent parts that become enlarged after fertilisation. Strictly speaking, true Fs. consist solely of gynaeceal structures, those in which other substances are involved being more or less 'pseudocarps' or false Fs. The entire structure of a F. as distinguished from the seeds which it encloses is called the pericarp; this consists of three layers, distinguishable in a greater or less degree in different Fs. These layers are called the outer epidermis or epicarp, the inner epidermis or endocarp, and between them a spongy mesophyll or mesocarp. In pseudocarps the other structures contributing to the F. are mainly derived from the floral receptacle. In the strawberry the carpels, which form the apocarpous polycarpellary gynoecium, are scattered in numbers over a fleshy outgrowth from the conical white receptacle. In the apple the true F. is the core; in the cucumber the fibro-vascular bundles of the carpellary leaves form a ring near the inner surface of the fleshy portion. The terms pericarp, epicarp, mesocarp, and endocarp cannot be properly applied to the whole of the pseudocarpic structures. Fs. have been variously classified, and a great variety of names applied to the different forms; these, however, do not as a rule come within the scope of a scientific classification. The following classification is simple, though not free from objection, as succulence has undoubtedly originated independently in many different groups.

Dry Dehiscent Fruit.—In this class the F. dehisces or splits either into one-seeded portions or cocci, which do not themselves split, so as to discharge its seeds. Most capsules split with a valvular dehiscence, the side walls (pericarp) splitting in a longitudinal direction, and coming away in segments known as valves. If this splitting takes place down the dorsal sutures it is called loculicidal dehiscence;

part of calyx-tube. 19. Carcerulus—Fruit of *Phlomis frutescens*, splitting into four nuts or achenes. 20. Drupe—Cherry. 21. Drupe—Section of same, showing stone. 22. Drupe—Complete section of same, showing kernel within stone. 23. Pome—Crab-apple. 24. Pome—Transverse section of same. 25. Pome—Longitudinal section of same. 26. Ætario of Follicle *Magnolia conspurcua*. 27. Ætario of Follicles—Vertical section of same. 28. Ætario of Drupes—Blackberry. 29. Ætario of Drupes—Vertical section of same. 30. Cynarhododum—Dog rose. 31. Cynarhododum—Vertical section of same. 32. Strobilus—Spruce Fir, closed cone. 33. Strobilus—Spruce Fir, winged seeds of same, within scale. 34. Strobilus—Weymouth Pine, open cone.

if down the ventral suture, septicial dehiscence. With either of these modes of dehiscence the septa may be broken across in such a manner as to leave the seeds as a free central column on the placenta; this is termed septifragal dehiscence. Some dehiscent F.s., as those of the balsams and geraniums, split so as to throw their seed for some distance. Other capsules dehisce by teeth, the carpels splitting slightly at the apex, as in the cowslip (*Primula veris*), dianthus, etc. The legume splits down both sutures; the follicle down one only. In the pimpernel (*Anagallis*) the top of the capsule comes off as a round lid.

Dry Indehiscent Fruit.—Fleshy F.s. are mainly indehiscent. The nut has a tough and leathery pericarp in the oak, chestnut, and beech, and a woody one in the hazel. An achene is a dry indehiscent one-seeded carpel; the caryopsis is the characteristic F. of grasses. The cypsela is the characteristic F. of the order Compositae, and differs from achene in being syncarpous. The bicarpellary F. of the Umbelliferae is an inferior schizocarp.

Succulent Fruit.—The two main varieties of succulent F. are the berry, and the drupe or stone fruit. The characteristic of the former class is the succulence of the whole pericarp. To this belong the gooseberry, the grape, the currant, etc. The drupe is indehiscent, and its pericarp is generally divisible into three layers, the epicarp, the mesocarp, the endocarp (see above). The last, which forms the stone, is densely sclerocarpous, and encloses the kernel. Stone F.s. are chiefly grown for their mesocarp; the almond is an exception, as in it the seed is of more value than the mesocarp. A knowledge of the flower and the process of fertilisation is necessary for the understanding of any F. See FLOWER; FERTILISATION; BOTANY.

Fruit-bat, name given to all members of the *Microptilidae*; a frugivorous family found only in the tropical regions of the E. and in Australia; they are variously called flying-foxes, flying-bats, and fox-bats. The heads of many of them are curiously fox-like, and their hair is a reddish brown. *Pteropus edulis*, the great kalong, is the largest of all bats, measuring nearly 5 ft. across the wings. *Cynopterus marginatus* is the destructive and voracious Indian F.

Fruit Drinks, see under COOKERY.

Fruit, Drying of, see PRESERVING.

Fruit-farming, as distinct from market-gardening, comprises the cultivation of tree and bush fruit, including strawberries and raspberries. The agric. conditions, etc., are treated under the headings of the different fruits; a short account of the extent of F. in this country, and of the importation of fruit will here be given. The growing popularity of the fruit industry may be gathered from the fact that the Ministry of Agriculture returns concerning the fruit areas of Great Britain show a continuous increase. The total area in 1888 was 199,178 ac., in 1901 234,660, and in 1947 about 311,000. The following are the areas devoted to F. by certain Eng. cos.: Kent, 60,000 ac.;

Devonshire, 22,000; Worcestershire, 22,000; Herefordshire, 20,000; Somersetshire, 19,000; Gloucestershire, 14,000; Cambridgeshire and Isle of Ely, 11,000; Norfolk, 9,000; Sussex, 5,000; Essex, 5,000; Lincolnshire, 4,000; Cornwall, 4,000; Suffolk, 3,500; Middlesex, 3,500; Shropshire, 3,500.

The acreage under small fruit cultivation is about one-ninth of the total devoted to F. (approximately 61,700 ac. in 1938). The prin. small fruits grown are strawberries, currants, gooseberries, and raspberries, while loganberries have increased in importance. Among the prin. strawberry-growing cos. are Cambridgeshire, Hampshire, Norfolk, and Worcestershire. The following is the proportion occupied by the various small fruits: strawberries, 21,600 ac.; raspberries, 6,600; currants and gooseberries, 34,000; other kinds, 4,200.

The following is the average crop per ac. of some of the fruits: strawberries, 16·5 cwt.; raspberries, 22·3; red currants, 20·6; black currants, 19·4; gooseberries, 46·1.

Filberts and cohnuts have the disadvantage that they will not bear for four or five years, and do not reach their maximum bearing capacity for eight years. F. is an uncertain industry, and a moderate crop in a bad year will probably yield more profit than a good crop in a very good year, when the market will consequently be glutted. A large amount of labour is required, but in some cases the profits have compensated for this. It is, however, in the cultivation of fruit, principally grapes and tomatoes, under glass, that the largest fortunes have been made. About 12 tons of grapes and 20 tons of tomatoes may be grown to the ac. by this method. Owing to the perishable nature of the produce, few industries are more precarious in this respect, and great developments are possible in the direction of systematic marketing in the interest of the producer. Experiments have been tried with considerable success along co-operative lines, the growers in a dist. (as in the Pershore dist. of Worcestershire) combining to form a market of their own from which supplies can be forwarded with the minimum of delay and expense to places where the demand is good. Another development which considerably enhances the profitable character of F. and diminishes its risks is the provision of factories and other facilities for preserving the surplus produce by canning or one or other of the various methods outlined in PRESERVING.

The great proportion of fruit grown in the Brit. Isles is produced as a side line on farms and in market gardens, and failing a highly elaborated system of marketing, within easy distance of a fruit farm, and failing also a specially well suited climate and soil, this is undoubtedly the best method of undertaking fruit culture. The grower is then not seriously dependent on the vagaries of the season, and can usually make good use of a considerable part of the land occupied by the fruit crops, as by pasturing sheep in the

orchard, or by enclosing it in a series of poultry runs.

Importation of Fruit.—F. is carried on extensively in all the dominions and in many colonies, and in foreign countries. By the process of canning, and by the use of refrigerating chambers on board ships, fruit can now be transported to any part of the world. The importation of fruits to Great Britain increased before the Second World War contemporaneously with the increase in home-grown produce. The following table gives figures for the years 1938 and 1946:

See the articles on the various fruits, and GARDENING; and C. Whitehead, *Fruit-farming*, 1904; A. H. Hoare, *Commercial Apple Growing*, 1937; W. E. Shewell-Cooper, *Up-to-date Fruit Growing*, 1938; H. Dunkin, *The Pruning of Hardy Fruit Trees*, 1934; and N. B. Ragenal, (ed.), *Fruit Growing: Modern Cultural Methods*, 1945.

converted to Christianity, and he was consecrated bishop of Axum about 336. He is said to have trans. the Scriptures into Geëz.

Frundsberg, Georg von (1473-1528), the great leader of the Ger. Landsknechts (free-lances) during the 11. wars of Maximilian and Charles V., was b. at Mindelheim in Swabia. He fought for Maximilian against the Swiss in 1499, and in 1504 took part in the war in the Netherlands. In 1509 he won fame in the war against Venice, and in 1513 and 1514 was again occupied with the Fr. and Venetians. He gained a victory at Bicocca in Italy in 1522, was partly responsible for the defeat of the Fr. at Pavia, 1525, and suppressed a peasant revolt in Germany the same year.

Frunze, Mikhail Vassilievich (1885-1925), Russian revolutionary general, b. at Pishpek (renamed F., 1926), son of a peasant, settled in Turkestan and became a surgeon. Sent to Siberia 1911, but escaped, and again heard of at Minsk, 1917. Defeated Koltchak, 1919; fought Wrangel successfully, 1920. In 1924 president of the Revolutionary Military Council. In Jan. 1925 became people's commissary for military and naval affairs.

Frunze, fn. (formerly Pishpek) and region of the Kirghiz S.S.R., Russian Central Asia, 150 m. S. of S.W. extremity of Lake Balkhash. Grain is cultivated and there are cotton mills and tobacco factories. Pop. 97,000.

Frustum, portion cut off from any solid figure. The term is most frequently applied in the case of the cone, and conoidal surfaces of revolution. By 'frustum of a cone' is meant any part cut off from a cone which does not contain the vertex. This distinction is drawn because any part of a cone which contains the vertex is still a cone.

Fry & Sons, Ltd., J. S., oldest cocoa and chocolate firm in the world. Estab. 1728. Founded in Bristol by Joseph F., an eighteenth-century Quaker, who was also interested in the making of soap, pottery, and type-founding. Many large factories were erected for the business in Bristol, but these proved insufficient, and between the First and Second World Wars they transferred their activities to Somerdale, situated in the country between the cities of Bristol and Bath. To-day these factories house the most modern machinery, and the workers are employed under conditions which provide a pattern for all industry. The firm have been recipients of royal favour since granted letters patent in 1729 by George II.

Fry, Charles Burgess (b. 1872), Eng. athlete and journalist, educated at Repton School and Wadham College, Oxford; has played in international football and cricket matches; founder and editor of *Fry's Magazine*, and pub. *Cricket* in 1912. Honorary director of the naval training ship *Mercury*. He captained England's team in test matches, 1912. See his autobiography, *Life Worth Living*, 1939, 1948.

Fry, Sir Edward (1827-1918), Eng. judge, b. at Bristol. He was educated at

Univ. College, London, and London Univ. and was called to the Bar in 1854. From 1877 to 1883 he was judge of the high court chancery div., and in 1883 was made lord justice of appeal, but resigned in 1892. He presided over the royal commission on the Irish Land Acts, 1897-98, and was conciliator in the S. Wales colliery dispute, 1898. He was chairman of the court of arbitration under the Metropolitan Water Act, 1902; arbitrator between the London and N.W. railway company and their employees, 1908; and ambas.-extraordinary and first Brit. plenipotentiary to The Hague Peace Conference in 1907. He wrote *Essays on the Accordance of Christianity with Nature of Man*, *The Doctrine of Election* (1864), *James Hack Tuke* (1899), *Studies by the Way* (1900), and *The Liverworts* (1911). See Agnes Fry, *Sir Edward Fry*, 1931.

Fry, Elizabeth (1780-1845), prison reformer, was a daughter of John Gurney, the Quaker banker of Norwich, and was b. there. Married in 1800 Joseph F., also a Quaker, and member of the family of the founder of the Bristol cocoa firm (see Fry & Sons, Ltd., J. S.). She devoted her life to endeavouring to alleviate the condition of those who suffered imprisonment. The conditions, especially in the women's prisons, were early in the nineteenth century only to be described as terrible, and it was mainly due to her efforts, which were as persistent as they were wholehearted, that the matter became one of practical politics, and thus, being dragged into the light, was made the subject of inquiry, and ultimately improved. She first visited Newgate prison in 1813, and in 1817 she formed an association for the improvement of conditions, and also extended her interests to continental prisons. There are biographies by her daughter, Mrs. Cresswell, 1845; Susanna Corder, 1853; G. King Lewis, 1910; and Janet Whitney, 1947.

Fry, Mrs. J. P., see KAYE-SMITH, SUZILLA.

Fry, Roger Eliot (1866-1931), Eng. painter and critic; son of Sir Edward F. (q.v.). Educated at Clifton College and King's College, Cambridge Univ. Was a pupil of Francis Bate and also studied in Paris. He first attracted attention by an exhibition of 'Post-Impressionist' paintings which he organised in 1911 and 1913, but the ensuing controversy left him unmoved, and it was to him that the belated recognition of Cézanne in Britain was due. He ed. the *Discourses* of Sir Joshua Reynolds (1905) and wrote monographs on Giovanni Bellini, Mantegna, and Paul Veronese; but his merits as an artistic philosopher will be estimated rather on such pubs. as *Vision and Design* (1920); *Transformations* (1927); and *Reflections on British Painting* (1931)—works of a speculative as well as of a critical nature. His last work, *Last Lectures*, was pub. posthumously (1939). For a time F. was curator at the Metropolitan Museum, New York, and in 1933 he was appointed Slade prof. of fine art at Cambridge.

Fryatt, Charles Algernon (1872-1916), Eng. master-mariner; b. at Parkeston, Essex. In 1904 he was chief officer in the Great E. railway's Harwich-Rotterdam steamservice; in 1913, captain. When the submarine policy of the Ger. Gov. came into force Feb. 18, 1915, it became F.'s constant business to cross a war zone where his ship was liable to be sunk without warning. On the afternoon of Sunday, March 28, 1915, when navigating the S.S. *Brussels* from Parkeston to Rotterdam, he was met by submarine U33 near the Maas lightship. He disregarded the signal to stop, and steered for the submarine, which escaped by diving. The Ger. afterwards stated that he had allowed the U33 to approach for inspection. On the night of June 23-24, 1916, steaming home from the Hook of Holland, the *Brussels* was captured by a torpedo-boat flotilla and taken to Zeebrugge. F. was tried (for his alleged offence of March 28, 1915) at Bruges, July 27, 1916, and shot the same day. His widow received a special pension, and his body was brought home to Dovercourt, July 7, 1919.

Fryth, John, see FRITH, JOHN.

Fryxell, Anders (1795-1881), Swedish historian, b. at Hesselåskog, Dalaland, Sweden. He was educated at Uppsala and ordained in 1820. In 1821 he became doctor of philosophy at the univ. of Uppsala, and in 1840 was elected a member of the Swedish Academy. His chief work is *Berättelser ur Svenska Historien* (trans. 1844), a hist. of Sweden from the earliest times to the death of Gustavus III., which took forty-six years to complete. He also pub. a Swedish Grammar, the first systematic one in the language, *Conspiracies of the Swedish Aristocracy*, *The Literature of Sweden* (1860), and *History of my History* (1884).

Fuad I. (Ahmed Fuad) (1868-1936), king of Egypt, b. in the palace of Iqzeh; youngest son of Khedive Ismail Pasha. After his father's fall he went to Italy and studied at the military academy and artillery school at Turin. On return to Egypt married May 30, 1896, Princess Shivokar (b. in Constantinople)—they had one daughter, and were divorced. In 1917, on the death of his elder brother, Sultan Hussain Kamil, F. became sultan, and, the Brit. protectorate coming to an end, he was proclaimed king March 16, 1922. Married 1919 Princess Nazli—they had one son and three daughters. In 1927 he visited European capitals. In 1928 the constitution was suspended, but restored in 1929, in which year the king was in England and a treaty with that country was signed.

Fuad Pasha, Mehemed (1814-69), Turkish statesman, b. at Constantinople. He entered the civil service about 1836, and became secretary of the embassy in London. In 1851, and three times thereafter, he was made minister of foreign affairs, and in 1861 was appointed grand vizier. He commanded the troops on the Gk. frontier during the Crimean war, and also accompanied the Sultan Abd-ul-Aziz on his journey to Egypt and Europe. He

ably managed the foreign affairs of Turkey, and was remarkable for his bravery and promptness of decision, as well as for his wit.

Fuchow: 1. City in China, cap. of the prov. of Kiangsi, an important seat of trade in native paper. 2. Tn. of Manchuria in the prov. of Liaoning on the E. shore of the gulf of Liaotung, S. by W. of Newchwang (Yingkow).

Fuchow (Fukien), see FOOCHOW.

Fuchs, Leonhard (1501-66), Ger. botanist, b. at Memmingen, Bavaria. He studied classics at Ingolstadt under Reuchlin, and became prof. of medicine at Tübingen in 1535. Soon he took up the pursuit of botany, of which he must be looked upon as one of the fathers. His most important work on the subject is *De Historia Stirpium Commentarii Insignes* (1545). This work is beautifully illustrated, and gives a clever description of domestic plants alphabetically arranged. In it F. laid the foundation of a permanent botanical nomenclature. The fuchsia was named after him.

FUCHSIA

Fuchsia (Neo-Lat., named after Leonhard Fuchs (q.v.)), a genus of plants of the family Onagraceae, containing more than fifty known species, mostly natives of tropical America. The majority are shrubs, but some are acaulescent or climbing. The flowers are generally pendulous, four-petaled and of a brilliant and delicate colouring, red, purple, and white, pollinated by humming-birds. The leaves are opposite and verticillate. F.s. are much cultivated as greenhouse plants, and a certain small-growing variety is a common outdoor plant, which flourishes over a wide area in the Brit. Isles where the climate is not too vigorous.

Fuchsin aniline dyestuff of a magenta or red colour, consisting of a mixture of the hydrochlorides or acetates of pararosaniline and rosaniline. In commerce F. is known by various names, such as

magenta, aniline, rubine, roseine, etc., and it is widely used for dyeing purposes. Occasionally it is also employed for the colouring of confectionery and wines.

Fucino, Lake of (Lat. *Lucus Fucinus*), lake bed of the Abruzzi, Italy, in the prov. of Aquila. The level of the lake was subject to great variations, owing to lack of an outlet, and disastrous consequences were frequently the result of this. It was 37 m. round and 65 ft. deep. In A.D. 37 the Emperor Claudius constructed a tunnel 3½ m. long by which the surplus waters were carried to the Liris. It is uncertain when it finally went out of use, but various attempts were made to reopen it from 1240 onwards. In 1876 the lake was finally drained and the bed is now cultivated.

Fuegians, aborigines of Tierra del Fuego. They are divided into three distinct groups, viz. the Onas, the Yahgans, and the Alacalufs, in the E., centre, and W. of Tierra del Fuego respectively. The Yahgans are the true aborigines, closely allied to the primitive long-headed races of the new world. Very little is known of the Alacalufs, but they are probably of Araucanian descent. The Onas are similar to the Tehuelche Patagonians in their tall stature and the nomadic life they lead. The F. have dark brown, copper-coloured skins, and plentiful black coarse hair, their heads being particularly developed. They hunt and fish to supply themselves with food, and live in huts formed of tree-trunks and branches. They obey no chief, and do not appear to believe in a future life, though they are afraid of invisible beings and spirits. See E. Lucas Bridges, *Uttermost Part of the Earth*, 1948.

Fuego, Tierra del, see TIERRA DEL FUEGO.

Fuelling Stations. Wide commercial interests of Great Britain have long made it essential that ample stocks of fuel should be stored at convenient ports along the chief routes to the Far East and Australia, for the service of the R.N. and the Mercantile Marine. As long ago as 1878 a royal commission was appointed to deal with the whole subject, and on the basis of this commission's report in 1881 adequate arrangements were made for the provision of suitable stations, especially for the service of ships travelling to and returning from the Far East. In 1889 the widening of the Suez Canal was completed, and the old journey around the Cape became no longer necessary, and, in consequence, additional ports had to be provided which involved new arrangements at Port Said, Suez, and Aden. As a great deal of anxiety was expressed concerning the unprotected nature of these F. S. in time of war, a Naval Defence Act was passed in 1889, under which powers were granted for the provision of protection from attack by sea. Further uneasiness arose on the development of aircraft during the First World War, and efforts were concentrated on giving protection to these stations against aerial attack. In the old days F. S. were practically coal stores, estab. at convenient

points, but of recent years the substitution of oil for coal as a fuel has proceeded at a great rate, so that these ports have become chiefly oil depots. This in turn has had its effect upon the Mercantile Marine, in which tankers have taken the place of colliers to a remarkable extent. At the beginning of the First World War there were under 1,500,000 gross tons of oil tankers. When war again broke out in 1939 the total had grown to nearly 11,000,000 tons. The biggest of these ships can carry 16,000 tons of liquid cargo. There were then estimated to be 2000 vessels entirely devoted to carrying oil, nine-tenths of which were themselves oil steamers.

Fuel Research Board. The F. R. B. of the Dept. of Scientific and Industrial Research was estab. in 1917, with Sir George Beilby (q.v.) as the first director. The board, in its first report, stated that the two main lines of research envisaged were, in the first place, a survey and classification of the coal seams in the various mining dists. of Great Britain by means of chemical and physical tests in the laboratory, and, in the second place, an investigation of the practical problems to be solved before any large proportion of the raw coal burned could be replaced by the various forms of prepared fuel obtainable from coal by carbonisation processes. A fuel research station was constructed at K. Greenwich, containing the necessary plant, laboratories, and offices. This has been extended as occasion has demanded and now includes horizontal and vertical retort plant and also low-temp. plants. The Survey of the National Coal Resources still forms an important part of the board's work, while useful work has been carried out on low-temp. carbonisation. In addition much other useful work has been done and the results are available to the public in the form of excellent cheap technical papers pub. by H.M. Stationery Office. The present (1949) director of fuel research is Dr. A. Parker, and the chairman is Sir Harold A. Brown.

Fuels may be described as almost invariably carbonaceous materials which give rise to the phenomenon of heat in combining with oxygen. The carbon and hydrogen which are contained in the F. unite with the oxygen of the air to produce a greater or less amount of heat, according to the properties of the fuel and the manner in which it is burnt. The amount of heat which a fuel gives out during combustion naturally has a great influence on its value for commercial purposes, and this will be considered in detail. With regard to their origin, F. may be divided into three classes: natural, prepared, and liquid and gaseous F. To the first class belong wood, peat, lignite, and all kinds of coal; to the second belong compressed F. such as briquettes, etc., prepared peat and wood, charcoal, and coke; in the third class are found petroleum and its extracts, alcohol and certain hydrocarbons, such as benzol and naphthalene, coal gas, natural gas, water gas, and producer gas. From the point of view of

composition, the F. in the first two classes above fall into the category of solid F., liquid F. form a second class, and gaseous F. a third.

The combustible portions of all F. consist of one or more of the following ingredients: free carbon, free hydrogen, and carbon combined with one or more of the elements hydrogen, oxygen, and nitrogen. The heating or calorific power of a fuel is the quantity of heat generated by the combustion of a unit weight. The heat is measured in units; the standard unit now adopted in this country is called the Brit. Thermal Unit (B.Th.U.), and is the quantity of heat required to raise 1 lb. of water by 1° F. when at its maximum density, i.e. from 39.1° to 40.1° F. The scientific unit of thermal value is the calorie, which is the amount of heat required to raise a unit weight of water (at 39.1°) 1° C. Heat may be stated in calories or B.Th.U. for comparative and calculating purposes, but to engineers the evaporative duty of the coal is of the most importance, and this is usually stated as so many pounds of water at 100° C. (212° F.) converted into steam at the same temp. In the case of fn. gas, to facilitate calculation, the 'therm' was introduced by the Gas Regulation Act. One therm is equivalent to 100,000 B.Th.U.s.

An important point with F. is the quantity of inorganic matter they contain, as this constitutes the ash, the amount of which is an important factor in the suitability and economy of the F. In addition to the F. enumerated above, various kinds of vegetable refuse, such as brushwood, straw, cotton, stalks, etc., are used for heating purposes where better fuel is lacking. In various parts of France and Germany tan cakes made of the spent bark used by tanners are employed as fuel. A common fuel in India and Egypt is the dung of camels and oxen, which is moulded into thin cakes and dried in the sun; these have very little calorific power, and are characterised by an acrid ammoniacal vapour during combustion. The salient characteristics of the various F. are briefly as follows:

Wood.—The value of wood as a fuel varies with the amount of moisture therein and the ash which remains after combustion. Even after prolonged drying wood will contain from 17 to 20 per cent of moisture. The percentage of moisture in a few varieties of fresh-cut wood is as follows: Hornbeam, 18.6; sycamore, 27; oak, 31.7; pine, 39.7; elm, 44.5; larch, 18.6; poplar, 51.8. The percentage of ash in wood is on the average between 2 and 3. The calorific value of wood is low, as much heat is required to consume the moisture, and the percentage of hydrogen is very low. The charcoal which is made from wood has about a quarter of the weight of the wood used, and double the calorific value of an equal weight of wood.

Peat is formed of vegetable matter, such as mosses and aquatic plants, which, by the agency of pressure, have in time become converted to the spongy brownish-

black substance which is found in peat bogs. When cut out in square blocks and air-dried in the usual manner, its calorific power is roughly equal to that of wood. When the peat is excavated and compressed into briquettes by machinery, however, a really valuable fuel is produced which will bear comparison with the best coal. Peat represents an intermediate formation between wood and coal.

Coal may be classified into three main varieties: Lignite, bituminous, and anthracite. Lignite or brown coal is the least carbonised of any coal, showing indications of organised structure, and containing a considerable proportion of hydrogen and oxygen. Most of the coals found in the Brit. Isles are bituminous in character; there is a larger variety in this class of coal, which includes steam coals, coke and furnace coals, gas coals, and household coals. The coals which are most used for the house and general use are non-caking long-flame coals. From 70 to 80 per cent of carbon is contained in them, but little available hydrogen; their specific gravity is about 1.25. The coals which are most used for the manuf. of gas contain from 80 to 85 per cent of carbon, with a sp. gr. of about 1.3. Coking and furnace coals burn with a smoky flame of varying luminosity, and contain in some cases nearly one-third of volatile hydrocarbons. The best steam coals are anthracitic in character, being difficult to ignite and without much tendency to smoke. The sp. gr. varies from 1.34 to 1.41, and the percentage of carbon from 90 to 93. Anthracite coals are hard and dense in character, with a metallic lustre. Intense heat without flame or smoke is generated by anthracite, but as a powerful draught is required and ignition is difficult it is chiefly used in furnaces and engineering works. The sp. gr. of anthracite varies from 1.4 to 1.6, and the percentage of carbon is as high as 98.

Coke has been prepared from coal for many years, but it was not until 1800 that the preparation of coke was carried out on scientific principles, great improvements being effected. For many metallurgical processes coke is specially prepared in coke ovens from well-washed small coal. The chief requisites of a good coke are strength, infusibility, a low percentage of sulphur, and a high calorific power. The constituents of a first-class coke should be, 92.98 per cent carbon, 5.22 per cent ash, 1.3 per cent oxygen, .27 per cent sulphur, and .23 per cent nitrogen. According to theoretical calculations coke should be slightly more efficient from a heating point of view than coal, but in actual practice the results are about equal. There are certain varieties of coal which can be used most economically, for firing boilers, furnaces, and kilns, when in a powdered form. As a result pulverised fuel has developed considerably of late.

Liquid Fuel.—The use of liquid F. may be said to date from the middle of the nineteenth century. Of late years their use has greatly extended for steam raising

and small furnaces, as well as for internal combustion engines. The various petroleum distillates and residues represent the chief source of liquid F.; alcohol is also used, but to a less extent. The lighter extracts of petroleum, such as petrol, are well suited for high-speed internal combustion engines, such as are used in motor-cars, whilst the heavier residues are suited for producing heat for other engines, etc. At the present time Russia, Iraq and Iran, the Dutch E. Indies, and America supply most of the petroleum of the world, but oil has been found in many other places. Most fuel oils have about 85 per cent of carbon, from 10 to 13 per cent of hydrogen, and the remainder of oxygen, etc. Weight for weight the heating power of petroleum is about one-third greater than that of good coal. The following table gives some particulars about the chief varieties of oil fuel (reproduced by permission of Messrs. Constable & Co., from V. B. Lewes's *Liquid and Gaseous Fuels*).

fugal action which sprays it in an exceedingly fine condition. In the Swenson injector the oil is forced out in a jet on to the point of a V-shaped metal cutter, which divides it into very fine spray. In the second class of injectors the usual method is that the oil is led down into the injector by the force of gravity and there meets a steam jet which drives it out from the nozzle of the injector with a high velocity and in a fine state of div. The outrush of steam and oil is usually allowed to suck in the air around the jet to aid in the combustion. Among the best known types of this class of injectors are those of Holden on the Brit. Railways, those of Messrs. Hushden & Kelce, and those manufactured by Messrs. Armstrong, Whitworth & Company, invented by E. L. Orde. When liquid fuel is atomised by an injector, the burning vapour as it rushes out is generally brought into contact with either a layer of fuel or brickwork near the mouth of the furnace; or in some cases the furnace is bricked all the

The chief advantages of liquid F. are (1) greater calorific power and less weight; (2) occupies less space; (3) convenience of storing and loading; (4) greater speed in getting up steam; (5) complete control over combustion. Against these must be set the danger of explosion of stored oil, loss by evaporation, and in some localities increased cost. In oil engines the vapour of the oil is exploded with air in the cylinder, the heat thus generated providing the motive power. When used for producing heat the petroleum is injected into the furnace in the form of a spray. The most generally used method now consists of the direct atomisation of the oil so as to drive it direct into the furnace chamber in spray which is so finely divided as to act almost as a gas, thus ensuring complete combustion. This atomising action is carried out either by forcing the oil out from a jet at a considerable pressure, or by injecting it with steam, or air, or a combination of the two. The Korting injector is a good type of the first method. The oil, at a temp. of 130° C. is forced into the injector at a temp. of 50 lb. to the sq. in. When inside the injector the oil flows into a chamber feeding the jet, which is fitted with a spindle carrying a spiral screw. The oil is forced down this screw, and acquires a centri-

way round. Brickwork when so used should be jointed so as to allow plenty of room for expansion or it will become buckled and the outside will fuse. It becomes heated to a very high temp., and helps to ignite the oil vapour and air which enter the furnace; if the oil jet is made to dash against it, it serves to disintegrate and gasify it; it also prevents the flame from passing too rapidly through the furnace and saves the plates from the direct impact of the former. For this purpose various forms of brick battles are also used.

Gaseous Fuels are now used in many metallurgical processes, as in the Siemens-Martin steel process. Re-heating and other furnaces also use gaseous fuel; and in the various types of gas engine gas is extensively used as a prime motor. Large quantities of combustible gases are obtained from the earth in the U.S.A., Russia, China, and other places; these are known as 'natural' gases. The natural gas found in Pennsylvania and Baku contains from 80 to 90 per cent of methane, and is the most valuable of gaseous F. from a calorific point of view, but the supply is diminishing.

Manufactured gases are of four main varieties: (1) Coal gas, produced by the distillation of coal in closed retorts; (2)

water gas, made by the action of steam on incandescent carbon; (3) generator or producer gas made by the passage of air through incandescent carbon; (4) mixed producer and water gas, called semi-water gas, made by the passage of both air and steam over highly heated fuel. Coal gas is used for lighting, heating, and cooking purposes and for gas engines; it is much in favour for both power and fuel purposes. When used for the latter purpose it is burnt at a very high temp., mixed with air in atmospheric burners; important features are the absence of mess, dirt, and smoke, and the ease and exactitude with which it can be regulated. Water gas depends for its formation upon the fact that at a high temp. carbon has a greater affinity for oxygen than has hydrogen, and that when steam and carbon in any of its amorphous forms are heated to such temp., the steam is decomposed, with liberation of either carbon monoxide or carbon dioxide, according to the temp. and the quantities of steam and carbon interacting. The value of water gas thus produced depends on the closeness of the approximation to ideal conditions. Water gas is largely used for welding and other engineering works, and when mixed with the gases formed by the decomposition of various grades of oil, forms the basis of carburetted water gas. Water gas is also used as the starting material in the manuf. of many important chemicals. Producer gas, which possesses the least thermal value of the four varieties, is a mixture of carbon monoxide and nitrogen. Air is passed through a column of heated coke, when the carbon at the lower surface thereof combines with the oxygen of the air to form carbon dioxide; this is turned into carbon monoxide by contact with the heated carbon over which it has to pass, and, in combination with the residual nitrogen from the air, forms producer gas. Siemens' producer gas differs from ordinary producer gas in that small coal or slack is used instead of coke. The gas thus produced has a higher thermal value. Mond's gas is an extremely cheap form of producer gas, made from a cheap bituminous coal slack. Arrangements exist in the process for the recovery of ammonia, which in other producers is wasted, and a sufficient quantity is recovered to pay for the fuel used, thus compensating for the low calorific power of the gas. The large amount of carbon dioxide and nitrogen present accounts for the low thermal value of producer gas. Gas generators which work on the suction system find considerable use for the working of gas engines. The charge of gas is drawn into the engine directly from the producer, in which a mixture of air and steam is drawn over red-hot anthracite. The cylinder is in direct communication with the producer, and the back stroke of the piston causes a fresh mixture to be drawn over the anthracite. A cheap form of gaseous fuel is thus obtained, when required, by a self-contained plant.

A large number of gas generators is now made in which air and steam are simultaneously passed through incandescent F.

in such proportions that the formation of producer gas, by the partial combustion of the carbon and the hydrogen of the air, raises the temp. in the same ratio as the decomposition of the steam, by the red-hot carbon, into water gas, lowers it. Thus a uniform temp. obtains in the generator, and a gas is produced which is practically a mixture of generator or producer gas with water gas, but which has a higher calorific value. The systems of Wilson, Dowson, Dawson, and Duff are based on this principle. The gases which until recently were blown to waste from the mouth of gas furnaces are now made use of, and have been shown by Bryan Donkin to be suitable for specially constructed gas engines. In the case of furnaces in general, increasing use is being made of the so-called 'waste-heat' of the products of combustion. The heat is generally recovered by passing the gases through fire-tube boilers.

The heating value of a gaseous fuel can be calculated by assigning to each constituent its calorific value, when the proportions of the mixture of combustible gases in the fuel are known by chemical analysis.

Analysis does not reveal the manner in which the hydrogen and oxygen are combined with the carbon, but merely the percentage of each element present; the heating value cannot therefore be calculated from analytical data with any degree of accuracy. An experimental determination is thus not only the simplest, but also the only reliable method of finding the calorific value of a solid or liquid fuel, and as an exact chemical analysis of a mixture of gases is a tedious and difficult operation, the experimental method is better in the case of a gaseous fuel.

Instruments for finding the heating value of a fuel are known as calorimeters. In all calorimeters the method adopted is to burn a weighed quantity of the fuel in oxygen so as to impart the heat produced to a known quantity of water. The many varieties in use differ in the method of carrying out the combustion of the fuel and of imparting the heat to the water, but may all be referred to one or other of three types. (1) Where the combustion of the fuel is effected with the admixture of a solid oxidising agent, as is done in the Lewis Thompson calorimeter. (2) Where the combustion is carried out in oxygen at constant pressure; (a) when the temp. of the escaping gas is undetermined, as in the Wm. Thomson calorimeter; (b) when the temp. of the escaping gas is under control, as in the Fischer calorimeter. (3) Where the combustion is carried out with oxygen at constant volume, as in the Berthelot, Mahler, Mahler-Donkin, or Mahler-Krocker calorimeters. The bomb calorimeter, belonging to the third class, is the most accurate, but that of Lewis Thompson is the most widely used, although the least accurate, as it is very easy to manipulate. All the above calorimeters are primarily designed for solid F., and if liquid F. are to be tested, the platinum crucible or holder should contain kieselguhr, on to which the

oil should be dropped. For testing the heating power of a gaseous fuel a Simmance-Abady calorimeter is one of the best; this is a modification of the original Junker calorimeter.

With the introduction of the Gas Registration Act, recording calorimeters, which give a continuous record of the heating value of the gas, have come into use. These ingenious instruments correct automatically for changes in barometric pressure, temp., humidity, and sp. gr. of the gas. The most important types are the Fairweather and the Thomas. The Simmance-Abady calorimeter is easily modified for use with light oils, alcohol, etc., a small lamp on a sensitive balance is used instead of a gas burner and meter. For further details see the articles on FISCHER-THORSCHE PROCESS, GAS, HEAT, COAL, and CARBONISATION, and the various gases herein mentioned. See also E. J. Mills and F. J. Rowan, *Fuel and its Application*; P. Bateson, *Fuel Purification*, 1891; Sir E. Lowthian Bell, *Gaseous Fuel* (J.I.S.I., vol. II.) 1889; R. Galloway, *Fuel*, 1901; H. L. Payne, *Fuel Value of Gases*; V. B. Lowes, *Oil Fuel*, 1913; J. Brame, *Fuel: Solid, Liquid, and Gaseous*, 1919; J. H. Nicolls and C. H. Mohr, *Fuel Analysis*, 1934-36, 1937; and E. Wright and H. F. Fuente Ovejuna, tn. in Spain, 45 m. N.W. of Córdoba. It has mines of argentiferous galena, and one of its prin. industries is meat-curing. It also produces a quantity of honey. Pop. 17,000.

Fuenterrabía, or Fontarabía (Fr. Fontarabie), fortress in Spain in the prov. of Guipuzcoa, at the mouth of the It. Bidasoa, on the Fr. frontier, 9 m. from San Sebastián. In 1638 it was unsuccessfully attacked by the Fr. under the duke of Herg. In 1813, however, Wellington succeeded in crossing the Bidasoa, near the tn., although strongly opposed by Somit. Milton confounds F. with Roncesvalles. Pop. 5500.

Fuero (Lat. *forum*), in Sp. law a term of wide import, but generally used to denote (1) General codes of law, or bodies of customs, such as the F. Viejo of A.D. 990 and the F. Juzgo; and (2) special tribunals having jurisdiction in cases relating to certain depts., such as the army and navy, or the post office. F. Juzgo was the code of laws estab. by the Visigoths as the *forum judicum*, and which later, after the reconquest of Spain, in the middle of the thirteenth century, by the Christians, continued to be administered by separate courts and judges for the Mozárabes, i.e. Christians who had lived under Muslim rule and assimilated themselves to the Arabs. This F. applied to Mozárabes wherever no provision was made by royal privilege, or by special charters, or Fu., as they are also called, such charters of Fu. being, as in medieval England, privileges granted to cities or tns. in consideration of the payment of dues to the owner of the land. No common tribunal administered the F. Juzgo, and it was subject to a great number of local jurisdictions. Many of its provisions

are still in force, but a number of unchartered tns. in 1260 adopted the F. Real, a code promulgated by Alonzo el Sabio in 1255, as a preliminary to a larger digest or code called *Las Siete Partidas*. But the latter, even when formally promulgated a century later, was expressly made subject to all existing Fu. The F. de Salamanca was a code of civil law promulgated in the beginning of the twelfth century for Salamanca, and there were a number of other such municipal Fu. for the government of different tns. and the administration of justice in them. Spain was early the home of a highly specialised local gov., acknowledging scarcely any relation to a central administration. In the provs. these written or unwritten codes of laws relating to legislative, judicial, and administrative functions were called Fu. or *Jors*; those of the tns., *cartas-pueblas* (tn. or vill. charters). Like the common law of England, or rather the special customs (see under COMMON LAW; CUSTOMS; CONSUETUDINARY), these Fu. owed their strength to their immemorial antiquity, although unlike Eng. customary law they owed their formal recognition to some royal grant or grant by a lord paramount. As in England some Sp. monarchs, e.g. the Castilian, were bound on their accession to swear to observe the Fu., but when Spain became united under an absolute monarchy, most of the Fu. were openly violated, one marked exception, however, being the Fu. of the Basques. See F. M. Marina, *Ensayo historico-crítico sobre la antigua legislación y principales cuerpos legales de los reynos de León y Castilla*, and M. de Colmeiro, *Curso de derecho político según la historia de León y de Castilla*, 1873.

Fuente Ventura, or Forteventura, one of the Canary Is., in the I. of the archipelago, separated from Lanzarote in the N. by the channel of Becania. Cap. Betancuria near the W. coast. Pop. 13,100.

Fuessli, Johann Heinrich, see FUSELI, HENRY.

Fugger, Swabian trading family, who lived at Augsburg, and who became so wealthy that they frequently financed the military expeditions of Ger. monarchs. The founder of the family was Johann (or Hans) F., a master weaver of Graben, near Augsburg. His son, Johann, became a citizen of Augsburg by marriage and an assessor of the dreaded *Fehmgericht* (see FEHMIC COURTS). His eldest son, Andrew, known as 'the rich Fugger', became the founder of a noble line, F. von Reh, which became extinct towards the end of the sixteenth century. Jacob, the second son of John, and the first of the family who owned a house in Augsburg, became head of the guild of weavers. His sons, Ulrich, George, and Jacob, all men of great energy and resource, enormously increased their patrimony—Ulrich as a trader of varied operations, and Jacob by exploiting the Tyrolean mines to such purpose that he lent the Archduke Charles of Austria 150,000 florins and built the castle of Fuggerau. All three brothers married women of rank and were themselves on-

nobled, by Maximilian. For a large loan this monarch mortgaged to the brothers the properties of Kirchberg and Weissenhorn. Jacob (*d* 1525) founded in the outskirts of Augsburg the Fuggerei, a settlement of about fifty double dwelling houses for needy people. Jacob and the sons of Ulrich *d* without issue, so that the family property passed to the sons of George. In consideration of the help rendered to him in the early sixteenth century by the two brothers, Raimund and Antonius, sons of George & King Charles V gave them the mortgaged properties mentioned above, and created them counts with princely

refuge in some other part of the Brit Empire, may be arrested and brought back under the Fugitive Offenders Act, 1881, either (a) upon a warrant duly endorsed by the colonial governor, or by a judge of the supreme court in the colony to which the offender has fled, or (b) upon a provisional warrant issued by a colonial magistrate upon such evidence and in such circumstances as would justify such a warrant if the offence had been committed within such magistrate's jurisdiction. These provisions extend also to countries to which the Foreign Jurisdiction Acts (*qv*) apply but where the

German State R. 11235 Tourist Dept

THE FUGGEREI, AUGSBURG
Sixteenth century

privileges. Later after they had financed his expedition against the Algerian pirates the king gave them the right to issue their own gold and silver coinage. Notwithstanding their exalted rank they continued their mercantile activities and Antonius (*d* 1560) left a fortune of 1,000,000 gold crowns in addition to other estate in various countries. Raimund (*d* 1535) and Antonius were founders of two great lines which were continued to modern times. The fortunes of the F family were some indication of the prosperity of Germany before the country was nearly ruined by the Thirty Years war. There are memorials to the F family in Augsburg. See R. Ehrenburg, *Capital and Finance in the Age of the Renaissance: a Study of the Fuggerei and their Connections* (trans. 1928).

Fugitive Offenders Act, 1881 A person who has committed a crime in the British Isles, and who, to avoid arrest has taken

offence has escaped to any other foreign country, he can only be got back under the terms of an extradition treaty. If the magistrate before whom the fugitive is brought thinks there is *prima facie* evidence of guilt he may commit or send the accused back for trial to the country or place where he is alleged to have committed the offence (*locus delicti commissi*). When at the *locus delicti* the accused is entitled to a trial within six months and if not tried within that period, or if acquitted he is entitled to be paid his passage money back either to the place of arrest or his intended destination at the time of arrest. In any case if not sent back for trial within one month of commitment he is entitled to be discharged. The judicial hearing of a case under this Act must be at Bow Street police court and in Scotland before the sheriff of Edinburgh. By an Act of 1915 persons may be arrested for treason and other

crimes, in any of the colonies and protectorates, and vice versa. See Earl of Birkenhead, *International Law* (6th ed.), 1927.

Fugitive Slave Laws In the U.S.A., prior to the constitution, there were no F.S.L. it being left to the comity (q.v.) of the different states or colonies to surrender slaves who had escaped from the places where they were held to service. In 1787 the different slave holding states inserted provisions in their constitutions regulating the surrender of fugitive slaves and these provisions later found expression in the federal constitution and in 1850 Congress strengthened the provisions by regulating the mode of arrest, trial, and surrender of fugitive slaves. This Act was repealed in 1864. The

being fully exploited by means of canon, synecdoche, and the introduction of episodes, the section works up to a climax over a pedal point, usually the dominant, and so leads to the recapitulation. In this section the material is greatly elaborated by various polyphonic devices, the whole work being thus brought to a conclusion in a passage of vigour and intensity (*stretto*). Although many sixteenth century experiments were designated by the title of *fuga* they were nothing more than canons, it was not until the latter part of the seventeenth century that the true F. was accomplished. The greatest master of it was J.S. Bach who not only wrote many fine organ Ls. which have not been surpassed but also originated the pianoforte L in his

THE CRIST OF FUJI SAN
A photograph from H. G. Lonting's *In Lotus Land*

L.S.L. are now of merely historical interest as the amended constitution prohibited the slave trade altogether. In England at a time when the status of serfdom existed (*glebae ascriptus* attached to the soil) it was a generally recognised principle that a serf who succeeded in evading capture for a year and a day obtained his freedom and further in time, serf could always purchase his freedom. No analogous provisions are to be found in the old American S.L. It may be said indeed that the constitutional freedom of the negro subject left no room for F.S.L.

Fugue, highest form of contrapuntal art, and the aesthetic and technical climax of the possibilities of the polyphonic school of music. A L commences with the statement of a subject by one part, followed by the restatement or answer by a second part, during which the first proceeds with a counter-subject, the third and succeeding parts being introduced in the same manner. When all the parts have been brought in, a free fantasia follows, in which the subject is developed at length, its contrapuntal possibilities

well exemplified (*Kluger* (1722-14) whilst the early eighteenth century oratorios of Bach and Handel contain some excellent examples of the chorale L. See G. Oldroyd *The Technique and Spirit of Music*, 1914).

Fuhnen, see LUNEN.

Fuh-Shin, see LASHIN.

Fuji-San, **Fujino-yama**, or **Fujiyama**, highest mt. in Japan (about 12,000 ft high) visible from Tokyo, 60 m. distant. It is a regular snow-capped volcanic cone, and is a favourite subject with Japanese artists. The last eruption occurred in 1707.

Fujuwara, see JAPAN, *History*.

Fukien, maritime prov. in China bounded on the S.E. by the Chiuai Sea and on the other sides by the provs. of Chekiang, Kwangsi and Kwangtung. Its area is 15,833 sq. m. The surface is very mountainous and the prov. is noted for its beauty, the mts. clad with timber and shrubs, forming a picturesque background. The prin. riv. is the Minkiang, which enters the sea below Foochow, the cap., which is celebrated for its fruits, and produces a considerable quantity

of ginger. The prov. produces tea, camphor, tobacco, sugar (cultivated in the irrigable country), indigo, and alum, which form its chief exports. The prosperity of Taiwan (Formosa) has spelt the decline of F., especially in the tea trade, though there is still a fair trade in flower-scented teas and in camphor production. But there is a good timber industry, the chief woods being fir, rosewood, and pine; and paper is manufactured from bamboo pulp. The mineral resources include coal and iron and the precious metals. Clay for the porcelain manuf. of Min ware is also important (see CHINA—Chinese Art). The coast people are engaged in trading and fisheries. The prov. was controlled by Japan until its liberation at the close of the Second World War. Pop. 11,101,000.

Fukui, tn. and prefecture in Japan, near the N.W. coast of Honshu, 86 m. N.N.E. of Kyoto. The tn. became an important educational centre at the Renaissance. Paper is manufactured there, and it is noted for its silk manuf. and tinned crabs. It is one of the chief tns. of the empire. An earthquake in June 1948 caused 12,000 casualties, including 1500 dead, in the prefecture. Pop. (tn.) 75,200; (prefecture) 646,700.

Fukuoka, tn. and prefecture of Japan, on the N. coast of Kyushu 90 m. N.N.E. of Nagasaki. The tn. has a number of fine streets and an old castle, and was famous for its silk and woven-picture fabrics. Pop. (tn.) 291,000; (prefecture) 2,750,000.

Fukushima, tn. and prefecture, Japan, in the prov. of Iwashiro, Hondu, 168 m. from Tokyo. The tn. is an important centre for trade in raw silk and cocoons. Pop. (tn.) 18,500; (prefecture) 1,580,000.

Fukuyama: 1. Seaport of Japan, 60 m. from Hakodate, formerly the seat of the lords of Matsunai. Pop. 10,000. 2. Tn. of Japan, 110 m. S.W. of Kobe, on the S. coast of Hondu. Pop. 58,200.

Fulahs, Fellata, Fulani, Fellani, or Foulhs (plural Fulbe), important ruling Hamite-Negro race in Nigeria and Fr. Sudan, founders of the sultanates of Sokoto (q.v.) and Gando (q.v.). They are of a light brown or copper colour, of good stature, with Caucasoid features, black hair, and negroid speech. Their name undergoes many changes, as indicated above. They seem to have migrated westward at an early period, and gradually extended their influence to the E. The F. is divided into four great branches, viz. the Jel, the Baa, the So, and the Ieri, each containing sev. tribes. They number from about six to eight millions, and towards the close of last century their sultans were a source of much trouble to legitimate Brit. trading interests. The estab. by the National African Company, between 1886 and 1896, of trading stations on the Niger and Benue brought the Brit. into contact with these vigorous Moslem emirates of the N. interior. The Fulani rulers of Kano and Sokoto and the neighbouring terns represented a century-old wave of Moslem conquest from the Sudan superimposed upon a much older Moslem element dating from the Middle Ages.

These Fulani states were strongly administered, warlike, and ruthless in slave-raiding among the pagans and in maintaining the ascendancy of the ruling class by bloodthirsty methods. Although the company had made treaties with them there was an obvious incompatibility between the two views of what constituted desirable government, and a warlike period began in 1897. Later, in a period of difficult relations here with the Fr., at a time when the Moslem states still remained to be settled with, it was evident that a trading company was unequal to the responsibilities that would fall upon it, and in 1899 the company's (now Royal Niger Company) charter and governing powers were withdrawn and Col. F. D. Lugard (q.v.) became high commissioner for the newly constituted protectorate of N. Nigeria. His first task was to subdue the N. emirates, whose sultans would not give up slave-trading without a struggle. Already the company had had some fighting with the sultan of Sokoto, but the result was inconclusive. In 1902-3 Lugard, with inadequate forces and great exertions, overcame the Fulani rulers, and brought their ter. within the area to be ruled by their Brit. suzerain, and according to Brit. ideas of justice and humanity. See Lady Lugard, *A Tropical Dependency*, 1904, and M. Delafosse, *Haut-Sénégal-Niger*, 1912.

Fulcrum, see LEVER.

Fulda, Ludwig (1862-1939), Ger. poet and dramatist, b. at Frankfurt-on-Main. His one-act verse comedy, *Die Aufschüßigen*, gained him a prize in a competition in 1882, and his dramatic career may be said to have begun with his tragedy, *Christian Gunther*, the same year. This was followed by a series of comedies, including *Ein Meteor* and *Die wilde Jagd*, and some dramas, amongst which are *Das verlorene Paradies* and *Die Zwillingsschwester* (1901). In 1893 he won the Schiller prize with his dramatic fairy tale, *Der Talisman* (1893). F. also wrote *Jugendfreunde*; *Kaltwasser*; *Novella d'Andrea*; and a vol. of dramatic studies entitled *Aus der Werkstatt*. His trans. from the Fr. are masterly, notably those of Molière, under the title of *Meisterwerke*. His later works included *Amerikanische Eindrücke* (1906); *Der Dummkopf* (1907); *Herr und Diener* (1910); *Die Rückkehr zur Natur* (1911); and *Des Keels Schatten* (1920). See monograph by A. Kloor, 1922.

Fulda, tn. of Hesse, Germany, and formerly cap. of Hesse-Nassau, Prussia, on riv. of the same name, 69 m. N.E. of Frankfurt. A Benedictine abbey was founded here in 744, to which the tn. owes its origin. Among the most prominent buildings are the cathedral, erected early in the eighteenth century, containing the remains of St. Boniface, founder of the abbey, and the old palace of the prince-bishops. The chief industries are weaving, spinning, dyeing, tanning, enamels, etc. Pop. 7,700.

Fulgentius (Ger. monk), see GOTTSCALK.

Fulgentius, Fabius Planciades (c. 480-550), Lat. writer and grammarian of N.

Africa, probably related to St. F. (q.v.), with whom he must not be confounded. The inflated style of his works affords strong indications of African origin. Four works, which bear evident marks of the same hand, are ascribed to him, and all represent the late African style. The *Liber Physiologus* and others are lost. The four extant works are *Mythologiarum liber iii. ad Catum Presbyterum* (the identity of Catus is unknown)—a collection of seventy-five myths connected with the hist. and exploits of gods and heroes, but marred by extravagance and unsound Gk. etymology; *Expositio sermonum antiquorum cum testimoniis ad Chalcedicum*—a glossary of obsolete words and phrases, but unreliable, it is often printed with or appended to the *De compendiosa doctrina* of Nonius Marcellus; *Liber de expositione Virgilianæ continentis ad Chalcedicum grammaticum*—a title which means an explanation of the *Æneid* as a picture of human life or of the esoteric truths allegorically conveyed in Virgil's poems; and *De exitibus mundi*. See M. Zink, *Der Mytholog Fulgentius*, 1867; R. Helm (editor), *Fulgentii Opera*, 1898; and H. Liebeschutz, *Fulgentius Metaphorialis* (on his influence on medieval mythology), 1926.

Fulgentius, St. (468-533), early Christian prelate. Made bishop of Ruspe in Numidia, N. Africa, 507 or 508, but evidently against his will. As the result of a disputation with Thrasimund, king of the Vandals (496-523), an Arian who had abated somewhat of the persecution of his predecessor Genseric against the Catholic Christians, he was banished from his see (510-23), but was restored (523-32). He then retired as an ascetic to a monastery on the is. of Circe. Wrote Lat. treatises against the Arians and Pelagians (ed. by Ilurter, Innsbruck, 1884). Regarded as one of the fathers of the Church. Works: *Ad Trasimundum regem Vandalorum libri tres* (three books to King Thrasimund); *De Veritate prædestinationis et gratiæ Dei* (on the truth of predestination and the grace of God); *De Fide*; *De remissione peccatorum* (on the remission of sins). See ed. by J. P. Migne, *Patrologia Latina*, vol. lxx. Life by A. Mally, 1885. See also O. Bardenheuer, *Patrologie* (Freiburg), 1901.

Fulguria, or Fulguro, see FULGUR.

Fulgurites (Lat. *fulgur*, lightning), in petrology, the name given to rocks whose surface has been fused by lightning, and to the characteristic holes thus formed. Examples of the kind have been found on Ararat, in the Alps, Pyrenees, and elsewhere, the surface showing in parts a thin, glassy crust or film, like a coat of varnish. Another kind of F. (vertical sand-tubes, sometimes half an inch in diameter) is found in dry sands, as on the sand-hills of S. America and N. Africa. They often run downwards in the sand for sev. feet, branching off and gradually lessening in their course. The glassy material is seen under the microscope to contain grains of sand and many small cavities. Minerals like mica and felspar are fused more easily than quartz, but sometimes silica abounds in F. glasses.

Fulham, parl. bor. and suburban par. of London co., England, 2 m. from Hammer-smith, 5 m. from St. Paul's, on R. Thames, just opposite Putney. Putney Bridge and Parson's Green are its nearest stations on the Metropolitan railway. F. Palace has been a residence of the bishops of London since 1141, the present building being mostly about a century old, surrounded by beautiful grounds overlooking the riv. The tombs of many bishops are in the church, and the place has memories of Bodley, Florio, Hallam, Crotch, and others. The fine market gardens are now mostly built over. F. returns one member to Parliament. Pop. 104,400.

Fulica, see COOT.

Fuller, George (1822-84), Amer. artist, noted as a portrait painter. He studied under H. K. Brown, the sculptor, in Albany (1842-43), exhibiting a portrait of him in 1857, and becoming associate of New York National Academy. He had an original, poetic style, and was a forerunner of the idealistic school. He travelled in Europe in 1860. His best works are 'Turkey Pasture in Kentucky' (1878); 'The Romany Girl' (1879); 'And she was a Witch' (1879); and 'Winifred Dysart' (1881). See van Rensselaer, *Six Portraits*, 1889.

Fuller, John Frederick Charles (b. 1878), Brit. soldier who has gained fame in connection with the development of tanks. Major-general, 1930. Campaigns: S. African war, 1899-1902, and First World War. It was mainly through his energetic advocacy and the part he played in the use of tanks in the First World War that the weapon became a success not long after it was first used at the battle of Cambrai (q.v.). His work, *Tanks in the Great War, 1914-18* (1920) reveals the grip he had on the potentialities of this war machine. He held staff appointments continuously from 1907 until he retired in 1932. When it was decided to introduce mechanised brigades he was appointed military assistant to the chief of the Imperial general staff in 1926. He has written numerous works of military science, including *British Light Infantry in the Fifteenth Century* (1925); *Sir John Moore's System of Training* (1925); *Foundations of the Science of War* (1926); *The Generalship of Ulysses Grant* (1929); *War and Western Civilisation, 1832-1932* (1932); *Empire Unity and Defence* (1934); *The Army in my Time* (1935); *Towards Armageddon* (1937); and *Armaments and History* (1946).

Fuller, Sarah Margaret (1810-50), Amer. critic and essayist, b. on May 23 at Cambridgeport, Massachusetts. She was educated by her father, a stern and unbending taskmaster, who exerted a great influence on the shrinking and sensitive nature of his child, and whose exactions helped to impair her never robust health. In 1839 she issued a trans. of the *Conversations of Goethe with Eckermann*. She became a member of the Transcendental Club, in which Emerson took a prominent part, and on the foundation of the *Dial* (q.v.), the literary organ of the club, she accepted the editorship, with George Ripley as

assistant editor. This was in July 1840, and for two years Margaret F. struggled to keep the paper afloat in the face of financial stress. In 1844 she pub. her first vol., *Summer on the Lakes*, and in 1845 *Woman in the Nineteenth Century*. In the same year she joined the staff of the New York *Tribune* as literary critic, under Horace Greeley, and in 1846 her contributions to the paper were reprinted as *Papers on Literature and Art*. In the next year she went to reside in Italy, and in Rome she met her husband, Giovanni Angelo, Marquis Ossoli, an adherent of Mazzini. During the siege of Rome in 1849 by the Fr., she took charge of a hospital; but after the capitulation of the city and the total loss of her husband's property she decided to return to America. Settling sail with her husband and her infant child on May 17, 1850, she made a successful voyage until nearly arrived at New York. Then on July 16 the vessel was wrecked on Fire Is. Beach, and she and her husband and child were drowned. Thus perished a woman remarkable for her culture, her courage, and greatness of intellect. Her *Autobiography*, with memoirs by Emerson, Chanulug, and Clark was pub. posthumously in 1852, and sev. lives have been written, notably those of Julia W. Howe, 1883; T. W. Higginson in 1884; and K. Anthony in 1922.

Fuller, Thomas (1604-61), Eng. author and divine, b. at Aldwinkle in Northamptonshire, his father being rector of the par.

THOMAS FULLER

He went to Queens' College, Cambridge, where he graduated in 1628, and two years later was appointed to the curacy of St. Benedict's. He became rector of Broadwindsor, Dorsetshire, in 1634, but gave up his living in 1641, and settled in London, taking a curacy at the Savoy church in the Strand. His *History of the Holy War* had appeared in 1639, and on coming to London he pub. the *Holy and Profane State* (1642), his most characteristic work. He was a chaplain in the

royal army during the Civil war, and a strong adherent of the royal cause; and during this time wrote, for the encouragement of his men, *Good Thoughts in Bad Times* (1645) and a sequel, *Good Thoughts in Worse Times* (1647). In 1648 he was appointed to the living of Waltham in Essex, and ten years later received the living of Cranford in Middlesex. At the Restoration he was appointed chaplain extraordinary to the king. One of F.'s characteristics is his quaint humour, though his wit is never forced, and, like Hood, he plays upon words instinctively. His writings are remarkable for wisdom and imagination, as well as pathos, when occasion demands. Amongst his numerous works, besides those already referred to, may be mentioned *A Pisgah Sight of Palestine and the Confines Thereof* (1650), with maps and views, a geographical account of the Holy Land; *The Church History of Britain from the Birth of Christ until the Year 1648* (1655); *Miscellaneous Contemplations in Better Times* (1660); and *The Worthies of England* (pub. posthumously, 1662), etc. See S. T. Coleridge, *Literary Remains*, 1836; E. K. Broadus (ed.), *Thomas Fuller: Selections, with Essays by Charles Lamb, Leslie Stephen, etc.*, 1929. Lives by A. T. Russell, 1844; J. E. Bailey, 1874; M. Fuller, 1884; E. N. S. Thompson, *Literary Hypothesis of the Renaissance*, 1924; and D. B. Lyman, 1935.

Fuller's Earth (A.-S. *fullere*, from Lat. *fullo*, *fuller*), pulverulent material resembling clay in appearance, fine-grained, and of a variable colour without plasticity, formerly much used for fulling cloth and wool, that is, cleansing these materials of oil and grease, from whence it derives its name. Nowadays it is more generally employed for clarifying cottonseed and lubricating oil, as a filtering material, absorbing their impurities. F. E. was at one time only mined in England, chiefly at Nutfield, near Reigate, Surrey, and also at Woburn and near Bath, and was considered of great value, its exportation being prohibited. Recently, however, deposits have been discovered in various localities in the U.S.A., chiefly in Florida. See *Mineral Resources of the United States*, issued by the U.S.A. Geological Survey (Washington, annually). Cimolite, a variety of F. E., is found in the Is. of Argentiara, Greece, and has been mined from ant. times.

Fullerton, Lady Georgiana (Leveson Gower) (1812-85), Eng. philanthropist and novelist; daughter of the first earl of Granville. Her earlier works include *Ellen Middleton* (1844) and *Grantlyn Manor* (1847). In 1846 she entered the Rom. Catholic Church and later wrote controversial novels on Catholic subjects, including *Lady Bird* (1852); and *Constance Sherwood* (1855). See lives by A. Craven (trans. from the Fr. by H. J. Coleridge), 1888; C. M. Yonge, 1897; and M. Oliphant, *Victorian Novelists*, 1892; F. M. Taylor, *The Inner Life of Lady Georgiana Fullerton, with Notes of Retreat and Diary*, 1899.

Fulleylove, John (1847-1908), Eng. oil and water-colour painter, especially of landscapes. He was early articted to a

firm of architects, and exhibited from 1871 at R.A., R.I., and R.B.A. His pictures show great feeling for colour and atmosphere, together with excellent drawing. He produced two series of drawings of the Oxford and Cambridge colleges and churches. F. became a member of the Royal Institute of Painters, 1879.

Fulmar, see PETREL.

Fulminates, class of salts derived from fulminic acid, $C:N:OH$; they are isomeric with cyanates, but explode violently when struck or heated. The two chief are fulminating mercury and silver. The first is obtained by heating mercury with alcohol and nitric acid. The white, silky crystals are used in manufacturing percussion caps. Brugnatelli's fulminating silver was first obtained in 1798, a year before Howard's mercury, which merely substituted mercury for silver in the heating process. The white needles are bitter and poisonous. Fulminates of sev. other metals are known. See J. F. Thorpe, *Dictionary of Applied Chemistry*, 1922.

Fulminic Acid ($C:N:OH$), an organic acid isomeric with cyanic acid. Its salts or 'fulminates' are very explosive and used as detonators. The free acid is also very explosive, and the vapour poisonous like that of prussic acid. It and its salts are interesting inasmuch as they contain a bivalent carbon atom, the normal valency of element being four.

Fulton, Robert (1765-1815), Amer. mechanician and engineer of Irish parentage. From 1786 he studied under West in England, taking out patents for sev. inventions. F. was in Paris, 1797-1804, and devoted considerable attention to steam navigation. By 1803 he had constructed a small steamboat which navigated the Seine. His inventions included flax-spinning and dredging machines, and a submarine or torpedo (Nautilus, 1801). Disappointed by his reception in France and England, F. returned to America, and was employed by the gov. in making canals. In 1807, with Livingston, he perfected the discovery of steam navigation, and launched the *Clermont*, which went from New York to Albany (150 m.) in 32 hrs. Speed was soon considerably increased. F. pub. *Treatise on the Improvement of Canal Navigation* (1796) and *Torpedo War* (1810). See lives by C. D. Colden, 1817, and C. Montgomery, 1825; and T. W. Knox, *Fulton and Steam Navigation*, 1893; Mrs. A. C. Sutcliffe, *R. Fulton and the 'Clermont'*, 1909; R. H. Thurston, *History of the Growth of the Steam-engine*, 1878; and H. W. Dickinson, *R. Fulton: Engineer and Artist*, 1913.

Fulton: 1. City of Oswego co., New York, U.S.A., on the Oswego Canal, 24 m. from Syracuse. It is on the New York, Ontario, and W. and other railways. It has flour, pulp, paper, and woollen mills. Pop. 13,300. 2. Cap. of Callaway co., Missouri, U.S.A., 26 m. from Jefferson city. It has a state asylum for the insane, a deaf and dumb institute, the Presbyterian Westminster College, and the Synodical Female College. The fireclay manufs. are important, and there

are coal-mines and mineral springs near. Pop. 3200.

Fulvia (d. 40 B.C.), Rom. lady noted for intrigue and ambition. Her first husband was Clodius, killed by Milo; her third, Mark Antony (44 B.C.). She had considerable power in Rome during the civil war that followed Caesar's murder, and showed a vindictive spirit over the proscriptions. She instigated an unsuccessful revolt against Octavius, her son-in-law, during his absence in the E. Besieged in Perusia, she managed to escape to Athens, but was coldly received by Antony, and d. soon afterwards at Sicily. See Cicero, *Philippics*, II.

Fum, Funs-hwang, or Fung-hwang, in Chinese mythology, a fabulous bird of good omen, one of the four symbolical creatures supposed to guard the celestial empire. Its appearance heralds an age of universal virtue and prosperity. Sometimes called the Chinese phoenix it is a grotesque mixture of many birds and beasts, with a fish's tail. It perches only on the woo-tung tree, and frequently figures on porcelains or the embroidered robes of mandarins.

Fumage, see HEARTH-MONEY.

Fumaric Acid, acid geometrically isomeric with maleic acid, and possessing the formula $HOOC-CH=CH-COOH$. It occurs in various fungi, in the fumitory (*Fumaria officinalis*), and in Iceland moss. It may be prepared by heating maleic acid alone to $150^{\circ}C$, or by heating it with hydrochloric acid or hydrobromic acid, and by boiling monobromosuccinic acid with water ($HOOC-CHBr-CH_2-COOH = HOOC-CH=CH-COOH + HBr$). F. A. is a white crystalline solid, which when heated yields maleic anhydride and water. See also MALEIC ACID.

Fumay, tn. of Ardennes dept., France, on R. Meuse, 16 m. from Mézières. It has slate quarries, breweries, and engineering works. F. stands among wooded heights, two being known as Dames de la Meuse. Pop. 4900.

Fumbina, see ADAMAWA.

Fume Precipitation, Electrical. This method, known also as electrostatic precipitation, is associated with the names of Lodge and Cottrell. Although attempts to precipitate smoke electrically were described by the Ger. Hohlfield in 1824, the first attempts at industrial application coincided with the work of Lodge (1884), and the first successful installation was in America in connection with the removal of sulphuric acid mist from smelter gases. The principle of electrostatic deposition consists in passing the gas to be treated through an intense electric field between a central electrode at high potential and the walls of earthed plates or tubes. The tubes, which may be of various materials depending on the nature of the gases treated, are frequently arranged in batteries or groups; the distance between the electrodes varies from 2 to 6 in., while the voltage may be between 30,000 and 100,000, and is regulated to give as strong a glow discharge as possible without disruptive or spark discharge. On passing through such an apparatus the particles

of dust, mist, or fume become charged, and are immediately attracted to and deposited on the larger electrode surfaces of opposite polarity. If liquid, the particles coalesce and flow away, if solid, a tapping device is provided to dislodge the dust which collects at the base of the apparatus. The high-tension direct current necessary for charging the central electrode is obtained from a rectifier supplied from a step-up transformer. There are three chief types of rectifier: (1) the thermionic valve, (2) the mechanical or commutator type, (3) the Westinghouse metal (copper oxide) rectifier. The valve is fragile and has a life of about only 1500 hrs. continuous working; the commutator-rectifier produces sparks and may cause interference with radio reception in surrounding dists. The metal rectifier represents the most recent development in the rectification of high tension voltages and is embodied in the Simon-Carves system. Electrostatic precipitation removes sulphur trioxide from gases by the formation and precipitation of sulphuric acid mist, so that moisture content and temp. are important considerations. According to Howard (*Trans. A.I.M.E.*, 49, p. 540) for the removal of sulphur trioxide and dust from copper furnace fumes, a gas velocity of less than 15 ft. per sec., a temp. of about 90° C. and a water content equal to about 4 per cent by weight of the dust collected, give the best results. The process has also been applied successfully to the electrostatic precipitation of various metallic and acid fumes, to the dust from cement kilns and, more recently, to the treatment of smoke and dust from power plants and the removal of tar from carbonisation gases. The efficiency of removal is generally over 99 per cent.

Fumigation (from Lat. *fumigare*, to smoke), operation of burning, or volatilising substances in order to produce vapours calculated to destroy disease germs, vermin, etc. The use of F. as a disinfecting process is now practically restricted to steam and hot-air disinfection. Other measures, such as the burning of resins, camphor, etc., have little or no effect on micro-organisms, and preserve their popularity by virtue of the powerful odours which effectually disguise any smell of putrefaction. F. for the destruction of vermin is effectively carried out in the case of house vermin by burning sulphur. The paper should be stripped from the walls, the room made as airtight as possible before the sulphur is lighted, and the fumes should then be left for some time to penetrate into every corner and crevice. A favourite manner of ridding the garden of insect pests was to fumigate with tobacco smoke. This was done by enclosing some strong tobacco mixed with organic refuse in a wire cage, getting it well alight by swinging the cage in the air, and then leaving it to smoulder in close proximity to the plants to be treated. In medicine F. means the treatment of the skin with the vapours of drugs; calomel is often absorbed in this way.

Fumitory, popular name given to species of *Fumaria*, a genus of herbaceous plants.

Funchal (Portuguese, place of fennel), cap. of Madeira, on the S. side of the is. The tn. is well built and picturesque, containing a cathedral, opera-house, and a museum. Its streets are narrow, and in the place of wheeled vehicles, sleds are used, drawn by oxen. The harbour of F. is the only port in Madeira for ocean-going steamers. It exports fruits, wine, embroidery, etc. F. has come into prominence as a health resort on account of its mild climate and is largely visited in the winter by convalescents. Magnificent scenery is presented by the neighbouring mts. Pop. 54,800.

Function, in mathematics a number whose value is dependent on the value of another number or other numbers. Any symbol which may take on one of a class of values, and is not restricted to a single value, is called a variable. A casual labourer's yearly income, which may fluctuate within certain fairly definite limits, is, therefore, a variable quantity. If it fluctuates simply because he cannot work on wet days, its value depends on the number of wet days in the year; the labourer's income may then be said to be a F. of the number of wet days in the year. If it depends on other causes also, such as the general prosperity of the dist., his personal health, etc., it may be stated as a F. of many variables. In algebraical language, the variable y is called a F. of the variable x if to every value of x there corresponds one or more values of y . Such quantities as ax , $ax+b$, x^2 , $\sin x$, $\log x$, etc., are all Fs. of x . When a quantity involves the first power of x only, as in $ax+b$, it is said to be a linear F., or F. of the first degree; when it involves the second power of x and no higher power, as in ax^2+bx+c , it is said to be a quadratic F., or F. of the second degree; when it involves the third power of x and no higher power, as in ax^3+bx^2+cx+d , it is said to be a cubic F., or F. of the third degree; in general, a F. of the

form $a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \dots + a_{n-1} x + a_n$ is said to be a F. of the n th degree. F.s. are indicated by the signs, F. ϕ ; thus, if y is a function of x , the relation is shown by the equation $y = f(x)$. Where there are two or more variables, the relation is indicated as in $y = f(x, r)$ and $y = f(x, r, s)$. The variable on which the value depends is called the independent variable, that whose value depends on the independent variable is called the dependent variable; thus in the relation $y = f(x)$, x is the independent, and y the dependent, variable. A F. is said to be *homogeneous* when all its terms are of the same degree. A *rational and integral* F. is one where the indices of the variable are positive integers and the coefficients do not involve the variable, as in the form $a_n x^n + a_{n-1} x^{n-1} + a_{n-2} x^{n-2} + \dots + a_{n-1} x + a_n$.

A *symmetrical function* is one in which any two variables may be interchanged without altering the value of the F. Thus $x^3 + y^3 + z^3 - xyz$ is a symmetrical F. An *alternating function* is one where, if two variables are interchanged, the F. is altered in sign but not in value. Thus $a^2(b-c) + b^2(c-a) + c^2(a-b)$ is an alternating F.

Derived functions may be obtained in this way. Let $f(x) = a_0 x^n + a_1 x^{n-1} + a_2 x^{n-2} + \dots + a_{n-1} x + a_n$. Then $f(x+h) = a_0(x+h)^n + a_1(x+h)^{n-1} + \dots + a_{n-1}(x+h) + a_n$. Expanding, we get $a_0 x^n + a_1 x^{n-1} + \dots + a_{n-1} x + a_n + h[na_0 x^{n-1} + (n-1)a_1 x^{n-2} + \dots + (n-1)a_{n-1} x + \dots + \frac{h^2}{2} \{n(n-1)a_0 x^{n-2} + (n-1)(n-2)a_1 x^{n-3} + \dots + 2a_{n-1}\} + \dots + \frac{h^n}{n} \{n(n-1)(n-2) \dots 2.1a_0\}$. This result is written more concisely as $f(x+h) = f(x) + hf'(x) + \frac{h^2}{2} f''(x) + \dots + \frac{h^n}{n!} f^n(x)$ and the numbers $f'(x)$, $f''(x)$, \dots , $f^n(x)$ are known as the first, second, \dots and n th derived F.s. of $f(x)$.

Limiting values.—In the equation $y = f(x)$, if, as the independent variable approaches a value a , the F. $f(x)$ can be made to differ by as little as we please from a fixed quantity b , then b is called the limit of y , when $x = a$. Consider the series $1 + \frac{1}{2} + \frac{1}{2^2} + \dots$. The sum $= 2 - \frac{1}{2^{n-1}}$ and is therefore a F. of n ; that is, $S = f(n)$. But $\frac{1}{2^{n-1}}$ can be made as small as we please by increasing the value of n ; that is, the value of S can be made to differ from 2 by as little as we please. This is expressed by saying that the limit of S is 2 when n is infinite.

F.s. may be either *algebraical* or *transcendental*. An algebraical F. is one which may be expressed in a finite number of terms, and involves no other processes than those of addition, subtraction, multiplication, division, and root-extraction. All other F.s. are called transcendental, and include such F.s. as $\log x$, $\sin x$, $\cos x$, etc.

A F. is said to be *continuous* when an infinitely small change in the independent variable is accompanied by a correspond-

ingly small change in the dependent variable. A F. is said to be *discontinuous* when an infinitely small change in the independent variable is accompanied by a great change in the dependent variable.

Periodic functions are those whose values recur regularly to certain limits, passing through all the values between those limits, while the independent variable increases or decreases in value by a certain definite amount called the period. To quote an example from trigonometry, $\sin A$ is a F. of A ; as A increases from 0° to 90° , $\sin A$ increases from 0 to 1; as A increases from 90° to 180° , $\sin A$ decreases from 1 to 0; as A increases from 180° to 270° , $\sin A$ decreases from 0 to -1 ; as A increases from 270° to 360° , $\sin A$ increases from -1 to 0; as A increases from 360° to 450° , $\sin A$ increases from 0 to 1, and so on. It is now seen that the limits of the values of the F. $\sin A$ are -1 and 1 , and that the values fluctuate between these limits as the angle increases. The value of $\sin A$ is 1 when $A = 90^\circ$ or 450° or 810° , \dots . The period in this case is therefore 360° , and any values of the independent variable which have a difference of 360° give the same value for the dependent variable. This is expressed by stating that $f(x+a) = f(x-a)$ for all values of x , a being the period. The importance of periodic functions is best demonstrated by their use in connection with the theory of sound vibrations. Any periodic disturbance in air may be resolved into a series of sine curves. Fourier's theorem states that a single-valued periodic F. may be expressed as a convergent series, thus:

$$\frac{1}{2}A_0 + \sum A_n \cos \frac{2n\pi x}{a} + \sum B_n \sin \frac{2n\pi x}{a} + \dots$$

where a is the period and n has values from 1 to infinity.

Elliptic functions are usually defined with reference to elliptic integrals, so-called because certain types are expressed by the arc of an ellipse. The development of these F.s. is owing in a great degree to the labours of A. M. Legendre (1752-1823), who pub. his *Traité des fonctions elliptiques* in 1827. His work was supplemented and to an extent revolutionised by N. H. Abel and C. G. Jacob. A good introductory treatise is provided by A. C. Dixon in his *The Elementary Properties of the Elliptic Functions*, 1891. See also J. Wright, *Theory of the Functions of Complex Variables*, 1918; E. Hobson, *Theory of Spherical and Ellipsoidal Harmonics*, 1931; and E. C. Titchmarsh, *Theory of Functions*, 1932.

Function, physiology, the special activity of a cell, tissue, or organ. In organisms which comprise but a single cell, all the various types of activity necessary for the maintenance of the living state are undertaken by the cell as a whole; the amoeba, for example, performs the processes of engulfing its food, digesting it, excreting waste material, and building up the nutrient matter into its

own substance by chemical and physical actions in which all parts of the cell seem to join. Multicellular organisms, on the other hand, possess cells which are differentiated for special activities, and their form is determined by the work they are called upon to do. Again, certain cells take on a measure of continuity with each other to form tissues which are again differentiated according to the work they have to perform. Thus we have connective tissues, including the varieties: osseous tissue, cartilaginous tissue, fibrous tissue, adipose tissue, nervous tissue, epithelial tissue, etc. These tissues enter into the structure of organs with special activities; thus we say the F. of the stomach is to digest, that of the kidney to excrete waste liquid products, and so on.

Functionalism, see under ARCHITECTURE, *Modern Architecture*.

Fundamental Base, music, is the note on which a chord is built—the root, ground note, or generator. Thus in the chord CEG, C is the F. B. in whatever position the chord is written.

Fundamentalism is in its essence the opposition of orthodox churchmen to the teaching of modern science where the latter comes into conflict with the Bible story. F. came into nation-wide notice in the U.S.A. in 1925 when a young school teacher, John T. Scopes, was arraigned in court on the charge of violating the Tennessee state laws which forbade the teaching of evolution in the state public schools. Scopes was a teacher in the high school in Dayton, Tennessee. Wm. Jennings Bryan, who had thrice run for the presidency of the U.S.A., came to Dayton to take part in the prosecution of the case. The immediate issue was a violation of a state law. But in its wider implications the case involved the serious question whether a state, through its legislature, could restrict scientific teaching when it conflicted with religious beliefs. The irreverent Amer. journalists labelled the case 'the monkey trial.' Bryan solemnly argued for the literal truth of every word and every sentence of the Bible. He objected to the theory of evolution, because it ran counter to the Bible story of creation. The jury promptly brought in a verdict against Scopes and he was fined 100 dollars. Later the highest court of the state reversed the decision, doing so on a purely technical point of law. Mississippi afterwards passed a similar law, and the Fundamentalists attempted to bring this about in some seven or eight other states, but their measures were killed by ridicule. See H. E. Fosdick, *The Modern Use of the Bible* (against F.), 1924; J. C. Machen, *What is Faith?* (for F.), 1925; M. Shipley, *The War on Modern Science*, 1927; and S. G. Cole, *History of Fundamentalism*, 1931.

Funded Debt was the term originally used for a debt the service (administration and payment of interest) of which was secured upon some specified fund. But the term is now used without special application to any fund in respect of any large public loan raised for permanent purposes, bearing a certain rate of interest. When

the loan is raised a date of repayment may or may not be quoted. The F. D. of the United Kingdom belongs to the latter category, but the gov. reserves to itself the right to redeem after a fixed period. Goschen's consols, a case in point, were made redeemable after 1923. The practice in general use in the United Kingdom for the reduction of debt is that of a sinking fund from which contributions should be made annually by the chancellor of the exchequer. This practice is open to the objection that in the hands of a chancellor who is not too squeamish the sinking fund is open to inroads which may help him to tide over his difficulties for the time, but unfortunately do not help in the reduction of the national debt. Another practice adopted is that of conversion, by which means loans issued at certain rates of interest are converted into issues bearing a lower rate. Nations other than Great Britain in reduction of their F. Ds. usually adopt the practice of yearly purchase by drawings, the money for this purpose being supplied by a sinking fund. See also under PUBLIC DEBT.

Fundi, see FONDI.

Funds, see PUBLIC DEBT.

Fundy, Bay of (Fr. *fond de la baie*, head of the bay), arm of the Atlantic Ocean separating Nova Scotia from New Brunswick and the state of Maine, extending 180 m. in length. It is exceedingly difficult of navigation, owing to the tides, which at certain seasons have a rise and fall of 53 ft., producing dangerous bores in the upper reaches. At low tide the shores have the appearance of long stretches of mud-flats.

Fünen (Dan. Fyn) is (with the exception of Zealand) the largest is. of Denmark, situated between the Cattegat, the Little Belt, and the Great Belt. It is 50 m. long by 40 m. wide, and is fertile and well wooded. Flax, fruit, grain, and hemp are cultivated. Bee-keeping and cattle and horse rearing are carried on and form the prin. export. The fisheries are also important. Chief tns.: Odense (the cap.), Svendborg and Nyborg; area 11,000 sq. m.; pop. about 300,000.

Funeral Orations, formal and elaborate eulogies given by the anc. Gks. and Roms. on some great person recently passed away. F. O. combined the strongest points of demonstrative oratory and employed the highest type of eloquence. They were finished and elegant in style, and the encomium was specific—the finished life and its closed events being held up as an inspiration to the living for future guidance.

Funeral Rites, observances connected with death and burial. The care of the dead is a marked feature of religion among all nations and all classes, being associated with spirit, belief, and custom. Among the Hindus the corpse is perfumed and adorned with flowers and then buried. The Muslims bury their dead; and, as is well known, the Egyptians always embalmed dead bodies (see MUMMIES). The mourning customs of the Jews may be collected from the Scriptures. In the religious creed of the Gks. and Roms.,

sepulture of the dead was an act of piety to prevent the wanderings of the spirit on the shores of Styx. They burned their dead on funeral pyres and deposited the ashes in an urn. Funeral expenses in law are a privileged debt allowed before all other charges, both in England and Scotland, if limited to the estate left by deceased. See BURIAL, CUSTOMS, AND LAWS OF.

Funeral Shows or Games, practice restricted chiefly to the Gks. and Romans of antiquity. In the heroic ages games were celebrated at the funeral of a great man (as of Patroclus, see *Iliad*, xviii.). Scenic exhibitions or more frequently combats of gladiators (Busturni) took place among the Romans. See Servius, *ad Verg. Æn.*, x. 519; Horace, *Sat.*, ii. 3; Livy, xxxiv. 46; Dion Cassius, xxxvii. 51; and Cicero, *Pro Sulla*, xix.

Funeral Societies, see under FRIENDLY SOCIETIES.

Fünfkirchen, see PÉCS.

Fungi, one of two classes of plants belonging to the Thallophyta, the group which includes the most lowly organised plants. F. are distinguished from the algae, the other class, by the absence of green colouring matter, or chlorophyll; hence they cannot assimilate carbon dioxide, but are dependent for food on organic substances. They are all either parasites, when they live on living plants or animals, or saprophytes, when they depend on dead organic matter for their food substances. Nearly all diseases of plants are due to the ravages of F. (apart from those caused by insects), and the class includes forms which vary from a single cell, only visible under a microscope, to more highly specialised forms with conspicuous fructifications. The vegetative part, or mycelium, of the higher F., consists of a mass of intertwined threads, or hyphae; in the common mushroom (*Agaricus campestris*) this constitutes what is known as spawn. The fructification is made up of the same sort of hyphae, which are more closely packed together to form the stalk, on the apex of which is the umbrella-like cap; the spores are formed in the pink gills on the under-surface of the cap. All forms produce asexual spores, and in some members, there is also a sexual process. There are six main divs. of F.: (1) Schizomycetes (Gk., *fission* F., from their mode of reproduction), which includes all the bacteria, though many authorities consider that the bacteria should form a separate kingdom of living organisms, neither plant nor animal. (2) Myxomycetes, or slime F.; in these the body is a plasmodium, a creeping gelatinous mass. This group is often claimed under the title Mycetozoa by the zoologists. (3) Phycomycetes To this div. belong many moulds, the potato disease, 'damping off' disease, and many others. (4) Ascomycetes. This includes a great many forms, some unicellular, others of complicated structure, but all have an ascus, which is a swelling cut off at the end of a hypha, and in it eight spores are formed. Mildew of roses, blue-green mould on jam, etc., the ergot

of rye, yeast, witches' brooms on silver birch-trees, and the green mould *Penicillium* from which penicillin is obtained, are all members of this subclass; some of the higher forms have cup-shaped fructifications which are brightly coloured, e.g. *Peziza*. (5) Ascidomycetes. The members of this group present a remarkably complex life hist., and among them are the rusts and smuts. *Puccinia graminis* may be cited as an example; at one stage of its existence it forms conspicuous rusty red streaks down the stems and leaves of wheat, rye, etc.; in this stage orange red spores are formed, which on germination attack the wheat again. Later in the season the mildew appears, which is another stage of the same fungus, when it

FUNGI (BASIDIOMYCETES)

A, Ink cap or Shaggy cap (*Coprinus comatus*); Left to right, puff-ball (*Lycoperdon sacculum*); edible mushroom (*Agaricus campestris*); morel (*Morchella esculenta*); *Agaricus (Pleurotus) ostreatus*.

is producing a different and darker kind of spore (the teliospore), which can rest through the winter. On germination it gives rise to a few hyphae which produce yet another kind of spore, which will only germinate on a totally different host, the common barberry. The disease on this plant takes the form of swollen discoloured patches on its leaves. (6) Basidiomycetes. These are the mostly highly organised of the F., and include mushrooms, toadstools, and puff-balls. The characteristic spores are the basidiospores, formed in fours on a basidium. Group (5) above, the Ascidomycetes, are often included with the Basidiomycetes. The lichens each consist of a fungus and an alga living in partnership (*symbiosis*). In addition to the above six groups there are also the Actinomycetes (called bacteria) and the Fungi imperfecti. See G. Massee, *British Fungi*, with a Chapter on Lichens, 1911; J. W. Harshbarger, *Text Book of Fungi*, 1917; M. Grieco, *Fungi as Food and in Medicine*, 1925; H. Gwynne-Vaughan and H. Barnes, *Structure and Development of Fungi*, 1927; A. H. Buller,

Researches in Fungi, 1931; and A. Parker-Rhodes, *Fungi, Friends or Foes?*, 1948.

Fungus, in pathology, a term applied to a variety of morbid excrescences of the appearance of fungi. F. of the brain is really a hernia, the brain protruding through the skull. F. of the *dura mater*, or outermost membrane of the brain and spinal cord, consists of a tumour which perforates the skull. F. arthritis is a name given to tubercular disease of the joints, accompanied with the formation of a white spongy mass. Some members of the F. order of plants are parasitic to man, causing diseased conditions; such are *Achorion schöleinit*, causing *farus*, *Microsporon andouini* and *Trichophyton tonsurans*, causing ringworm, and *Achnomyces bovis*, or ray F., which causes the swelling of the jaw, known as actinomycosis (q.v.).

Fungus Mellitensis, see CYNOMORUM.

Funicular Machine, name applied by some mechanicians to a cord or chain attached at one end to a fixed point, the other end passing over a fixed pulley or friction wheel and having a weight suspended from it; a weight is also hung from the cord or chain in some part of its length, between the fixed end and the pulley. This cord becomes a mechanical agent, for unequal weights applied, as has been said, may be in equilibrium. When a cord is suspended in a vertical plane between two fixed points and acted on by weights at different places, it is called a F. polygon; if the form of the suspended cord is given, and the weight to be applied at one angular point, the weights at all the other angular points in the case of equilibrium can be found.

Funicular Railway, see RAILWAYS, Mountain Railways.

Funk, Isaac Kaufman (1839-1912), Amer. author and publisher, b at Clifton, Ohio, and educated at Wittenberg College and Wittenberg Theological Seminary. He was ordained a minister of the Lutheran Church (1861), and after holding various pastorates, he started a publishing business (1876), in which he was joined by A. W. Wagnalls (1878), the firm being known since 1890 as Funk and Wagnalls Company. He ed. the *Standard Dictionary*, founded the *Metropolitan Pulpit*, now the *Homiletic Review*, 1876, and various other papers, and wrote, among other works, *The Next Step in Evolution* (1902) and *The Psychic Riddle* (1907).

Funk, Walther (b. 1890), Ger. journalist and economist, educated at Berlin and Leipzig Univs. Appointed head of the Reich press bureau in 1933; in the same year made Reich minister of propaganda. Minister of economics, 1938, and in 1939 he took over the Reichsbank when Dr. Schacht (q.v.) was dismissed in Jan. of that year. He was president of the Reichsbank until 1945. His publs., mostly on economics, include *Deutsche Wirtschaftenot* (1926); *Deutsche Wirtschaftspolitik im Osten* (1927); *Internationale Kapital-verflechtungen und -aufgaben des neuesten Kapitalismus* (1928). Tried at Nuremberg as a war

criminal, and found guilty of planning aggressive war, war crimes, and crimes against humanity and sentenced to life imprisonment.

Funkia (from Funk, a Ger. botanist), a genus of Liliaceae, occurs wild in China and Japan, but the five species are all hardy plants and will grow in Britain. The flowers are very showy and are often called plantain-lilies.

Funny-bone, popular name for that part of the elbow where the ulnar nerve passes down the inner condyle of the humerus. The nerve being comparatively unprotected, a blow on this point will cause a tingling, pricking sensation down the whole length of the nerve to the ulnar side of the hand, followed by numbness. It has also been termed the crazy-bone.

Fur, see FURS.

Fur, matter formed inside vessels through the lime in water, or similar constituents, used also of deposits left by damp. More frequently used as a verb, as, a kettle has become 'furred.' In this way it is also applied medically to a 'furred' tongue, one that has become coated with matter.

Furetière, Antoine (1619-88), Fr. lawyer and lexicographer, b. in Paris. His announcement that he had compiled a dictionary of the Fr. language brought about his expulsion from the Fr. academy for alleged plagiarism, that body fearing that his dictionary was intended to supersede their own. F.'s dictionary was pub. two years after his death, and it is a valuable work. An improved ed. was pub. by B. de Banval in 1701, and the last reprint was at Amsterdam in 1725. It has survived as the basis of what is called the *Dictionnaire de Trevoux*. His other works were *Cinq Satires* (verse); *Gospel Parables* (verse); *Le Roman bourgeois*; and especially *Furetieriana* (pub. posthumously), being a collection of *bons mots* or anecdotes, which have often been parodied.

Furfuran, or **Furan** (C₄H₄O), organic substance obtained by heating the barium salt of pyromucic acid with soda-lime. It is a colourless liquid boiling at 32° C., is insoluble in water, and has the characteristic smell of pine-wood tar, in which it occurs. A molecule of furan may be looked upon as possessing closed chains of five atoms; if the oxygen atom be replaced by sulphur, thiophene is produced; if it be replaced by NH, pyrrole is produced. *Furfural*, *furfural*, or *furfuraldehyde* (C₄H₄O·CHO) is the aldehyde of pyromucic acid, and may be prepared by distilling bran with dilute sulphuric acid. It is a colourless liquid boiling at 162° C., and is soluble to some extent in water. It has a pleasant smell, and turns brown on exposure to the air. When mixed with caustic potash, furfur-alcohol and pyromucic acid are formed, and it shows general properties analogous to those of benzaldehyde. With phenol (q.v.) furfural forms resins which are widely used in the manuf. of moulded articles similar to those made from cellulose, galolith, etc. Furfural and various of its derivatives are employed as solvents, germicides, etc.

See Chicago Mines Laboratories Bulletin, No. 2 (1925), *Furfural and its Derivatives*.

Furfuratorium, see CRUSCA, ACCADEMIA DELL'.

Furias, or Furias, see EUMENIDES.

Furka Pass, one of the highest Alpine passes in Switzerland (7992 ft.). It leads from Andermatt, in the canton of Uri, to the Rhone glacier, passing through the Reuss valley and ending at the Hôtel Gletsch in Valais.

Furlong, measure of length amounting to one-eighth of a statute mile. The original term was 'furlow-long,' and was the measurement of a furrow in the 'common field' system, and in consequence varied according to the dists., but the side of a square containing 10 ac. was the generally accepted length, 40 poles. In the ninth century the word F. was used to translate the Lat. *stadium*, which was one-eighth of a Rom. mile.

Furlo Pass, tunnel, some 40 yds. long, excavated in the Apennines, Italy. It is part of the Via Flaminia, the old Rom. road from Rome to Fano on the Adriatic. An inscription at the N. end records that the tunnel was made by the Emperor Vespasian, A.D. 77.

Furlough, military term used for leave of absence. On home service it applies to non-commissioned officers and men, but on foreign service it is also applied to officers. When on F. a soldier may not leave the United Kingdom, and is in receipt of full pay.

Furnaces (Lat. *fornax*, a vault), contrivances for producing useful application of heat generated by the combustion of fuel. The number of different varieties and uses of F. is very great, but there are in the great majority of cases three essential parts. The fire-place is the portion of the furnace where the combustion of the fuel takes place; the place where the heat is applied to the special work of the furnace is known by various names, such as the chamber, laboratory, hearth, working-bed, etc.; and in addition there is the chimney, or some apparatus for supplying air under pressure to the fire. The class of fuel used and the intensity of the heat required are factors in determining the different modifications of F. In all cases the combination of economy and efficiency is desired; combustion should be regular, and the air and fuel mixed in correct proportions. F. may be classified into two main types, in the first of which the effect of combustion is simply the heating of the material to which the heat is applied. In the second a chemical change also occurs as a result of heating. F. for steam and for heating buildings are examples of the first type, whilst most metallurgical F. belong to the second type. The second class of F. may be subdivided as follows: (1) Where the fuel and the substance to be heated are in contact with each other: to this class belong shaft, blast, and hearth F. (2) Where the substance is heated directly by the products of combustion: these are reverberatory F. When the charge is not melted the furnace is known as a 'wasting' or 'calcining' furnace; when it is, as a

'melting furnace.' (3) Where the substance is not directly heated by the fuel or the products of combustion. When the heating chamber is fixed and forms part of the furnace, the latter is known as a muffle furnace. Other varieties are crucible F. and retort F. There are four main objects to be studied; the greatest quantity of heat must be ensured, the dissipation of heat must be prevented, the heat must be concentrated and directed to the substance to be acted on, and it must be under the control of the operator.

In the F. of the first class, for heating boilers, a grate of fire-bars with short spaces between forms the receptacle for the fuel, and part of the air for combustion is drawn between these bars. As the fuel burns it is converted into gases, which burn above and in contact with the boiler. In addition to the air which comes through the fuel, a considerable quantity is admitted into the space between it and the boiler. The supply of air thus admitted is regulated by such contrivances as dampers; if too much is admitted heat escapes up the chimney, whilst if too little the combustion is retarded and unburnt fuel is wasted, and in both cases smoke is caused. Where possible a tall chimney provides the draught required, the sharpness of the draught varying as the height of the chimney. In ships and locomotive steam engines a chimney cannot always be erected, and draught is then produced by fans, or by the action of a jet of exhaust steam. Blast F. are of very great antiquity, and forms differing little from ordinary smith's F. are now used in India. The Catalan and Walloon forges, formerly used in the production of malleable iron, mark stages in the development of blast F. which is the development of the science of iron-smelting (*q.v.*). Hearth F. are sometimes employed in the air reduction process of smelting iron, but they are very wasteful and have little to recommend them.

Where the substance to be heated must not come into contact with the fuel itself, the operation of producing the heat must be performed in a special combustion chamber. This chamber is placed at the side of the hearth or working-bed, in which the material is exposed in a broad thin layer. The chimney is placed at the other end from the combustion chamber, and consequently the body of flame and the heated gas are drawn over the working-bed and beaten down by reverberation from the low vaulted roof which covers the hearth and the working-bed and slopes down to the base of the chimney. The term 'cupola' was originally used for the reverberatory furnace, but is now used to designate a small blast furnace, such as that used by iron-founders. The 'melting' reverberatory furnace is used in the concentration of poor metallic compounds into a regulus by fusion, in the reduction of lead and tin ores, in the refining of copper and silver, and in the puddling processes of making malleable iron. The 'calcining' or 'wasting' type of reverberatory furnace has a less extended use. It

is employed chiefly in the conversion of metallic sulphides into oxides.

The most important of the F² which are used in industry are gas F². Besides the furnace for which illuminating gas is used, on the Bunsen burner or blowpipe principle, and which are employed in small operations and in the laboratory, gas firing on a large scale is very extensively carried on. The origin of gas F² dates back to the patents granted to Friedrich and Wm Siemens in 1856 and 1861, and no new principles have been

chimney so far as draught is concerned. The gas furnace is in general use in metallurgy to day, in the glass, gas, and by-products coke industries. It is also used in ceramics, though rarely. Its success is due to the easy regulation of combustion which can be made perfect without excess of air, the possibility of a long flume and therefore of large F², and the use of fuel of inferior quality. The original perfection of the furnace, and the fact that regeneration permits high temp as well as economy have also

THE BLAST FURNACE AT THE FORD WORKS AT DAGENHAM
It is one of the largest in the world

added since that time. A gas furnace has, in general, the following parts: (1) The gas-producer, which may have its own draught apparatus or may form a close part of the furnace, and depend upon its chimney. (2) The inversion valves, which direct to one side or the other the products of combustion and the gases required for the firing of the furnace. (3) The chambers of recuperation utilize those calories which would otherwise be carried away by the products of combustion. (4) The laboratory, or hearth, where the industrial operation is effected. The combustion of the fuel is here completed by a new influx of air, known as the secondary air. (5) The chimney, or the draught apparatus taking its place, discharges into the outer air the products of combustion, and at the same time ensures the circulation of the various gas currents. A number of dampers at the various flues of admission and exit complete the

contributed to its success. In the older methods of heating everything was conducted. The old glass-pot furnace, for example, was formed of a hearth which contained the pots placed above the fire-grate without a stack. The only way of regulating the draught was by varying the depth of fuel in the grate. Under such conditions a high measure of skill was needed to obtain a satisfactory result. In a modern gas-fired furnace, the grate, the hearth, the chimney, and the recuperator are all distinct and may each be controlled in a methodical way.

F² in which coal-gas or hydrogen was burnt with pure oxygen were formerly used when the highest temps were required but electrically heated F² are now largely used. The advantages of electricity as a heating agent are the possibility of local application of the heat and the high temps. obtained; against these are to be set its enhanced cost

Walnut desk chair with seat covered in leather.

Electric F differ in type according as the product is to be obtained in the form of a gas, a liquid, or a solid (e.g. carbon disulphide, calcium carbide, and graphite). (For further particulars see ELECTRICITY and ELECTROLYTICITY) For the casing, walls, pillars, etc., of F., ordinary building materials, such as red bricks are used, for the parts which come in contact with the fuel or flame, refractory or fire resisting materials are necessary. Such parts are the linings of fire places, arches, roofs, and flues, the lower parts of the chimney of a reverberatory furnace, and the whole of the internal walls of blast. A list of fire resisting substances may be given, for further particulars see under their names, brick, clay and fire bricks, certain sandstones, silica, in the form of ganister, Dinas stone and bricks, carbon (as coke and graphite), ferrous oxide and alumina, in the form of bauxite. See BLEASTING, IRON AND STEEL, ANNEALING, HARDENING, METALLURGY, SHAPING etc. See also Mills and Rowan, *Fuel and its Application*, 1889; Baldwin, *Steam Heating for Buildings* 1900; J. Wright, *Electric Furnaces and their Industrial Applications*, 1906; W. E. Groun, Grimaldo, *Essays on a Theory of Furnaces* (trans.), 1913; H. Armstrong, *Fuels and Furnaces for Industrial Heating*, 1938, and H. Ethington, *Modern Furnace Technology*, 1944.

Furneaux Islands, also called Flinders Group of Is. between Australia and Tasmania in the Bass Strait and included within the state of Tasmania. Flinders, or Great Is. is the most important, others being Cape Barren, Clark, Hummock, and Babel. They were discovered in 1773

by Cook's lieutenant, Furneaux, from whom they take their name. They are for the most part barren and unproductive. Pop. 800.

Furnes (Flemish Veurne), tn. of Belgium in the prov. of W. Flanders. It is situated at the junction of sev. canals, 16 m. N.E. of Dunkirk and 27 m. S.W. of Bruges. The prin. industries are the manuf. of linen and tils; there is a trade in hops, corn, and dairy produce. Pop. 7600.

Furness, Sir Christopher F., 1st Baron (1852-1912), shipowner and shipbuilder, head of the shipping firm of F. Wath & Co. He was b. at W. Hartlepool, Durham. He started a shipbroking business when he was twenty-four years of age. He next estab. the line of steamers. In 1885 he joined Edward Wath and founded the present firm. In 1910 he was raised to the peerage as a baron and took the title of Lord F. of Hartlepool. He was Liberal member for the Hartlepool div. 1891-1910.

Furness, peninsula of N. Lancashire, England, situated between the Irish Sea and Morecambe Bay. The ruins of F. Abbey stand in a deep valley S. of Dalton and adjacent to the F. railway. It is interesting to artists and antiquaries, being a fine example of the transition Norman and early Eng. architecture. It was founded in 1127 and was, until the Reformation, a great and wealthy Cistercian abbey. The prin. tn. of F. is Barrow (q.v.), noted for its docks and iron works.

Furniss, Harry (1854-1935), Eng. caricaturist; b. March 26, in Wexford; son of a Yorkshire engineer; at the age of nine-

teen settled in London, and soon after became a regular contributor of humorous drawings to the *punch* illustrated papers. He joined the staff of *Punch* in 1880 and for many years was one of its most popular illustrators. He leapt into fame with his invention of the Gladstone collar and became known all over the world for his picture (used since by *Life* Soap as an advertisement). Two years ago I used your *comic* since then I have used no other. An admirable humorist he illustrated with success the work of the two great humorists Thackeray and Dickens. Author of many books, including *Confessions of a Caricaturist* 1901, and *Harry Furniss at Home*, 1903.

Furniture (from *Le fourrier*, to furnish) includes all movable goods such as fittings, vessels, etc. supplied to buildings to adapt them to their use. Until the Renaissance days, household appliances were few and a luxury to their possessors. Indeed the peoples of antiquity were satisfied with a bed, a table, a couch and sometimes a chair for the best hours of their lives were spent out of doors and sedentary pastimes were few. Up to Roman times the woods most commonly used for domestic furnishings were first of all cedar, and then rosewood, ebony, oak, pine and walnut, whilst bronze and electrum, and the precious metals—silver and gold and ivory, were more freely used for them than they are to-day, under the empire wealthy Romans had golden cooking utensils. Still, wood has always been the basis of furniture, and that being so it is not surprising that few examples of early work have lasted to our day. The chief sources of information about Assyrian

and Egyptian household fittings and likewise about those of Greece and Rome are various sculptures and mural decoration and paintings. The cabinet makers of Nineveh, as also of Thebes and Memphis knew how to embellish their couches and tables with inlayings of ivory, and were fond of supporting their chairs and thrones on legs of wild animals—bulls, lions and rams were favourite devices for carving, and slaves usually captives in war were often depicted in the position of upholding, some portion of the regal throne. The Greeks derived their mobiliary fashions from the Egyptians and the plutocrats of Rome patronised Greek in preference to native workmen. Folding chairs, chairs with sloping and upright backs, elaborate footstool, Roman tripods, arm chairs with sphinxes for elbow rests, splendid marble tables and candelabra, oriental couches and all manner of bronze work damasked in gold and silver were common appendages in the palaces and sumptuous homes of the kings and aristocrats of classical antiquity. Roman fashions were copied by Byzantine craftsmen and under Charlemagne there flourished the Rheno-Byzantine school of art whose best work appears in their magnificent enamelled shrines and reliquaries. In the Middle Ages beds and chairs were still restricted to the upper classes, but in the castles and manor houses of the Norman barons household appliances were rapidly developing, both in number and artistic worth. Bedsteads were square in frame and roofed with panelled testers supported on carved posts, rich hangings and tapestries and decorated chests of cypress were imported, and other chests

and portable presses were made at home with wrought-iron clasps and hinges and with inlaid wood or iron strap-work ornament, or sometimes with panels of tempera painting on gilt backgrounds. Chests were used as repositories for money and valuables, and also for eccles. vestments. When the family removed they served as trunks for all forms of apparel and costly fabrics, usually stored in massive wardrobes or *armoires*. It is, of course, from the chest that the modern *dressoir*, or sideboard, has developed.

Before passing on to the Renaissance one word must be said of Saracenic work. Omitting what they did for the interior of churches, the Saracens deserve every praise for the beauty and delicacy of their lattice work, and for their skill in inlaying, whether with silver filigree, brass, ivory, or mother-of-pearl. These merits are well illustrated by their tall hexagonal tables and cross-legged reading desks. After the great revival artisans no longer carved episodes from the cycles of romance or the legends of their saints, for these were swept away by the classical mythology which men so eagerly absorbed. During the Quattrocento period in Italy (1400-1500) sumptuous F. of every description was executed at the bidding of the Medic and other patron princes. Gilt grounds, *pietra dura* work, that is, the inlaying of slabs of coloured and richly veined marbles, and *tarsia*, or *certosina* work, or inlaying of wood in geometrical patterns or floral designs came quickly into vogue and spread rapidly across the Alps to other countries. During the reign of Henry VIII. Jean de Mabuse and Holbein introduced it. fashions into England, and in France, as the result of the infiltration of it. craftsmen, a mass of heavy and rich F. was made, but the frequent use of strap-work and the *carouche*, which characterises the Henri Deux style, is peculiarly Fr.

The so-called Jacobean style undoubtedly has its attractions, although it was overshadowed by the great *floraison* in F., which marks the eighteenth century throughout W. Europe. Like the famous 'great bed of Ware' of Elizabethan days, it is very solid and very heavy, both in design and in the thickness of the oak or chestnut which were the favourite woods; yet these qualities recommend themselves to many, and undoubtedly suggest a simplicity and strength absent from later work.

In this country the heyday of cabinet-making is associated with the names of Chippendale, Sheraton, and Adam, who raised the manuf. of F. to an art, to which they freely gave their talent both for execution and design. Their inspiration was clearly drawn from the Fr. artist Boulle, who owed his excellence in marquetry work to Florentine and Venetian craftsmen. These men had already shown the scope and beauty of the art. But marquetry did not originate in Italy: its home was the E., Damascus, Persia, and India, and thence it passed to Europe by way of the great trade routes. Boulle belongs to the Louis Quatorze period—

the *armoire* in the Jones collection at Victoria and Albert Museum, S. Kensington, London, is a beautiful illustration of his work—but though this period and the succeeding ones, the regency and the Louis Quinze or rococo, afford much that is both sumptuous and elegant, the cabinet-maker's art reaches its high-water mark just before the revolution, that is, in the reign of Louis XVI. In the S. Kensington Museum may be seen some splendid specimens of the exquisitely finished and truly choice work of Roulton, Riesener, and Gouthière, who enjoyed the patronage of Marie Antoinette. Gouthière was the first founder and chaser of his day, and used to mount in ornolu or bronze-gilt the elegant commodes and cabinets which the other two had made. These men turned their backs on the frivolous, rampant vagaries of Meisssonier and the other apostles of the rococo school, and developed a beautiful restraint and delicacy accentuated by their preference for classic forms. Thus the 'riotous curves' of the du Barry period gave place to medallions and straight-lined patterns, which heralded a purer, nobler style. But the advent of Napoleon witnessed a backsliding, and F. became tainted with the dry and heavy classicism of the time. The best examples of the 'empire style' may impress and awe, but despite the richness of their woods—mahogany, satinwood, etc.—they are sadly deficient both in charm and grace. In England after the death of Chippendale, the master of the *soi-disant* 'Chinese style,' and his compeers, there is little to note but a slavish, tasteless imitation of Fr. models. To-day an attempt is being made in *l'art nouveau* to resuscitate a naturalness and simplicity long since passed away. This style is marked by the popularity of various light oaks and may be said to draw all that is good in it from the lectures and teachings of Wm. Morris and his band of fellow workers. However, it seems at present as if the economic dir. of labour, the substitution of machinery for hand labour, and the utter divorce of the designer from the artisan have wellnigh killed cabinet-making as an art. The finest collections of old F. are housed in the Louvre, the Victoria and Albert Museum, and Hertford House (the Wallace collection).

The manuf. of Amer. F. has developed along much the same lines as Eng., but it has been influenced by other European and by oriental styles in addition. The vogue for collecting 'antiques' in America leads only to the discovery of very primitive F. of a strictly utilitarian nature, chiefly for kitchen use. The early colonists naturally designed their F. on simple lines, and the woods they employed were for the most part pine, maple, oak, and the native nut-woods. Mahogany, rosewood, and black walnut were all greatly favoured in Victorian times. The F. of the late seventeenth and early eighteenth centuries showed such characteristic pieces as high-backed chairs, gate-leg and butterfly tables; while in Queen Anne's time appeared sofas, tallboys,

lowboys, cupboards, writing-tables, and chests of drawers in both walnut and maple. In the middle of the eighteenth century Chippendale F. in mahogany became the vogue, and, to a somewhat lesser extent, Sheraton, Shearer, Hepplewhite, and Robert Adam. Adam was an architect, but he believed in designing the F. for the houses he built or rebuilt, and this F. he ordered from Chippendale; Hepplewhite was also influenced by Adam. Later on Directoire and Empire styles were used as models for many graceful chairs, sofas, and other pieces of Amer. manuf. The leading cabinet-makers of early times were estab. in Philadelphia, with New York as second, and Salem as third in importance. In America, as in England to-day, the Cubist style has been developed as a passing novelty, and it has a certain amusing and bizarre charm of its own. See T. Chippendale, *The Gentleman and Cabinet Maker's Directory*, 1754; L. V. Lockwood, *Colonial Furniture in America*, 1902; W. Nutting, *Furniture of the Pilgrim Century*, 1921; H. Schmitz (ed.), *Encyclopædia of Furniture*, 1928; O. Bracket, *An Encyclopædia of English Furniture*, 1927; P. Macquoid, *English Furniture of the 16th-19th Centuries*, 1928; K. M. Furniture Cream, mixture used for polishing chairs and sideboards, etc. Beeswax and resin are dissolved in heated turpentine and then mixed with a solution of powdered soap and carbonate of potash. When applied to wooden surfaces, the oil dissolves the former polish and the other constituents make a new one.

Furnivall, Frederick James (1825-1910), Eng. philologist and editor. He founded seven societies for the promotion of literary appreciation and for the pub. of texts. These were the Early Eng. Text Society (1864), the Chaucer (1868), Halliwell (1868), New Shakespeare (1874), Browning (1881), Wyclif (1882), and Shelley (1886). By means of these associations he collected as much as £30,000, which was expended in issuing cheap eds. of a number of early texts and rare works of literary merit, which thus became accessible to a large circle of interested students. Many of the texts were ed. by F. himself, but his great work as editor was his issue of *A Six-text Print of Chaucer's Canterbury Tales in Parallel Columns* (1868-75), which was an exact replica of six original MSS. F. further supervised the pub. of a series of

farsimiles of the quartos of Shakespeare's plays, and for some years was ed. of the Oxford *New English Dictionary*, later under the care of Sir J. A. H. Murray. Besides his earnest and unremitting labour in the literary field, F. was in his day a splendid oarsman, and in 1885 introduced races for sculling fours and eights. See *Frederick James Furnivall: a Volume of Personal Record* (reminiscences) by forty-nine contributors, with a biography by J. Munro, 1911.

Furnival's Inn, see INNS OF COURT.

Furruckabad, see FARRUKHABAD.

Furs, term used generally to cover the skins of animals complete with the outer covering of wool and hair, are used for the manuf. of coats, ties, and trimmings.

Reproduced by permission of the Governor and Committee of Hudson's Bay Company

PLATINA FOX, RAISED IN CAPTIVITY

Fur-bearing animals are found widely distributed throughout the world, but with some exceptions the finest are obtained from the colder regions of the N. hemisphere. The animals should be taken when the weather is coldest, as then their fur is most fully developed—that is in winter or early spring in the case of water animals. F. present a considerable variety of colour, texture, and pattern; after dressing, some are used in a more or less natural state, whilst others are dyed and submitted to various processes before being manufactured into coats.

For.—The silver fox occurs in the wild state as a mutant of the red fox, and exhibits colour phases varying from pure black to a complete covering of silver guard hair. Wild silvers are comparatively rare, but the animal has been raised in captivity since 1903, and silver fox ranching is now an extensive industry, particularly in N. America, the Scandinavian countries, and Russia. Cross fox occurs in red fox litters, and its distinctive feature is a dark cross on the

shoulders. White fox is found mainly in the Arctic circle and Siberia. Is pure white in colour with deep, dense fur, and is used for making capes, trimmings, etc. Most is dyed, particularly with the light pastel shades. Red fox is found in practically every country N. of the equator. It varies in colour from yellow to dark red, and is often dyed and used extensively for trimmings. Blue fox is found in the Arctic regions of Canada, Alaska, and Greenland, is bluish in colour, and used to make capes and stoles. It is farmed extensively in Scandinavia.

Weasels.—Fisher is the largest species of the weasel family, and has very fine, silky hair, which is a dark brown in colour. This is a highly prized and very valuable fur, found only in N. America. Badger is found in the N. Amer. continent, Europe, and Asia. The hair is silvery grey in colour, and those from N. America are used for trimming, etc., and the European and Asiatic skins for brushes. Ermine is found mainly in Canada and Siberia, and is creamy white in colour, with a black tip to the tail. Marten is a fine and valuable fur used for capes, stoles, etc., found mainly in Canada, and varying in colour from yellow to dark brown with soft, silky fur. It is the Canadian counterpart of Russian sable. Sable is the most costly and prized member of the weasel family, and is found in most parts of Russia. It has the same characteristics as the Canadian marten, but is smaller, with better colour and quality of fur. Skunk is found in N. and S. America, and is black in colour. Many have white stripes, which are cut out or dyed before the fur is used.

Rodents.—Beaver is found mainly in Canada and N. U.S.A. The best types come from E. Canada; they are brown in colour, and are not used in their natural state. The top hair is plucked, and the under fur is sheared to make coats, etc. There are three main types of muskrat recognised by the fur trade: (a) Canadian and Amer., which varies from golden to dark brown in colour, and has thick underwool with short top hair, and is used naturally and dyed for coats, etc. (b) Black, which is found mainly in E. America; apart from being black in colour its characteristics are as (a). (c) S., which is found in Louisiana and Texas, and has brown underwool and black top hair, otherwise with the same characteristics as (a) and (b). Marmot is found mainly in Mongolia, and is generally used as a cheap imitation for mink. Nutria is native to S. America, and is an inferior species of the beaver. It is also raised in captivity; the top hair is plucked or sheared, leaving soft brown underwool. Squirrel is found in all parts of the N. hemisphere, but the largest quantities come from Russia and Canada. The finest come from Russia, and are grey-blue, and very well furred. The Canadian type are weaker and of a red-brown hue. They are dyed and manufactured into coats.

Cat.—Leopard is found principally in India and Africa, the best types coming from Somaliland. The hair is short and

the best bear a well-defined pattern of black rosettes on a clear yellow background. House cat is found in almost all countries; it is of many different colours, and is used for cheap coats, trimming, etc. Lynx is found mainly in Canada, a few coming from Siberia. It is the most beautiful of the cat family, having long, silky fur of a silvery grey colour, and is used for trimming.

Fitch.—This is a species of ferret found in Europe and Asia. The colour varies from dark brown to yellow (found in Europe) and white to pale brown (found in Asia). It is used to make cheap coats, etc.

Mole.—This is a small insect-eating animal with soft, velvety, blue-black fur, which is found throughout the N. hemisphere. It wears badly and is not in great demand.

Opossum.—Each country produces a different type, but in the main they have creamy white underwool with darker, somewhat silvery, guard hair, and are found in N. and S. America, Australia, and New Zealand.

Pony.—The ponies used by the fur trade come mainly from S. America and Russia. They have short, coarse brown hair, the short-haired variety with a moiré pattern being recognised as the finest.

Raccoon.—These are found in America and Canada, are reddish-brown in colour, and have thick, woolly fur, used for trimming, coats, etc.

Mink.—The most desirable types of wild mink are found in Canada and N. America. The fur varies in colour from light to dark brown, and is of a dense, even, silky texture. Its prin. use is for manuf. into coats. Mink are also raised in captivity, and the best of the ranch types compare very favourably with the wild types. In recent years few varieties have been developed. They are known collectively as mutation mink, of which the most valuable are silver blue, pastel, and white.

Seal.—There are two types, which are found in most oceanic regions: (i) Fur seal, which is taken mostly in Alaska, where the animal goes to breed. It has coarse, silvery top hair and very soft underwool which, when the top hair has been removed, is dyed and used for coats, etc. (ii) Hair seal, which is found mainly in the N. hemisphere, and is characterised by its absence of underwool.

Lamb.—There are very many varieties of lamb which are used by the fur trade. The types most commonly used are the Persian and Indian lambs. Persian are indigenous to Bokhara, Afghanistan, and Samarkand, but are now extensively found in S. Africa, whence come most of the skins used commercially. The wool is curled, and the value of a skin depends on the size, lustre, and pattern of the curls. The majority are black, but grey, white, brown, and mottled varieties also occur. Indian lambs are not so fine as Persian, and are mainly white in colour, though some are brown, black, or mottled, the curl being flat and open, and the skins are used for coats, etc.

See H. A. Innis, *Fur Trade in Canada*, 1930; F. Merk, *The Fur Trade*, 1931; F. Moloney, *Fur Trade in New England*, 1931; C. T. Williams, *Modern Fur Farming*, 1934; and B. A. de Voe, *Across the Wide Missouri*, 1948; and *The British Fur Trade Year Book*.

Furse, Charles Wellington (1868-1904), Eng. painter, b. at Staines. His first exhibit in the Royal Academy was a vigorous picture called 'Cain' (1888). All his pictures are free from restraint, especially those whose subjects are of outdoor life, such as 'Diana of the Uplands,' which breathes of the fresh wind. Many of his works show a tendency to be decorative, and his mural decorations for the tn. hall at Liverpool are excellent both in composition and proportion. Among his other pictures are 'The Return from the Tide,' 'The Lilac Gown,' 'Cubbing with the York and Ainsty,' etc. His early death was a serious loss to Brit. art.

Fur Seal, or **Sea Bear**, belongs to the Otariidae, or sea-lions, as opposed to the Phocidae or true seals. F. Se. are divided into N. and S. herds, the latter of which are almost extinct. But the *Otaria ussuriensis* of the N. Pacific, especially of the Commander and Pribylov (or Pribilof) Is. in the Behring Sea, are still comparatively plentiful. These were leased by the U.S.A. to the Alaska Commercial Company (1870-90), and afterwards to the N. Amer. Commercial Company, whose monopoly, however, expired in 1910. The adult bull is 6 ft. long, with a girth of 4½ ft. In its seventh year it weighs about 450 lb. Its fur is dark brown, but that of the female, which is much smaller and weighs only 80 lb., is often fairly light. Seals feed in deep water chiefly on a small fish rather like smelt, and on Alaska pollack and squid. Their breeding-grounds are the rock-strewn Is. shores. The bulls arrive in May and the cows in June, the pup is b. soon after the cow's arrival, and by the winter-time (Nov.) is ready to swim away with its mother, the bulls having already (in Aug.) gone to sea to feed. In their winter migrations the Commander seals penetrate to the lat. of S. Japan, and the Pribylov as far as S. California. It is the custom of the young bachelor seals to sleep away from the 'rookeries.' Those who hunt them for their fur surround them in gangs by night, and drive them inland to the killing ground, where they knock them down with clubs. This method of trapping has been superseded by 'pelagic sealing,' that is, pursuit in open waters with spear or shot gun. Pelagic hunters, however, have killed male and female indiscriminately, with the result that the species is fast dying out. Various commissions have tried to remedy this abuse. Land sealing on the Pribylov and Commander Is. from 1868 to 1897 resulted in a catch of 3,382,949 and pelagic sealing of 963,529. The gov.-owned fur-seal herd of the Pribylov Is., administered by the dept. of commerce, comprises about 85 per cent of the F. Se. of the world. This herd contained about 2,338,000 animals in 1941.

Fürst, Julius (1803-73), Ger. orientalist,

b. at Zerkowo. He was of Jewish descent, and many of his works are Judaic in character. He pub. a considerable number of works on oriental languages and literature, including *Concordantiae Veteris Testamenti Hebraicæ et Chaldaicæ* (1837-1840), an Eng. trans. of which appeared in 1871; *Kultur und Literaturgeschichte der Juden in Asien*, vol. 1, (1849); and the famous *Bibliotheca Judaica* (1849-63).

Fürstenberg, tn. of Brandenburg, Germany, situated about 60 m. E.S.E. of Berlin. Pop. 7000.

Fürstenwalde, tn. of Brandenburg, Germany, situated on the Spree, about 21 m. W. of Frankfurt-on-Oder. It is noted for manuf. of machinery, gas and electric light fittings, and has breweries. Pop. 25,700.

Furth, tn. of Bavaria, Germany, situated near the Bohemian frontier, about 40 m. N.W. of Ratisbon. Its chief industries are the manuf. of glass and toys. Pop. about 6000.

Furth, tn. in the prov. of Middle Franconia, Bavaria, Germany, situated about 5 m. N.W. of Nuremberg at the junction of the Regnitz and Pegnitz. Its manufs., which are similar to those of Nuremberg, include mirrors, toys, gold leaf, pencils, optical instruments, furniture, and chicory. The first steam railway in Germany was between F. and Nuremberg, opened in 1835. Pop. 75,000.

Further India, see IND-CHINA.

Fur Tribe, see DARDUR.

Furtwangler, Adolf (1853-1907), Ger. archaeologist, b. at Freiburg-im-Breisgau. He took part, 1874-79, in excavations in Olympia. Assistant in Berlin museums, 1880; prof. and keeper of antique records, in Munich, 1894. In 1901-7 he undertook excavations in Egina, Amyklä, and Orchomenos. Wrote *Meisterwerke der griechischen Plastik* (1893); *Die antiken Gemmen* (1900); *Griechische Vasenmalerei* (1900); *Agina* (1906); and *Klassische Schriften* (1912-13).

Furtwangler, Wilhelm (b. 1886), Ger. musical conductor; b. in Berlin, son of Adolf F. (q.v.). Studied in Munich; was in the court theatre under Mottl, 1911-15. Conducted opera in Munich, and 1915-19 in Mannheim. Conducted, 1920-22, symphony concerts of Berlin state orchestra, and Frankfurt museum concerts; and, 1922-27 (as successor to Nikisch), Leipzig Gewandhaus concerts. Conductor of concerts of Gesellschaft der Musikfreunde, Vienna, 1921-30. Conducted at Philharmonic concerts, New York, 1926-27; Vienna Philharmonic concerts, 1927-30; director of the Berlin Philharmonic concerts, 1922-34, and from 1935; of the Berlin state opera, 1933-34; permanent guest conductor, Vienna Philharmonic orchestra and Vienna state opera; conductor, Bayreuth festival, 1931, 1936, 1937. Since Nikisch's death chief Ger. conductor. A Ger. denazification tribunal, in Dec. 1946, accepted F.'s application to have his name and record cleared, on the ground that his return to musical life in Germany after Hitler came to power was due to misunderstanding of the conditions in Nazi Germany. The tribunal thought

that F. took this step to serve Germany's cultural interests. See monographs by O. Schrenk, 1940, and F. Hierfeld, 1941.

Furze, name given to sev. species of the leguminous genus *Ulex*, which occurs in Europe and Africa. There are three species known in Britain, *U. nanus*, *U. Gallii*, and *U. Europæus*, and they are called also whin and gorse. They are all bushy shrubs with reduced leaves and many reduced branches; the bright yellow flowers make gay the bare heaths from early summer. The fruit has a curious explosive mechanism.

Fusan, or **Pusan**, important seaport on the S.E. shore of Korea, is the terminus of the railway from Seoul. This treaty port was opened to Jap. trade in 1876 and later on to foreign trade generally. The tn. consists of two parts, the native part and the Jap. settlement, which is the new part. The chief exports are rice, beans, hides, and silks, while cotton goods and Jap. goods are imported. The fisheries are also of some importance. It has a good harbour. Pop. about 180,300.

Fusaro, Lake of, lake of Italy, situated about 11 m. W. of Naples. It is the Acherusia Palus of Rom. times, and is near the ruins of Cumæ. It is also famous for oysters.

Fuse, or **Fuze**: 1. Contrivance for igniting the explosive element in a shell or blasting cartridge at the required moment. A F. may be required to be instantaneous, or it may be designed to delay the explosion. Fs. used for blasting purposes are either slow-burning or electrical. In the former case a cylindrical packing of linen with a core of gunpowder is used. As ordinarily prepared, this burns at the rate of about 2 ft. per min., and takes effect on the detonating cap which then explodes the main charge. An electrical F. is constituted by inserting the ends of two insulated copper wires in the detonating cap. The wires are then attached to long wires leading to a battery deposited some distance from the scene of the explosion. Fs. for service shells are either percussion or time F.s. Percussion Fs. are actuated either by the pressure of the gases behind the shell, or by the rotation induced by the rifling, or by the impact of the shell when it reaches its destination. Where the F. is actuated by the forces acting upon the shell at the moment of discharge, it means that a needle is set free or unlocked, so that it causes the explosion of the detonator when the shell strikes. If the F. is operated by direct impact only, it must necessarily be of sufficient strength to prevent explosion at the discharge of the gun. Time Fs. were formerly made of wood; their action depends upon two channels of slow-burning F. composition which is ignited by the discharge of the gun; these channels are movable with respect to each other, so that the distance from the point of first ignition to the magazine may be adjusted, thus determining the time to elapse before the explosion of the shell. 2. In electricity a thin wire (usually made of copper but sometimes of tin or an alloy) inserted in

an electric circuit from considerations of safety. If the current in the circuit is too large the F. wire becomes hot and melts, thus breaking the circuit and preventing the flow of the current. Fs. are mounted in insulating holders of porcelain, glass, or the like. For larger currents they are replaced by circuit breakers which work magnetically.

Fuses, or **Fuzee**, see **HOROLOGY**.

Fusel, or **Fousel**, Oil, also called **Potato Spirit**, consists chiefly of amyl alcohol (C₁₁H₂₄O), but with it are also mixed butyl and propyl alcohol. It is a colourless fluid with an oppressive smell and a burning taste. Commercially it is used for making peardrops and other forms of amyl acetate for flavouring purposes, patent varnishes, and essential oils. When potatoes, rye, and barley are fermented and the liquor distilled, it will usually be found to contain F. O., which becomes gaseous at a higher temp.; 'can either alcohol or water. It is a constituent of most inferior spirits, but is not poisonous, though it produces undesirable physiological effects.

Fuseli, or **Fusoli**, Henry, or **Fuessli**, Johann Heinrich (1742-1825), artist and writer, b. at Zurich. He studied art in Italy, and then took up his residence in London, where he was known by the name of Henry Fuseli. He was elected R.A. in 1790, and about 1798 became a prof. of painting at the academy. His pictures, which testify to his wonderful imagination, are somewhat lacking in their method of execution. He painted 'The Nightmare' (1782), and illustrations for both Shakespeare's and Milton's poetry. He wrote *Lectures on Painting* (1801-20). His collected works, with a life by J. Knowles, were pub. in 1811. See P. Ganz, *The Drawings of Henry Fuseli*, 1919.

Fushiki, or **Fushigi**, seaport of Japan, on the W. coast of Honshu, about 32 m. N.E. of Kanazawa. It was made an open port in 1889. Pop. 35,000.

Fushimi, tn. of Honshu, Japan, about 6 m. S.E. of Kioto. Here was fought a battle between the imperialists and the followers of Shogun in 1868. Pop. 31,000.

Fusible Metal, general term applied to certain bismuth alloys which have a particularly low melting point. The chief varieties are (1) Newton's metal, containing 8 parts of bismuth, 5 of lead, and 3 of zinc; melting point 95° C. (2) Darcel's metal, containing 2 parts of bismuth, 1 of lead, and 1 of tin; melting point 94° C. (3) Rose's metal, containing 25 parts of bismuth, 14 of lead, and 14 of tin; melting point 94° C. (4) Wood's metal, containing 4 parts of bismuth, 2 of lead, 1 of tin, and 1 of cadmium; melting point, 67° C. A useful property of these alloys is that they expand on cooling, and therefore give a sharp definition when used for type-founding, stereotyping, etc. Such metals are also used as safety plugs in steam-boilers, when, if the water level falls too low, they are melted and act as a safety valve.

Fusiliers, originally soldiers armed with a 'fusil' or lighter musket than the rest of the infantry. As all Brit. regiments

now carry rifles of one pattern, the term *F.* has only an historic significance. See also under the names of the various regiments: LANCAIRE FUSILIERS; ROYAL FUSILIERS; SCOTS FUSILIERS; ROYAL; WELCH FUSILIERS, ROYAL, etc. *Fusi-Yama*, see FUJI SAN.

Fust, Johann (d. 1488), wealthy burgher of Mainz, Germany, associated with Gutenberg and Schoeffer, to whom, with them, the invention of printing has been ascribed. A masterpiece of this partnership was a Lat. psalter, 1457, the initial letters in which were printed in red and blue. He is sometimes supposed to have been the original of the Faust legend.

Fustel de Coulanges, Numa Denis (1830-89), Fr. historian, b. in Paris. He was prof. at Amiens, Paris, and Strasbourg, etc.; in 1870 was appointed to the Ecole Normale, Paris, and afterwards became a prof. at the Sorbonne. His most famous work is *La Cité antique* (1864, trans. into Eng., 1874). Other works are *Histoire des institutions politiques de l'ancienne France* (1875-92); *La Gaule romaine et le royaume des Francs* (1888-91); *Nouvelles Recherches sur quelques problèmes d'histoire* (1891); *Questions historiques* (1893). P. Giraud, *Fustel de Coulanges*, 1896, and L. E. Champlon, *Les Idées politiques et religieuses de Fustel de Coulanges*, 1903.

Fustian, cotton fabric. The name is an old one, said to be derived from El-Fustat in Cairo. During the Middle Ages women's apparel and priest's vestments were made of *F.*, but to-day the material is commonly used for labourers' clothes. It is the cotton equivalent of silken velvet, and is variously known as velveteen, corduroy, and knolekin. Jean, which is a thick twilled, or twilled, cotton cloth, is one kind of *F.*, and corresponds to satin in silk stuffs. *F.* is dyed many colours, mostly dark.

Fustic, name of two dyestuffs. Old *F.* is the wood of the *Maclura tinctoria*, a tree indigenous to the W. Indies and Brazil. The dye from it is yellow, and was widely used before the introduction of aniline dyes for animal fibres, especially wool. Young *F.* is the wood of the smoke plant, *Rhus cotinus*; as a dye the yellow colour derived from it is very fugitive to light, but it is much employed in tanning operations.

Futa-Djalon (Fouta Djallon), dist. of Fr. Guinea, W. Africa, having an area of about 42,500 sq. m. It stands at an elevation of about 4000 ft., with beautiful scenery and a pleasant climate. The chief productions are cattle, gold and other metals, rice, and cotton. Its chief riva. are the Senegal and Gambra, both of which rise here, while the cap. is Timbo and Tuba is the largest city. Pop. about 700,000. See also FRENCH GUINEA.

Futa-Toro, ter. of W. Africa in the N. portion of Fr. Senegal. It produces large quantities of pig-iron and tamarinds. Pop. about 120,000.

Futehgunge, see FATEHGANJ.

Futhore, see RUNES.

Futehghur, or *Fatehgarh*, tn. on the r. b. of the Ganges in the dist. of Faruk-

habad, India. With the tn. Farukhabad it forms a joint municipality, and is not only the civil cap., but also a manufacturing centre for cotton prints, gold lace, tents, and metal utensils. It has also a gov. gun-carriage factory and a military cantonment. During the mutiny (1857) more than 200 of the European residents were massacred. Pop. 70,000.

Futehpur, see FATEHPUR.

Futigarh, see FATEGARH.

Futtiipoor, tn. in the plain of the Ganges, India. It is the cap. of a dist. in the United Provs. of Agra and Oudh. It is situated 18 m. by rail S.E. of Cawnpore. It has many fine public buildings, and is especially noteworthy for the very beautiful mosque which it possesses. Pop. about 15,000.

Futures, commercial term applied to the purchase of a commodity (merchandise, stocks and shares) with a view to delivery at a future date. The practice lends itself to speculation in that a person may sell in the hope that by the time of delivery the price will have fallen and he can repurchase at a cheaper rate.

Futurism. This movement was founded in 1909 by the lt. poet, Filippo Tommaso Marinetti, and spread to art and music, as well as to letters. In 1911 Marinetti pub. his work *Le Futurisme*, and in Feb. of that year he arranged an exhibition of the work of five lt. painters in the Bernheimjeune gallery in Paris. These artists, Umberto Boccioni, Carlo D. Carra, Luigi Rossolo, Giacomo Balla, and Gino Severini, issued a 'profession of faith,' in which they stated that they were young and their art was of a violently revolutionary nature; they expressed their strong hatred of the academic in art, and showed that their aim was to portray movement. Painting and sensation, they declared, were inseparable words, and that 'what must be rendered is *dynamic sensation*—that is to say, the particular rhythm of each object, its inclination, its movement, its interior force... we thus arrive at what we call painting of states of mind (*la peinture des états d'âme*).' In the summer of 1913 (June 20 to July 16) Boccioni organised an exhibition of his own works, his paintings and sculptures; but in later years he developed a different and more intelligible style, which showed him as a sculptor of note. See also *SURREALISM*. In 1920 Marinetti issued *I Manifesti del futurismo* in 4 vols. in Milan. See G. Coquiott, *Cubistes, Futuristes, Passistes*, 1914, and R. Wilenski, *The Modern Movement in Art*, 1927.

Fuze, see FUSE.

Fuzuli (d. 1522), Turkish prose writer, see TURKEY, Literature.

Fyllot, see SWASTIKA.

Fyn, second largest is. of Denmark, see FÜNEN.

Fyne, Loch, inlet of the sea in Argyllshire, Scotland, extending in a northerly and north-easterly direction from the sound of Bute, some 6 m. beyond Inveraray, having the dist. of Cantire on the W. and Cowal on the E. On its W. also is Loch Gilp, and the tn. of Inveraray is on this side of the loch. It is famous for its herrings.

Fyzabad, see FAIZABAD.

G, seventh letter of the Eng. alphabet. The Semitic *gimel* (=Gk. *gamma*) passed through the Etruscan alphabet to Lat. and became *C*, originally employed for both *k* and *g* (see under *C*). At a later stage a change (attributed to Appian Claudius Censor in 312 B.C.) was adopted to denote the voiced guttural stop *g*. This consisted in the addition of a bar to the lower end of *C*, thus converting it into *G*. This letter was placed in the position of the *zeta* in the *ik* alphabet, which was dropped (see under *Z*). At a later period the Lat. *g* was palatalised before front vowels. O.E. *G* may be considered under three headings: (1) As an *explosive* or *stop*. It was a voiced guttural stop in the forms *ng*, *gg*, developing into hard *g* (cf. O.E. *singan*, *frogge*; Mod. E. *sing*, *frog*). When *ng*, *gg* was followed by *i* or *j*, it was a voiced palatal stop, developing into the sound *dje* (cf. O.E. *sengean*, *eye*; Mod. E. *singe*, *edge*). (2) As a *spirant* *G* was a voiced guttural spirant initially when followed by an original guttural vowel (*a*, *o*, *u*) or by a consonant, and medially when following an original guttural vowel or a consonant. Initially it developed into Mod. E. hard *g*, except before *n*, when it became silent (cf. O.E. *gōs*, *gripan*, *gnagan*; Mod. E. *goose*, to grip, to gnaw). Medially it became palatalised (cf. O.E. *burga*; M.E. *burwe*; Mod. E. *borough*). Finally it was a voiceless guttural spirant when following a guttural vowel or consonant, and often was vocalised to *h*. It is present in Mod. E., but is silent or pronounced as an *f* (cf. O.E. *hēah*, Mod. E. *high*; and O.E. *geuōg*, *geuōh*, Mod. E. *enough*). Initially before, and medially and finally after, an original palatal vowel *G* was a voiced palatal spirant. Initially it developed into Mod. E. *y*, otherwise becoming vocalised to *i* (cf. O.E. *zieldan*, *daeg*; Mod. E. *yield*, *day*). (3) O.E. *G* also represented the Germanic *j*, and as such was always a palatal spirant, represented in Mod. E. as *y* (cf. O.E. *geong*, *gfa*; Mod. E. *young*, *yea*). The M.E. symbol *ȝ*, used through Fr. influence, was used much later in Scotland than in England, and may still be noted in such words as *capercaille*, *Menzies*. To the forms of Mod. E. *G* already noted may be added the hard *g* before *e*, *i* in words of Teutonic origin, e.g. *give*, *get*, and in Heb. proper names, *Gileon*, *Gehenna*. As an initial preceding *n* *G* has become silent, and *gn* is sounded in many words of Fr. origin as *sign*, *feign*. It may or may not be pronounced hard medially, e.g. *singer*, *younger*. See also ALPHABET.

G, in music is the fifth tone of the natural diatonic scale of C.

Gaba Tepe, headland on the E. end of the Gallipoli peninsula in Turkey, between Suvla and Krithia. During the First World War the Australian and New

Zealand Army Corps, under the command of Gen. Birdwood, landed just N. of the headland on April 25, 1915. The Turks attacked heavily in this locality, but failed to move the Brit., who, however, made little progress, and finally withdrew in the following Dec. See GALLIPOLI CAMPAIGN.

Gabbard, Battle of the, naval battle fought during the first Dutch war (1652-1654) between an Eng. fleet of 105 vessels, with 16,000 men, under Adm. Blake, and a smaller Dutch fleet under van Tromp. The decisive engagement was fought on the second day of a two-day battle when nineteen of the Dutch ships were sunk or captured with the loss of 3000 seamen killed or wounded. Though won by Blake it was one of his hardest fights. See D. Mathew, *The Naval Heritage*, 1915.

Gabbatha, place of Pontius Pilate's judgment seat. It was erected when he pronounced sentence on Christ (John xix. 13), and stood outside the pretorium, for sentence had to be pronounced in the open.

Gabbro, group of basic igneous (plutonic) rocks. They have a completely crystalline granitoid texture, and usually occur in association with the crystalline schists as large amorphous masses or bosses. The chief mineral constituents are plagioclase, generally a soda-lime or lime felspar—labradorite being the commonest, though anorthite is often present in abundance—together with hornblende, augite, magnetite, and sometimes olivine. Apatite is almost invariably present. Generally the felspar is embedded in great crystals of augite which have evidently developed last of all. The composition of these rocks shows from 45 per cent to 55 per cent of silica and a large proportion of lime and magnesia. The proportion of alkalies is small. There are G. areas in Cornwall, in Ayrshire, in Mull, and in Skye, and they occur usually in a somewhat central position surrounded by masses of basic lava, such as basalt. The composition of it bears a very close resemblance to that of dolerite.

Gabelentz, Hans Conon von der (1807-1874), Ger. philologist, b. at Altonburg. Said to have been master of thirty languages. Wrote treatises on a number of them, his chief work being on the Melanesian.

Gabelle (Low Lat. *gabulum*, a tax), term applied in France to a tax on various articles, but more particularly to the tax on salt. It was first levied by Philippe IV. in 1286, and was made permanent by Charles V. It compelled all above the age of eight to purchase, every week, a fixed quantity of salt at a set price. It was always most unpopular, and was finally abolished in 1789.

Gabelsberger, Franz Xavier (1789-1849), b. at Munich, inventor of a Ger. system of shorthand. The formation of his signs in shorthand corresponded as far as possible with the written characters of the Ger. alphabet, and his method is still used in Ger.-speaking countries.

GAHLE

John H. Stone

A farmhouse at Forthampton, near Tewkesbury, Gloucestershire

Gaberlunzie, old Scottish name for a beggar or tinker, who was so called from his wallet. Scott's Edie Ochiltree in the *Antiquary* is a good example of the professional beggar. Tradition has it that the author of the song or ballad entitled *The Gaberlunzie Man* (see *Percy Reliques*) was King James V. of Scotland, who was noted for strolling about his dominions in the disguise of a tinker or beggar.

Gabers, see GUBBERS.

Gabes, see GABLS.

Gabli, ant. in of Latium, situated on the Via Gabina, about 12 m. from Rome. It played an important part in the expulsion of the Tarquins. It was famous for its baths, and the Emperor Hadrian built a senate house (Curia) and an aqueduct there.

Gabinus, Aulus, one of the Rom. tribunes in 67 B.C. He was a partisan of Pompey and it was through him that Pompey secured his 'extraordinary' command in the E. He proposed that a magistrate should be appointed who should be absolute master in all maritime affairs of Rome. The measure was supported by Cæsar in opposition to the Senate, and carried. In 58 B.C. he was consul, and supported the tribune

Clodius in his free distribution of corn. He was made governor of Syria in consequence, and in 55 B.C. restored, on his own responsibility, Ptolemy Auletes to the throne of Egypt, receiving for this a bribe of 10,000 talents. In 54 B.C. he was condemned for prov. misgovernment. In 49 B.C., at the outbreak of the civil war, he supported Cæsar against Pompey.

Gabirol, see AVICENNA.

Gable, triangular-shaped piece of wall closing the end of a double-pitched roof. It is a decorative feature of Ger. renaissance and of Elizabethan architecture in England.

Gablonz, see JARLONCO NAD NISOU.

Gaboon, or Gabun, dist. on the W. coast of Africa, which forms part of Fr. Equatorial Africa. It was discovered by Spaniards in the fifteenth century and received its name from its fancied resemblance to a cabin. The Fr. first settled there about 1842. It has an area of about 105,000 sq. m., and its chief rivers are the Ogowe and the O. The surface is flat near the coast, but behind this rises to a plateau at a height of 3000 ft. The climate of the coast is unhealthy, that of the plateau is better. The natives grow manioc, bananas, nuts, and tobacco, while the Europeans cultivate coffee, cocoa, and vanilla. The chief exports are coffee, india-rubber, ivory, and palm oil and nuts. In the Second World War, in 1940, after the collapse of France, the dist. espoused the cause of the Free Fr. under Gen. de Gaulle. Pop. 421,000. Cap. Libreville. See also FRENCH EQUATORIAL AFRICA.

Gaboriau, Émile (1835-73), Fr. writer of detective novels, was b. at Saunjon. He began by writing for the Parisian papers and became famous at once when his story *L'Affaire Lerouge* was pub. in 1866 in *Le Pays*. He quickly wrote others: *Le Crime d'Orival* (1868); *Monsieur Lecog* (1869); *Les Esclaves de Paris* (1869); *La Vie infernale* (1870); and *L'Argent des autres* (1874).

Gabriel (Heb., man of God), archangel who explained to Daniel the vision of the ram and the he-goat, who appeared to Zacharias to announce the birth of John the Baptist, and to the Blessed Virgin to announce the birth of Christ. He is called archangel by both Jewish and Christian writers and is mentioned in the book of Enoch as the one who is set over 'all the powers.' The Targum assigns to him the destruction of the host of Sennacherib, and in the Koran his special work is divine revelation. Indeed he is still given the titles of Holy Spirit and Spirit of Truth by the Muslims.

Gabrosentum, see under GATESHEAD.

Gabun, see GABOON.

Gad, seventh son of Jacob by Zilpah, the handmaid of Leah and founder of the Israelitish tribe which is described in Genesis as a 'plundering troop.' When the Israelites left Egypt they settled to the E. of Jordan close to the dist. inhabited by the tribe of Reuben, their thr. including Gilead. They have a character for bravery; eleven of the tribe of G. came to the assistance of David when he most

needed help. G. is also the name of a seer of King David, as well as of the god of luck or fortune.

Gadag, or **Garag**, important railway centre and manufacturing tn., 42 m. E. by S. of Dharwar, in the dist. of Dharwar, Bombay, India. Pop. about 41,000.

Gadames, or **Ghadames**, tn. and oasis in N. Africa situated on the N. border of the Sahara, about 300 m. from Tripoli on the frontier of the Algerian and Tunisian ters. of the S. and Tripoli. The tn. had its origin from the hot spring which probably made the Roms. visit it about 20 B.C., when it was captured by Balbus and called Cydamus. It is important for its caravan trade, and its gardens produce apricots, dates, and figs. The inhab. are chiefly Arabs and Berbers. Captured by Gen. Leclerc's expeditionary force on Jan. 26, 1943 (see FEZZAN). G. is the mysterious city, the citadel of Islam, into which no white man had succeeded in penetrating before the beginning of this century, and for the first four decades few ventured to go there. The marquis de Morès, a coeval of Pétain (q.v.) at St. Cyr, was murdered there by fanatical Moslems. The white fathers who had tried to catechise the natives of G. had been assassinated one after the other. The Its. only risked their lives with considerable mistrust in this restless tn. Relatively strong It. forces were holding the tn. when the Free Fr. forces appeared and, without striking a blow, took the It. garrison prisoners of war. Pop. 7000.

Gadara, anct. tn. of Syria, situated to the S.E. of the sea of Galilee, and one of the Decapolis cities. It was originally a Gk. city, but is said to have been captured by Antiochus of Syria in 218 B.C. Some years after it was besieged and partly destroyed by Jaunemus, but it was restored by Pompey about 63 B.C. It is now in ruins. Its coins bear Gk. legends and inscriptions; from which fact it is probable that the wealthy classes were Gks. It was famous for its hot sulphur springs which still exist. The destruction of the Gadarene swine took place probably at Kersa on the E. shore of Galilee and not here.

Gaddi, It. family of artists:

Gaddo Gaddi (c. 1260-1332), painter, was b. at Florence. He was a friend of Cimabue, whose influence is seen in the 'Coronation of the Virgin with Saints and Angels,' a mosaic in the cathedral at Florence which is said to have been executed by him. Other works assigned to him are the mosaics in Santa Maria Maggiore, and those in the choir of old St. Peter's at Rome.

Taddeo Gaddi (1300-66), son of the former and a student of Giotto, was also b. at Florence. He painted in fresco the 'Virgin and Child between Four Prophets' in the Baroncelli Chapel in Santa Croce at Florence, as well as 'Scenes from the Life of the Virgin,' besides other frescoes at Pisa, Naples, and Berlin. His pictures are vigorous, but somewhat lacking in imagination.

Agnolo Gaddi (c. 1333-96), son of Taddeo, was b. at Florence and studied

under Giovanni da Milano and Jacopo del Casentino. His first work was probably the 'Resurrection of Lazarus' in the church of San Jacopo tra' Fosse at Florence. Other works of his are the frescoes at Prato, representing the two legends of the Virgin and the Sacred Girdle (these are still to be seen though much damaged), and the legend of the Cross, a work in the choir of Santa Croce, Florence, consisting of eight frescoes.

Gade, **Niels Wilhelm** (1817-90), Dan. musician, was b. at Copenhagen. His *Echoes of Ossian* (1841) first brought him before the public, the composition was well received, and the king gave him a stipend which enabled him to go to Leipzig. Here he became acquainted with Mendelssohn, and on his death became chief conductor of the Gewandhaus concerts. In 1818 he returned to Copenhagen and founded, some years later, with the composer J. P. E. Hartmann, the musical conservatorium. His compositions include orchestral music, e.g. his eight symphonies which are estimated his best work, cantatas, e.g. *The Erl-King's Daughter*, *Psyche*, *Spring Message*, *Spring Fantasy*, pieces for the piano, and pieces for strings. He was probably one of the founders of the Dan. school of music. See lives by W. Neumann, 1857, and W. Behrend (*Minder om Gade*), 1930.

Gades, see CADIZ.

Gad-fly, see under HORSE-FLY.

Gadidae, family of fish called technically Malacopterygians, or bony fish. The cod-fish, or *Gadus*, is a member of this family. Other are the haddock and the whiting, both of which form valuable foods.

Gadolinium, metallic element of atomic number 64 and atomic weight 157.3. It belongs to the group of rare-earth metals, from which it may be isolated by the fractional crystallisation of their nitrates and bromates. Its salts are colourless and it forms a white oxide. Its symbol is Gd.

Gadsden, **James** (1788-1858), Amer. diplomatist, b. at Charleston, S. Carolina. He fought in the war of 1812, as also with Stonewall Jackson against the Seminole Indians. He afterwards became Amer. minister in Mexico and purchased by treaty in that capacity part of the states of Arizona and New Mexico. His diplomatic career was very successful.

Gadsden: 1. Co. in the N. of Florida, U.S.A.; pop. 30,000. 2. Tn. in Alabama, U.S.A., cap. of Etowah co. It is 60 m. N.E. of the tn. of Birmingham, and has cotton manufs., blast furnaces, and pipe works. Pop. 36,900. 3. Vill. of S. Carolina, U.S.A. 4. Vill. of Crerkett co., Tennessee, U.S.A.

Gads Hill, short distance outside the tn. of Rochester. It forms the scene of the adventures of Falstaff and Prince Henry, as depicted in Shakespeare's *Henry IV*. It is of more recent interest as the residence of Charles Dickens. He had always coveted the house known as Gads Place, and purchased it in 1856. He lived here between 1860 and his death in 1870.

Gadwall, species of duck. It is practically unknown in Britain, although it

has been known to exist in the marshes of Norfolk. It is, however, found practically all over the world, existing in N. Africa, Asia, America, and in all parts of Europe. It is much esteemed as a table luxury, and is for that purpose imported in large quantities into Britain. In size it is not quite so large as the mallard, and it is a fresh-water bird. It breeds principally in marshy districts.

Gæa, or **Gæ** (Rom. *Tellus*), the earth-goddess. She was supposed to be the daughter of Chaos, and the mother of Uranus and Pontus (Earth and Sea). She is also said to have been the mother of the Titans and the Cyclopes. Her cult became extensive in the E., and she was worshipped originally at the oracles of Delphi and Olympia. She was also supposed to preside over Death, Hades, and Marriage.

Gaekwar, **Gulcowar**, **Garkwar**, or **Gáckwár**, title of a powerful Mahratta prince, ruler of the state of Baroda in W. India. It was originally a family name, and is derived from the word meaning cow, though the family are not of low caste, but belong to the Mahrattas proper. The dynasty was founded in the first half of the eighteenth century by Damaji I., P'ljaji, who gradually acquired authority over Gujarat, and Damaji II., who threw off his allegiance to the Peshwa. In 1948-49, the G. after a series of disputes with his State Congress party, agreed to the merging of Baroda in Bombay.

Gaelic Language and Literature. *Language*.—The G. branch of the Celtic language may be said to be confined at the present day to some few thousand people in the Scottish Highlands, the W. of Ireland, the Isle of Man, Wales, and perhaps in parts of Cornwall. The language of the Scottish Highlanders is familiarly known among the Lowlanders as *Erse*, but the Highlanders themselves are never so named, nor is the name even known among them. They style themselves the *Gadhel*, sometimes written and pronounced *Gael*, and their language, *Gaedhelig*, pronounced *Gaelic*, or nearly *G.* But the only name by which the Irish are, or were till recently, known to the Scottish Highlanders is *Gael*. In contradistinction the Scottish Highlanders call themselves *Gael Albainn* or the Gael of Albin, and the Irish *Gael Erin* or the Gael of Erin. The Welsh call the Irish *Gryddel*, which is evidently the same as *Gadhel* or *Gael*. It is a matter of topographical and, indeed, philological controversy exactly how the various branches of the Celtic family were disposed in Great Britain and Gaul in auct. times. It is sometimes assumed that the modern Gaels are a portion of the *Galli*, or Gauls, of the Romans, and the Galatæ of the Gks. But, if so, these names might be taken to be the same as the *Celtæ* or *Keltai*, sometimes spoken of as a general name for the Gauls. This seems on historical grounds to be erroneous. The Gaels or Goidels of Great Britain and Ireland in Cæsar's time were, with the Brythons (Britons), merely two Aryan races of the Celtic family, while the Ivernians or Hebernians (a word cognate

with *Erse* and *Erin*) were Turanian, which last fact makes it difficult to understand how *Erse* and *G.* came to become practically identified. It is probably largely a matter of mere names, and the identity of tongues is to be accounted for by the close intermingling of the races before the conquering Goidels drove the Ivernians into the W. of Ireland before they themselves were driven westward by the Brythons. All the G. or Celtic tongues as now spoken resemble each other closely in structure, though each has its distinctive features.

It is often asserted that *G.*, even if once the universal language of the Goidel and Brythonic peoples of Early Britain, has left no trace in modern Eng., having disappeared with the reputed extermination of the Celts. The best authorities concur in seeing abundant traces. The very idiom 'I am speaking' is *G.* and is impossible of an exact rendering in any continental tongue, and the employment of the auxiliary 'do' as an intensive is another common illustration of a distinctive *G.* idiom, and corresponds to the *G.* 'dean.' Whether or not *G.* is doomed to expire as a spoken language, nothing can destroy its imperishable influence on literature. So great an authority as Matthew Arnold declared that rhyme, the most striking characteristic of our modern poetry as distinguished from that of the ancients, is a direct legacy of the Celts, and in this opinion he is confirmed by Zeuss, the most distinguished of Ger. Celtic scholars.

G. itself, or *Erse*, as spoken in the Highlands of Scotland and in Ireland at the present day, was one branch of the Celtic language, the other being Cymric or Welsh. The former was the common language of the greater part of England before Rom. invasion. It has been objected with much sound criticism that even at the Norman Conquest the great majority of the Eng. people were Celts, and that the stereotyped belief in the virtual extermination of the Britons, resting as it does on the sole authority of *Gildas*, as echoed by Bede, is really groundless. If this objection is accepted, many philological difficulties disappear, and it is probable that the etymologist Mackay is justified in assuming an unlimited blending of Celt and Saxon reflecting itself in the language, literature, and national character of the hybrid Eng. race. *G.* prevails largely in the colloquial speech of the Eng. people of to-day, and it underlies the Fr. and Sp. and some parts of the It. languages. The 'Low Latin' of the Middle Ages, so beloved of law books, is a compound of *G.* (or other Celtic) words with Lat. terminations. Even the word *Angle* in the race-appellation A.-S. is a corruption of An Gael, or 'the Gael.' These and similar indications are the best possible refutation of Dr. Johnson's assumption that *Erse* was the rude speech of a barbarous people, who had few thoughts to express and that, such as it was, it was never a written language. The absence of much in the way of written records of *G.* is due largely to the ruthless destruction by piratical Danes and Norse-

men of all the records, monuments, and MSS. collected in the sacred isle of Iona. Irish records met with a better fate, but it seems that Dr. Johnson did not realise, in his strictures on Scottish G., that Irish and Scottish G. were essentially the same language, with but few more important orthographical differences than the substitution of a dot for the letter *h* in the mode of expressing the aspirate.

A curious survival of G. choruses and Druidical chants in G. is to be seen in the apparently meaningless words 'fal, la, la'; 'tooral, looral'; 'hey nonnie, nonnie,' and 'down, down, derry down.' For example, the chorus in Morley's *Invitation to May*, 1595:

'Now is the month of Maying
When merry lads are playing,
Fal, la, la!
Each with his bonnie lass
Upon the greeny grass,
Fal, la, la!'

The G. interpretation of these syllables is 'Welcome! the day!' (*Fal* abbreviation *faile*, welcome, and *la*, a day).

Again, Shakespeare in many passages uses 'hey nonnie, nonnie,' which in G. signifies 'Hail to the noon.' For example, in *Much Ado About Nothing*, Belthazar sings the well-known lines:

'Sigh no more, ladies, sigh no more,
Men were deceivers ever,'

and ends with

'Converting all your sounds of woe,
Into hey nonny, nonny.'

Writing.—The peculiar Ogham script (see OGHAM), used by the ant. Celtic pop. of the Brit. Isles, was the only original 'national' script of the Celts. The modern Irish script is a development of the medieval Irish hand of the Lat. alphabet, which is considered by some scholars to have been introduced into Ireland from Gaul by St. Patrick (fifth century A.D.). In medieval times three varieties were employed: the *majusculæ*, mainly used for headings; the semi-uncial, mainly used for religious books; and the *minusculæ* or angular script mainly used for lay books and documents. The Irish missionaries and monks carried their script into various countries of the Continent.

G. presents various peculiarities which cannot be expressed by the usual Rom. characters. For instance, some Irish consonants have two different pronunciations: the plosives *c*, *t*, *p*, *g*, *d*, *b* are sometimes aspirated and sometimes non-aspirated. Thus a dot placed on a consonant generally indicates that it should be aspirated. On the other hand, the acute accent placed on a vowel indicates that it should be pronounced long; besides, there are a great many vowel combinations, which generally have but a single sound. For instance, *ai* or *ea* represents the short sound *æ*, *ae* or *ao* = long *æ*, *oi* = *o*, *oi* or *eo* or *éoi* = long *o*, and so forth.

Apart from these dots, accents, and combinations of vowels, the Irish alphabet only consists of eighteen characters,

i.e. five vowels (*a*, *e*, *i*, *o*, *u*) and thirteen consonants (see figure on p. 286 of vol. 1.). It may be pointed out that *c* represents the sound *k*, but also final *g* is pronounced like *k*; *s* before *e* and *i* is pronounced like *sh*. In comparison with the Eng. alphabet, the following letters are missing: *j*, *k*, *q*, *v*, *w*, *x*, *y*, *z*.

Literature.—The most ant. literary specimen relating to the Scottish Gaels is the *Book of the Deer*, or *Book of Deer*, which contains part of the gospel in St. Jerome's Lat. version in handwriting reputed to be of the ninth century. After the twelfth century there followed a long period of literary sterility in the Scottish G. language, the written language having almost entirely disappeared. Such MSS. as are preserved are in the Irish language. There is in the National Library, Edinburgh, the celebrated codex of verses (said to be the oldest extant Scottish G. verse), known as the *Dean of Lismore's Book*, compiled by Sir James Macgregor, the dean of Lismore. A number of books, mainly of a devotional character, were trans. into G. from time to time, for the use of Scottish Highlanders; but down to the eighteenth century the blank in Scottish G. literature is relieved only by a few MSS. like the *Red Book of Clanranald*, dealing with the hist. of the Scottish clans of Macdonald and Montrose, and the *Book of Fernaig*, a compilation of religious and political poems; and the collection of poems entitled Mackenzie's *Beauties of Gaelic Poetry*, 1904, chiefly remarkable for the ballads of the famous woman-bard, Mary MacLeod. The 1st puted first book actually printed in Scottish G., apart from the devotional books above noticed, was the G. vocabulary compiled by the Scottish poet Alexander Macdonald (commonly called Mac-Mhaighstir-Alastair). Incomparably the most popular work of the Scottish G. poets was that of Dugald Buchanan, the schoolmaster of Perthshire. The most notable of his hymns, which are collected in the *Laidibh Shiorradal* (Spiritual Hymns), first pub. in 1767, are 'Latha a' Bhreitheanais' (The Day of Judgment), 'Am Bruadar' (The Dream), 'An Claiogann' (The Skull), and 'An Geamhradh' (The Winter).

Of far greater interest from a purely literary standpoint is James Macpherson's *Poems of Ossian*, the pub. of which led to a bitter controversy as to their authenticity, which culminated in an inquiry by the Highland Society and a considerable literature. The result of the controversy establishes that though the characters introduced by Macpherson were not fictitious in the sense that they were known to the traditions of the Highlands and that there were in existence ballads repeated orally among the Highlanders relating to the deeds of mythical heroes, yet Macpherson had pieced together into an apparent sequence the fragmentary nature of this raw material with compositions of his own containing sentiments familiar in classic epics like the *Iliad*.

Of later Highland poets Ewen Mac-Ioslan's G. poems of nature and romance

contain many exquisite lines. The most noteworthy of them were pub. under the title of the *Metrical Effusions*. Peter Grant's sacred poems are as well known to every Highlander as those of Buchanan. Notable, too, in a lesser degree was the poetry of 'Rob Doon' (Robert Mackay). Among prose writers Norman Macleod's name is most noteworthy in G. literature. But apart from his name and that of other modern writers, in the decaying G. language there is but little prose, outside collections of folklore and proverbs, except religious books like Knox's *Liturgy*, Calvin's *Catechism*, and Kirke's version of the Celtic Bible, together with various dictionaries like Armstrong's *Gaelic Dictionary* (London), 1825, and the *Dictionary Scolto-Cellicum*, pub. by the Highland Society of Scotland in 2 vols. (London and Edinburgh), 1828.

The Irish G. language is infinitely richer in extant work than the Scottish, and indeed, as has been shown, inspired and set the style to most of what remains of the latter. Far from being confined to a little poetry, collections of folklore, and prose, conspicuous either by its absence or confined to trans. of religious works, Irish G. can show miscellaneous tracts like the *Book of Leinster*, a bibliotheca or collection of historical MSS., poems, tales, and genealogies (written by Finn, bishop of Kildare for Aedh MacCremhthainn, tutor of Diarmait MacMurcadha, the celebrated king of Leinster); chronicles of wars like the fragments in the *Chronicles of Picts and Scots*, and the chronicles of wars of the Irish with the foreigners like the *Cogadh Gaidheal ne Gallaidh* (authorship attributed to MacLiam, the bard of King Brian); various compilations from ant. MSS., like the *Book of Ballymore*, the *Leabhar Briac*, or *Speckled Book*, the *Leabhar na-h-Midhrí* (Book of the Dun Cow) and the *Book of Fermoy*, all in the G. vernacular, containing a valuable miscellany of poems, tales, and legal matter; the celebrated 'Breton Law Tracts'; eccles. documents and lives of saints; works on medicine; and an inspiring array of ant. Irish annals, notably those of Ulster and Connacht, besides trans. from foreign languages. For fuller information on the literature of the Irish, Welsh, Manx, Cornish, Breton, and other dialects, rooted in G., reference should be made to works on Celtic literature, especially as to Ireland, O'Reilly's chronological account of some 400 Irish writers down to 1750; *The Transactions of the Ossianic Society*, containing the tales of the Ossianic cycle; *The Miscellany of the Celtic Society*, 1849; *Chronicon Scotorum*, dealing with Irish affairs down to A.D. 1135; and *The Annals of Loch Cé*; as to Welsh, the *Myvyrian Archæology*; the *Four Ancient Books of Wales*, containing the Cymric ballads of the sixth century; the *Mabinogion*, a collection of romantic tales and myths (an excellent trans. of which, by T. and G. Jones is pub. in Everyman's Library), the most notable character in which is, perhaps, the bard Taliesin ('Radiant Brow').

The most striking of Irish G. poems are,

of course, the Ossianic, sev. of which appear to have been taken from a MS. of lays collected in 1626 in and about the glens of Antrim, and sent out to an Irish officer to while away the tedium of a campaign in the Low Countries. Ossian, or Oisín, was the last of the ant. pagan heroes, and in the many collections of poems traditionally ascribed to him, or to his father and chief, Fionn MacCumbhall, it is not always certain which of them are really authentic G. poetry. The Ossianic poems have survived by oral tradition, and do not exist in written form earlier than some 300 years ago. The worship of nature, which runs through most of them, and the rugged note of the fighting clansman are in curious contrast to the simple plety of religious poems like those of Conor O'Riordan. The prin. religious poem of ant. Ireland is the celebrated *Sallair na Rann*, or *Psalm of the Verses*, attributed to Oengus the 'Culdee' of the ninth century. It contains 150 poems and is not inaptly regarded as the Irish *Paradise Lost* and *Paradise Regained*, dealing as it does with the Creation of the Universe, the Heavenly Kingdom, the Forbidden Fruit, the Fall and Expulsion from Paradise, the Penance of Adam and Eve, and the Death of Adam. The only complete existing copy of this poem is contained in the Bodleian MS., the text of which was pub. in 1883 by Dr. Whitler Stokes. Miss Eleanor Hull's is the first Eng. trans. and her work repays study if for no other reason than the curious Irish conception of the universe with its faint flavour of Lucretius, softened albeit by the mystic notion of eight winds fashioned in manifold hues. The purely pagan G. poems are strongly tinged with mysticism, and display in a marked degree the sort of conflict of an open and joyous temperament, weighing its material love for the songs of birds, the dancing song-time, and all the glories of brilliant nature against the advancing claims of Christianity to a wholehearted enthusiasm for the purely spiritual. Some of these poems are of unquestionably fine dramatic power, and reveal a subtle beauty of correspondence between the sentiments of the 'Keen' ('Keeners' are professional Irish singing mourners) and the imaginary scene surrounding of the singer. Sev. are laments on untimely deaths, echoing a fatalistic acceptance of the fierce vindictiveness and jealousy of the G. character. The *Keen on Art O'Leary*, which originally appeared in Mrs. Morgan J. O'Connell's *The Last Colonel of the Irish Brigade* (1892), is a dirge of singularly moving pathos.

Bibliography.—GRAMMARS: Armstrong, *Gaelic Dictionary and Grammar*, 1825; C. Mackay, *Gaelic Etymology of the Languages of West Europe*, 1877 (a book to be used with caution); G. Calder, *Gaelic Grammar*, 1923; H. Lewis and H. Pederson, *A Concise Comparative Celtic Grammar*, 1932; and G. O'Nolan, *Gaelic Grammar*, 1934.

DICTIONARIES: H. C. Dickhoff, *Gaelic Dictionary*, 1932; *The Highland Society's Gaelic Dictionary*.

LITERATURE, ETC.: J. Logan, *The Scottish Gael or Celtic Manners*, 1831; J. F. Campbell, *Popular Tales of the West Highlands*, 1860-62; Dr. Todd, *The War of the Gaedhil with the Gaill*, 1867; W. M. Hennessy (ed.), *The Annals of Loch Cé*, 1871; J. S. Blackie, *Language and Literature of the Scottish Highlands*, 1876; R. MacLagan, *Scottish Myths*, 1882; A. Nicolson, *Collections of Gaelic Proverbs*, 1882; M. Maclean, *Literature of the Celts*, 1902, and *Literature of the Highlands*, 1904; M. C. Macleod, *Modern Gaelic Bards*, 1908; Eleanore Hull, *Text Book of Irish Literature*, 1901-8, and (ed.), *Poem Book of the Gael*, 1912; A. de Blacam, *Gaelic Literature Surveyed*, 1932; K. J. Jackson, *Studies in Early Celtic Nature Poetry*, 1935; and J. A. MacCulloch, *The Celtic and Scandinavian Religions*, 1947.

Gaertnera, genus of Rubiaceae. It is common to the tropical dists. of Africa and Asia; some of the species are cultivated for their fragrant blossoms. Of these *G. racemosa* is one of the best known.

Caeta, tn. and fortress of Campagna, Italy, situated some 70 m. N.W. of Naples on the gulf of G. It is the seat of an archbishop, and was the scene of the last stand of the reigning prince of Naples against united Italy (1861). In Rom. times it was known as Portus Caeta. It is one of the best ports in Italy. G. fell to the allied Fifth Army in Oct. 1943. In the campaign the cathedral suffered considerable damage, but its fifty-seven Rom. columns, Gothic arch, and bell-tower survived. The church of San Cosmo at Klona was badly hit, and many churches sustained some damage. The Palazzo Caetani (or Gaetani) was partly demolished. Pop. (com.) 22,000.

Caetulia, name given in classical times to the region immediately S. of Numidia and Mauritania in N. Africa. The country was inhab. by a Libyan race who are probably the ancestors of the modern Berbers. They were conquered and made part of the empire by the Romans at the beginning of the Christian era.

Gage, Thomas (1721-87), Eng. general, son of the first Viscount G. Served in the Seven Years war, and, in 1755, in Braddock's ill-fated Amer. expedition. In 1760 he was appointed military governor in Montreal, and, in 1763, commander-in-chief of the Brit. forces in America. As governor of Massachusetts he precipitated the revolution by his ill-timed severity, and, after the battle of Bunker's Hill, he was recalled to England.

Gage, see GATAGE.

Gahanbars, name applied to the six ann. Parsoo festivals. Each of the festivals lasts for five days.

Gahnite, ore of zinc belonging to the class known as spinels. It varies in composition, and may contain sev. elements other than zinc. Part of the zinc may be replaced by iron or magnesium. The general formula may be given as (ZnFeMg)(AlFe)O₄.

Gaiety Theatre, London, opened in Dec. 1868 by John Hollingshead. The first productions were *On the Cards* by F. C.

Burnand and *Robert the Devil* by Gilbert. The new building, designed by the famous Eng. architect, Norman Shaw, was opened in 1903 with George Edwards's *Orchid*. Among other early plays which appeared at this theatre were *The Spring Chicken*, *The New Aladdin*, *The Girls of Gottenburg*, and *Our Miss Gibbs*. The Gaiety is in the Strand, on the N. side, at the W. end of Aldwych.

Gallac, Fr. tn., dept. of Tarn, situated on the R. Tarn, near Albi. The tn. was built round a great Benedictine monastery of the tenth century, and still has a great wine trade. Pop. 7000.

Gainesville: 1. City of Florida, U.S.A., and co. seat of Alachua co. It stands in the midst of a co. which yields cotton and fruit in abundance. There are phosphate and fertiliser industries, bottling works, etc.; market gardening is also carried on. It is a well-known winter resort. The E. Florida seminary is situated here. Pop. 13,700. 2. City of Texas, U.S.A., situated in Cooke co. It is a great industrial centre and manufs. cotton-seed oil, flour, and iron ware. Pop. 4600. 3. Tn. of Georgia, U.S.A., in Hall co. Is a mining centre, and has some cotton mills, and is a popular summer health resort, with mineral springs. Its chief manufs. are cotton-seed oil. It is the seat of the Brenau College. Pop. about 10,200.

Gainsborough, Thomas (1727-1788), Eng. portrait and landscape painter, b. at Sudbury in Suffolk, where he received small schooling, but where, by the age of ten, he had 'sketched every fine tree and picturesque cottage.' At fourteen he went to London, studied etching under Gravelot and painting under Hayman. At nineteen he married a young lady with £200 a year, and started housekeeping in Ipswich, where he remained till he moved to Bath in 1759. His studio soon became a resort of wealth and fashion, and among his sitters at this period were Richardson and Sterne, the novelists, and Garrick, whom G. regarded as 'the greatest creature living.' Moreover, he patronised musicians of every nationality, himself tried to play the harp, hautboy, and violà-gamba, and was a welcome *habitué* at the green-room of Palmer's Theatre. In 1768 G. was chosen one of the thirty-six foundation members of the Royal Academy, and was a regular contributor at its exhibitions until 1784, when he virtually retired because in his opinion 'The King's Daughters' had been unfavourably hung. In 1774, at the height of his fame, he removed to London, where he paid £300 for his share of Schomberg House, Pall Mall. Here he painted a number of the great people of the day, among them Dr. Johnson, Clive, Franklin, Sheridan, Canning, Burke, Lady Mary Montagu, and Mrs. Siddons, whose portrait is still one of the treasures of the National Gallery. His death was due to a cancer which rapidly developed after a chill caught whilst attending the trial of Warren Hastings. At the last he was reconciled with Reynolds, his rival and former friend, who came to him on his deathbed and who was dismissed with the words: 'We

are all going to heaven, and van Dyck is of the company.'

It was Reynolds who generously and truly prophesied that, with the growth of an Eng. school, 'the name of Gainsborough will be transmitted to posterity as one of the very first of that rising name.' His contemporaries were almost unanimous in their preference for his landscapes, a judgment due largely, no doubt, to the pre-eminence of Reynolds in portraiture, but one nevertheless which most critics of to-day will endorse. In his earlier works he faithfully reproduced nature down to her smallest detail, but when he grew older his landscapes became, as Ruskin justly remarked, 'rather motives of feeling and colour than earnest studies.'

THOMAS GAINSBOROUGH

Self portrait.

Whilst Richard Wilson looked back to Claude for much of his inspiration, G. sought always, as in his 'Waggon and Horses Passing a Brook,' 'The Cottage Door,' and 'The Market Cart,' to give an individual and personal rendering of what he saw, anxious above all to present a harmonious picture of an artistic impression. His portraits, such as 'Orpin, the Parish Clerk' and 'Master Buttall (the Boy Blue),' although invariably graceful and often expressive to a high degree of a passing phase or gesture, have all the merits of instinctive genius without any of the laborious finish essential to the best work. His lightning speed might secure a good likeness, but the style was inevitably one of 'hatching and scumbling.' Yet such is the exquisite blend of shining draperies with backrounds of soft cloud-girt skies and feathery trees of spraying, lightly touched foliage; such is the solemn grandeur produced by the glow and richness of his colours and the transparency

of his shadows, that even his least scholarly portraits are justly deemed masterpieces. *Ser A. Cunningham, Lives of the Painters*, 1829-33; lives by Lord R. Gower, 1903; J. Greig, 1909; W. T. Whitley, 1915; E. R. Dibdin, 1923; and Mary Woodall, 1949.

Gainsborough, mrkt. tn., situated on the R. Tront, Lincolnshire, England, about 15 m. N.W. of Lincoln. Its chief industries are shipbuilding, engineering, and the manuf. of agric. implements, also oil, linseed cake, malt, and cordage. A tumulus here is supposed to be the tomb of King Sweyn. The tn. has a very fine bridge and a manor house, said to have been founded by John of Gaunt. Pop. 17,900.

Gairdner, James (1828-1912). Eng. historian. b. at Edinburgh. He entered the Public Record Office when a boy, and afterwards became assistant keeper. He ed. a considerable number of historical works, and contributed much to modern historical literature. His accuracy has seldom been at fault, and he proved himself a man of unprejudiced judgment. Among the works which G. ed. are *Memorials of King Henry the Seventh* (1858); *Letters and Papers of the Reigns of Richard III. and Henry VII.* (1861); *The Paston Papers* (1872-75); and *Letters and Papers of the Reign of Henry VIII.* (1880-1910). His other works include *Richard III.* (1878); *Studies in English History* (with James Spedding) (1881); *A History of the English Church* (1902); and *Lollardy and the Reformation in England* (1908).

Gairloch, Scottish vil., 30 m. N.E. of Portree in Skye. The vil. is the centre of large cod fisheries. It is mentioned in *My Schools and Schoolmasters* (1854), autobiography of the geologist, Hugh Miller. Pop. 3000.

Gaisin, tn. of the Ukraine in the region of Kamenets-Podolsk. Pop. 11,000.

Gaius, or Caius, Rom. jurist and one of the five great luminaries of Rom. jurisprudence, the others being Papinian, Paul, Ulpian, and Modestinus. Probably b. in the time of Hadrian, and flourished during the second Christian century, writing under the Antonines. Nothing is known of his personal hist., although he himself tells us that he was an adherent of the school of Sabinus. He composed, besides other works he is known or believed to have written, a treatise on the *edictum provinciale*—i.e. the edict of the proconsul in the prov.—and a commentary on the Twelve Tables (q.v.). But the work by which he is known to all law students is his Institutes, and the discovery of the MS. of this work by Niebuhr in 1816 has very greatly contributed to our modern knowledge of Rom. law. The MS. had been written over with the letters of St. Jerome, and its very existence was all but unsuspected until Niebuhr found it while examining the contents of the library of the chapter at Verona. The work formed the basis of the Institutes of Justinian (q.v.), who has followed the order in which G. treats his subject, and adopted his exposition of law, so far as it

was applicable to the times in which Justinian's Institutes were composed. The work of G. affords a valuable comparative study, showing where the law changed between the two periods, and so enables us to understand what the law had really been at the time when its system was most perfect. The best ed. of G. is that of Posle. Other eds. are those of Kruger and Studemund (4th ed., 1900); E. Duvois; and Aldy and Walker (1885).

Galactometer, see LACTOMETER.

Galactose (formula $C_6H_{12}O_6$), one of the hexose sugars, isomeric with glucose (grape sugar) and fructose (levulose or fruit sugar). G. exists in three forms, viz. inactive, dextro-, and laevo-rotatory. The dextro-modification is obtained, together with glucose, by the hydrolysis of milk-sugar. On reduction it yields the alcohol dulcitol, and on oxidation first galactonic acid and finally mucic acid. Melting point 166° . Potassium hydroxide converts d-G. into a mixture of d-tagatose and ψ -tagatose.

Galago, see GALATZ.

Galago, name of a genus of Lemniridae found in Africa. The species are small, carnivorous animals with long, bushy tails. *G. crassicaudatus*, of the W. coast, the largest species, is about the size of a cat; *G. senegalensis*, common in equatorial Africa, inhabits the impenetrable forests.

Galahad, in the Arthurian romances the son of Lancelot and Elaine. In the cycle of legend he is the model of ideal knight-hood and purity. He sets out on the quest of the Holy Grail, and on his journey redresses all grievances that cross his path.

Galanga, or **Galangal** (Chinese *Kao*, name of a prov., *Kiang*, mild, and *Kiang*, ginger), name given to *Alpinia*, a genus of plants belonging to the Zingiberaceae; it contains many species, the most important being *Alpinia officinarum*, a native of S. China. The roots and stems of this plant possess aromatic, stimulating properties similar to those of ginger, and are largely used in E. pharmacy.

Galapagos (Sp. tortoise) Islands (officially renamed the Colon Archipelago in 1892), group of volcanic is. in the Pacific near the equator, W. of Ecuador, to which they were annexed in 1832. The chief is. include Albemarle (largest), James, Charles (on which is a penal settlement), Chatham, and Indefatigable. The group was discovered by the Spaniards in the sixteenth century. They were once noted for tortoises of enormous size (*Testudo elephantopus*), which are now far less numerous. Large turtles abound, and there are remarkable peculiarities in the fauna and flora. Products: Guano, sulphur, sugar, and archil (purple dye from lichen). Darwin explored the is. The total area is about 2950 sq. m. Pop. about 1000. See C. Darwin, *Journal of Researches into the Natural History and Geology of the Countries visited during the Voyage of H.M.S. 'Beagle'*, 1839; A. Wallace, *Geographical Distribution of Animals*, 1878; — Wolf, *Ein Besuch den G. Inseln*, 1879; and W. Beebe, *Galapagos: World's End*, 1924.

Galashiels, parl. bor. and tn. in Selkirkshire, Scotland, situated about 4 m. N.W. of Melrose and Gala Water. The chief industry of the tn. is the manuf. of Scotch tweeds, and to this industry the prosperity of the tn. is due. The residence of Sir Walter Scott, Abbotsford, is just outside the tn. Pop. 13,300.

Galata, suburb of Istanbul, situated at the S. end of the Bosphorus. Here are found principally the banking houses and shipping agencies. There is also a light-house.

Galatea: 1. Sea-nymph, daughter of Nereus and Doris, see ACIS. 2. Name given to an ivory statue endowed with life by Venus at the prayer of the sculptor Pygmalion (q.v.).

Galatia: 1. Anct. dist. of Asia Minor. The name is derived from the Galatæ who invaded and settled in that part of the peninsula about the third century B.C. It was included in the Rom. Empire and under Augustus became a Rom. prov. The tns. of Antioch, Derbe, and Lystra, all of which were visited by St. Paul, are in this dist. 2. Vil. of Saline co., Illinois, U.S.A., near Eldorado. Pop. 1000.

Galatians, St. Paul's Epistle to the, one of the four epistles undoubtedly written by St. Paul, and forms part of the N.T. Marcion's canon contains the first allusion to it, but by the second century it was widely read and appreciated. It was probably composed at Ephesus about A.D. 56, although some critics believe it was dispatched from Achaia or Macedonia during the winter or spring of A.D. 57-58, and an attempt has been made to antedate the Council of Jerusalem. The epistle was addressed, it seems, to the inhab. of that part of Galatia which bordered on Bithynia and the prov. of Asia. They were mostly of pagan birth, in the main Celts, though there were Phrygian aborigines and Rom. and Gk. immigrants besides. During his missionary journeys, St. Paul had founded and revisited the churches of Galatia. The epistle, which 'reads like a passionate outburst, containing, strangely enough, no word of praise, greetings, nor messages against the 'lapsi,' who had been won over to circumcision and countless other formal observances by certain Judaizing enemies of St. Paul. Briefly speaking, the letter is divided into a vindication of his mission and apostolic independence, an inspired exposition of how Christianity had superseded the Mosaic law, a panegyric of faith as the mark of the true 'son of Abraham,' and finally a fervid plea for the superiority of Christianity to legalism as the 'free and final religion.' The whole style of the epistle, which has been described as 'a veritable torrent of genuine and inimitable Paulinism'—and especially the spontaneous but jerky thought development with its hurried sentences and abrupt pauses is in very strong contrast to the calm and measured exposition of the later Epistle to the Romans, which deals with the same issue; but it is inferred from the Epistle to the Romans, as well as from

1. Corinthians, also written after the Epistle to the Galatians, that the Christians in Galatia had then been won back to St. Paul and his gospel. The Epistle to the Galatians is something more than a writing dealing with a controversy of bygone days; it is for all time the charter of Christian freedom 'not only from the Mosiac law, but from every yoke that is imposed upon the religious life as an external condition of salvation without reference to any inner necessity of the soul.' The Epistle to the Galatians furnished Luther with his weapons in the battle for freedom at the Reformation. Earlier commentaries by Luther, Calvin and Beza, Eng. commentaries by Ellicott (1851), Jowett (1855), Alford (1857), and Lightfoot (1865, 1874).

Galatz (Rumanian Galăți), tn. in Rumania, important as a port and as the seat of a bishop. It is situated on the l. b. of the Danube. It is the seat of the Rumanian III. Army Corps and the naval school, the International Danubian Commission and the chief Danube shipping companies, and three chambers of commerce. It is an important industrial tn. and among its chief industries are the manufs. of candles, soap, wire, nails, buttons, chemical products, iron, and copper. It possesses saw-mills, paste-mills, flour-mills, roperies, and petroleum refineries. It is the chief port of entry for the overseas trade of the Danube and the chief port for the export of timber. Other exports are maize, wheat, barley, rye, and flour. The rapid growth of the tn. is due to the opening up of the Danube carrying trade. It has been the scene of two engagements between Turks and Russians. In the Second World War it was captured by the Russians on Aug. 27, 1944 (see *further under EASTERN FRONT, OR RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR*). Pop. 101,000.

Galaxy, or Milky Way, (from Gk. γαλαξίας, milk), name of a splendid luminous belt of innumerable stars, which may be seen, on a clear night, stretching in a great arc from horizon to horizon. It surrounds the whole earth in what is almost a great circle, and is inclined to the equinoctial at an angle of 63°. For some 150° the zone spreads out into two branches—one shining, the other dull and disconnected—which eventually reunite. To the naked eye the stars are merged together in one broad stream of light.

Galba, Servius Sulpicius (3 B.C. to A.D. 69), Rom. emperor, became consul in A.D. 33, and under Nero showed courage, force, and equity in the administration of Aquitania, Africa, and Hispania Tarraconensis. With the help of Vindex, Otho, and the praetorian guard, he became emperor instead of Nero in A.D. 68. But no sooner was he fully instated than he lost all his popularity and became a laughing-stock for his extreme avarice, the extortions of his favourites, to whom he surrendered the reins of power, and his refusal to pay the soldiers the promised rewards. In A.D. 69 Otho led a successful mutiny and became emperor in his place. G. was assassinated by Otho's legions.

Galbanum, gum-resin obtained from *Ferula galbaniflua* and *F. rubricaulis*, two species of Umbelliferae. It can be used medicinally as an antispasmodic expectorant, and external rubefacient, but is inferior in power to asafoetida obtained from an allied species.

Galdós, Benito Pérez (1842-1920), Sp. novelist and, in his time, Spain's foremost man of letters. B. at Las Palmas, Canary Is. He was educated at Madrid, and when twenty years of age he returned to Madrid and worked for seven years as a journalist, afterwards devoting himself to writing novels until a few years before his death, when he became blind. G. was a most prolific writer, and his great collection of works comprises early novels, two series of Sp. national historical episodes, contemporary Sp. novels, new Sp. historical episodes, comprising three series of fifteen works, dramas, and miscellaneous works. He first made a name with his historical novel *La Fontana de Oro*, and many of his books have been trans. into Eng., amongst these being *The Perfect Lady*, *Trafalgar*, *Leon Roch*, and *Marianela*. Since the time of Cervantes, G. was the writer who most influenced the Sp. mind. For nearly a quarter of a century he was a member of the Royal Academy of the Sp. Tongue, but he more than once refused official honours owing to his excessive modesty. He sat in Parliament on sev. occasions as a Republican member. The honour in which he was held was shown at his funeral, there being an attendance of members of all the academies, members of the gov., the whole of the Madrid tn. council and prov. deputies; while the official *Gazette* announced a decree of the gov. offering to pay all the expenses of the funeral of 'Spain's greatest writer since Cervantes.' Many of his theatrical works have been played both in Spain and in other countries, the best known being *Gloria* and *Electra*. See L. B. Walton, *Pérez Galdós and the Spanish Novel of the Nineteenth Century*, 1927.

Gale, see STORM.

Gale, Sweet, see BOG MYRTLE.

Gale, Thomas (c. 1636-1702), Eng. antiquary. Became prof. of Gk. at Cambridge in 1666 and fellow in 1669. Dean of York, 1697. Noted for his eds. of classical writers and works on early Eng. hist.

Galen, or Galenus, Claudius (c. A.D. 130-201), Gk. physician, b. at Pergamos in Mysia, Asia Minor. He studied medicine here, and later travelled to the tns. of Corinth and Alexandria in order still further to continue his studies. He went to Rome, where he spent some years in study, afterwards being made physician to the Emperor M. Aurelius. He also attended the emperors Commodus and Severus. He is supposed to have d. in Sicily. He gained a great reputation in all branches of medical science, and was a great writer on this subject. His discourses, and his commentaries on Hippocrates, are very learned and show great medical knowledge; they prove beyond doubt that he was a practical as well as

a theoretical scientist. For many years they formed the basis of the world's medical knowledge. Many of the works attributed to him are, if not spurious, at any rate so doubtful that we cannot recognise them as his. There are, however, about eighty treatises which are beyond doubt genuine.

Galen, Clemens August, Count von (1878-1946), Ger. prelate b. at Dinklage of an anct. noble family. In 1933 he became bishop of Münster, and as a leader of the Rom. Catholic Church, like Cardinal von Faulhaber and Cardinal Count von Preysing, was an outspoken critic of National Socialism, especially during the Second World War. He was elected cardinal in March 1916, but d. of exhaustion soon after his return from Rome in the same month.

Galena: 1. City of Illinois, U.S.A., cap. of Jo Daviess co. It is the centre of a lead-mining industry and has foundries, machine-shops, and flour-mills. Chief manufs. are shoes, furniture, lumber, etc. It was the home of President Grant and it has a Ger.-Eng. College and the St. Clement Academy. Pop. about 5000. 2. City of Kansas, U.S.A., in Cherokee co., an important centre of the lead and zinc industries, and there are large smelting and stamping works. It is the seat of Spring River Academy. Pop. 5000.

Galena, or Lead-glance, the naturally occurring sulphide of lead (PbS) which constitutes the chief source of the metal. G. is found widely distributed in the form of cubic crystals of a lead-grey colour (sp. gr., 7.5; hardness, 2.5), occurring chiefly in veins in the carboniferous deposits, and often accompanying other metallic ores. G. is easily oxidised, and the metal is readily obtained by reduction. Some specimens contain so much silver that the separation of that metal is profitably carried on. See LEAD.

Galeopithecus, name given to the single genus of the Galeopithecidae, a family of Insectivora which is sometimes included among the bats or the Inquirs. They inhabit the forests of Malaysia and the Philippine Is., flying from tree to tree by means of the patagium, or parachute-like membrane; when at rest they hang by their posterior limbs, head downwards, after the manner of bats. They are about the size of cats and are nocturnal animals. There are only two species, *G. volans* and *G. philippinensis*.

Galerius (Galerius Valerius Maximianus), Rom. emperor, b. in Dacia, of humble parentage. Rose from a common soldier to be the son-in-law of Diocletian, who, in 292, made him Caesar over Illyricum and the Danubian region. On the abdication of Diocletian in 305, G. became emperor of the E. Empire, which he ruled till his death in 311. His name is associated with the cruel persecutions of the Christians under Diocletian.

Galesburg (named after a famous Presbyterian preacher, George Gale), the co. tn. of Knox co., in the N.W. of Illinois, U.S.A. It is on the Atchison, Topeka, and Santa Fe, and also the Chicago, Burlington, and Quincy railways, the

latter having important steam-car factories here. Machinery and vitrified bricks are also manufactured. Other manufs. are brooms, wagons, and corn-planters. Knox College, founded in 1837, and Lombard College, chartered in 1851, are important educational establs., also the Ryder Divinity School and St. Joseph's Academy. Pop. 23,800.

Galgaous, Caledonian chieftain who headed the desperate resistance offered about 85 B.C. to the Rom. invaders under Gn. Julius Agricola. He was finally defeated at the battle of the Gramplians.

Galiani, Ferdinando (1728-87), an It. political economist, pub. in 1750 his *Della Moneta*, a revolutionary description of coin or currency. For he maintained that money, being a merchandise, must not be restricted, either as regards interest or value, a doctrine at once adopted into the practice of his native city Naples. In the later ed. of 1780 he enlarged on the intrinsic value of the precious metals, and on their suitability as media of exchange. See A. Marchiori, *L'Abbate Galiani*, 1878.

Galicia, now a captaincy-general, and formerly a kingdom founded in the fifth century by the Suevi, occupies the N.W. corner of Spain. It is covered by ridges of the Cantabrian Pyrenees, the highest peak (6593 ft.) occurring in the Peña Trevinca. The Miño, rising near Mondoñedo, with its great affluent, the Sil, which rises between Leon and Asturias, is the chief riv. (170 m. long). The deep floods along the indented coast afford splendid anchorage, the chief harbours being Ribadeo, Ferrol, Corunna, Corcubion, and Carril. Both the mineral and agric. resources are, as yet, poorly developed, but cattle and swine (which feed on the abundant chestnuts) are reared for export. G. (11,254 sq. m.), which is the dampest part of Spain, has also the densest pop. (2,596,500).

Galicia, part of S.E. Poland and the Ukraine. Before the First World War the largest prov. (30,307 sq. m.), and a crownland of Austria, being then bounded to the N. and E. by Russia, to the S.W. by Bukovina and Hungary, and westward by Austrian Moravia and Silesia. An arc of the Carpathians, whose highest summits in this prov. are Wolowice (6713 ft.) and Czarna Góra (6505 ft.), forms a S. boundary, and from its ridges both the Dniester and Pruth take their source within G. The Vistula, which becomes navigable below Cracow, flows in the prov. on the N.W. The climate is very severe; the winters are long and the summers short. The region is largely forested but there are extensive tracts of pasture land. The soil is fertile, and wheat, rye, barley, oats, and maize yield good crops, also hemp, flax, and tobacco. Potatoes are grown in large quantities. Horned cattle and horses are bred, also sheep, goats, swine, etc. Salt, petroleum, and coal are the most valuable minerals, the first being mined at Wieliczka, Bochnia, Kalusz, and Dolina, etc.; the second at Boryslaw, Słoboda-Rungurska (near Kolomea), and Polanka, etc.; and the third in the dist. of Cracow. Other

minerals are marble, alabaster, copper, calamine, and iron. Manufactures are backward, but textile goods are made in Biala, and distilling is important. The chief exports are salt, petroleum, cattle, hides, wool, coal, linen, aniseed, and brandy. Lvov (Lwów, Lemberg) (pop. 160,000) is the largest city, and Cracow (90,000), Przemyśl, Kolomea, Tarnopol, and Stanisławów all have over 25,000 inhabitants. Educational establishments are numerous, the chief among them being the universities of Lvov and Cracow. G. was a crownland of Austria between the years 1772 and 1918. In the First World War both Poles and Ukrainians claimed her and fighting occurred until in 1919 the supreme council assigned W. G. to Poland and E. G. the right of self-determination. In Dec. of that year it was announced that E. G. should be granted autonomy under a Polish protectorate for twenty-five years, the future then to be decided by the League of Nations. In March 1923 the Council of Ambassadors recognised E. G. as a part of Poland. After the defeat of Poland by Germany in 1939, which resulted in the fourth partition of the country between Germany and Russia, G. was occupied by the Russians. In the German attack on Russia launched in 1941 the Germans overran the Russian-occupied portion of Poland. In July 1944 the Russians took Lvov, Stanisławów, Przemyśl and other centres of G. Cracow fell to them on Jan. 14, 1945. (For details of military operations see *EASTERN FRONT* or *RUSSO-GERMAN CAMPAIGNS IN SECOND WORLD WAR*). The prov. of Lvov was incorporated after the war as a region of the Ukrainian S.S.R. Pop. over 8,500,000.

Galicia, Campaign in (First World War). In the early months of the First World War the Russians attempted to break through to Germany via Bohemia which necessitated an advance through G. In Sept. 1914 they swept over Tarnopol, Lemberg, and Przemyśl, but were arrested at the Carpathian Mts. which were strongly held by an Austro-Hungarian force which offered the stoutest resistance. In the spring of 1915 the Germans, under von Mackensen, broke through the important Gorlice Pass and soon hurled the Russians back. Mackensen relieved Przemyśl at the commencement of June and Lemberg towards the end of the month. Brusilov (q.v.) commanded the Russians on this front and as soon as he reorganised his force dealt the Austrians a severe blow S.E. of Lemberg in Sept. 1915. He made another attack in the autumn of 1916 but the Russian Revolution brought all operations to a standstill. See also *WAR, FIRST WORLD* *Eastern Front*.

Galliani, John Antony (1796-1873) and **William (1798-1882)** were two publishers in Paris. They continued to bring out the daily newspaper (written in English) entitled *Galliani's Messenger*, which their father had founded in 1814. In its columns they did what they could to establish cordial relations between England and France. Their connection with the paper was severed in 1884. A monument to their honour stands in Corbeil,

where they built and endowed a hospital. **Gallileans**, fanatical sect, followers of a certain Judas of Galilee, who fiercely resented taxation by the Romans, and whose violence led the latter to vow to exterminate them (see *Acts v. 37*).

Galilee (from Heb. *Gali*, a border or ring), is rarely mentioned in the O.T. but some time after the return of the Jews from exile was surrendered by the Assyrians to the Israelites, and rapidly developed a vigorous nationalism so that

IN 4

FIBRIAS ON THE SEA OF GALILEE

when Palestine came under the Romans G. became a tetrarchy under the Herods. In the time of Jesus Christ the prov. spread from the Mediterranean to the Jordan thus embracing all N. Palestine. Upper G. was mountainous and well wooded whilst Lower G. was wonderfully fertile and flat. The prov. now forms part of Palestine being divided into Upper and Lower G. In the time of Christ the chief cities were Sepphoris and Tiberias, though other places such as Capernaum, Nazareth and Nain are much more important in the gospel story. The inhabitants were chiefly Syrians, Hebrews, Arabs, Greeks and some Jews whereas the pop. to-day consists of Muslims, Jews, Greeks, Christians, Arabs, Druses and Maronites.

but many Arabs, following the Jewish invasion of 1948 fled to neighbouring Arab countries. The sea of G., called also the lake of Gennesaret (the sea of Tiberias) and the sea of Tinneroth is an expansion of the Jordan, 650 ft. below sea level, 13 m. long and 8 m. broad. When Christ preached it was surrounded by smiling and happy hills of which Keenan draws a beautiful picture as indicated of the whole country, in his *Life of Jesus*, but whereas this part of G. was once densely populated, it was until very recent years almost a wilderness and even fertility seemed to have deserted its shores. The people of G., despite the fact that in Judaism they were regarded as boorish

provincials, whose Judaism was overlaid with despicable laxity and corruption, were attractive for their very simplicity and happy, gentle dispositions.

The vegetation of Lake G. (or the sea of Tiberias) is sub-tropical. Lower G. has a less intensive agriculture than the plain of Esdraelon but resembles it in having 50 per cent of its ordinary crops, in the non-irrigated land, under cereals, and has proportionately less tubers, hay, and fruit, but more legumes. Its distinctive feature is its large area of olives and of fallow land. Upper G., on the other hand, has more of the intensiveness of the plains and more irrigated land, producing more deciduous fruit, especially grapes and apples, and more vegetables and green fodder. There are facilities for the repair of agric. machinery at the Ilon settlement in G. Kersennah, beans and lentils are grown in Nazareth; chick-peas in Tiberias. Shortly after the First World War two small hydro-electric plants were founded at Nazareth and at Tiberias. The Nazareth station went out of business after a short time; the Tiberias station was taken over by the Palestine Electric Corporation in 1925, in which year a new 102-kw. station was built at Tiberias. During the Second World War Tiberias had a lake airport for flying boats. There are not springs at Tiberias, and parks, a feature of the development of the tourist trade in recent years by Jewish immigration. Of all the centres of the developing tourist trade the biggest development is foreseen in G. from Tiberias, to the waterfalls of Metullah (as well as in the coastal plain). Nazareth, a purely Arab town, until recently, is distinctive in Palestine in having stone buildings. It retains something of the period of the crusaders, with its Franciscan monks and their old gardens and women clad in costumes embroidered in the style of the twelfth century carrying earthen jars on their heads. Amidst the hills of G. are hotels and sanatoria in the Jewish settlements, which offer hospitality to the visitor.

Galilee, architectural term for a porch or chapel attached to a church, examples of which may still be seen at the W. end of the nave in Ely and Durham cathedrals, and on the W. side of the S. transept in the cathedral of Lincoln. They were used sometimes as the part reserved for penitents, sometimes for corpses previous to interment, and at other times as the meeting ground for monks and their women relatives, who might not penetrate further into an abbey church.

Galileo Galilei (1564-1642), It. experimental philosopher and astronomer, a native of Pisa, and who, in 1581, entered the univ. there. At first he studied medicine, but early renounced this science in favour of experimental philosophy, finding a good friend in Guido Ubaldo, through whose good offices G. eventually obtained, in 1589, a mathematical lectureship in Pisa under the Grand Duke Ferdinand I. de' Medici. Having watched the swing of a bronze lamp in the Pisan cathedral, G. soon discovered the

isochronism of pendulum oscillations; for he found that the range of the swing or oscillation had no effect on its duration. He tested his discovery by counting the beats of his pulse and comparing the number of pulsations with the time of the pendulum vibration, and at once saw the possibility of utilising his invention for chronometers. In his youth he also wrote a treatise on the sp. gr. of solid bodies and constructed a hydrostatic balance. His next vital discovery was the equality of the velocities of all falling bodies great and small. Up to his time people had imagined that a body six times as heavy as another would fall through the same space in one-sixth the time, and although G. gave a practical demonstration of his principle from the Leaning Tower of Pisa, many among his audience continued unbelievers. In 1592 G. accepted the chair of mathematics in Padua, as his revolutionary discoveries and still more his biting satire had made him many active enemies in Pisa. Here he worked till 1610, and among his numerous inventions were an imperfect species of thermometer, a proportional compass, and the all-important refracting telescope. The Dutch claim that Jansen made the first instrument of this kind, but at least G. was a pioneer in employing it for astronomical investigations. With his new appliance he revealed a series of startling and brilliant scientific facts. Never before his time had any one declared that the Milky Way was, as Milton, who had visited G., stated, 'powdered with stars,' or that the moon, far from being a smooth and self-luminous sphere, was diversified with great mts. and valleys, and lightened only by reflections of the sun's rays from the earth, or that the planet Jupiter had four satellites, or that Saturn had a triple aspect (due to her rings), or, finally, that the sun which the schoolmen had regarded as a symbol of perfection was, in reality, besmirched with spots. It is not generally appreciated by modern scientific thinkers what little prominence time had in pre-Galilean systems of philosophy. It was taken for granted as being practically identical with consciousness itself, thus calling for no special thought on its own account. The great achievement of G. was to create conceptions in terms of which motion could be treated mathematically, and to this end he represented time as a space-like dimension which could be measured—divided up into equal parts as a length is. But this dimension, or 'spacified' extension, of time was so conceived for the one purpose of making motion amenable to mathematical treatment. The world describable in terms of it was specifically limited by G. to the world of mechanical phenomena. All else—even physical experiences like heat, sounds, smells, colours, and the rest—he excluded from this world, and located in the perceiving being. It is difficult to overestimate the value of this achievement, for it has made possible the whole of modern physical science; and it is difficult also to overestimate the illustrious it has created, for, having seen the

value of the concept of 'spacified' time in mechanics, subsequent thinkers, less perspicacious than G., have taken it to be a universal receptacle for the whole of human experience, and therefore as representing in a more precise form everything that human consciousness has ever meant by time. Consequently the whole of experience has been distorted to fit a concept to which most of it is non-conformable (Herbert Dingle).

After 1610 he worked freely in Florence under his new patron, Ferdinand II., to whom he dedicated, in 1632, his famous *Dialogue on the Ptolemaic and Copernican Systems*. Not content with showing that the latter adequately explained celestial movements, G. threw himself into theological controversy by trying to explain the congruity or incongruity of certain biblical texts read in the light of his theory. His interpretations ran counter

GALILEO GALILEI

Engraving from a picture by Allan Ramsay in Trinity College, Cambridge

to the accepted opinion, and already in 1616, though not condemned by name, he had been compelled by the Rom. Inquisition not to assert 'what seemed to contradict Scripture.' His 1634 pub. therefore was taken by the Rom. authorities under his former patron Urban VIII. as a direct challenge. He was summoned to Rome, where he was obliged solemnly to abjure his 'heresies,' above all that of the diurnal and yearly motion of the earth and of the stability of the sun. He was further to recite the seven Penitential Psalms once a week and was technically imprisoned, i.e. under observation, for the rest of his life. The remark said to have been made to a friend—*Eppur si muove!* ('It moves for all that')—as apocryphal. Inscrutable, but forgiving by nature, G. loved the amenities of social life and was

qualified by taste and knowledge to pass judgments in poetry, music, and painting. Torricelli, who was passionately attached to his master, is the most famous of his pupils. See F. R. Wegg-Prosser, *Galileo and his Judges*, 1889, and J. Fahle, *Scientific Works of Galileo*, 1921.

Galileo's Telescope, see OPERA GLASS.

Galitzin, or Gallitzin, famous and powerful Russian family whose members have distinguished themselves alike in war and diplomacy from the sixteenth century onwards. The following were among the best known:

Vasili Vasiljevitch Galitzin (1643-1714), surnamed the Great, regent during the minority of Peter the Great.

Dimitri Aleksevitch Galitzin (1735-1803), Russian ambas. in Holland and France, and the intimate friend of Voltaire and Diderot.

Dimitri Augustine Galitzin (1770-1841), son of the preceding, was b. at The Hague. He was for some time vicar-general of the diocese of Philadelphia. Severely simple in his own mode of life, he was prodigal of help and sympathy to those around him, by whom he was universally known as Father Smith.

Nikolai Sergievitch Galitzin (1808-92), historian and lieutenant-general in the Russian Army. His chief work is a hist. of war (Ger. trans., *Kriegsgeschichte seit den ältesten Zeiten* (13 vols.), 1874-89).

Gallium, genus of Rubiaceae, consists of over 200 species, ten of which occur in Britain. They are herbaceous plants with whorls of leaves, and are visited by insects for the sake of the honey they secrete. *G. cruciatum*, the cross-wort, is a native of Europe, and is commonly found in Great Britain; *G. verum*, the ladies'-bedstraw or cheese-remnet, is found in dry soils and serves sev. useful purposes; *G. aparine*, the common goose-grass or cleavers, is a native of Europe, N. Asia, and N. America. The term bedstraw applied to many of the species is obtained probably from the old custom of strewing beds with fragrant herbs.

Gall, St., 'the apostle of the Alemanni,' Irish saint and pupil of St. Columba, whom he accompanied to Gaul about 585. After much missionary work he retired to the forest of Steinach, near Lake Constance, and founded the famous monastery of St. G. The Swiss canton and tn. are also named after him.

Gall, Franz Joseph (c. 1757-1828), founder of the system of phrenology, was b. at Tiefenbronn, near Pforzheim in Baden, Germany. He became physician in Vienna in 1785. Having studied exhaustively from boyhood the external manifestations on the cranium of the different powers of human mind and character, he began a series of phrenological lectures in Vienna, 1796. (Chief works (in collaboration with Spurzheim) were *Introduction au cours de physiologie du cerveau* (1808); *Recherches sur le système nerveux* (1809); and the first two vols. of *Anatomie et physiologie du système nerveux* (4 vols.) (1810-19). See life by Jessie Fowler, 1896; and Dr. B. Hollander, *In Search of the Soul*, 1920.

Gall, see BILE; GALL BLADDER.

Gallait, Louis (1810-87), Belgian painter, was b. at Tournai, where he studied art and painted his picture of 'Christ Healing the Blind Man' now in Tournai cathedral. He afterwards went to Paris to study art, where he also painted a number of pictures. Among his works are 'The Abduction of Charles V.'; 'Alva looking at the Bodies of Egmont and Horn'; 'The Last Moments of Egmont'; and 'The Plague of Tournai'.

Galland, Antoine (1646-1715), Fr. archaeologist and orientalist, b. at Rollot. In 1701 he became a member of the Académie des Inscriptions, and in 1709 prof. of Arabic in the Collège de France. His chief work is his trans. of the *Arabian Nights*, being the first trans. into a European language. He wrote also *Les Paroles remarquables, les bons mots et les maximes des orientaux* (1694).

Gallarate, tu. situated in the prov. of Milan, Lombardy, Italy. It lies to the N.W. of Milan, and is engaged in cotton manuf. Pop. 22,000.

Gallas, Matthias von, Count of Campo, Duke of Lucera (1581-1647), Austrian general, distinguished in the Thirty Years war. He first served w. the Spaniards in Savoy (1617), then with the army of the Catholic League, and was major-general of the forces which captured Mantua (1629). He commanded under Wallenstein in Bohemia, fighting against the Swedes at Nuremberg and Lutzen (1632). G. then intrigued against Wallenstein, and after the latter's assassination succeeded to his command (1634), winning a notable victory at Nördlingen. Archduke Leopold superseded him (1638). G. was in command again in 1642, but was defeated by Torstenson at Magdeburg (c. 1644). His army earned a reputation for cruelty, and the word *marauder* is derived from his *Marode Bröder*. See J. C. Schiller, *Geschichte des 30 jährigen Kriegs (History of the Thirty Years War)*, trans. (1846).

Gallas, African Hamitic tribe, racially closely allied to the Somahs. Their original home is uncertain, but was probably somewhere in the highland massing between the Abyssinian plateau proper and the Somali plain. Some believe that they came across the Red Sea from S. Arabia. From the sixteenth century onwards they have migrated in waves into the main plateau of Abyssinia, and occupied great parts of the S. highlands. It is largely due to the Galla invasions that the aboriginals of the S. of Abyssinia have not been assimilated like those of the central highlands. The G. were pagans when they invaded the country, and for the most part remain so in practice. Some Galla tribes, like the Wollo, have become fanatical Muslims. Others have received a faint tinge of Christianity. Much information on them has been gathered from the writings of Balthazar Telles, a Portuguese Jesuit, who incidentally disillusioned the world on the myth of Prester John. The G. number over 4,000,000, and are still mostly heathen. See A. H. M. Jones and

Elizabeth Monroe, *History of Abyssinia*, 1935.

Gallatin, Albert (1761-1849), Amer. financier and statesman, b. at Geneva. He emigrated to the U.S.A. (1780) and, unsuccessful in trade, supported himself for some time by teaching Fr. at Harvard College. He was elected to the U.S.A. Senate (1793) and made a member of Congress (1795). It was as secretary of the treasury (1801-13) that he first proved himself a great financier. He was mainly responsible for the favourable conclusion of peace negotiations with England in 1814, and himself signed the treaty of Ghent. After filling important diplomatic positions in Paris and London he returned to New York, and retired from public life (1827). His works include *A Sketch of the Finances of the United States* (1796); *Indian Tribes, East of the Rocky Mountains*, etc. (1836); and *Semi-civilised Nations of Mexico, Yucatan, and Central America* (1815). His diary was pub. in 1915. See lives by Henry Adams, 1879, and J. A. Stevens (Amer. Statesman series), 1883.

Gallatin, 1. Cap. of Davies co., Missouri, U.S.A. It stands on the Grand R., and also on the Chicago, Rock Is., and Pacific and the Wabash railways. Pop. 1500. **2.** Cap. of Sumner co., Tennessee, U.S.A., situated on the Chesapeake and Nashville railways, and on the Louisville and Nashville railways. The Howard Female College is in this tn., which has flour-mills and manuf. spokes. Pop. 3000. **3.** Riv. rising in Montana, U.S.A., and is one of the forks of the R. Missouri. It flows in a northerly direction.

Gallaudet, Thomas Hopkins (1787-1851), Amer. and a teacher of the deaf and dumb. He was b. at Philadelphia, and took his degree at Yale. He afterwards became a student of theology at Andover, and after having obtained, in 1811, a licence to preach, visited Europe with a view to teaching the deaf and dumb. He studied in Paris under the Abbé Siccard, and in 1816, on his return to America, founded a school for deaf mutes at Hartford, being the head of it until 1830. He wrote sev. works, among them *The Child's Book on the Soul* (1832) and *The Youth's Book on Natural Theology* (1832).

Gall Bladder. This organ is a pear-shaped membranous sac, 3 or 4 in. long and about 1½ in. across its widest part, and capable of containing 8 to 12 fluid drachms. It is lodged obliquely in a cleft of the concavo lower surface of the right lobe of the liver. Its large end or *fundus* projects beyond the anterior border of the liver and is directed forwards, downwards, and to the right. Its upper surface is attached to the liver by areolar tissue, its under surface and *fundus* are covered by the peritoneum, which is reflected over them from the surface of the liver. The neck gradually narrowing is curved S-shape, and then becomes much constricted and, changing its general direction, it bends downwards and terminates in the cystic duct. This duct joins, at an acute angle, the single duct made by the joining of the right and left hepatic ducts, and

the common channel to all three is termed the *common bile duct* which runs down to the second part of the duodenum. The chief function of the G. B. is to act as a reservoir for the secreted bile. The secretion of bile from the liver is continuous, unlike the other digestive secretions, which take place only during digestion and cease, more or less, during abstinence. But while the secretion of bile is continuous, its excretion or output into the duodenum is periodic, and coincides exactly with the period of digestion in which the acid chyme is spurted by rhythmical jets from the stomach to the intestine. It is therefore evident that the bile secreted during abstinence must all collect in the G. B., which, in short, is a lateral diverticulum of the excretory bile ducts, where the bile becomes condensed by absorption of water. The removal of the G. B. from dogs has been accomplished and the animals have recovered quickly without exhibiting abnormal phenomena of any significance. The ultimate result of such removal was a dilation of the various bile ducts to twice or even three times their normal calibre.

The cystic duct in fact appeared to be transformed into a reservoir for the bile, and had the appearance of a newly formed G. B. Experiments made by Oddi in 1887 resulted in the discovery of a special sphincter of plain muscle situated at the duodenal end of the common bile duct. The mechanism by which the flow of bile into the intestine is brought about consists in a reflex diminution in tone of this sphincter caused by the distension of the intestine and the entrance of the chyme from the stomach. It is therefore an inhibitory reflex discharged from a higher centre. The secretion normally poured into the G. B. consists in part of bile reabsorbed from the intestine, that which is collected from the G. B. is a mixture of the secretion from the hepatic cells and that of the epithelia which line the bile ducts and the G. B., and through condensation of the liquid contains up to 16 or 17 per cent of solids.

Galle, Johann Gottfried (1812-1910). Ger. astronomer, b. at Pabsthaus, near Wittenberg. He was the first to observe the planet Neptune (Sept. 23, 1846), the existence of which had previously been proved by the calculations of the Fr. astronomer, U. J. J. Leverrier (q.v.). The theory ascribing the formation of halos to the refraction of light by floating ice crystals was completely demonstrated by G. (and A. Bravais). The third ring round the planet Saturn, commonly known as the 'Crape' ring, was first recorded by G. at Berlin in 1838.

Galle, called also **Point de Galle**, seaport tn. of Ceylon, situated in the S.W. of the is. In the S. prov. It has a good harbour, but is not so important now as a port of call for steamers to the E. and Australia, since Colombo is now the port. Tea-planting is a growing industry, and the digging of plumbago, also grass-growing for the distillation of citronella oil. The chief exports are plumbago, coco-nut oil, tea, rope, and coir yarn. Pop. 49,000.

Galleon (Sp. *galeon*), large ship used by Sp. merchants in the fifteenth-eighteenth centuries to convey gold and silver from Mexico and Peru to Spain. The ships, which were armed, possessed three or four decks.

Gallery means a long and narrow passage, raised above the ordinary floor of a room. These Gs. are often to be seen in churches, as in the case of the rood-loft, which is a G. forming a means of support and elevation for the rood or cross; in Norman castles the great hall often had a G. surrounding it. Old mansions were almost always provided with a G., but as a domestic feature the G. only attained importance with the introduction of the Elizabethan long G.; whence the application of the word to a museum of art treasures. Another form of G. is the minstrels' G. of manor houses. For G. in military mining see MINES, Military.

Galley, narrow and long boat having sails, but usually moved by means of oars. Some of these boats were about 160 ft. long and 32 ft. wide, and had as a rule just over fifty oars, each of the latter having six or more men to work it. These

Picture Post Library
GALLIA

men, who wore chains, were usually either prisoners, Turks, or convicts, and had to work for long periods on these vessels, which were used largely by the Its.

Galley Slaves (Fr. *galériens*; It. *galotti*), term applied in older times to convicted criminals who had to work out their hard labour as rowers on board a galley. In later days such convicts were principally employed on the docks and military harbours of France, Spain, and Italy.

Gall-flies are small hymenopterous insects belonging to the family Cynipidae and related to the ants and bees; they are black and wasp-like in shape, with straight antennae. The presence of the larvae results in plant excrescences, or galls (q.v.), from which the insect emerges on reaching maturity. *Rhodites rosea* causes the bedeguar gall which is commonly found on wild rose-trees and also on the cultivated plant. The true gall-makers are called Psenides, and, in addition to the typical genus *Cynips*, include *Aphilotrix*, *Andricus*, *Neurotrous*, *C. gallatinctoria* produces the gall-nuts of commerce, and *C. usana* produces those known as Dead Sea Apples or Apples of Sodom.

Gallia, in auct. geography 'the country

of the Gauls' (Galli), in two great divs., Cisalpine or Citerior (on 'this,' i.e. the Rom. or S. side of the Alps) and Transalpine or Ulterior (across the Alps from Rome). G. Cisalpine extended S. and E. from the Alps, and was bounded in Caesar's time by Liguria, Umbria, and the Rubicon, comprising N. Italy between the Alps and the Apennines. Gallic invaders came here perhaps as early as the sixth century B.C. A Rom. colony was estab. at Sena Gallica (282), the country was reduced after the second Punic war (203), and its conquest finally completed on the defeat of the Boii (191). G. Transalpine extended N. and N.W. of the Alps, comprising all modern France (often loosely called 'Gallia'), Belgium, and parts of Holland, Germany, and Switzerland. The Rom. prov. of G. Narbonensis, originally called the Provincia (later Provence) was formed in the S.E. (121 B.C.). Julius Caesar thoroughly subdued the whole ter. (58-50 B.C.), then divided into three parts, Aquitania (S.W., inhabited by Iberians represented by the modern Basques), Celtic Gaul (in the centre, the cradle of the modern Fr. nation), and Belgic Gaul (N.E., inhabited by Belgae, closely allied to the Celts of central Gaul). Augustus made four provs. (27 B.C.), Narbonensis, Aquitania, Lugdunensis, Belgica. In the second century A.D. Christianity was introduced, and in the fourth century there were two dioceses, Galliarum and Viennensis. After invasions by Vandals, Goths, and Franks in the fifth century, a fresh empire rose on the ruins of the old. See T. Thierry, *Histoire des Gaules*, 1872; E. Desjardins, *Géographie historique et administrative de la Gaule romaine*, 1877; C. Jullian, *Histoire de la Gaule* (8 vols.), 1907-28; C. Dottin, *La Langue gauloise*, 1920; and A. Grenier, *La Gaule celtique*, 1915.

Galliard (O.F. *gaillard*), old lively dance in triple time, and much in vogue in the sixteenth-seventeenth centuries. The minuet is a development of the G.

Gallic Acid ($C_{12}H_{10}(OH)_2COOH$), one of the six possible trihydroxybenzoic acids, occurs together with tannin (tannic or gallo-tannic acid) in gall-nuts, divi-divi, sumach, etc. It forms colourless silky crystals, having an astringent and slightly acid taste, readily dissolves in hot water and melts at $220^{\circ}C$, at the same time decomposing into pyrogallol and carbon dioxide. G. A. is a powerful reducing agent, readily absorbing oxygen in alkaline solution. With iron (ferric) salts a blue-black solution is produced, from which a black precipitate is finally deposited; use is made of this in the production of ink.

Gallicanism, title used in theology to describe certain theories which, while recognising the primacy by divine right of the see of Peter, yet limit the power of the pope in temporal matters and in certain eccles. matters. This attitude of resistance to the papal claims was particularly strong in France, and hence the name G. was given to it, while the church in France is known, in this connection, as the Gallican Church. G. can only be under-

stood in connection with the rival theory, known as Ultramontanism, which now holds almost complete sway in the Rom. Church. The first clear enunciation of Gallican principles was made in the Pragmatic Sanction (1269) in the reign of St. Louis, which declared that the government of the church should be carried out in conformity with the common law, the canons of the councils, and the statutes of the anct. fathers. It was still further developed by Philippe le Bel in his conflict with Pope Boniface VIII. The most celebrated expression of G. is found, however, in the Four Propositions of 1682, drawn up by Bossuet and signed by thirty-five bishops and thirty-five other clergy. The propositions are: (1) That the pope's jurisdiction is in things spiritual and not in things temporal, and therefore that kings are not subject to eccles. authority in such matters; (2) that the authority of a general council is at all times superior to that of a pope; (3) that the authority of the pope is to be limited by the canons of the universal church, and that the rules, customs, and institutions of the Gallican Church and kingdom remain intact; (4) that the judgment of the pope is not infallible unless it be afterwards confirmed by the whole church. These declarations, especially the last three, were frequently condemned by the papal authority, and Ultramontanism if not in its extreme manifestations is now substantially triumphant. G. throws much stress on the authority of the civil power, and has therefore been generally condemned as Erastian.

Galli-Curci, Amelita (b. 1889), Italo-Amer. coloratura soprano, b. at Milan, Italy, of mixed It. and Sp. extraction. Educated at International Institute and Lyceum High School, Milan; studied piano, composition, and harmony at Royal Conservatoire, Milan. Self-taught as a singer. Made début as Gilda in *Rigoletto*, at Costanzi Theatre, Rome, 1909; married Marquis Luigi Curci of Smeri, 1910. Made début in U.S.A. with Chicago Opera Association, at Auditorium, Chicago, as Gilda, 1916; début in New York, 1918, at Lexington Opera House, in *Dinorah*. Divorced, 1920. Married, 1921, at Minneapolis, Homer Samuels. Began performances with Metropolitan Opera Company, Nov. 14, 1921, as Violetta in *La Traviata*. Other parts she has sung are Mmo Butterfly, Juliette in *Roméo et Juliette*, Lucia in *Lucia di Lammermoor*, Lakmé, Mimi in *La Bohème*, Elvira in *I Puritani*, and Lella in *The Pearl Fishers*. Her great reputation in England was made largely on gramophone records of her best vocal performances.

Galliéni, Joseph Simon (1849-1916), Fr. soldier and colonial administrator whose fame rests on the great share he had in winning the first battle of the Marne (1914); b. at Saint-Béat in the Haute-Garonne, and received his military education at St. Cyr. He fought bravely in the Franco-Ger. war of 1870, and increased Fr. power in Senegambia, whither he was sent as captain in 1878. He served with distinction in the Sudan and crushed

brigandage in Tonking. He was made governor-general of Madagascar in 1890, and general of div. on his return to France in 1899. In 1904 he was military governor of Lyons, and when the First World War broke out he had virtually retired. At that time he was military governor of Paris, and when the Ger. right wing under Gen. von Kluck changed its direction from S.W. to S., thereby leaving Paris on its right, G. at once began to organise his command, and the troops sent by Marshal Joffre to augment it, for a blow at the exposed Ger. right wing when the right moment arrived. The threat was noticed by von Kluck, who halted and faced W. to meet it. It was this movement that arrested the victorious Ger. progress towards Paris. He became war minister in 1915, but resigned in 1916, and d. in May of the same year. He wrote *Trois colonnes au Tonkin* (1894-95), *La Pacification de Madagascar* (1900), and *Neuf Ans à Madagascar* (1908). See P. Ellis, *Le Général Gallieni*, 1900, and P. Gheusi, *Le Maréchal Gallieni*, 1921.

Gallienne, Richard Le, see **LE GAL- LIENNE**.

Gallienus, Publius Licinius, Rom. emperor (A.D. 260-68), and co-regent with Valerian, his father, from 253 until the latter's capture by the Persians in 260. G.'s reign is historically known as 'the time of the Thirty Tyrants,' for usurpers arose throughout the provs. The most prominent, Aureolus, was proclaimed emperor in Illyricum, invaded Italy, captured Milan, and advanced on Rome. G. defeated him, but later, while besieging Aureolus in Milan, was himself put to death by his own officers. Claudius II. succeeded him.

Gallifet, Gaston Alexandre Auguste, Marquis de, Prince de Martignes (1830-1909). Fr. general, b. in Paris, who distinguished himself in the Crimea, the It. campaign (1859), Mexico (1863), and at Sedan in 1870. He commanded the 3rd Chasseurs d'Afrique in the Franco-Ger. war (1870-71), winning fame by his heroic cavalry charge at Sedan. He earned a character for severity by his rigorous measures against the Communists. See his *Mes Souvenirs*.

Gallinaceous Birds, or Galliformes (Lat. *gallus*, a cock), constitute an order under which are included such birds as the Phasianidae, or pheasants, the Tetraonidae, or grouse, the Turnidae, which include the bustard or button-quails of India, the Megapodidae, or mound-makers; the Cracidae, curassows, and guans; and the Opisthocomidae, the curious hoatzins, or 'stinking pheasants' of S. America. They are a widespread group, being found in almost every part of the globe, and they include almost every variety of plumage and shape from that of the common domestic fowl to the beautiful silver pheasant of S. China, which is embroidered as an emblem on mandarins' dresses.

Gallio, Junius Annæus, - Rom. pro-consul of Achaia under Claudius, while St. Paul was at Corinth, A.D. 53-54. He was a brother of Seneca and uncle of

Lucan. Ill health induced him to resign, and he was either put to death by Nero's order or committed suicide in 65. His name is now synonymous with an easy-going man, unwilling to shoulder responsibility.

Gallipoli: 1. Well-fortified seaport tn. in S. Italy, 50 m. S. of Brindisi, built on a steep rock in the gulf of Taranto. Its chief industries are tunny-fishing and the export of fruit, wine, and olive oil, which is deposited in basins excavated out of the solid rock. Pop. 14,500. 2. Turkish seaport tn. on a peninsula at the N.E. extremity of the European side of the Dardanelles. It has been Turkish property since 1357. The Venetians defeated the Turks here in 1416. Trades in corn, wine, and oil. The magazine and collars built by Justinian and other anct. remains are in the vicinity. The tn. boasts two harbours and is the prin. station for the Turkish fleet. It was fortified by the Eng. and Fr. in 1854 and these fortifications were renewed and enlarged in 1878. The guns of G. command the Dardanelles just before the strait joins the sea of Marmora. Pop., principally Gks., Turks, Armenians, and Jews, 18,000.

Gallipoli Campaign (1915-16). The political considerations which actuated the Brit. Gov. in launching this much-criticised campaign in the First World War will be found under WAR, FIRST WORLD. The naval operations of the early part of 1915-16 in which the allied Anglo-Fr. fleets endeavoured to force the passage of the Dardanelles are described under DARDANELLES. This article deals with the military or land operations in the peninsula.

The immediate purpose of the attack on the Dardanelles was to force the straits in order to deal so effective a blow against the Turks that the pressure on Russia might be relieved and Bulgaria deterred from active adherence to the cause of the central powers. There is no doubt that had the attack been crowned with success Turkey would have been out of the war, whilst the check to Ger. aspirations in the S.E. (see also BAGDAD RAILWAY) would have been so serious that the war might well have been curtailed by as much as two years.

Experience having taught the necessity of a combined land and water expedition the Brit. Cabinet resolved to send out a force to Gallipoli to co-operate with the fleet. It was hoped by effecting a landing of soldiers on the European side of the peninsula to storm Gaba Tepe (q.v.), Achi Baba (q.v.), and other formidable forts and thereby to facilitate the task of the ships in running the 40-m. gauntlet of the straits.

Cape Helles and Anzac Cove Operations.—In the last week of April 1915 two divs. of the Australian Imperial Force and troops of the 29th Div. effected a landing at Helles at the S. tip of the peninsula and also at Anzac Cove (as it was subsequently called), which lies some 15 m. to the N. of Cape Helles. The landing at Helles forms one of the most poignant episodes of warfare, the men scrambling through the

water in the face of a murderous hail of bullets and seeking in every conceivable way to shelter themselves on an exposed beach offering nowhere any hope of throwing up defensive works speedily enough to avoid grave casualties. The Australian and New Zealand troops brilliantly scaled a series of steep cliffs and with the most dogged resolution gradually dug themselves in. In particular the ruse by which the *Clyde*, an old troopship which, like the wooden horse of Troy, concealed numbers of armed men, was brought close up to the shore and the men rapidly disembarked through an improvised gangway, will live long in the annals of the First World War.

Krithia). But, in view of the Turkish reinforcements, it was decided to send out, in addition to the 52nd Brit. Div., three more regular divs., and two territorial divs. of infantry. Among these latter were the Lancashire Fusiliers, and troops of the Manchester Infantry Brigade and E. Lancashire Brigade.

The Suvla Bay Plan.—The new plan was to land troops at Suvla Bay and by a combined advance from there, and from Anzac Cove on the heights of Sari Bair, to cut the Turkish communications on the Gallipoli peninsula. The prin. battles of this ill-starred plan, which began on Aug. 6, were the battles of Sari Bair and Suvla (Aug. 6-15); but, although the allied

GALLIPOLI AND THE DARDANELLES

The map on the right shows the three main theatres of operations: Suvla Bay, Anzac Cove, and Cape Helles, while on the left is a more detailed map of the Cape Helles area with the well-known names of the places where landings were effected. The black lines show the final positions of the Allies' troops before the evacuation.

The Battles for Krithia and Achil Baba.—It was decided, after the landing was effected, to make a combined advance by forces from both the S. and the W. This attack eventuated in the sanguinary battle of Cape Helles and the battles for Krithia, the objective being the commanding height of Achil Baba. The attack, however, failed, the enemy being fully prepared, the terrain being ill adapted for offensive operations and the foe being constantly reinforced, as the attack dragged on, by ever more overwhelming numbers. A little ground, however, even against heavy Turkish counter-attacks, was gained during these battles and, in the course of other engagements, during May, Ir May, June, and July the Turkish armies received a great accession of strength through Russia being forced to abandon her initial plan of co-operating with the Fr. and Brit. from the Black Sea. During these months heavy engagements were fought on May 6-8 (second battle for Krithia) and June 4 (third battle for

forces were foiled in their plan, they undoubtedly made such a drain on the Turkish forces that the repercussion was felt both in Suvla and in Mesopotamia. Some have supposed on what seems tolerably reliable evidence that the attacking troops were within a very narrow margin of accomplishing their object and that if they had continued their operations those would have been successful within a very short space of time.

Sari Bair and Suvla.—The operations involved an advance from Anzac on the Sari Bair hills, a landing at Suvla Bay, and an advance thence to join up with the colonial troops. The advance on the Sari Bair heights had to be carried out over numerous ravines, and though the heights were reached, the Turkish troops, by heavy counter-attacks, drove the allied forces out again. Added to this check was the failure of the Suvla Bay operations. Troops were landed under cover of night, but grave difficulties of transport and water supply nullified any

advantage that might have been gained by this surprise. Far more casualties indeed occurred through dysentery, from lack of water, and general disorganisation of auxiliary services, than through actual fighting, there being in fact but little resistance to the landing parties. The result of these failures was that the attempt to clear the European side of the straits was abandoned; but it was made clear to the world through official pronouncements that the Allies would certainly remain on the peninsula. This they did until the end of the year, the troops digging themselves in and carrying on months of very trying trench warfare

d of wounds: 8000 missing and prisoners; 74,000 wounded. In all there were about 327,000 combatant troops and 141,000 non-combatant troops employed from time to time. The maximum strength at any one time was about 85,000 combatant and 42,000 non-combatant troops.

Gallipoli, Strait of, see DARDANELLES.

Gallitzin, Dmitri Augustin, see under GALITZIN.

Gallium, metallic element first discovered by Lecoq de Boisbaudran in 1875 by spectroscopic analysis of a zinc blende from Pierrefitte in the Pyrenees. It occurs in blendes from different localities and also but in minute amounts in other

Lepid 170

THE GALLI POLI CAMPAIGN. TROOPS LANDING AT ANZAC COVE

which at least had the effect of greatly impairing the Turkish forces. The endurance of the allied troops during this terrible campaign, with its casualties from constant sniping, occasional hand to hand engagements, disease through the trying climate, and lack of water, is a veritable epic in British history.

Results of the Campaign.—The principal object of the Gallipoli operations was not effected and the evacuation, brilliantly carried out in Dec 1915 and Jan 1916, brought the operations to a close. The conception was sound, but the means at the disposal of the Allies, and the inevitable disorganisation resulting from local circumstances, rendered its execution all but impossible. That the enemy—and especially the Germans—believed the attack would succeed appears from a most indiscreet article written in 1915 by Maximilian Harden in the *Zukunft* in which periodical the writer prepares his readers for the Allies' success. It need hardly be said that the pub of this article resulted in the temporary suppression of this well-known periodical. Indirectly, however, the campaign achieved notable results in the wastage of the Turkish armies, which, apart from the victory over Gen. Townshend's small force at Kut, never seriously hampered the steady pressure of the Brit. and Fr in Palestine and the Brit. in Mesopotamia and the Russians in Armenia.

Casualties (approx.): 30,000 killed and

minerals. G is obtained by dissolving the ore in acids, treating with zinc to precipitate the foreign metals, redissolving the precipitate in hydrochloric acid and throwing out the G in the cold with zinc. Subsequent fractionation yields G in the pure state. In properties G is allied to aluminium. It has a characteristic spectrum, two lines in the blue and violet. Atomic weight 70, atomic number, 31, symbol Ga, melting-point, 30.1°. It is identical with Mendeléeff's hypothetical element aluminium G. is very widely distributed, but usually in very minute quantities. It seems likely to find industrial application in electric lamps and in optical apparatus.

Gallivara, or Gellivara, tn. of Sweden, situated about 130 m. NW of Lulea, with which port it is connected by rail. There is also a railway line connecting G with the Ofoten Fjord, Norway. The iron mines near this tn. are exceedingly productive, the output being considerably over 1,000,000 tons per year. Pop. 12,500.

Gall-midges, minute dipterous insects belonging to the family Cecidomyiidae, which live in the different parts of plants or under the bark of trees. Certain species of *Miasor* and *Oligorus* possess the remarkable power of reproduction whilst in the larval state. *Cecidomyia destructor*, the louse fly, is injurious to cereals, and is a great pest in some parts.

Gallon, O.E. measure of capacity, which underwent much alteration until the present imperial G., containing four quarts, was fixed by Act of George IV., 1824, as the standard unit of measure for liquids throughout the United Kingdom. This imperial G. contains 10 lb. avoirdupois of distilled water—277.274 cub. in. A wine G. in the reign of Queen Anne (1707) held 231 cub. in., the same measure of capacity as the G. in America to-day.

Galloway, Joseph (c. 1731–1803), Amer. lawyer and anti-nationalist; b. in Kent co., Maryland; early removed to Philadelphia. Member of the Pennsylvania Assembly during most of the period 1757–1774. He was against proprietary government and advocated the erection of Pennsylvania into a royal prov. He married a daughter of Lawrence Growdon, Speaker of the House, and was himself Speaker 1766–71. Opposing the ideas of the revolution, he proposed, as a member of the Congress of 1771, a scheme of government consisting of a president-general, appointed by the king, and a grand council elected for three years by the various assemblies of the colonies. This was rejected by a narrow majority. In Dec. 1776 G. joined the Brit. Army under Sir Wm. Howe, and he became superintendent of prohibited articles at Philadelphia on its capture. He accompanied the army to New York. In 1778 he went to England, and his estate of £40,000 was confiscated by Congress. He wrote many pamphlets—on Amer. and biblical subjects.

Galloway, fertile and extensive dist. in the S.W. of Scotland, comprised in Wigtonshire and the stewartry of Kirkcudbright. It is bounded by the sea, the Solway Firth, and the R. Nith, and is divided into Upper and Lower G. Famed for its breed of small horses and hornless black cattle, with dairy-farming as its prin. industry. The climate is mild, and there is much diversity of scenery. G. is associated with the story of the Covenanters. G. contains a predominantly Celtic element and, indeed, it is not very long ago that the Gaelic of G. died out. The first waves of the Celts who arrived in Britain are traced to G. and the region between the Solway and the Clyde, and they retained their identity and language longer than was the case anywhere else in the S. of Scotland where they settled.

Galloway Breed, see under CATTLE.

Galloway, Mull of, rugged and mountainous promontory, situated at the S.W. extremity of the G. peninsula, and the most S. point of Scotland. On its E. side it rises to a height of 210 ft., crowned by a lighthouse 60 ft. high. Small horses, known as Galloways, are bred here, also large numbers of sheep and cattle, chiefly for the Eng. market.

Gallowgane, see ELLAGIC ACID.

Gallowglass (Irish *gialla*, a manservant), heavy-armed foot soldiers or chieftains' retainers who fought in the old Irish wars. Armour-bearers in the Scottish Highlands were once so called and are mentioned in Shakespeare's *Macbeth* as coming, with Kernes, from the W. isles of Scotland.

Galls, excrescences or tissue-bodies produced in plants by the presence of parasitic insects or fungi; they vary greatly in form, some of them being complicated structures resembling fruits and flowers. The so-called oak 'apples' are a well-known example. See GALL-FLY.

Gall-stones, Cholelithiasis, Hepatic Calculi, or Biliary Calculi. G. are found in the gall bladder and biliary ducts of man and most vertebrate animals, being especially common in oxen. Their size varies from that of small gravel to large stones quite 5 in. in length. When large the stones are usually found singly and of a rounded or oval shape. The smaller, wedge-shaped ones are generally more numerous. Their colour ranges from white to black, but is generally brown. Chemically they are a compound of lime and bile pigment, with traces of mucous and phosphatic earths; the larger and lighter coloured stones are covered with cholesterol. G. are rare before puberty, and most common after thirty years of age. They are usually associated with a sedentary life and excesses or irregularity of diet. They are frequently found in cases of cancer of the liver and adjacent parts. While still in the gall bladder, the stones give rise to no symptoms.—In some cases patients may never have any indication of their presence. It is only when the stones leave the gall bladder and escape into the cystic duct that inflammation is set up in the gall bladder and biliary passages.

Cholecystitis.—When the stones enter the bile passages, they give rise to biliary colic, that is to say, intense pain on the right side of the abdomen, below the ribs. This attack is followed by jaundice within twelve to forty-eight hours. The pain usually lasts until the stone is passed out of the duct or falls back again into the gall bladder, which may take place in a few hours or only after sev. days. The attacks may recur from time to time as new stones leave the bladder. The treatment consists in the immediate relief of pain by the application of heat, fomentations, hot bottles, and other means, as well as the administration of hypnotics, either by the mouth or through the skin.

The prevention of biliary colic consists in giving considerable quantities of boiled water or weak alkaline mineral waters. Considerable benefit results from taking four ounces or more daily of olive or other oil. If, despite internal treatment and regulated diet, the trouble still continues, operative measures (opening and draining of the gall bladder) must be resorted to, as they alone will give relief.

Gallup, George Horace (b. 1901), director of the Amer. Institute of Public Opinion, b. at Jefferson, Iowa. Educated at the state univ. of Iowa, and from his studies in psychology made a profession of investigating the tastes of newspaper readers. In 1935 he founded the G. Institute, which conducts research by means of 'straw polls' to determine public opinion on political, social, and economic problems. The results are then placed at the disposal of

the press. The institute made remarkably accurate forecasts of the results of three U.S. presidential elections, but in 1948 it was completely wrong when it stated that Governor Dewey would win by a substantial majority. See (i. H. Gallup and S. F. Rae, *Pulse of Democracy*, 1940).

Gallus, Aelius, learned jurist and contemporary of Cicero. A single excerpt is given in the *Digest* (50, tit. 16, s. 157) from a treatise he wrote on the significance of terms (*Gellius*, x. 22).

Gallus, Caius Aquilius, Rom. equestrian, was made praetor in 66 B.C. He was a pupil of Q. Mucius Scaevola the Pontifex, and became celebrated as a jurist. His writings were ed. by Servius Sulpicius, his pupil, and himself a famous jurist. Cicero eulogised G. in an oration for having promulgated an edictal rule on fraud in matters of buying and selling.

Gallus, Caius Cornelius (66-26 B.C.), Rom. poet. b. at Forum Julii (Fréjus) in Gaul, and the friend of Virgil and Ovid. Augustus sent him as general to Egypt, where he defeated Antony's forces and captured and imprisoned Cleopatra. Upon her death (30 B.C.) and the conversion of Egypt into a Rom. prov., G. was made first governor. Four years later he was deposed and exiled by order of Augustus, but preferring death to dishonour he committed suicide. He wrote four books of elegies not now extant. He was the hero of W. A. Becker's well-known story *Gallus*, 1838, Eng. trans. by Metcalf (London, 1868).

Gallus, Julius Aquila, jurist under the empire of uncertain date. The *Digest* contains two excerpts from his work, *Liber Responsorum* (26, tit. 7, s. 31; and 26, tit. 10, s. 12).

Gallus, Trebonianus, a Rom. emperor (A.D. 251-54), is said to have been treacherously concerned in the defeat and death of Decius, whom he succeeded. After his accession G. concluded a dishonourable peace with the Goths, conceding them a fixed ann. tribute and allowing them to retain their captives and plunder. He was killed by his own soldiers when on the march to suppress another Gothic invasion.

Galluzzo, vil. and com. of Italy in the prov. of Florence, Tuscany. It lies 2 in. S.W. of Florence. In the fighting of 1944 the Carthusian convent suffered many shell-hits, but the Pontormo frescoes were undamaged. Pop. 20,000.

Gally, Merritt (1938-1904), Amer. inventor, b. near Rochester, New York. He was ordained Presbyterian minister in 1866, but resigned owing to voice trouble, and interested himself henceforward in mechanics. He took out more than 400 patents, many connected with printing machinery. His inventions included the Univ. printing press, a machine for the manuf. of printers' types from cold metal by swaging, and the composite swage-locked type-bar or linotype. He was also the inventor of the 'orchestrone,' and made many productive experiments with automatic musical instruments.

Galston, tn. In the co. of Ayr, Scotland. It stands on the Irvine, E. of Kilmarnock,

and is engaged in coal-mining and the manuf. of muslin and cotton goods. Pop. 4700.

Galsworthy, John (1867-1933), Eng. novelist and dramatist, b. at Kingston Hill, Surrey. Educated at Harrow and at New College, Oxford, where in 1889 he took an honours degree in law. Instead of going to the Bar, like his father, from 1881 to 1886 he travelled round the world, and on the sailing ship *Torrens* met Joseph Conrad. In 1898 he pub. a book of stories, *From the Four Winds*, under the name John Sinjohn; also in 1898 the novel *Jocelyn*, in 1900 another novel, *Villa Irbain*, and in 1900 *A Man of Devon* and other tales. *The Island Pharisees*, a novel pub. in 1904, was the first book to be pub. under his own name. In 1906 the novel *The Man of Property* was pub. This novel, the first of that great series of novels 'The Forsyte Saga' and 'The Modern Comedy,' is the most dramatic of his novels, and the complete saga probably his greatest work. He himself says of the Saga that it 'cannot be absolved from the charge of embalming the upper middle-class life,' and in the complete success of this undertaking consists the greatness of 'The Forsyte Saga.'

In 1906 G. first became known as a dramatist with the play *The Silver Box*. In 1907 came the comedy *Joy* and the novel *The Country House*. A vol. of sketches, *A Commentary*, was pub. in 1908 and in 1909 the important novel *Fraternity*; also during that year the play *Strife* was first performed, to be followed in 1910 by *Justice*, and another vol. of sketches, *Motley*, and in 1911 by the novels *The Patrician*, *The Inn of Tranquility* (further sketches), and the play *The Little Dream*. In 1912 he pub. a book of verse, *Moods, Songs and Doggerels*, and the original tragi-comedy *The Pigeon* and the play *The Eldest Son* were first performed. The novel *The Dark Flower* and *The Fugitive*, a drama, came in 1913; the novel *The Free-lands* and the play *A Bit o' Love* in 1915; in 1917 *Beyond*, a novel, and the play *The Foundations*, in 1918 *Indian Summer of a Forsyte*, a delicate short story, later included in 'The Forsyte Saga,' *The Fire Tides*, *Another Sheaf*, *The Burning Spear*, and *The Saul's Progress* in 1919. In 1920, in *Chancery*, the second vol. of 'The Forsyte Saga,' was pub., and in 1921 the last vol. of the trilogy, *To Let*. *The Skin Game* was first performed in 1920, and in that year *Tatterdemalion*, a collection of war stories, was pub.; the comedy *A Family Man* was produced in 1921, and in 1922 *Loyalties* and *Windows*. More tales, *Captures*, appeared in 1923, and in 1924 *Old English*, an earlier story dramatised, was first performed, and later in that year the play *The Forest*. At this time also *The White Monkey*, the first book of the second trilogy, 'The Modern Comedy' was pub., to be followed by the second book, *The Silver Spoon*, in 1926 in 1927 by two interludes, later to be included in the second trilogy, and in 1928 by the last book of the cycle, *Swan Song*. Another play, *The Show*, was produced in 1925,

and in 1926 the drama *Escape*. A selection of earlier and unpublished poems, *Verses New and Old*, was pub in 1921. In 1927 a book of essays, *Castles in Spain and other Screeches* and *The Way to Prepare Peace*. *The Roof*, a play, in 1929 and in 1930 a book of short stories *On Forsythe Change*. In 1929 he was awarded the Order of Merit and in 1932 the Nobel prize for literature. His last novel *Flowering Wilderness* appeared in 1932. *Over the River* was pub posthumously in 1933.

JOHN GALSWORTHY

G is sometimes considered to use too much propaganda in his works, particularly in his plays, but he uses it rather as a framework than as the purpose of his plays. He is ironical but humanitarian, reserved, and this reveals itself in reticence and sparseness of words in dialogue — and although seemingly oppressed by the sadness of life he has a sense of humour at its best when ironical and a great appreciation of beauty. His work is influenced by Turgenyev and Maupassant whom he read a great deal in his youth but it is essentially English. *The Silver Box* is a play typical of his dramatic methods and *The Man of Property* contains the essence of his greatness as a novelist. It has been well said that if no biographical facts were available about G. it would be possible to deduce from his works and from their style that he was an aristocrat and that he had had a legal training. His books are not especially rich in incident, but they convey an almost

unique effect of abstract beauty suspended in an ethereal atmosphere. His purpose as a novelist, which will be found stated allegorically in his *Inn of Tranquillity*, is that of a light bearer in dark places — to show in a detached manner what is there whether good or bad, but readers are very divided on the question of his reputed impartiality. This conviction is irresistible, however, that the dominant motif of his work is the cult of the underdog in which motif he reveals the influence of Turgenyev and of other Russian novelists. Like a judge he weighs the evidence but his emotions are apt to colour the impartiality of his presentation. In G's world love is closely related to pity and hate is half brother to fear. His plays show a remarkable economy of construction, but in the later work the economy of style and characterization is so extreme as to produce the effect of meagreness and a want of human warmth. See lives by Sheila Kaye-Smith 1916 L. Schallert 1928, and H. Gould 1934 and H. V. Mairiot, *The Life and Letters of John Galsworthy*, 1935.

Galt, Sir Alexander Tilloch (1817-93) Canadian politician b in Chelsea. In 1833 he went to Canada and in 1849 sat in the Canadian Parliament. From about 1855 to 1862 he was the minister of finance and in another administration from 1864 to 1866 and eventually became first finance minister of the Dominion of Canada. From 1880 to 1883 he was in England, first commissioner to the Dominion. He wrote *Civil Liberty in Lower Canada* (1876) and *The Future of the Dominion of Canada* (1891).

Galt, John (1771-1839) Scottish novelist and dramatist, son of a sea captain b at Irvine, Ayrshire. He first worked unsuccessfully in London then travelled extensively on the Continent, where he made friends with Byron (of whom he wrote a life). Returning to England he pub *Letters from the Levant in Fanny's Magazine*, *The Ayrshire Legacies* (1820) and his masterpiece *Annals of the Parish*. In the following year he became secretary for the Canada Company where he founded the town of Guelph but returned to England a ruined man and devoted himself henceforward to literature. He pub his *Autobiography* (1833), *Itinerary Life and Miscellaneous* (1834) and a number of novels including *The Provost* (1822), *Sir Andrew Halliday* (1822), and *Laurie Ridd* (1830). He married the daughter of Dr Tilloch the proprietor of the *Star* newspaper for which he worked. G was a prolific but unequal writer, unrivalled in his delineation of life in small Scottish towns. An ed of his works, with introduction by S. R. Crockett was pub. in 1830. See lives by W. Maginn 1830; Sir G. Douglas, 1897, and J. W. Aberdein, 1936.

Galt, city of Ontario, Canada, 54 m W of Toronto and 24 m. N.W. of Hamilton. On main line of Canadian Pacific railway, and branch lines of Canadian National railways with electric railways to Kitchener and Brantford Market.

centre for tns. of Preston and Hespeler and vils. of Ayr, Blair, Dumfries, etc. It lies in a rich agric. dist., and has thirteen churches, three parks, two hospitals, a co-education school, and a fine public library. Industries include boilers, boots, brass goods, edge tools, engines, farm implements, leather, belts, lime, lumber, safes, soap and oils, nails, etc. The neighbourhood supplies limestone, sand, lime, and natural gas. It is named after John G. (q.v.). Pop. 15,000.

Galton, Sir Francis (1822-1911), anthropologist, cousin of Charles Darwin, was b. at Duddleston, Warwickshire. Educated at King Edward VI.'s Grammar School, Birmingham, he became medical student at Birmingham Hospital and King's College, London, and took his degree at Trinity College, Cambridge (1844). In 1850 he explored unknown parts of S. Africa, embodying his experiences in his *Narrative of an Explorer in Tropical South Africa*, 1853 (which gained for him the Royal Geographical Society's gold medal), and *Art of Travel*, 1855. He was made member of the Meteorological Council, general secretary of the Brit. Association (1863-68), president of the anthropological section (1885 and 1887), president of the Anthropological Institute (1885-86). He devoted himself to the study of heredity, and endowed a research fellowship for the study of eugenics in the univ. of London (1904). He systematised finger-print methods of crime detection. He received a knighthood in 1909. His prin. works are *Meteorographica* (1863); *Hereditary Genius* (1869); *English Men of Science, their Nature and Nurture* (1874); *Human Faculty and its Development* (1883); *Natural Inheritance* (1889); and *Memories of My Life* (1908). See life by K. Pearson, 1914-24.

Galuppi, Baldassare (1703-85), famous It. composer, particularly noted for his comic operas, b. at Burano, near Venice. He also wrote sacred music and sonatas for the harpsichord. He has been called the 'father of Italian comic opera.' See F. Ruabe, *Baldassare Galuppi als Instrumentalkomponist*, 1928.

Galvani, Luigi (1737-98), It. physiologist, b. at Bologna, and in spite of his own wish to enter the church was educated for the medical profession. He attained great fame as a comparative anatomist at the univ. of Bologna, where he became a lecturer. His greatest discovery was pub. in the treatise called *De Viribus Electricitatis in motu Musculari Commentarius* (1791). He was not a brilliant teacher, but owes his fame chiefly to his research work. The word galvanism is derived from his name, as also galvanometer. His whole research was directed towards ascertaining the relation of animal muscle to electricity. He refused in 1797 to take the oaths of the gov. of the new Cisalpine republic, and was deprived of his chair at the univ. Before he could be reinstated he died.

Galvanising, name applied to the process of coating iron or steel with another metal, usually with zinc to preserve it from rusting. The iron, thoroughly

cleaned by scouring with dilute sulphuric or hydrochloric acid and sand, is dipped into a bath of molten zinc covered with ammonium chloride to act as a flux, whereby a protecting layer of zinc-iron alloy is formed on the outside. The temp. of the bath varies from 450° to 480° C. It was first practised about 1837; iron so treated withstands the action of air and moisture better than tinned (q.v.), hence it is extensively used for single wire, wire-netting, corrugated roofing, cooking vessels, chains, water tanks, etc. *Galvanising* is employed to improve the adhesion of the galvanised coating, and is usually applied to give flexibility to galvanised wire. The wire is passed, immediately after galvanising, through a furnace maintained at 650-700° C. for about 15 min.

Galvanism, term applied to the method of alleviation of pain and cure of disease by means of a current of electricity. The current may be obtained from a battery of cells, or by means of a switchboard where electrical power is available. An alternating current may be used instead of a direct current, and is often of much value for therapeutic purposes. The terminals of the source of the current are connected to metallic electrodes which are covered with some absorbent material. To make the resistance of the skin of the patient as low as possible the electrodes and the skin are well wetted with a solution of sodium bicarbonate. The electrodes are applied to the body and the current passes from the one to the other through the body. Great care must be taken to prevent the metal touching the skin, and to avoid too strong a current.

Galvanometer, instrument used in electrical work for the detection and measurement of small currents. Gs. are of sev. distinct types, their designs and constructions being dependent upon the tasks they are required to perform.

Moving-magnet Galvanometers.—The earliest and also the most sensitive modern instruments are of this type. If a current is passed round a flat coil of wire the coil acquires the properties of a flat sheet of magnetised material, and one of its faces acts as a N. and the other as a S. pole for as long as the current continues to flow. Suppose that a flat circular coil is fixed in a vertical plane with its axis normal to the earth's magnetic field, and that a short bar-magnet is supported on a pivot at the centre of the coil. When a current is passed round the coil the magnet is deflected, and its position of rest is determined by the ratio of the strengths of the magnetic fields due to the earth and the current; the strength of the current can thus be inferred from the deflection of the magnet. This is the principle of the tangent G., an instrument that was at one time used for measuring currents, but is now obsolete. The moving-magnet G., however, is still extensively used for the detection and measurement of very small currents, although the simple construction described requires considerable modification. To make the instrument as sensitive as

possible it is necessary (a) to make the magnetic field produced by the current as strong as possible, (b) to reduce to a minimum the other forces which act on the magnet and resist its rotation; and (c) to provide means for detecting very small movements of rotation: (a) is achieved by using a small coil with very many turns of fine wire. To eliminate friction at the pivot the moving magnet is suspended from a fine quartz fibre that is so thin that it exerts only a very small couple to oppose rotation, and the controlling field of the earth is reduced by placing near the coil a permanent magnet whose magnetic field at the centre of the coil opposes, and is nearly equal to, that of the earth. The effect of the small residual controlling field is also further reduced by replacing the single suspended magnet by an astatic pair. This consists of two similar small magnets rigidly connected together, with the N. pole of one pointing in the same direction as the S. of the other; if these magnets were exactly alike the pair would experience no controlling couple in a uniform magnetic field. If the coil carrying the current passed in the same direction round both magnets of the pair the deflecting couple due to the current would also be very small, since the couple exerted on one magnet would be balanced by that on the other. This can be avoided, however, by winding the coil in the shape of a figure 8, and arranging that one magnet lies in the upper and the other in the lower loop of the 8; the current then passes in opposite directions round the two magnets and the couple on one reinforces that on the other. Finally the deflection of the magnet system is measured with the aid of a small mirror rigidly attached to the suspended system. A beam of light passes from a lamp to the mirror and is reflected from it to a distant scale. When the magnet system is deflected the reflected beam rotates about the mirror as centre, and the movement of the suspended magnets is indicated by that of the spot of light on the scale. Formerly a serious disadvantage of moving-magnet Gs. was that they were affected by variations of the intensity of the external magnetic field, and, although shielded by iron cases, they were not satisfactory in the vicinity of electrical machinery, etc. This led to their supersession for most purposes by moving-coil Gs. More recently it has been found that the difficulty can be overcome if they are surrounded by a shield made of mumetal, an alloy of iron and nickel. Some idea of the sensitivity of a moving-magnet G. may be obtained from the fact that a deflection of 50 mm. on a scale distant one metre from the instrument may be produced by a current of one thousand millionth of an ampere.

Moving-coil Galvanometers.—In this type of instrument the current passes round a flat coil suspended in the magnetic field of a powerful fixed magnet, and causes the coil to rotate. The principle is illustrated in the figure. A permanent magnet A is fitted with concave iron pole pieces NS, and produces a strong and nearly uniform

field in the gaps between these and the soft iron cylinder B. The coil C, to which is rigidly attached a small mirror E, is suspended in the gaps between the pole pieces and cylinder by a phosphor bronze ribbon D. The current enters at H, passes by way of the magnet and the suspension D to the coil, and leaves via the fine wire F, causing the coil to rotate to a new position where the couple due to the magnetic forces between the magnet and coil is balanced by the mechanical couple due to the twisting of the ribbon D. The rotation of the coil is measured by the movement of a beam of light reflected from the mirror. Such an instrument is practically unaffected by changes of the external field, since the coil lies in the intense field of the permanent magnet,

MOVING-COIL GALVANOMETER

but it cannot readily be made as sensitive as the moving magnet type of G. This is now of less importance than formerly, however, for means are available for increasing indirectly the sensitivity to any desired extent, subject to the limitations imposed by Brownian movement of the coil. To attain this sensitivity the light reflected from the mirror is made to pass to a photo-electric cell, where it is absorbed and produces another electric current which is passed through another G. Under suitable conditions it can be arranged that extremely minute deflections of the mirror of the first G. produce comparatively large changes of current in the second, and the only limit to the overall sensitivity is set by random deflections of the mirror of the first instrument. These are caused by impacts of air molecules with it, the impacts with one side being sometimes more violent than with the other. If a high sensitivity is not required the coil of a moving-coil G. may be mounted upon a pivot instead of being suspended, and the mirror and beam of light can be replaced by a pointer moving over a scale. This provides a more robust instrument suitable to many needs. The whole of the current that is to be measured may be passed through

the G., or, if the current is larger, a shunt may be provided. This consists of an alternative path by which part of the current may by-pass the instrument, while a constant fraction passes through the G. itself and is measured. The G. is thereby converted into an ammeter suitable for the measurement of larger currents, and may be provided with a set of shunts, by a suitable choice of which almost any current can be measured. Alternatively a high resistance may be connected in series with the G. The current through it then varies directly as the voltage applied to the resistance and G., so that the movement of the pointer is a measure of the voltage; the instrument then functions as a voltmeter.

String Galvanometers.—Neither of the above types of G. is suitable for use with rapidly changing currents, because the movements of the suspended magnet or coil take place slowly. The string G. fills this need. A fine silvered quartz fibre is stretched taut in a strong magnetic field and at right angles to its lines of force. The current passes along the fibre by way of its metallic coating, and causes a deflection by the bending of the fibre. This deflection is viewed or photographed with the aid of a microscope focused on the fibre.

Ballistic Galvanometers.—When a current is suddenly passed through a moving-coil or moving-magnet G. the coil or magnet is set in motion and, if no arrangements were made to prevent it, would swing backwards and forwards several times before settling down at the steady position corresponding to the current. In practice means are usually provided for damping the motion—that is, for making it die away rapidly. The damping of a moving-coil G. may be achieved by winding the coil on a closed metal frame, or by connecting a suitable resistance across its terminals; currents are then induced in the frame or in the coil and resistance, and as the energy for these currents is derived from that of the swinging coil the motion quickly dies away. The motion of the suspended magnet of the other type of G. may be damped by the friction between the air and moving vanes of mica attached to the magnet system. Sometimes, however, the damping is deliberately reduced to a small value, and the G. is then said to be a ballistic G. Such an instrument is useful for measuring the passage of small charges of electricity instead of constant currents, for if a charge is passed through it and the flow ceases before the coil or magnet has moved appreciably from its zero position, the amplitude of the first swing varies directly as the charge. The G. can therefore be calibrated to measure directly the magnitude of the charge that passes when, for example, a condenser is discharged through it.

Alternating-current Galvanometers.—Special arrangements must be made if the current to be measured is an alternating one. One method of doing so is to pass the current through a fine wire enclosed in an evacuated bulb. A thermocouple junction is attached to the middle

of the wire, and is heated when current passes. A direct current is thus produced by the thermocouple, and if passed through an ordinary G. serves as a measure of the alternating current. See A. Gray, *Absolute Measurements in Electricity and Magnetism*, 1921; D. J. Bolton, *Electrical Measuring Instruments and Supply Meters*, 1923; and E. W. Goldring, *Electrical Measurements and Measuring Instruments*, 1940.

Galveston, port of entry and cap. of G. co., Texas, U.S.A., on G. ls. (N.E.), at the mouth of G. Bay. Next to New Orleans it is the most important port on the gulf of Mexico, and trades with Great Britain, France, Cuba, Mexico, and Brazil. Its harbour, which is the best in the state, has over twelve feet of water on the bar at low tide. The chief export is cotton, others are grain, timber, cattle, hides, oil-cake, petroleum. There are iron foundries, machine-shops, cigar factories, grain elevators, and manufs. of flour, ice, rope, bagging, cotton-seed oil, cotton-cake, etc. There are regular steamship sailings to all parts of the globe. It is a Catholic bishop's see, and has sev. academies. Settled in 1837, it was captured by the Federals (1862), and retaken by the Confederates (1863). A fire in 1885 caused much destruction, and worse havoc was wrought by a storm and influx of the sea (1900). Precautions against a similar disaster include a $\frac{1}{2}$ m. sea-wall, and raising of the city's level. Pop. 60,800.

Galvin, George, see LENO, DAN.

Galway: 1. Maritime co. of Connaught, W. Eire, bounded W. by the Atlantic (coast much indented); S. by Clare co.; S.E. by Tipperary, Lough Derg, and the Shannon; E. by Offaly and Roscommon; N. by Roscommon and Mayo. Among the ls. off the coast are Inishboffin, Inishark, Gormuna (N.W.), and the Aran ls., which form a natural breakwater at the entrance to G. Bay (about 20 m. broad) between G. and Clare cos. (S.W.). The surface is mountainous in the W., with the Twelve Pins group and the Mamurk Mts. (over 2300 ft.). The Slieve Baughta (Aughty) Mts. come further S. G. contains Lough Corrib and part of Lough Mask. The chief rvs. are the Shannon and its trib. the Suck, the Black, and the Clare. There are wild moorland tracts in the W., such as Joyce's Country, Connemara (noted for marble), and Iar-Connaught. A branch of the Grand Canal connects the Shannon harbour with Ballinasloe. Agric. produce, wool, and marble are the chief exports. Limestone is plentiful, and copper ore is found at Roundstone (S.W.). Area 2293 sq. m. Pop. 165,100. 2. Cap. of above, par. bor. and seaport on G. Bay, 115 m. W. of Dublin, at the mouth of the Corrib, Claddagh vill., the fishermen's quarters, is close by. Coarse linens and stockings are the chief manufs., and kelp on the coast. G. is the seat of a Rom. Catholic bishop. Queen's College (founded about 1845) was renamed Univ. College (1908). Pop. 20,400. See J. Hardiman, *History of the Town and County of Galway*, 1820.

Gama, Vasco da (1469-1524), Portuguese navigator, b. at Sines, in the prov. of Alentejo. He early estab. a reputation as a fearless sailor, and followed closely in the footsteps of Prince Henry of Portugal. In 1497 he was dispatched with three vessels to attempt to round the Cape. With incredible difficulties to face he at last succeeded in doing so, and continued his journey across the Indian Ocean to Calicut. Here he estab. a settlement, but owing to the hostility of the natives had great difficulty in cutting his way out of the harbour. He returned to Portugal in 1499, and was raised to the nobility. At the same time an expedition was dispatched to plant a Portuguese colony at Calicut, but the atrocities of the natives caused G. to be sent out there again. He estab. a number of stations on his way there, and finally returned with rich booty to Portugal in 1503. It was not until 1524 that his services were again required. The atrocities at Calicut had again become excessive, and G. was again dispatched. He succeeded in restoring Portuguese prestige, but on the way back he d. at Cochín. See G. Correa, *The Three Voyages of Vasco da Gama and his Vice-royalty* (Hakluyt Society), 1869; R. W. Major, *Discoveries of Prince Henry of Portugal* (1868-77); *The Lusitads of Camoens*; and Castan Ledra, *Historia do Descobrimento da India* (1551), largely based on MSS. of Alvaro Vilho—a trans. of which MSS. by Ferdinand Denis is to be found in E. Charton's *Voyageurs Anciens et Modernes* (vol. III., 1855). See also E. G. Ravenstein (trans. and ed.), *Journal of the First Voyage of Vasco da Gama*, 1898; K. G. Jayne, *Vasco da Gama and his Successors*, 1910; and J. P. Alaux, *Vasco da Gama, ou l'épopée des portugais aux Indes*, 1931.

Gamaliel (d. 52), a Pharisee. According to the accounts of the life of St. Paul in the Acts of the Apostles, he was the teacher of that saint. He was a well-known and influential member of the Sanhedrin. He was the grandson of Hillel. As a member of the school of Pharisees he was more tolerant, peaceful, and broad-minded than the other members. He had a great liking for Gk. and studied well that language and the manners and customs of the people. He does not seem, on any reliable authority, ever to have been inclined towards Christianity, except for his defence of Sts. Peter and John (Acts v. 31). The stories which we find nowadays to that effect are the aftermath of the influence of Paul.

Gamba, Viola da, see VIOLA.

Gambetta, Léon Michel (1838-82), Fr. statesman, b. at Cahors, being of Jewish extraction. He became a member of the Paris Bar and sprang into notoriety almost immediately. He advocated very Liberal ideas, and was in 1869 elected as deputy both for Marseilles and for Belleville by the ultra-extremist party. He was largely instrumental in causing the proclamation of the republic after the disaster of Sedan. In 1871 he founded the newspaper *La République française* in an effort to strengthen the new republic. The provisional gov. which was

formed to conduct affairs after this defeat was largely under his influence, and he held the portfolio of the Ministry of the Interior. He conducted the defence of Paris, but after the beginning of the siege he escaped from Paris by means of a balloon, and conducted the war from outside. He struggled on bravely to the end, and was bitterly opposed to any surrender, and he was finally repudiated by the Fr. provisional gov. and fled to Spain. He was soon, however, elected as a deputy, and from 1872 onwards he took his place as the leader of the Republican party, putting forward an advanced programme for them. He was instrumental in preventing the attempted royalist restoration under the duc de Broglie in 1877, and quarrelled very badly with President MacMahon. For making statements about MacMahon which were held to be libellous he was arrested and imprisoned, but finally his popularity was so great that he gained practically a victory over the president, who resigned. In 1878 he became president of the Chamber of Deputies, and two years later Premier. His revision of the constitution was, however, rejected, and he retired. He d. two years later as the result of a pistol accident. His *Discours et plaidoyers politiques* were pub. 1881-85 and *Dépêches, circulaires, décrets*, 1886-91. See J. Reinach, *Histoire du ministre Gambetta*, 1884; F. Laur, *Le Cœur de Gambetta*, 1907; and H. Stannard, *Gambetta and the Foundations of the Third Republic*, 1921; and lives by P. Deschanel, 1919, and P. Matter, 1923.

Gambia: 1. Riv. of W. Africa, flowing for about 1000 m. through Fr. Guinea, Senegal, and the G. It discharges into the Atlantic at Bathurst through a deep estuary. Light craft can ascend as far as the Barraconda Rapids, 350 m. from the estuary, and about 150 m. further when the riv. is in flood. 2. Brit. crown colony and protectorate on W. coast of Africa. It extends for about 250 m. along each bank of the R. G. and its area, including that of the parts of the colony administered as a protectorate, is 3099 sq. m. The Fr. have been given access to the navigable parts of the riv. The chief tn. is Bathurst, on the is. of St. Mary. Bathurst, together with Georgetown and some adjoining land and is., forms the colony proper, which has an area of 69 sq. m. and a pop. of 14,000. The remainder of the ter. constitutes the protectorate. The country consists largely of creeks and swamps. The protectorate contains four provs., each under a commissioner who is responsible to a senior commissioner for the protectorate, who is, in turn, responsible to the governor. By an ordinance of 1916 the Kombo St. Mary Div. was subtracted from South Bank Prov. and added to the colony. The executive council consists of the colonial secretary and four other ex-officio members, namely, the river-general, attorney-general, senior medical officer, and the senior commissioner. The legislative council consists of the governor as president, the colonial secretary and five

officials (viz. the four executive council members plus the commissioner of the colony), and two unofficial members. There are sev. elementary and secondary schools run by the gov. and the church. Internal communication is maintained by steamers or launches; there are no local railways. Bathurst is connected with St. Vincent and Sierra Leone by cable and with tns. in the protectorate by wireless. The prin. exports are ground-nuts, hides and skins, and palm kernels; the prin. imports are tobacco, wines, sugar, tea, soap, oils, metal, cotton goods, boots and shoes, coal, etc. Bathurst is fortified, and the chief Brit. naval base in W. Africa. The tn. is built on piles, and considerable improvements have been effected in recent years.

G. was discovered by the early Portuguese navigators, but no settlement was made. The Brit. colony was founded purely for trading purposes, the original patent being granted in 1588 by Queen Elizabeth. Later various merchant companies obtained charters and settled along the riv. banks. From 1807 G. was controlled from Sierra Leone, but in 1843 it was made an independent crown colony. It was recognised as Brit. by the treaty of Paris, 1814. In 1866 it was included in the W. African Settlements, but was again a separate crown colony in 1888. Pop. (colony) 21,100; (protectorate) 233,100.

Gambier, James, Baron (1756-1833), Eng. admiral, b. in the Bahamas. He entered the navy and rose rapidly in its service. He served under Lord Howe in 1794, and commanded the fleet which bombarded Copenhagen in 1807. He was present with Cochrane at the battle in Aix Roads in 1809, but refusing to act on that sailor's advice was tried by court-martial and honourably acquitted. He was made an admiral of the fleet in 1830, and d. three years later. His memoirs were pub. in 1861 by Lady Chatterton.

Gambit, see under CHESS.

Gambling may be broadly defined as the playing at games of chance or wagering on some fortuitous event for money or money's worth. At the common law all games were allowed provided they were played fairly. When the legislature first intervened is not quite certain, but once having done so it classed together as illegal all sorts of games and pastimes such as cards, dice, cock-fighting, and races, without regard to the absence of any inherent common element. Perhaps the earliest instance of state interference was the proclamation issued by Edward III., who is recorded to have looked with disfavour on games of stones, bars, hand-ball, football, cockfighting *et alios ramos ludos*, not because of anything vicious in the games *per se*, but apparently because he found that his subjects preferred such peaceful games to the 'noble sports of war.' The proclamation was therefore made, according to some historians, not out of regard for the moral welfare of the people, but in the interests of recruiting for the army. Statutory restrictions on games and gaming are to be found as early

as the reign of Richard II. The object of these and subsequent statutes has generally been to punish as public nuisances all manner of games of chance by referring the persons who play at them to the category of rogues and vagabonds. Old writers assign the quaintest reasons for this legislative interference. In regard to the later statutes against gaming and wagering, including the prohibition of lotteries, it is to be noted that the principle varies according as the statute is creating a criminal offence or merely declaring that certain contracts shall not be civilly enforceable. (As to this see also GAMING.) G. or wagering contracts are unenforceable simply because there is no legal consideration (see CONSIDERATION; CONTRACT). The principle underlying the Acts which punish certain forms of G. as indictable offences is by no means clear. As the criminal law now stands a number of games are expressly forbidden avowedly on the principle that they are games of chance. The Gaming Act (1845), the Betting Act (1853), the Gaming House Act (1854), the Vagrancy Act (1873), and the Street Betting Act (1906), without expressly defining gaming, strengthen the common law against the keeping of common gaming houses or betting in the streets or other public places, presumably on the common law principle that such practices are public nuisances in that they promote cheating and other corrupt practices. But the element of chance as the deciding factor is apparent in most of them. Members of a bona fide club may bet with each other at their club, and apparently betting in the streets could only be punished if any person were found frequenting or loitering in the streets or other public places for an appreciable time for that purpose (see BETTING).

Certain games are expressly made unlawful by a series of statutes: they are ace of hearts, pharaoh (faro), bas-set, hazard, roulette, passe-passe, and every other game played with dice or any instrument, engine, or device in the nature of dice, having figures or numbers on it, but not backgammon or games played on backgammon tables. The prohibition is wide enough to include any card game of mere chance, and that form of buccarat called *chemin de fer* (q.v.) has been vetoed since 1895. In the celebrated case of *Jenks v. Turpin* (1884), where a divisional court upheld a magisterial decision which punished the playing of *baccarat banque* in a gaming-house, the only substantial argument urged against the inclusion of this game was that the element of skill consisted in the player determining whether he would stand on the card dealt to him or take another. Considerable public comment was evoked by a later decision of the courts against progressive whist drives. The principle of the decision was that the element of chance altogether predominated over that of skill, especially as after the first hands were played no player knew whom his partners were going to be for the rest of the drive, and further that weak or un-

skilful players might be indiscriminately pitted against strong players. The craze for limericks in certain pubs. was also suppressed by decisions which declared that such competitions were mere lotteries. All lotteries are public nuisances according to the Eng. law. The Lotteries Act, 1823, punishes as rogues and vagabonds persons who sell tickets or chances in lotteries authorised by foreign potentates or states, and an Act of 1836 provides penalties for advertising lotteries (*see also* LOTTERY).

There can be no two words about the popular love of G. at all times and in all countries. The periodical raiding of West End clubs and the organisation, especially since the First World War, of sweepstakes offering immense prizes are evidence of this fact (*see* CALUTTA SWEEPSTAKE). It is by analogy to the principle of betting in a club that the football pools continued to function after it was decided by the courts that the pub. of forms in the press was illegal. It seems evident that pools partake of the nature of both lotteries and sweepstakes; but the position regarding both is as obscure as it is on the licensing of bookmakers and the estab. of totalisators on race-courses; and it may be said that the law on G. is publicly flouted every day. It may be said that the G. instinct is more prevalent among the hot-blooded and oriental races. If that were not so it would be difficult to explain the absence of restrictions on such games as roulette and *hente-et-quarante* in France, Monaco, and, formerly, in Portuguese colonies, and other countries inhabited mostly by Lat. races, and in China. For a time, it is true, Ostend was a serious rival to Monte Carlo, but in 1902 the Belgian Parliament suppressed public gaming, and awarded compensation to the gaming-house proprietors of Ostend. Baccarat is still prevalent in France, although strictly regulated by the clubs who play the game. The Chinese are a race of notorious gamblers, and, with them, there is curiously intermingled a strong vein of superstition.

At the present day, however, it must be conceded that even among Lat. races G. is less and less favoured by the various states, and that this dis-favour has resulted in the isolation of Monaco as the one spot in Europe where the roulette whirls, not only by the sanction of the State, but for the express purpose of providing the revenue to support it, and such epithets as 'a hot-bed of vice,' 'the plague-spot of Europe,' 'the pickpockets' paradise,' 'the wastrels' Eldorado,' and so forth have been showered on this place. *See* MONTE CARLO; ROULETTE. *See also* GAMING and UNDER the various games, CHEMIN DE FER; TRENTE-ET-QUARANTE, etc.

Gamboze, resinous gum which is procured from certain trees in Siam, Ceylon, and other tropical places. It may be used medicinally as a purgative, but cannot be used alone. It is also used for obtaining a yellow pigment.

Gambrinus, mythical Flemish king who is supposed to have commenced the brewing of beer. The exact derivation of his

name is not known, but it is held to be derived from Gan Primus, who was the president of the Guild of Brewers.

Game Laws. Laws relating to the preservation of game and the punishment of persons unlawfully killing game have sunk to a position of comparative insignificance as compared with the state of things a century ago. Blackstone in his time could truly write of the offence of destroying game, that the sportsmen of England seemed to think it of the highest importance, and the only one of general and national concern. The statutes on the subject were many and various, and, as the classical commentator said, not even grammatical. Moreover, they exhibited the worst features of class legislation, for they drew broad distinctions between offenders of such rank as was called a 'qualification' (i.e. being the son and heir apparent of an esquire) and indigent offenders. Traditions, however, die hard, and the G. L. were a legacy of the repressive forest laws of the Conqueror. For centuries the one passion of the Eng. landed gentry seems to have been the pursuit of game, and no punishment was too terrible for the poverty-stricken wretch who poached to supply his needs. Even as late as 1827 an Act was passed punishing the felony of killing or wounding deer in any enclosed land with transportation for seven years. But the effect of protecting game by oppressive laws was probably more injurious to the morals of the rural pop. than any other single cause. The game swarmed before the labourer returning home from a day of unremunerative toil. Repression only led to night poaching with violent resistance to escape detection. The jails were not large enough to contain the hundreds of prisoners annually convicted. The total public expenditure which the preservation of game occasioned was probably more onerous than that which was required for the support of pauperism. The G. L. were indeed also the greatest hindrances to the improvement of agriculture; and it has often been stated that from three to five hares eat and destroy as much as would keep one sheep. The destruction by game to crops was enormous.

But public opinion has effected a great change, notwithstanding the curious anomaly that the Game Act of 1831 and most of the other repressive G. L. still remain on the statute book. Poaching is not now looked upon as much more than an escapade, and, comparatively speaking, is but lightly punished. In a word, it may be said that the milder manners of the present age, the growing humaneness towards dumb animals, and the tendency to excuse offenders where no great moral iniquity characterises the offence have conspired to reduce the G. L. to a purely secondary place in the criminal system. The prin. Acts now in force are the Game Act, 1831; the Night Poaching Act of 1829 as amended by 7 and 8 Vict. c. 29; the Hares Killing Act, 1848; the Game Licences Act, 1880; and the Ground Game Act, 1880; besides certain Acts for

the protection of wild birds. Broadly speaking, these Acts have for their object the restriction of the right either to kill or sell game, and, as incidental thereto, the punishment of those who infringe that exclusive right; the provision of close seasons for birds; and the regulation of game certificates and licences. It may be noted here that these Acts, by punishing trespass as a criminal offence, and inflicting penalties on those who infringe exclusive rights of killing game, have overcome the difficulty presented by the common law principle that there could be no private ownership in animals *feræ naturæ* (i.e. in a state of nature) unless reclaimed or confined, or killed on one's land.

Game is declared by the Game Act of 1831 to include hares, pheasants, partridges, grouse, heath or moor game, black game, and bustards. Snipe, quail, land-rail, woodcock, and conies are not game, but they may only be taken or killed by certificated persons. Woodcock and snipe may be taken with nets or snares, and also rabbits, by the proprietor in an enclosed ground or by a tenant and his servant. The right to the game is vested in the tenant in all cases where it is not reserved to the landlord in his agreement with the tenant. Where the game is reserved the occupier can neither kill game nor give permission to another to do so.

Poaching or trespassing on the lands of another in search of game is, if committed in the daytime, an offence punishable summarily under section 30 of the Game Act, 1831, by a fine not exceeding £2. Trespassers may be required to quit the land, and give their names and places of abode, and in case of refusal may be arrested. Firing at game from a highway is a trespass in pursuit of game. The leave of the occupier of the land is no defence where the game belongs to the landlord or some other person, unless given prior to the trespass. These provisions do not apply to persons hunting, or coursing, or exercising a right of free warren, nor to gamekeepers. An information for trespass may be laid by a common informer. Trespassers to the number of five or more acting together are liable to a penalty not exceeding £5. The law is more severe against poaching by night. Under the Night Poaching Act, 1829, as extended by an Act passed in 1844, any person unlawfully (i.e. having no certificate or licence) taking or destroying any game or rabbits by night, in any land open or enclosed, or on public roads or highways, gates, paths, outlets, or openings between such lands and roads or paths, or leading to enclosed gates; or any person either entering or being by night in such places, with any gun, net, engine, or other instrument, for the purpose of taking or destroying game, may be summarily punished for the first offence with imprisonment not exceeding three months, and at the expiration of such period be bound over for a year; for the second offence the above periods are doubled; and for the third or subsequent offence penal servitude may be awarded

to the extent of seven years. Under the same Act as similarly extended to public highways and gates by the Act of 1844, if three or more persons by night unlawfully enter, or are on any land for the purpose of taking or destroying game or rabbits, any of the party being armed with firearms or other offensive weapons, they shall be guilty of a misdemeanour punishable by penal servitude to the extent of fourteen years. The Poaching Prevention Act of 1861 gives power to a constable to search persons in public places whom they have good cause to suspect of coming from any land where they have been unlawfully engaged in pursuit of game; they may also search any cart or conveyance of the suspects, and seize game, guns, nets, and engines. By an Act passed in 1862, unlawfully taking or killing hares or rabbits in warren by night is punishable as for a misdemeanour; the punishment for the same offence committed in the daytime is a fine of £5. Unlawfully coursing, hunting, or killing deer in an unenclosed part of a forest is punishable by a penalty not exceeding £50 for a first offence, and, for a second offence, imprisonment not exceeding two years, which latter punishment also applies to a first offence where the deer were on any enclosed land. Strong measures to prevent trespassing or poaching may doubtless be adopted, but setting spring-guns, man-traps, or other engines calculated to destroy life renders the person so doing liable to penal servitude to the extent of five years.

A licence is required by every person who hunts or takes game, except persons (in Great Britain) taking woodcock or snipe with nets or springs; proprietors or tenants on enclosed land killing rabbits; persons hunting deer or hares with hounds; and others. Occupiers of enclosed land, or owners, having the right to kill game, may themselves kill hares, or authorise others to do so, without a licence, but such authority must be limited to one person at a time in any one par., and must be registered with the clerk of the petty sessions' justices. A gun licence is required even when the quarry is not legally game; but a game licence covers a gun licence. The charge for a licence taken out after July 31, to expire on the next July 31, is £3; to expire on Oct. 31 next ensuing, £2; for a licence taken out after Nov. 1, to expire July 31, £2; and for any continuous period of fourteen days, £1. *See also* 'LOSE TIMES'.

Gamelin, Maurice Gustave (b. 1872), Fr. general, educated at St. Cyr. Chief of staff to Gen. Joffre in the First World War from 1914 to 1916. General of brigade and a divisional commander in 1917. Led a military mission to Brazil, 1919-25. General of div., 1925. Commander of the Fr. forces in the Levant, 1925-28. Chief of staff of the Fr. Army, 1931-35. Inspector-general, 1935-37. Vice-president of Higher Council of War, 1935. Chief of general staff of national defence, 1938. Commander-in-chief of the allied forces in France in the Second World War, 1939. Of 'Maginot' mentality. Sustained a colossal defeat by the

Gers. in June 1940. He was one of the defendants at Riom in a trial for treason and in 1943 was imprisoned. His book, *Servir: Les Armées françaises de 1940* (pub. in 1946), is his defence against charges of having contributed to the disaster of 1940, and he is at pains to show that he had done his best to rear France and had not failed to explain to his officers what the nature of the coming attack would be. His position was difficult: he was chief of staff of national defence and commander-in-chief of all Fr. land forces; but Gen. Georges was commander-in-chief of the Fr. and allied forces in N.E. France. G. gave Georges too free a hand and for too long. Finally, on May 19, 1940, he intervened with an order that the First Army Group should counter-attack the S. flank of the Ger. salient. A few hours later G. was replaced by Weygand, who, in consequence, has been thought to have given the order; but in any case it was never carried out. As chief of staff from 1938 it fell to G. to recommend equipment for the Fr. Army and air force and to mould army training to doctrine, and also to provide against the most likely form of attack. He defends himself effectively on all these counts. It is evident that he was not the advocate of a first that he has been assumed to be; that was the doctrine of Pétain and his group, which included Weygand and Georges. G. understood and preached the theory of *Blitzkrieg* and the importance of armour and the air; and he also fully understood that the Montmédy-Sedan sector was the point most likely to be attacked. But he is less convincing in his defence of Fr. military equipment; though the Fr. War Office was never allowed adequate funds. In 1935 G. had to abandon a project to prolong the Maginot line (q.v.) to the Escart (Scheldt) because it had become more urgent to spend money on tanks. The neglect of anti-aircraft artillery was in part the result of policy. The decision to advance into Belgium has been criticised in France, but G. defends it effectively. The actual break-through of the Ger. Army was due to the collapse of Corap's Fr. Ninth Army, which left a 60-m. gap between the Ardennes (anal and Namur). On its right Huntziger's second Army did a little better, but lost Sedan. G. maintains that Georges should and could have had more reserves available to reinforce both Corap's and Huntziger's armies, and in any case their divs. were short of anti-tank guns, while too high a proportion of their men were second-line troops and older than the average. G. puts the blame for all these matters on Georges, and perhaps it is true that G. was up against a heavy weight of apathy and covert opposition; but it seems inconceivable that any Brit. or Russian commander-in-chief would have held the reins with so lax a hand during a battle on which his country's survival depended.

Game Reserve is the term applied throughout the Brit. Empire to large tracts of country which have been set aside or reserved by the var. govts. in order that the wild life of the particular ter. may

be protected against extinction, likely to be brought about by the predatory instinct of man and the spread of civilisation. In the old days the term was applied to reserves in England which were delimited in the first place for the king so that within these reserves game should be encouraged and preserved in order to provide pleasure for the royal hunt. In recent times, however, the original purpose of the G. R. has been reversed and the modern G. R. has been set out not as a measure against 'indiscriminate' killing of the game, but as a means of preserving the wild life of the locality against total extinction. Large tracts have been set aside in N. America, Australia, Africa, and Malaya. In Canada the Dominion Gov. maintains a number of wild animal parks which are administered by the National Parks branch of the Dept. of the Interior. These are the Buffalo and Elk Is. Parks in Alberta, noted for their herds of buffalo, and the Nemiskam Park, also in Alberta, which is a sanctuary for pronghorn antelope. In these parks the hunting of game is forbidden, and the wild life resources preserved. There are also other parks not included in the G. Rs., of which the most important are the Algonquin Park in Ontario, and the Laurentides Park in Quebec.

In the U.S.A. the movement of G. Rs. (or game preserves as it is here known) has been actively pursued, and large tracts of ter. embracing sev. thousands of square miles have been set aside for the preservation of wild animal and bird life. The Yellowstone Park is the most important wild animal and bird sanctuary in the U.S.A.

Gamete, biology, the sexual protoplasmic body, which unites with another for reproduction. Typically Gs. consist of the ovum, a large cell containing nutritive material, and the spermatozoon, smaller and frequently active. The individual bearing the former is the female, the latter the male. See **BIOLOGY**.

Gaming. A wager or G. transaction involves a promise to pay money or something of value solely upon the determination of an uncertain event. The policy of the Eng. law is to render practically all such agreements unenforceable, the only substantial exceptions being the various commercial transactions relating to insurance and the purchase of shares on the Stock Exchange. The Gaming Act of 1845 makes all G. or wagering contracts null and void. By the Gaming Act of 1892 no one can recover under a contract in any form commission or reward promised him for making or paying bets on behalf of another. The effect of this Act is that if A employs B, a betting commissioner or turf agent, to make bets for him and losses, B cannot recover from A money paid to discharge such bets; again, if A obliges his friend B by paying his racing debts, he cannot recover the money from B; and again, if A lends B money, knowing that B is going to make bets with it, he cannot recover from B the money so lent. But if A makes bets for B and receives the winnings he can be compelled

to pay them over to B; and, again, if A deposits money with B, a stakeholder, he can recover it from B at any time before B has actually paid it away on the determination of the wager. Securities such as promissory notes or bills of exchange given in payment of a bet are void as between the original parties to it, and a subsequent holder even for value cannot enforce such an instrument if it be shown that he knew of the illegal consideration for which it was originally given. Speculating on differences in the Stock Exchange falls under the Act of 1845 where it can be shown that the contract was a 'time bargain,' or mere gambling transaction (see DIFFERENCES). Contracts of marine insurance are perfectly valid where the person effecting the insurance had an insurable interest in the subject matter of the policy at the date of the loss; the result of this is that a cargo owner may recover on a policy entered into many days after his cargo has been lost at sea provided he was ignorant of such loss at the time he made the contract. See under INSURANCE. For the Acts forbidding certain games as criminal offences, see under GAMBLING; and for the prohibition of lotteries, see GAMBLING and LOTTERIES. See C. F. Shoolbred, *Law of Gaming and Betting* (2nd ed.), 1935, and H. A. Street, *Law of Gaming*, 1937.

Gamma Rays (γ rays). Radioactive substances emit three kinds of 'rays' named α , β , and γ . The first two radiations consist of material particles, but γ rays are electromagnetic radiations identical in character with light, wireless waves, and X-rays, but of wave-lengths of the order of 10^{-10} cm.; indeed they are the shortest electromagnetic waves known at present. γ rays are more penetrating than X-rays because of their shorter wave-lengths, and are used to cure deep-seated cancers.

Gamut, set of notes in a musical scale which number eight, and which form an octave. In old notation the G. refers to the lines or spaces on which the notes are printed.

Gand, see GHEHT.

Gandak: 1. Great G., an Indian riv. which rises in the Himalayas in Nepal, and is a trib. stream of the Ganges, joining that riv. at Patna. Its length is about 400 m., and it is known also as the Narayani. 2. Little G., a riv. which rises in the hills of Nepal, and which joins the Gogra at Suvaria. It is called also the Gunduck.

Gandersheim, ant. tn. in Brunswick, some 50 m. from the tn. of that name. Its abbey made it famous for some centuries; it was used as a place of education for the daughters of nobles. Pop. 2700.

Gandharvas, one of the bands of semi-divine beings created in the beginning by Brahma. They were 6333 in number, and were b. 'imbibing melody.' There are different accounts of their origin. In later myth they are met with as the musicians of Indra's heaven, espoused to the Apsaras (nymph-like beings). They have been identified with the Centaurs.

Gandhi, Mohandas Karamchand (1868-1948), Indian Nationalist leader, was b. Oct. 2 at Porbandar, in the Kāthiāwār peninsula, on the coast of the Arabian Sea. His parents were of Bania caste and Jain religion. In boyhood he went through a period of atheism, out of which he came, by the help of such authors as Tolstoy and Edward Carpenter, into an ethical dogmatism that caused much trouble to himself and his countrymen. At twelve he was married, and his marriage was happy. In 1888 he arrived in England; he studied at the Univ. College, London, and was called to the Bar at the Inner Temple. He returned to India in 1891, and soon afterwards began practice in the supreme court of Bombay. In 1893 business took him to Pretoria. He resolved to stay in S. Africa to support the cause of Asiatic immigrants, and he obtained a lucrative practice in Johannesburg, but gradually came to consider his profession immoral. In 1899 he organised an Indian Red Cross for the Boer war. In 1903 he founded a paper, *Indian Opinion*, at Durban. In 1904 he instituted a hospital in Johannesburg when plague broke out, and he was prime mover in the great demonstration there, Sept. 11, 1906, whereat the oppressive 'Asiatic ordinances' were denounced. During the native revolt in Natal in 1908 he organised, and served in, a corps of stretcher-bearers. For his political activities he was frequently arrested and imprisoned; even from extremists on his own side he suffered violence. The oppressive ordinances were removed in 1914; G. returned to India, and on the outbreak of the First World War came to London to organise an Indian ambulance corps. The attitude of the Brit. Gov. in India after the war entirely alienated him. He was the religious leader of the national movement till Tilak's death in 1920; he then became political leader by necessity. He proclaimed the *hartal*, or cessation of work, of April 6, 1919, which was the precursor of the affair of Amritsar (*q.v.*). He took advantage of Moslem unrest provoked by the Allies' treatment of Turkey; and their Khilafat Committee, 1920, endorsed his non-co-operation policy. It was, like Sun Fei in Ireland, an ignoring of the Brit. Gov. although it did not yet involve withholding taxes. The All-India Congress of Calcutta in that year approved the policy, which included the fostering of home industries, such as the use of the spinning-wheel.

In Nov. 1920 G. founded the National Univ. of Gujarat at Ahmedabad. The non-co-operation policy, of course, did not pursue the quiet course indicated by G.'s ethics. Strikes and riots were widespread in 1921 and, in the same year, G. superintended the burning of foreign merchandise in Bombay. 'Civil disobedience,' the next step, involved non-payment of taxes - it began in Nov., when the Prince of Wales arrived. There was rioting and looting, so G. suspended the disobedience order. At the end of the year Congress invested him with dictatorship. More violence by Nationalists (at Gorakhpur)

caused G to abandon civil disobedience, but he was arrested and tried at Ahmedabad in 1922 and sentenced to six years' imprisonment for preaching disaffection. After an operation for appendicitis in prison he was released (1924) but for a while suffered eclipse. Near the end of 1927 his fame revived—he was enthusiastically received in Ceylon. After a visit to Burma he was in Aug. elected to presidency of Congress but he declined it, leaving it to his lieutenant Motilal Nehru (d. 1931). In March and April 1930 he made his celebrated march from Ahmedabad to the sea and formally violated the unpopular salt monopoly of the gov. by

MAHATMA GANDHI

publicly distilling salt from sea water on the shore. He was arrested May 4 and sentenced to be kept in Yeravda Jail near Poona during the gov. pleasure. He was released again in Jan. 1931 to attend the Round table conference in London. Two months later he concluded a truce with Lord Irwin the viceroy. During further unrest in 1931 he was once more arrested and again released. The following year he left the National Congress, saying that he wished to give up politics but in fact he merely retired to a vil. in the Central Provs. where he closely observed developments and retained his position as the most influential figure in the Nationalist movement. He now seemed to show a tendency to favour the right wing group of Congress and directed his influence in a manner which was opposed to the views of Jawaharlal Nehru (q.v.), the Socialist Congress leader. He entered public life again in 1937 when he acted as mediator between the gov. and the Congress party on the issue of the assumption of office by the party in the provs.

On the outbreak of the Second World War it seemed at first that G. would advise the Congress party to lend their moral support to the nations resisting aggression. But he convinced himself that only a 'free India' could render effective moral support to Britain, and his demand for 'complete independence' became even more insistent. When Japan invaded India he became much perturbed at the defence measures which the Gov. of India set in motion. At this time discussions on the Cripps Mission (see INDIA History) had reached a hopeful stage but G. threw his weight against settlement and the negotiations with Congress leaders broke down. At a moment when the war situation was unfavourable he spurned the draft declaration whereby India was promised autonomy and demanded that the Brit. should quit India, that the Indian Army should be disbanded and that Japan should be allowed to enter India and arrange terms with a non-resisting people.

In Aug. 1942 he concurred in the decision to strike the blow of mass obstruction against the war effort. This 'open rebellion' as he himself called it led to his arrest and that of other Congress leaders and to widespread disorder and bloodshed. G. was interned in the Aga Khan's palace at Poona and forbidden public contacts though he was allowed the companionship of Mrs. Gandhi who d. in Feb. 1944. He was released unconditionally on medical grounds on May 6, 1944. Subsequently all the Congress leaders were released to take part in the protracted discussions arising out of attempts to end the strife between Hindus and Muslims over the Pakistan (q.v.) issue. A series of conferences between him and Mr. Jinnah (q.v.) at the latter's house in Bombay were fruitless, for G. stated that he spoke only for himself and had no mandate from the working committee of the Congress. For many years in fact he had withdrawn from actual membership of the party, only to dominate it from without. In the negotiations in the spring of 1946 at Delhi with the historic Brit. Cabinet mission under Lord Pethick-Lawrence, G. took a large share mainly behind the scenes and when at length amid very serious outbreaks of communal violence, the plans of the mission led to the formation at Delhi of an Interim National Gov. with Indira Nehru as vice-president of the council G. remained outside the Cabinet much to the relief of its members. Yet no major decision could be taken at the centre or by the prov. govts. without full reference to the wishes of the Mahatma, the idol of the Hindu masses.

When Independence Day came in 1947 sanguinary unrest in Calcutta led to fears that the partition of Bengal between the new dominions of India and Pakistan would have disastrous consequences. G., who had been travelling through E. Bengal and in Bihar preaching brotherhood, went to Calcutta and in Sept. undertook another fast until normal conditions were restored. The party

leaders exerted their influence over the people and on the fourth day G.'s fast ended. Thus he miraculously succeeded where armed force had failed. This success encouraged him to stage in Delhi early in Jan. 1948 his fifteenth fast in the hope of bringing harmony between India and Pakistan. The fast began as the Security Council at Lake Success (U.S.A.) was considering the Kashmir and related problems between the two dominions. This fast ended on the fifth day through the Delhi Cabinet's decision on G.'s advice no longer to withhold from the Pakistan Gov. payment of the £41,000,000 due from the undivided cash balances at the time of the Brit. withdrawal. On Jan. 30 he was assassinated in Delhi on his way to an evening prayer meeting by a Hindu fanatic named Nathuram Vinayak Godse. The trial of Godse, together with others implicated in the murder, began on May 27, 1948 and ended on Feb. 10, 1949. Godse and his associate, Narayan Apte, were found guilty of the murder and of conspiracy to murder and were sentenced to death, while five other persons were sentenced to transportation for life for conspiracy to murder.

As a social reformer G.'s personality and purpose excited the widest interest throughout the world. More than a politician, he long figured as a prophet in revolt against the ideas of an age of machinery, of science, of more complex organisation, and of ever-increasing state control. But the Congress, of which he became leader in the campaign for *swaraj* or self-government for India, was mainly dependent for finance upon Indian big business, and the repudiation of W. methods was seldom preached by him after his first civil disobedience movement in 1919. Often as he seemed to change his mind on matters of detail, and adept as he was in political expediency and tactics, the burden of his message was the same, the repudiation of violence and the exaltation of the individual conscience. Fundamentally this part of his doctrine was a conviction, based, in his belief, on the purest forms of Hindu religion, that the innate goodness of the common man was the essence of all sacred and political organisation. This was in later years the inspiration of the campaign against 'untouchability' which lost him a multitude of supporters among the orthodox. A pacific individualist, whom millions of his countrymen revered as a saint and whom all respected as the embodiment of tradition, G. was not a man of commanding gifts nor an orator, nor did he make any real constructive contributions to the solution of constitutional problems. He was in fact a perpetual enigma both to admirers and critics. If he was certainly a propagandist versed in all the arts of publicity, Hindu India either held that his guidance was infallible, though difficult to follow, or pleaded his saintliness and the imperfections of his human instruments in mitigation of his manifest errors. Muslims, however, soon became less acquiescent. His European and Amer. admirers were few by comparison

with the many who were puzzled or irritated by the frequent contrast between the humorous, kindly, and courageous social reformer and the headstrong demagogue, who could split hairs with any sophist. But he was the most influential figure India has produced for generations, though it must be left to posterity to determine precisely how much the eventual triumph of *swaraj* owed to G. and how much to the inevitable development of Brit. policy in the government of dependent peoples from the era of Burke to the modern application of the concept of dominion status as the goal of the free and equal partnership which is called the Brit. Commonwealth of Nations. See R. Rolland, *Mahatma Gandhi*, 1924; C. F. Andrews, *Mahatma Gandhi's Ideas*, 1929; R. Privat, *Aux Indes avec Gandhi*, 1934; K. Shridharani, *War Without Violence*, 1939; C. Heath, *Gandhi*, 1944; and G. Catlin, *In the Path of Mahatma Gandhi*, 1948.

Gandia, Sp. seaport in the prov. of Valencia, nearly 40 m. S.S.E. of the tn. of that name. The chief exports are oranges, raisins, wine, onions, and tomatoes. Pop. 13,000.

Gando, or Gandu, native state in N. Nigeria (Brit. protectorate). The natives belong to the Fulah race. The chief tn. is G. The total area is about 80,000 sq. m.

Gandzha, or Ganja (formerly Elizavetpol or Ye Iizavetpol): 1. Former gov. in Transcaucasia, Russia, extending from the Caucasus to the Iranian border; now part of Azerbaijan. 2. Tn. of Azerbaijan, S.S.R. A grain centre. Also trades in wine and copper. Pop. 85,000.

Ganesha, or Gana-pati (i.e. Lord of Hosts), name of a Hindu God, the son of Shiva. His images represent him as a stout man with an elephant's head and four arms.

Ganges, riv. of N. India. This great stream is formed by the draining of the S. slopes of the Himalaya Mts. It rises in the Garhwal state and issues from an ice cave of the Himalayas, near Gangotri, 10,000 ft. above the level of the sea. The riv. when it first issues forth is called the Bhagirathi. It is not until it is united with the Jalsari and the Alaknanda that the united stream is known as the G. The G., besides being the great riv. of India, is also an essential part of the Indian religious system. Both the source and the junction of the rivs. are regarded as sacred spots by the Hindus. Emerging from the Himalaya Mts. it turns to the S.W. It can hardly, however, be regarded as a great riv. until at Allahabad it receives the Jumna, a stream which has its origin to the W. of the G. The junction of the Jumna and the G. is regarded by all Hindus as the holiest and most sacred of places, and is the scene of constant pilgrimages by the Hindus, who come there to wash away their sins. Other tribs. of the G. are the Gomti, Gandak, and Gogra. Opposite the confluence of the Gandak is the city of Patna, 140 m. E. of Benares. The riv. passes through the great city of Benares and then approaches the bay of Bengal; 220 m. before reaching

the shores of the bay it begins to spread out and form the delta. The main channel, which is called the Padma or Padda, flows in a south-easterly direction, and is met at Goalanda by the main stream of the Brahmaputra, and these two streams form a great estuary which is known by the name of Neghka, and which enters the bay of Bengal at Moanahall. This great channel is the most easterly of all the channels of the delta. On the other side we find the Hugli, which is the most westerly of all the channels. The land which goes to form the delta is in the N. fertile and rich, but in the S. is swampy and goes by the name of the Sundarbans. The great commercial stream of the delta is the Hugli, on which stands the tn. of Calcutta, which is about 90 m. from the sea-coast. Formerly steamer communication existed as far as the tn. of Allahabad, but nowadays, owing to present-day facilities for traffic by rail and the increasing shoals in the riv., steamers go no further than Calcutta. Often great changes take place in the riv.-bed; is. are thrown up, new channels are sought. Such changes are so rapid that it is dangerous for any large or permanent structure to be erected on its banks. The G. is crossed by six rivers, bridges as far as Bonares and another in E. Bengal has been erected. There are two canals—the Upper G. Canal and the Lower G. Canal—which together with the Jumna irrigate the greater portion of the land between the G. and the Jumna above Allahabad. There is no important navigation on them.

Ganges Canal, constructed mainly to irrigate the arid country between the G. and the Jumna Rts.; originally extended from Haridwar to Cawnpore and Etawah, but later it was much enlarged and at present has a total extent (including branches) of 3700 m., of which 500 m. are navigable. It has greatly conduced to the mitigation of distress caused by famine.

Ganglion (Gk. γαγγλιον, swelling or excrescence): 1. In anatomy an enlargement occurring in the course of a nerve, and containing bi-polar or multi-polar nerve cells in addition to nerve filaments. Two systems of nerves have ganglia upon them. First those of common sensation, whose ganglia are near to the origin of the nerve in the spinal cord. Secondly the great sympathetic nerve which has various ganglia on various parts of it. In the invertebrates these ganglia are centres of nervous force and are distributed through the body in pairs. The cerebral ganglia of vertebrates are the brain itself, the masses of grey matter at the base of the brain, as the optic thalamus, etc. 2. In surgery an encysted tumour, situated somewhere on a tendon. 3. In botany the mycelium of certain fungals. **Lymphatic G.**—a lymphatic gland.

Gangotri, Hindu temple and place of pilgrimage in the Himalayas, on the r. b of the Ganges. It dates from the eighteenth century, and the pilgrims to this temple are supposed to be relieved of their sins.

Gangpur, state of Orissa Agency, India. Area 2484 sq. m. Pop. about 400,000.

Gangrene (Gk. γάγγραινα), or **Mortification**. G. is the condition in which putrefaction accompanies the death and degeneration of body tissues or of some of their constituent cells and arises from an interference with the blood supply. The part affected may be either dry, that is mummified, or moist, the amount of moisture depending upon the degree in which the blood supply is cut off. The cause of G. may be local, constitutional, or the two combined. It may be the result of changes in the vessel wall, as in senile G. of the old and feeble, and in certain diseases, such as diabetes, typhoid, measles, etc. Blocking of the vessels is another cause, for example in the lungs or other parts, from pressure or changes whose ganglia are near to the origin of the nerve in the spinal cord. Secondly, outside the vessel. Heat or cold (burns or frostbite), chemical agencies and bacillary affections, such as carbuncles, erysipelas, etc., may all bring G. in their train. Since the use of antiseptics has become general, traumatic and hospital (i.e. comparatively rare. During the First World War conditions were frequently such that it was impossible to pay immediate and constant attention to wounds and G. not infrequently supervened. Antisera effective against germs causing G. and other dangerous diseases are now injected, and the wounds, cleansed with antiseptics, are kept open until they are completely drained and show no sign of discharge or inflammation. Dead and injured tissues are removed, and the wound is reopened if any inflammation appears. If the disease shows any indication of spreading, amputation well above the limit reached by the G. is the only means of preserving life. The pain and extent of the G. depend upon the cause and its persistence. When the cause is removed the gangrenous dead part dries up and separates.

Treatment.—During the separation the affected parts should be kept aseptic, surgically clean, and free from germs. The patient's strength should also be kept up by good nourishing food. In G. of a limb amputation is indicated when there is no prospect of a return of healthy blood to supply the part affected.

Ganja, see GANDHIA.

Ganjam, dist. of India, in the N. of Madras Presidency. It has an area of 4380 sq. m. The bay of Bengal bounds the dist. on the S.E.; the low-lying plain that lies along the coast produces rice, millet, and grain. To the W. lie the E. Ghats, the jungles on the slopes of which are inhabited by very backward, indigenous tribes. Tanning and weaving are the chief industries, and Berhanpur is the cap., superseding G. This old tn., once an important centre of trade, is now of little importance, having been abandoned after an epidemic in 1815. It stands near the mouth of a small riv., 90 m. S.W. of Calcutta. Pop. (dist.) 1,520,000.

Gannet, or *Sula bassana*, web-footed, aquatic bird, a species of *Sulidae* or *Steganopodidae*. It is popularly called

the Solan goose, and derives its specific name from the Bass Rock, one of its favourite haunts. It is solely an oceanic bird, with an easy and powerful flight; its entire length is about 3 ft., and the general colouring is white with a buff tinge on the head and neck; the bill is long and thick and compressed at the point. Gs. are found nesting on several rocky stations on the coast of the Brit. Isles, Ailsa Craig, St. Kilda, Sulliskerry, and Grassholme (where it is estimated that there are over 6000 pairs belonging to the Royal Society for the Protection of Birds).

GANNETS

In late autumn they migrate to N. Africa. They feed on such fish as swim near the surface, herrings, pilchards, etc., diving swiftly, and sometimes from a considerable height, upon their prey.

Ganoidei (Gk. *ganos*, brightness), name given to one of the great orders into which fishes are divided; most of the fossil fish of palaeozoic and mesozoic ages belong to this group, whose members are generally distinguished by the skeleton being cartilaginous and the skin furnished with hard, bright scales. Fossil G. include *Holoptichius*, of the Upper Devonian, *Palaeoniscus*, of the Permian, and *Cephalospis*, of the Upper Silurian and Lower Old Red Sandstone strata. The living genera of G. are chiefly freshwater fishes and include *Acipenser*, the sturgeon, *Amia*, the bow-fin, *Lepidosteus*, the gar-pike, and *Polypterus*, found only in tropical Africa. It is now customary for systematists to unite the G. and Teleostei under the heading Teleostomi.

Ganshoren, tn. of Brabant, Belgium, and suburb of Brussels. Pop. 9000.

Ganymede, son of Tros, king of Dardania, was a Phrygian youth of surpassing beauty, who was borne up to heaven to serve as Zeus's cupbearer. Classical poetry is full of allusions to his fate, whilst Leochares, a fourth-century Athenian sculptor, made a fine bronze group representing the eagle with outspread wings in the act of carrying the boy to the home of the gods. Later Gk. mythology represents him as the genius of the life-

giving Nile, and anct. astronomers said he was Aquarius.

Gao, or Gogo, tn. of Fr. Sudan, Fr. W. Africa. It stands on the l. b. of the Niger, about 200 m. E. of Timbuctoo direct, and by riv. nearly twice that distance. It was once a prosperous tn., the cap. of the empire of the Songhals, and the ruins of the tomb of a Songhai leader, Mohamed Askia, are still to be seen. Of this anct. native tn. nothing but ruins now remain. The Fr. estab. a military post here in 1900, and the new tn. that has since sprung up has a pop. of 9400. Mungo Park, Barth, and Ilourst visited G. in the course of their explorations.

Gao, Karveh, Persian blacksmith hero, whose sons had been slain to feed the serpents of the reigning tyrant. He raised his leathern apron on a spear as a standard of rebellion and, the revolt succeeding, the apron became the standard of the new dynasty and so remained until it was replaced by the crescent.

Gaol, see PRISONS.

Gaol Delivery, one of the commissions under which the judges of assize derive their authority (see ASSIZE). The Commission of G. D. is a patent in the nature of a letter from the king, directed to the judges of assize of each circuit (see CIRCUIT), king's counsel attending the circuit, clerk of assize, and associate, authorising them to 'deliver his gaol at a particular town of the prisoners in it, i.e. to try every prisoner in the gaol committed for trial on any charge whatever. As, under this commission, judges may proceed upon any indictment of felony found before other justices and not determined, their authority differs from that of justices of oyer and terminer (q.v.), who can only proceed on indictments found at the same assizes. The court of king's bench (q.v.) on account of its status as the highest court of criminal jurisdiction, automatically determines and absorbs by its coming into any co. all former commissions of G. D. and oyer and terminer. This, however, does not apply to the Central Criminal Court. See Harris, *Principles of Criminal Law*, and Russell on *Crimes*.

Gaon (pl. Geonim), properly signifies pride or majesty, and the word may be a trans. of the Lat. word *clarissimus*, which was sometimes a title applied to the Rom. emperors. In the hist. of Judaism G. was a title given especially to the heads of the Jewish academies of Sura and Pumbedita in Babylon. Sura was the senior academy, and the G. of Sura was recognised by the Babylonian court as the civil head of the Jews. During the Babylonian Gaonate there were thirty-nine Geonim of Sura, beginning with Mar R. Mar in A.D. 609, and ending with R. Samuel ha-Kohen in 1034, and forty-nine Geonim of Pumbedita from Mar b. R. Hanan in 589 to R. Hal in 1038. The age of the Gaonate was marked by an excellence in literary studies and an increase of culture, especially during the rule of R. Saadia, G. of Sura in 928. Studies were not confined to the Talmud, but one of the

prin. works of the Geonim was in replying to questions of ritual, submitted to them by Jewish congregations in distant communities. A century after the death of R. Hui, the last Babylonian G., the title was assumed by the head of the Jewish academy in Palestine. This academy probably ceased to exist before the capture of Palestine by the Christians, but Mazliah retained his title of G. while at the Fostat Academy. The traditions of the Gaonate survived in Damascus, where in 1200 the teachers there were spoken of as 'the scholastic heads of Israel.'

Gap (anct. *Vapincium*), cap. of the dept. of Hautes-Alpes, France. It is built on the r. b. of the Luye, 2418 ft. above the sea, and is connected by rail with Grenoble (48 m. to the S.S.E.). It possesses a fine new cathedral. Pop. 16,300.

Gap Canal, or Canal du Drac, means of communication between the Durance and the Drac Rs., and an enormous aid to irrigation. It was dug in 1864-88, and is 4.5 m. long. With its arms, the Rochette and the Charance, and other subsidiary branches, it affects an area of 18,600 ac.

Garag, see *GADAG*.

Garamond, Claude (d. 1561), Fr. type-cutter, who designed, in collaboration with Robert Estienne, a now famous Gk. type named *l'écrit du roi* (in recognition of the patronage of François I) which was first printed in an ed. of Eusebius. The modern type Garamond was designed by Jean Jannon.

Garashanin, Iliya (1812-74), Serbian statesman, b. at Garasha; son of a rich peasant. Exiled 1839 for plotting against Obrenovich dynasty; returned 1842; entered office of Ministry of Interior and helped to restore Karađorđević family. Premier 1852-54. Dismissed, because of anti-Russian proclivities, at instance of Menshikov, but managed to keep Serbia neutral in the Crimean war. Minister of interior, 1857-58; and, at his instance, the Serbian National Assembly, after an interval of ten years, was convoked on St. Andrew's Day, 1858. It, however, restored the Obrenovich dynasty. Prince Michael, who succeeded Milosh in 1860, gave premiership to G., who obtained great concessions from the sovereign power. He began to prepare a general Balkan rising, but resigned suddenly late in 1867.

Garat, Dominique Joseph (1719-1833), Fr. publicist, b. near Bayonne. In 1790 he was a member of the Constituent Assembly whose debates he reported in the *Journal de Paris*. First won literary distinction by his *éloges* on Fontenelle and other famous Fr. writers, taking sev. prizes awarded by the Fr. Academy. A revolutionary at heart, he became minister of justice during the early days of the Fr. Revolution and in that capacity apprised Louis XVI. that the convention had condemned him to the guillotine, but at the same time expressed his abhorrence of the decision. Under Napoleon he was ennobled and also became a senator and president of the institute; but lost office on the restoration in 1815. See

L. Thiers, *Histoire de la Révolution française*, 1838 (Eng. trans. 1873).

Garat, Pierre-Jean (1764-1823), singer, secretary to comte d'Artois. Prof. in singing to the Fr. queen, he later suffered imprisonment for an original song of Royalist sympathies. The fine quality of his voice, combined with a remarkable compass, secured him an unrivalled success in the five countries of Europe which he had occasion to visit.

Garay, Janos (1812-53), a Hungarian poet, had throughout his life a struggle for a bare existence, and was obliged to eke out his livelihood with literary hack-work. Yet his numerous historical dramas, ballads, romances, and lyrics are justly treasured to-day by all his book-loving compatriots. His ambitious historical poem, *Saint Ladislaus* (1852), is his last and most celebrated work. *Arbocz* (1837) and *Bathori Ersebet* (1840) are two of the historical plays, whilst *Balaton Kanyók* (shells from the Balaton Lake, 1848) contains some of his finest lyrics.

Garbo, Greta (*Greta Louisa Gustafsson*) (b. 1905), Swedish actress, b. in Stockholm. At the age of fourteen she entered a dept. store. Took up dancing. Attended a dramatic school attached to the Royal Theatre, Stockholm. Began film career, 1922, appearing in *The Moment of Gusto* (Hollywood under the direction of Mauritz Stiller and changed her name to Garbo). Then went with Stiller to Hollywood and starred in many films which brought her world-wide fame, including *Mata Hari*, *Anna Christie*, *Queen Christina*, *Ana Karenina*, and *Marie Walruska*.

Garaçã, Pedro Antonio Corrêa (b. 1735 or 1724-72), Portuguese poet, lived a sequestered life near Lisbon till, in his thirty-sixth year, he was thrown into prison, perhaps because some of his writings had offended the autocratic gov. There he d. In most of his dramas, sonnets, odes, satires, and epistles, he was avowedly imitating classical models, and in the last two he has assuredly proved himself 'the Portuguese Horace,' a title given also to Ferreira. The purity of his taste and style undoubtedly lifted the national literature out of the mire of decadence into which it had fallen, but G. must be described as a writer of conscientious refinement rather than as a genius. See T. Braga, *Arcaidia Lusitana*, 1899.

Garcia I., Sp. king, reigned over Navarre from 885 to 905. His reign was darkened by continual warfare against the Moors.

Garcia II., the Trembler ('El Tembloroso'), ruled Navarre from 924 to 970. His surname was due to a physical infirmity, and in the active part he took in the struggles between Leon and Castile he proved a worthy successor to the warlike Sancho.

Garcia III., king of Navarre from 1035 to 1054. He was the eldest son of Sancho II., the Great. Defeated and killed in the battle of Atapuerca, his kingdom passing to Ferdinand's nephew, Sancho IV.

Garcia IV., ruler of Navarre from 1134 to 1150. When Alphonso the Battler, or the emperor, foolishly bequeathed Navarre to the Knights of St. John, and Aragon to the Templars, the Navarrese, refusing a foreign yoke, chose G. Ramirez, a scion of the old royal stock, to be their king.

Garcia, Manuel del Popolo Vicente (1775-1832), vocalist and composer, was famous among his contemporaries for his splendid and artistic singing, but is best remembered as the author of *The Caliph of Bagdad*, an opera performed with remarkable success at Naples in 1812. At first a chorister in the cathedral of Seville, he appeared successively in his own and other musicians' operas in Cadiz, Madrid, Paris, and London. After a profitable tour in America (1825), he was robbed of all his wealth whilst on his way to Vera Cruz. For the remainder of his life he taught his art in Paris, using the excellent system advocated in his *Metodi di Canto*. His son, Manuel Patricio Rodriguez G. (1805-1906), as a teacher was no less famous than his father. Prof. at Paris Conservatoire, 1842, and Royal Academy of Music, London, 1846. Inventor of the laryngoscope (1855). His daughters, Maria (1808-36) and Pauline (1821-1910), were also well-known singers. See M. Sterling Mackinlay, *Garcia the Centenarian*, 1908, and J. M. Leven, *The Garcia Family*, 1932.

Garcilaso the Inca (c. 1533-1616), as he called himself, was a Sp. historian, son of G. de la Vega and a princess of the royal line of Incas. Born at Cuzco in Peru, he early (c. 1560) migrated to Spain and passed most of his life at Cordova, where a chapel in the cathedral bears his name. Considering his intimate knowledge of his native language, his Peruvian hist., entitled *Commentarios Reales que tratan del Origen de los Incas reyes, que fueron del Peru* (1609-17), is disappointing. See study by J. Fitzmaurice-Kelly, 1921.

Garcilaso de la Vega (c. 1503-36), a Sp. poet, became at the age of seventeen *centino* or guardsman of Charles V., and displayed signal courage at the battle of Pavia (1525), fought in 1529 against the Turks, who were trying to reach Vienna, was present at Bologna in 1530 at the magnificent coronation of the emperor, and in 1532-34 served Don Pedro de Toledo, the victor of Naples. Wounded during the Tunis expedition of 1535, he met his death the following year whilst storming a small fort in Muz during the retreat from Marseilles. He is the finest pastoral poet of Spain, and with Boscan, his friend, shares the honour of having popularised the It. hendecasyllable verse. His finest poem is the first of his three eclogues, penned in Naples under the inspiration of Virgil's tomb. Only a few odes and sonnets are included in his scanty remains, but they are fine enough to enrol him among the classics, and, as Ticknor says, "Garcilaso de la Vega has come down to us enjoying a general national admiration such as is given to hardly any other Spanish poet, and to none before his time." He was the author

of that great sonnet which begins 'O dulces prendas por mi mal halladas.' See study by H. Keniston, 1922.

Gard, S. dept. of France, corresponding to the old prov. of Languedoc, and confined on the N. by Lozere and Ardèche, on the E. by the Rhone (its chief riv.), on the S. by the Mediterranean, on the S.W. by Hérault, and on the W. by Aveyron. The Cèze, the Ardèche, and the Gard are all affluents of the Rhone. Ridges of the Cevennes, which in l'Aligoual attain an altitude of 5120 ft., cover the N.W. portion, whilst at the S. low marshy plains, which yield quantities of salt, stretch away to the sea. The Garrigues comprise the rest of the dept., being a hilly, dry limestone dist., tormented with the biting N.W. wind known as the mistral. G. yields splendid crops of wheat, oats, and rye, abounds in mulberries, olives, and vines, is known for the excellence of its cattle, and has a plentiful store of mineral wealth, including coal, iron, lignite, copper, zinc, and lead. Alais, the centre of the silk industry, Bessèges, Nîmes, the cap., and La Grand'Combe are important towns, in the mining dist., other cities of note being Alcuès-Mortes, Uzès, Beaucaire, Saint-Gilles, and Le Vigan. There are three arrons., Nîmes, Alais, and Le Vigan. The total area is 2270 sq. m. Pop. 393,200.

Garda, Lake of (anc. *Lacus Benacus*), largest of the Lombard lakes, lies partly in the prov. of Verona and partly in that of Brescia, in Italy; except Riva, the most important city on the lake shores, which lies at the N. end, and is in Tyrol. At this extremity the Sarca feeds the lake from the glaciers of the Adamello, whilst the Minelo flows out at the S. end to join the Po. Here too the beautiful and luxuriant promontory of Sirmione, the 'Sirmio' of Catullus, juts outward into the lake, separating the fns. of Peschiera and Degganzo, which lie 8½ m. apart. On its E. fringe G. is overlooked by the precipitous grey cliffs of Monte Baldo, but opposite, on the W. shore, between Garguano and Salò, stretches a fertile region, where olives, lemons, and mulberries abound. G. lies 215 ft. above sea level, has an area of 142 sq. m., a length of 33 m., and a breadth varying from 2 to 10 m.

Garde Nationale, of France. A body of armed citizens, organised in Paris in 1789 for civic defence. In 1795 they helped to put down the Parisian mob and, in the revolutions of 1830 and 1848, supported the revolutionaries. In 1871 they were dissolved by Parliament.

Garden Art. The first gardens were made when the early nomadic tribes settled down on an approved spot, surrounded themselves and their herds with a hedge as a protection against wild beasts, and within their enclosure planted vegetables and fruit trees for their sustenance. Little art was used in their formation, but planting in regular rows was recognised as a useful measure in order that the plants should receive the attention they required. Anc. tablets from Egypt show orderly rows of syc-

more, fig-trees, and date-palms under cultivation for their enjoyable shade, profitable fruits and wood. That flowers were grown for pleasure is indicated by a representation in a Theban tomb of early date of beds of cornflowers, poppies, and papyrus growing by the side of a canal. Parks of trees with cared-for paths and bushy undergrowth were instituted by the Babylonians, who also invented about the fifth century the 'hanging gardens of Semiramis'—one of the wonders of the world—a series of terraced gardens supported by strong arches. The acclimatisation of foreign trees in his own land began with Tiglath-Pileser I., c. 1100 B.C. The early gardens of Greece were strictly utilitarian, consisting of vegetable beds, and our modern pot-gardening began when the votaries of Adonis sowed in earthen pots fennel, lettuce, wheat, and barley—plants which sprang up soon and as quickly withered, thus symbolising the early violent death of the beautiful youth. The gymnasiums of early times were finely ornamented with park grounds, and were later constructed with the addition of baths. Both in Greece and in Italy fountains, water-works, and statuary have always played a leading part in the formation of a garden; and in Spain and France these are also important. The wonderful water devices in the ruined garden of the Villa d'Este at Tivoli still reflect in some measure the marvels of the Renaissance. In England during the early part of the Christian era useful plants constituted the gardens, while the rose and lily were regarded as being heathenish plants; later they became the symbol of Mary and the reward of martyrdom. During the Middle Ages ladies of the household used to attend to the gardens, having learned from the monks the art of growing healing herbs among their vegetables (an early garden was called *Ortus sanitatis*, the place of health); flowers were planted in the grass, clipped trees, arbours of roses and honeysuckle, turf seats, and outdoor baths added to the later pleasures of gardens, and meals in the open air became popular.

Among great garden artists or architects were Rainaldi, Le Blond (who worked for Peter the Great), Boyceau (Fr. Renaissance garden artist and architect of the Versailles garden), Andre Le Nôtre (seventeenth-century Fr. garden artist, who worked at Versailles and Vaux-le-Vicomte), Léon Battista Alberti (It. Renaissance), Bramante (It. Renaissance), Lancelot Brown (Eng. landscape garden artist), Sir Joseph Paxton (who laid out the Chatsworth gardens), and Winkelmans. England has learned much from other countries in the making of gardens—as the Dutch sunk gardens show, or the oriental influence at work in the pagoda at Kew—but in naturalness she is supreme; the unrivalled lawns with herbaceous borders, or rock borders planted with alpine flowers, are part of her glory. Hampton Court, Kew Gardens, Hyde Park, and Regent's Park all supply beauty and inspiration to dwellers in London; and among exquisite private

gardens are those at Sandringham in Norfolk, Chatsworth in Derbyshire, Aldenham House in Hertfordshire, The Pleasaunce in Overstrand, Norfolk, and Wisley Gardens in Surrey. America has vast national parks and also charming domestic gardens; they are usually enclosed by hedges, vines on lattice screens, or masses of informal plantings; climbing vines on porches and walls are popular; clipped trees and shrubs and statuary are very little used. See also GARDENING, LANDSCAPE GARDENING. For a full, illustrated, scholarly work consult *A History of Garden Art* by M. L. Goehe, trans. by L. Archer-Hind, and ed. by Waller P. Wright, 1928; G. Gromort, *L'Art des jardins*, 1931; and H. F. Clark, *The English Landscape Garden*, 1948.

Garden Cities are indigenous to England; the only two examples are Letchworth Garden City (1903) and Welwyn Garden City (1920), both in Hertfordshire. They owe their origin to the enthusiasm of Sir Ebenezer Howard (q.v.) and his book *To-morrow: a Peaceful Path to Real Reform* (1898), subsequently issued as *Garden Cities of To-morrow* (1902). There were, prior to these G. Cs., 'industrial villages,' built by manufacturers near industrial centres, of which the most famous are Bourneville and Port Sunlight. The three-fold character of the garden city—industrial, agric., and residential—differentiates it from the 'industrial' or 'garden' vil. on the one hand and the 'garden' suburb, like Hampstead, on the other, with which later indeed it is often confused. Neither is the garden city mere town planning, although it provides for town planning. It is essentially a self-contained unit launched *de novo*, and not a mere scheme of land development. Sir Ebenezer Howard's idea was to check the migration of pop. from the country dists. to the overcrowded tns. by establishing new industrial areas in rural dists. His proposal was to build these new tns. on land held in trust for the community, so that the increment in the land values should be secured for the benefit of the people who created it. The tns. were to be limited in extent and were to be surrounded by an agric. belt.

Letchworth was estab. in 1903 by a joint stock company (First Garden City Ltd.), with a nominal share capital of £300,000, entitled to a cumulative dividend limited to a maximum of 5 per cent. The property purchased consisted of 3822 ac. at a cost of £160,378. Subsequent purchases have increased this area to 4598 ac. On this area a tn. of 30,000 inhab. was planned; the company undertook the construction of roads, drainage, water, gas, and electricity supplies. The complete tn. was planned in outline before building started, and provision was made for residential, commercial, and industrial areas and for an agric. belt surrounding the tn. To facilitate control land was let on lease, the freehold being retained by the company. Building started in 1904, and at the present date (1949) there is a pop. of 21,500, with many industries employing a large proportion of the inhab. The indus-

tries include heavy and light engineering, printing, bookbinding, furniture, corsets, parachutes, embroidery, tabulating machinery, baby carriages, refuse-collection vehicles, scientific instruments, and many smaller industries. In Jan. 1918 the urb. dist. council passed a resolution requesting the minister of tn. and country planning to set up a development corporation for

company has issued debentures and has received loans from the Public Works Loan Board under the Housing Act of 1921. The tn. was planned for a pop. of 50,000. At the present date (1949) the pop. is 18,000. A large proportion of the inhab. travel to London daily, but a number of important industries has been estab., including breakfast foods, chemicals, en-

Letchworth Garden City Ltd

LETCHWORTH GARDEN CITY

Letchworth under the New Towns Act, 1946, but the minister declined, indicating that he considered the company was a suitable instrument to complete the development of the tn. By the nationalisation of its electricity and gas undertakings the company was faced with a considerable loss of revenue, but from the proceeds was enabled to discharge nearly all its loan capital.

Welwyn Garden City was estab. by a joint stock company in 1920⁶ with the nominal share capital of £250,000, entitled to a cumulative dividend of 7 per cent. The property purchased consisted of 2378 ac. at a cost of £105,804. The

gingering, wireless apparatus, and films. A notable feature of Welwyn Garden City is that no shop sites were disposed of by the company in the early stages, the shopping facilities being provided by a subsidiary company. Another subsidiary company was formed by licensed premises. Particular attention has been paid at Welwyn Garden City to the architecture of the tn., and speculative building in the ordinary sense has not been done on any large scale, most of the buildings having been erected as part of definite architectural schemes. There is an agric. belt, but its area is small. On May 20, 1948, an order was made by the minister of tn. and

country planning setting up two development corporations for Welwyn Garden City and Hatfield New Tn. Thus the future development of the tn. was taken out of the hands of the Garden City Company. Welwyn Garden City is more under the influence of London than Letchworth, as it is much nearer.

The lessons that the two G. C. teach are that development of new residential and industrial units is practicable and that they offer an alternative to the ordinary sporadic development in the neighbourhood of tns., and that the preservation of rural England need not entail any arrest of human activities or enterprise even in their most modern forms.

Satellite Towns and Trading Estates.—The term satellite town arose somewhat later than that of garden city, and indicates a development on garden city lines, but in the neighbourhood of, and to some extent dependent on, an existing large tn. G. C. and satellite tns. were the subject of investigation by a departmental committee (chairman Lord Marley), which reported in 1935. As this committee pointed out, there has been a tendency since 1920 to confuse the two terms, and they thought it 'questionable whether at this date there is any value in the maintenance of the expressions in any definitive sense.' The committee advocated the fullest adoption of the type of development usually associated with the idea of a garden city, while making other and more general recommendations as to better planning. They also recommended the estab. of a planning board under whose aegis should be brought land development and redevelopment throughout the country, but no action was taken to set up the proposed board. As in the case of G. C., so in that of satellite tns., there are two outstanding examples: Wythenshawe and Speke, developed respectively by the corporations of Manchester and Liverpool. They owe their origin to local authorities, and are framed, primarily at any rate, to meet rehousing requirements in connection with large and crowded municipalities; they are in fact housing developments carried out largely on garden city lines, including provision for industry. What are known as trading estates also fall into two categories: (a) Estates such as Trafford Park and Slough, financed by private enterprise on a profit-making basis; and (b) estates such as Team Valley near Gateshead, Treforest near Cardiff, and Hillington near Glasgow, started with a view to grappling with the severe unemployment problem in those areas. These latter estates owe their origin to the commissioners for the special areas in England and Scotland. They are undertakings not carried on for gain, and are financed by loans from the special areas fund. The companies responsible for the estates are not expected to pay interest on the loans during the early period of development, usually anticipated to be about five years, but thereafter it is assumed that interest at the rate of 4 per cent will be payable.

It is important to bear in mind the different aims and circumstances attending these various communities. G. C. and satellite tns. are attempts to provide both sites for industry and homes for the workers employed, together with centres for community life: Wythenshawe and Speke were undertaken in the first instance by the local authority as housing schemes, but they also set out to provide accommodation for industries within the community and to stimulate the community idea. Trading estates set out to offer facilities and attractions to industries seeking location, but provision is not made by the estate companies, except to a small extent, for housing the workers employed by tenants on the estate. But in relation to the problem of the distribution of the industrial pop. all these various communities have features in common: all have been founded in more or less definite relation to, but at varying distances from, large urb. units; all are intended to give to industry, or an industrial pop. or both, opportunities that are not usually available in the big urb. centres. These opportunities, so far as an industrial pop. is concerned for, take the form of improved facilities for housing accommodation, for open spaces, and for recreation; and, in the case of industry, for better planned and generally cheaper factory accommodation. All represent, in greater or less measure, and in various stages of development, experiments in decentralisation of industry or of industrial pop., or of both.

Barlow Commission and Scott Committee Reports on Garden Cities, Satellite Towns, etc. in Relation to Decentralisation of Industry.—According to the Report of the Royal Commission on the Distribution of the Industrial Population (commonly known as the Barlow Report (Cmd. 6153, 1940) G. C. and satellite tns., seek to embody a system of social life in connection with, but distinguishable from, factory activity, and some liberal-minded and far-sighted employers have also made interesting experiments on somewhat similar lines (see above as to Bournville and Port Sunlight). It is doubtful, in the opinion of the Barlow commission, whether in the future 'there will be so much necessity for such experiments, owing to the enlarged powers and duties imposed on local authorities by the Housing Act.' The commission considered to what extent and under what conditions resort might in the future be had to the expedient of establishing G. C. and trading estates as a contribution towards the problem of decentralisation in the case of overgrown and congested urb. areas, and whether in fact they were capable of further extensive development. The commission came to an affirmative conclusion, provided the development were well considered, but that the development of G. C. was not likely to proceed successfully if left entirely to private enterprise, on account of the magnitude of the financial commitments involved. Success was, in their view, much more likely to be obtained if the development

were undertaken by municipal authorities, especially in cases where they were faced with the necessity of decentralisation with a view to meeting their responsibilities in relation to housing needs.

According to the *Report of the Committee on Land Utilisation in Rural Areas* (known as the Scott Report—Cmd. 6378, 1943) there was, during the Second World War, 'a widespread movement among town planners that new construction after the war should take the form of well-designed towns with a spacious lay-out, where the areas devoted to housing should be carefully sited in relation to the industrial sections and the shopping and community centres, where the houses should be designed as integral units in well-conceived street lay-out, and have abundant garden space, and where indeed there were all the facilities for a complete and satisfying life both for the individual and the community as a whole.' These are the ideals which the founders of the garden city movement had in mind and which the G. C., despite the erroneous views frequently held about them, have endeavoured to achieve. The Scott Report goes on to suggest that it may be that satellite tns. to be built beyond the green belts of existing tns. would be of this type, and that as their demand for rural land would be considerable, any proposed sites should be examined with the utmost care from both national and local standpoints. The amount of good farmland in England and Wales being very strictly limited, the Scott committee states that unless there are strong reasons to the contrary, new tns. should not be sited on good agric. land. The report states: 'We have examined carefully the view that the gardens, being intensively cultivated, of a garden suburb, provide more produce than if the whole area were farmed, but we are unable to accept this view. The comparison in the case of good land should be between the proportion of the gardens which is used in the growing of fruit and vegetables, and the whole area if it were under intensive market gardening. Reliable figures of the proportion, after due allowance has been made for roads, footpaths, actual house area, garden paths, lawns, flowerbeds, etc., of the total area used productively are not available, but in cases examined it is not above 25 per cent, and we take the view that once good agricultural land is taken for housing it is of necessity lost to agriculture for ever, no matter how desperately it may be needed in the future for food production. We accordingly recommend (i) that new satellite towns, housing estates, garden cities, and suburbs be sited wherever practicable away from the better farm land; (ii) that in their siting due attention be paid to agricultural considerations; (iii) that as in the case of the planning of existing towns the Ministry of Agriculture be consulted from the inception of the planning schemes.' The New Town Act of 1946 provided the necessary machinery for the development of new tns. on the principles advocated by Sir Ebenezer

Howard: in 1947 work was begun on the first of these at Stevenage, 5 m. from Letchworth.

Although the term garden cities is sometimes said to have originated in America the Amer. conception of them was not that of Sir Ebenezer Howard, and there has never been in the U.S.A. any development of these cities in the Eng. sense. Garden vils. or suburbs in the U.S.A., frequently called G. C., have been the creation of great industrial companies, which have estab. new plants in growing tns. and housed their employees in homes situated near the factories. There are also so-called G. C. which are high-class residential estates. See reports mentioned above and C. B. Purdom, *The Building of Satellite Towns*, 1925, 1949.

Gardenia, genus of greenhouse and stovehouse plants, belonging to the order *Rubiaceae*. There are a good many species, but few are grown except in botanical gardens. Much the most popular is *Florida* as represented by its double white variety, which is a favourite button-hole flower with those who appreciate its powerful and penetrating fragrance as well as its symmetry and purity. The scent is, however, too strong for some people at close quarters. The plant thrives in a warm greenhouse if the air is kept moist, but it dislikes aridity. Fibrous loam should be the prin. component of the compost, lightened with leaf-mould, decayed manure, and sand. Propagation is by cuttings in bottom heat in spring.

Gardening. Development of G. in Britain and America since the latter part of the nineteenth century has been rapid and almost continuous. It was not checked either by the world war of 1914-18 or by that of 1939-45, as were many other branches of art and industry. Both wars did, however, change its direction. Wartime demands for economy and home-raised food led, in each case, to increased efforts to grow vegetables and fruits in home gardens and on allotments. Increasing taxation and labour stringencies were reflected in a reduction of large private estates or their amenities. In the Second World War gov. direction of horticultural cropping and their sponsored 'Dig For Victory' campaigns led to a great decline in flower cultivation and ornamental gardening, but a vast increase in the ranks of gardeners. Lingering food difficulties and slow recovery of nursery stocks have served to delay advances in floral G. The human need for beauty, however, is irrefragable, and the indications are that ornamental G. on more labour-saving and less spacious lines than in the past will find new and greater expression in the coming years. The ever-growing awareness of the need for open spaces, municipal parks, gardens, and playing-fields only serves to emphasise the increasing and valuable part that G. now plays in national life.

History.—Limits of space preclude a lengthy disquisition on this subject, nor is it necessary, in view of the fact that ample information is readily accessible in such

complete and richly illustrated works as Goethe's *A History of Garden Art*. It is there shown that G. has been pursued from the earliest ages of which records exist. Nor should it be assumed that the art of the pre-Christian era was mean and crude. Egyptian, Assyrian, Babylonian, and Persian monarchs had skilled gardeners in their service long before the days of Virgil. Anct. Egypt, anct. Greece, anct. Rome, all had beautiful gardens. Persepolis and Palmyra, Babylon and Nineveh, Thebes and Memphis, Bagdad, to name but a few great ins. of the past, were famous for their parks and gardens. It is probable that Gk. and Rom. G., which in due course spread its influence and gave its lessons to W. Europe, derived in the main from the Near and Middle E., but the Far E. must not be overlooked, because gardens were also cultivated in India and China from very early times. The Rom. were the chief agents concerned in introducing G. into England, and they instructed the early Britons in the growth and use of many vegetables and fruits hitherto unknown to them. When the Rom. were compelled to leave Britain G. languished, but it revived under the influence of the monks after Christianity had been introduced, and a considerable variety of vegetables and medicinal herbs, together with many fruits, were grown. Flower cultivation was little practised at first, but in the three centuries which followed the Norman Conquest there were developments in ornamental culture, and in the Middle Ages gardens gradually increased around the palaces, castles, and granges; walks, terraces, steps, balustrades, summer-houses, statues, lakes, and fountains, etc., being formed. Labyrinths became popular.

The Renaissance brought a remarkable development in ornamental G., both in France and Italy, and its influence spread to Britain; they were, however, formal. Topiary work, i.e. clipping yews, etc., into fantastic shapes, came into fashion. Even in the eighteenth century formalism reigned, and it was left for Addison (essay in the *Spectator*, 1712), Pope (essay in the *Guardian*, 1713, and *Epistle on Taste*, 1731), Whately (*Observations on Modern Gardening*, 1770), and Horace Walpole (*Essay on Modern Gardening*, 1785) to condemn the monotonous repetitions of the formal school. Pope, aided by the famous gardener Kent, carried his principles into practice. The latter, with Bridgeman and 'Capability' Brown, estab. the Eng. or natural system. Briefly this is an imitation of nature; the most beautiful trees, shrubs, and flowers for the space required being arranged in as natural and happy a combination as possible. Later, Chambers, Knight, Loudon, and others did good service, while in quite modern times Robinson, Veitch, Wilson, Farrer, Kingdon Ward, Forrest, and others exercised great influence as gardeners, writers, or introducers of new plants. (See also GARDEN ART.)

Layout.—Coming to practical matters, it will be obvious that great detail is impossible within the limits of this article,

but a few hints may be given. While some operations can be carried out in large gardens which are impossible in small ones, it may be assumed that most gardens have sufficient space for a flower garden, a kitchen garden, and a lawn of greater or less size. Except in very small gardens ornamental trees and shrubs should be used as freely as possible. Roses should be planted in beds and on walls, arbours, and fences. A rockery, large or small according to space and means, is an attractive feature, and a pool for water-plants can often be associated with it to advantage. Shrub borders are valuable for their permanence and labour-saving. Herbaceous borders are still popular, though the tendency is to introduce flowery shrubs and Polyantha roses to save labour. In small gardens annuals and biennials, raised from seed, are excellent, while bulbs for autumn and spring planting provide beautiful flowers with little trouble.

Shelter.—Most gardens are more or less enclosed. If hedges form boundaries, they are ornamental in themselves when kept trimmed. Yew, holly, beech, hornbeam, hawthorn, privet, box, Lawson's cypress, thuya, and *Lonicera yunnanensis* are good subjects for boundary hedges. Laurels and privet are too troublesome, except for larger gardens. For internal low hedges, barberries, escallonnias, lavender, *Lonicera nitida*, rosemary, sweet briar, and veronica are suitable. Walls should be decorated with some ornamental plant or trained fruit tree. Actinidias, roses, clematis, honeysuckle, and wisteria are ready choices, but even a N. wall will favour winter jasmine, Virginian creepers, kerria, or ivy. Fences may similarly be made ornamental.

Paths.—For hard wear in all weathers paths may be of stone, bricks, concrete, macadam, or gravel, but occasional paths within the garden may be of grass. All hard paths should be made on foundations of 4-8 in. broken brick or stone, with 2 in. of ash or sand, on which to lay the final surface, finished with a slight crown or slope to one side (½ in. per foot width) for drainage. The surface of gravel paths may be fixed with a cold bitumen product. An ann. dressing of weed-killer keeps paths free from greenness. Edgings of metal, stone, or bricks are best to keep a walk in place. Plant edgings are only good for occasional paths, and here dwarf box is right.

Lawns.—As the base ground or carpet against which flowers and ornamental plants are seen at their best, well-kept turf is an essential feature of most gardens. A lawn may be made from turf or seed. In either case the soil should be adequately prepared, drained, levelled, cultivated, and fertilised beforehand. A lawn from turf is best laid between Sept. and Feb., good sods are cut 12 in. wide, 1 in. thick, and 1 to 3 ft. long, from heath, moorland, parkland, or sea-washed marsh turf. Laying is done in a forward direction, with a board on the now-laid sods, which are alternated to overlap at the joints. Lawns from seed are best made in early Sept., or April for second choice.

The finest lawns are made with such grasses as *Chewing's Fescue* and *New Zealand Browntop* or *Bent*, but the seed mixture should be made up to suit (1) the soil, (2) the situation, and (3) the purpose of the lawn. To sow evenly at 1-2 oz. per sq. yd. divide seed into two lots, mix with an equal bulk of dry sand, and sow a square yard at a time, sowing one way with one lot of seed, and crosswise with the other. Protect from birds by a network of black cotton thread on sticks. A light rolling when the grass is 2 in. high, followed by a high cut, removing no more than 1 in. of grass blades, and a sifting of rotted organic matter as a top-dressing, will give the sown lawn a good start. The management of existing turf may be based as follows: Autumn—top-dress with sharp sand and finely broken charcoal. Winter—acrate thoroughly by spiking or piercing turf mat with spiking tool or fork. In Feb., top-dress with soil compost (2-3 parts, by bulk, good loam, 1 part rotted organic matter, 1 part sand) at 1-2 lb. per sq. yd. Spring—apply complete lawn fertiliser in March. Use weed-killers from April to June. Selective hormone herbicides (MCPA or Methoxone, DCPA or 2:4-D) destroy plantain, starweed, self-heal, cat's-car, dandelion, and many common weeds. Lawn sand is best for daisy and clover. Summer—mowing frequently, and with not too close a cut, strengthens grass growth and inhibits weeds best. Moss implies diminishing soil fertility, poor drainage, or matted turf. Spraying with a 10 per cent solution of tar-oil wash kills moss in winter, but basic causes must be removed for permanent improvement.

Trees and Shrubs.—Forest trees belong to the estate or park, and such species as sycamore, chestnut, alder, beech, sweet chestnut, ash, walnut, tulip-tree, plane, poplar, oak, lime, and elm are best excluded from the small garden. Here, a choice should be made from birch, thorns, laburnum, magnolia, prunus, cherries, almond, peach, crab-apple, rowan and service trees, dogwood, and willows, which have foliage, floral, bark, or berrying colour to offer. Evergreens such as holly, strawberry-tree, *Azara microphylla*, and laurels are useful for screening. Conifers need to be planted judiciously in a country where so many of them are foreign. The native yew and juniper seldom come amiss. It is among the cypresses, cedars, retinosporas, and thuysas that pleasing conifers of suitable stature and shades of green are to be found, while pines and spruces supply miniatures for the rock garden. Shrubs combine permanence with floral and colourful grace, and are increasingly planted for their labour-saving virtues. They may be planted singly, in groups, in borders, or in combination with herbaceous flowers. A list of the popular species according to their flowering season would include: Winter—*Elagnus* sp., *Jasminum nudiflorum*, *Erica darleyensis*, *E. carnea* and vars., *Viburnum fragrans*, *Chimonanthus fragrans*, *Hamamelis mollis*, *Lonicera Standishii*, *L. fragrantissima*, *Prunus davidiana*, *P. kansuensis*, *Vibur-*

num Tinus, *Camellia Sasanqua*, *Clematis calycina*, *Azara microphylla*, *Cornus mas*, *Daphne Mezereum*, *Garrya elliptica*, *Corylus* sp. Spring—*Magnolia stellata*, *M. conspicua*, *Forsythia* sp., *Prunus cerasifera*, *Erica mediterranea*, *E. Veitchii*, *Ribes* sp., *Corylopsis* sp., *Daphne blagayana*, *Stachyurus* sp., *Rhododendron* sp., *Prunus persica* and vars., *Berberis* sp., *Prunus lannesiana* and vars., *P. serrulata*, *P. avium*, *Pieris* sp., *Viburnum Carlesii*, *Osmanthus Delavayi*, *Azaleas*, *Malus* sp., *Cytisus* sp., *Syringa* sp., *Ceanothus* sp., *Laburnum* sp., *Cistus* sp., *Helianthemum* sp., *Spiraea* sp., *Philadelphus* sp., *Genista* sp., *Deutzia* sp., *Lonicera* sp. Summer—*Kalmia latifolia*, *Zenobia pulverulenta*, *Buddleia* sp., *Styrax japonica*, *Viburnum tomentosum* and vars., *Fabiana imbricata*, *Escallonia* sp., *Daboecia polifolia*, *Erica cinerea* and vars., *E. tetralix*, *E. Mackayi*, *E. ciliaris*, *Spartium junceum*, *Genista setensis*, late *Ceanothus* sp., *Lavendula* sp., *Veronica* sp., *Olearia Haastii*, *Clethra* sp., *Eucryphia glutinosa*, *Hydrangea* sp., *Erica ragana*, *Yucca* sp., *Clematis Jackmanii*. Autumn—*Hibiscus* sp., *Gerodendron Fargesii*, *Perovskia atriplicifolia*, *Caryopteris* sp., *Romneya* sp., *Colletia armata*, *Fuchsia* sp., *Abelia* sp., *Hieraria populnea*, *Fatsia japonica*, *Salix Beckii*; and for their berries—*Coloneaster* sp., *Malus* sp., *Pyracantha* sp., *Pernettya* sp., *Skimmia* sp., *Berberis* sp., *Rosa* sp., *Stranversia* sp., *Lucuba* sp., *Sambucus* sp., *Rhus* sp.

Herbaceous Borders.—There is nothing better suited to skirt a lawn than a border of hardy herbaceous perennials. No matter how small the garden it can be provided, the point being to adapt the selection of plants to the area available. Herbaceous (i.e. non-shrubby) plants vary greatly in height and spread; some require only a square foot of space each, others a yard or more. While large plants should not be put into small borders, small plants may be used for the front areas of large borders, as in many cases they are very beautiful and also easily grown. The following selection of plants will be useful in either case, because the plants marked 'middle' and 'back' are suitable for such positions in large borders, whilst those marked 'front' will come in handy for the front areas of large borders and the main area of small ones.

Achillea ptarmica. The Pearl (front).
Aconitum (monkshood) (front). Root poisonous.
Astromeria (front). Very graceful.
Alchusa (front).
Anemone, poppy and Jap., the latter the taller, but both front.
Anthemis (front).
Antirrhinum (front), very graceful.
Aquilegia (columbines) (front).
Arneria (middle).
Artemisia (middle).
Asters (Michaelmas daisies), alpinus and ericoides (front, most middle and back).
Astilbe (back).
Begonia cordata (back).
Boltonia (back).
Campanula (most front).

Catananche (front).
Celsia (front).
Centaurea (back).
Chrysanthemum, *koreanum*, *marimum*, and *leucanthemum* (middle or back).
Cimicifuga (back).
Coreopsis lanceolata and *grandiflora* (front).
Delphinium nudicaule, *cardinale*, and Blue Butterfly (front, most back).
Dicentra (front).
Doronicum (front). Early bloomers.
Echinops (middle).
Eremurus (back).
Erigeron (front).
Eryngium (sea holly) (middle and back).
Funkia (front).
Gaillardia (front).
Galiga (back).
Geranium sanguineum and *pratense* (front).
Geum (front).
Gypsophila paniculata (gauze flower) (middle and back).
Helenium (front).
Helianthus (sunflowers) (most back).
Heliosis (back).
Helleborus (Christmas and Lenten roses) (front).
Heimerocallis (day lilies) (front).
Huechera sanguinea (front).
Hollyhocks (back).
Hyacinths (front).
Inula glandulosa (front).
Irises (front).
Kniphofia or *Tritoma* (red-hot poker) (middle).
Linaria (front).
Lobelia cardinalis and *fulgens* (front or middle).
Lupinus polyphyllus, hybrids and varieties, splendid (middle).
Lychis chalcidonica, *L. ussaria splendens plena*, etc. (front).
Lylthrum (middle).
Meconopsis Wallichii, *nepalensis*, and *Baileyi*, beautiful poppies (front or middle).
Mimulus (front).
Monarda (bergamot) (front).
Narcissi (front).

For full descriptions see *The Wright Encyclopedia of Gardening*.

Clearly, there is no lack of hardy herbaceous plants suitable for small borders. Empty spaces can be filled with annuals and biennials. Squat plants like double daisies, pansies, polyanths, primroses, and bulbs such as snowdrops, narcissi, scilla, and tulips, and corms such as crocus and gladioli may be used to lend added colour. Most soils can be made suitable for herbaceous plants. Light soils need rotted organic matter (dung, compost, leafmould, peat, shoddy, etc.). Heavy soils are improved by draining, liming, and incorporating dryish organic litter (peat, compost, hop manure, etc.). An annual dressing of organic manure should be given in autumn or early winter. If herbaceous plants are to prosper they must be lifted and divided every two to three years, usually in autumn, or spring. The centre and older part of the lifted plant is discarded, the younger, more vigorous outer parts being retained for replanting and propagation.

Rock Gardens.—Although there is much potential interest and charm in a rock garden, its construction requires skill, its planting care, and its maintenance regular attention. The ideal site is sunny, yet with partial shade during the day. It is easier to build on a natural slope than on the flat, which presents difficulties in blending a raised rock garden with the garden as a whole. Good drainage is essential for alpine plants, and on heavy soils a good bed of rubble or hard core should underlie the construction. A rock garden should represent a natural stone outcrop in miniature. It may incorporate a ravine, stream, or scree. The stone used should be chosen from sedimentary rocks—Westmorland, Cumberland, or Cheddar limestone, or a good sandstone; not igneous granite, gabbro, or basalt. Two principles should guide the placing of rocks: the strata of the rocks must run in the same plane with the graining parallel, and joints between stones should be at right angles; the exposed rock should be sunk well into the soil, to suggest a preponderant mass of stone underneath. The soil should be reasonably, but not too fertile, and well rammed about the stones. Planting pockets and crevices are best filled with soil compost to suit the chosen plants. A good basic mixture is one part by bulk loam, two parts each sand and leafmould, plus two handfuls of bonemeal per barrowful. For lime-loving plants

add a handful of crushed chalk or limestone dust. Calcifuge plants may need extra leafmould or peat. Alpine plants dislike wet around their necks, and a collar of limestone chippings is often helpful to drainage. Others, chiefly those with downy leaves, should be given the protection of small glass covers in winter. Alpine plants are now generally sold *ex pots*, and so planting can proceed at almost any time of the year, weather conditions permitting. Many alpine plants can also be raised from seed without much trouble. The following list includes selected species of good character. Fuller descriptions and information on culture will be found in *The Wright Encyclopædia of Gardening*.

Acena microphylla, etc.
Achillea Clareana, *leucisii*, *tomentosa*.
Æthionema × *Wartley rose*.
Alyssum saxatile, *serpyllifolium*.
Andromeda polifolia compacta.

Veronica sp.
Viola cornuta, *gracilis*, etc.
Wahlenbergia sp.

Annual Flowering Plants.—In common with other classes of flowers, annuals, hardy and tender alike, have undergone considerable development during recent years, particularly in the cases of sweet peas, clarkias, godetias, asters, stocks, and (not strictly annuals but generally treated as such) snapdragons. The development of sweet peas has been remarkable, and the number of varieties is now enormous, while cultivation as an exhibition flower has led to what is called cordon training, the plants being grown on single stems like cordon fruit trees. As regards most hardy annuals, however, the older, time-honoured principles of cultivation apply to-day: fertile deeply tilled soil, thin sowing, and subsequent timely thinning of the seedlings, so that the plants cannot get crowded and thereby become attenuated. Nevertheless, failures are not infrequent, because many growers sow too early in spring while the soil is still cold. However good and however finely raked the soil, however thin the sowing, failure is probable unless the soil has been warmed up by adequate spring sunshine. This applies to chalky as well as to clayey soils, because chalk does not warm up quickly. Sowing may be earlier, as a rule, on sandy loams than on either clay or chalk; in any case, local conditions should be considered. The class known as half-hardy annuals is best sown in pots, pans, or shallow boxes and shaded with glass and paper till germination has taken place, then gradually inured to light on a greenhouse shelf or near the glass in a frame. Abundance of air, careful watering (strictly avoiding excess), and timely pricking-out 3 to 4 in. apart in other boxes should then ensure sturdy and healthy plants, suitable for putting out in the garden when summer weather comes; or, at will, potted singly for greenhouse decoration. The following are selections of hardy and half-hardy annuals; detailed descriptions will be found in *The Wright Encyclopædia of Gardening*.

Hardy Annuals

<i>Abronia umbellata</i> .	<i>Collinsia bicolor</i> .
<i>Agrostemma cili-</i>	<i>Convolvulus major</i> .
<i>rosea</i> .	<i>Convolvulus minor</i> .
<i>Alyssum</i> , Sweet.	<i>Coreopsis</i> (see <i>Cal-</i>
<i>Bartonia aurea</i> .	<i>lopsis</i>).
<i>Calendula</i> .	<i>Cornflower</i> .
<i>Calliopsis Drum-</i>	<i>Eschscholtzia</i> , many
<i>mondii</i> .	vars.
<i>Candytuft</i> , many	<i>Evening primroses</i> .
vars.	<i>Godetia</i> , many vars.
<i>Chrysanthemum</i> ,	<i>Gypsophila elegans</i> .
many vars.	<i>Helichrysum Jaco-</i>
<i>Clarkia</i> , many vars.	<i>bæa</i> .

Hardy Annuals—Cont.

Larkspurs, many vars.	<i>Nemophila insignis</i> .
<i>Lavatera rosea</i> .	Night-scented stock
<i>Leptosiphon</i> .	<i>Phacelia campanularia</i> .
<i>Lamnanthes</i> Douglassii.	Poppies, in var.
<i>Linaria</i> , in var.	<i>Salvia</i> , Blue Beard.
<i>Linum grandiflorum</i>	<i>Saponaria</i> , in var.
Love-in-a-mist.	Scabious, in var.
Love-lies-bleeding.	<i>Silene</i> , in var.
Lupins, in var.	Sunflowers.
<i>Malope grandiflora</i> .	Sweet peas.
Mignonette, in var.	Sweet sultans.
Nasturtiums, in var.	Virginian stock.
	<i>Viscaria</i> .

Half-hardy Annuals (or plants commonly treated as such)

<i>Acroclitum</i> (everlastings).	Malvo, coloured.
<i>Antirrhinum</i> (Snapdragons), many vars.	Margolds, Fr. and African, in var.
<i>Arcotis grandis</i> .	<i>Minulus</i> , in var.
Asters, Chinese, many types and vars.	<i>Nemesia</i> , in var.
Balsams.	<i>Nicotiana affinis</i> and <i>Sanderæ</i> .
Carnations, Marguerite.	Pansies, in var.
<i>Celosia</i> .	<i>Petunia</i> , in var.
<i>Cosmos</i> , or <i>Cosmos</i> , in var.	<i>Phlox Drummondii</i> , in var.
<i>Dimorphotheca aurantiaca</i>	<i>Phlox</i> like <i>Hyph-terum</i> (Everlastings).
<i>Dianthus</i> (Indian pink), in var.	<i>Sahynglossis</i> .
<i>Eccremocarpus scaber</i> .	<i>Schizanthus</i> , in var.
<i>Gaillardia</i> , in var.	<i>Statice sinuata</i> .
Golden Feather.	Stocks, many types and var.
<i>Lobelia</i> , in var.	<i>Tropæolum pinnatifidum</i> .
	<i>Verbena</i> , in var.
	Zinnia, single and double, in var.

Biennials such as wallflowers, foxgloves, Canterbury bells, forget-me-nots, Brompton stock, and sweet williams, suitable for sowing outside in May or June to flower the following year, should also be used.

Roses.—Wherever the atmosphere is reasonably pure, and the soil fairly substantial, roses can be grown successfully. A light dry soil is distinctly unfavourable, although some of the rambling Wichuriana roses will thrive in shallow chalky ground if well fed at the surface. The deeper, richer and more substantial soil, the more likely roses are to thrive year after year. In poor ground frequent renewal will be necessary. Another great factor in maintaining health is to keep the plants free from injurious insects and fungi. Shelter without shade is desirable. Any time in open weather between Nov. and March is suitable for planting. On the whole bushes are more satisfactory than standards for beds, although the latter have their uses. Liberal use should be made of rambling roses for walls, fences, arbours, and pillars, and polyantha roses for bedding.

Kitchen Garden.—Productivity of a garden, especially the kitchen garden, rests on maintaining and improving soil fertility and structure. The three essentials are (1) organic manuring, (2) liming, and (3) fertilising.

Under cultivation the organic soil content is lost more quickly than it is replaced. In light soils this means loss in moisture-retentiveness; in heavy, loss in aeration; in all soils loss of humus, the chief reservoir of plant foods. The soil needs at least once every other year a dressing of organic manure. In the scarcity of farmyard and stable manure substitutes must be used, such as leafmould, peat, hop manure, shoddy, and compost. Organic compost consists of organic refuse (plant remains, leaves, mowings, etc.) and household refuse (kitchen waste, vacuum cleaner dust, etc.), scientifically rotted with an accelerator of decomposition. A common method is to heap the material in layers like a sandwich; thickish layers of mixed organic debris being interleaved with an accelerator (dung, nitrogenous chemical mixture, or proprietary compound), sprinkling of soil and lime, and left 4-12 months to decompose. Such compost is roughly equivalent to good farmyard manure, and a compost heap should be a permanent asset in every garden.

With few exceptions, notably rhododendrons, certain ericas, cranberries, strawberries, and raspberries, garden plants thrive best when there is adequate calcium (lime) in the soil. Lime also liberates other plant foods, and improves soil structure by causing the particles to flocculate. Sour clay soils benefit greatly from liming, so do acid sands, silt, and peat. Also some crops need more lime than others. Onions, beets, celery, spinach, brassicas, lettuce, and leafy etc. as need a well-limed soil. Peas, beans, carrots, sweet corn, and runner beans need a moderately limed soil. Potatoes, tomatoes, turnips, marrow, cucumbers, and melons need very little or no lime except when grown in most acid soils. The type of lime used influences the amount. Ground limestone or chalk is used at rates of 1-2 lb. per sq. yd.; ground burnt lime or quicklime at 1-1 lb. per sq. yd.; and hydrated lime at 1-1 lb. per sq. yd. The latter can be applied at any time of the year. Other limes are best applied in autumn or winter. Fertilisers are necessary to make good soil deficiencies and to get increased yields. Broadly, fertilisers are designed to supply three major plant foods: nitrogen, phosphorus, and potash. The common nitrogenous fertilisers are: Inorganic or chemical—sulphate of ammonia (20-6 per cent), nitrate of soda (16-0 per cent), nitro-chalk (15-5 per cent); Organic—dried blood (12-14 per cent), hoof and horn meal (14 per cent). Phosphatic fertilisers: Inorganic—superphosphate of lime (17-18 per cent) basic slag (9-18 per cent), triple superphosphate (40-48 per cent); Organic—steamed bone flour (27-5 per cent), bone meal (20-24 per cent). Potassic fertilisers: Inorganic—muriate of potash (50-60 per cent), sulphate of potash (48-5 per cent), kainit (14 per cent), potash salts (20-30 per cent), wood ash (2-5-6 per cent). Certain fertilisers contain more than one element, notably guano (10-14 per cent nitrogen, 9-11 per cent phosphorus), meat meal (3-7 per cent nitrogen,

YELLOW TURK'S CAP LILY

Lilium Pyrenaicum one of the earliest lilies to bloom. Although it has a heavy strong smell, and has newer and more showy rivals, the peculiarly bright greenish yellow flowers with their dark vermilion anthers make it very pleasing.

Drawings by Miles Hadfield from *The Gardener's Companion*.

ENGLISH GARDEN PINKS

From the earliest days the *Dianthus* has lived up to an old description as a genus furnishing plants of the herbaceous-flowered ornamental order. From left to right descending, 1, deep pink; 2, light (race of pinks); 3, Alwoodii (the perpetual flowering pink); 4, Alpine pinks show pink, village pinks, Scotch pink.

9-16 per cent phosphorus), and fish guano, (9-14 per cent nitrogen, 9-20 per cent phosphorus). Inorganic fertilisers are quickly exhausted; organic fertilisers tend to have residual effects for 2-4 years. The use of good fertilisation is to combine chemicals carrying the three major elements to suit the needs of the crop and the soil in which it is grown. Such combinations are known as 'complete' fertilisers. In practice deficiencies of other elements, many known as trace nutrients, may occur, and other chemicals be used to correct them. Borax, for instance, is used to correct a boron deficiency. In the well-tended garden however, unusual soil deficiencies are rare. One sided exhaustion of the soil, and susceptibility to insect pests and diseases in the kitchen garden, can be minimised by crop rotation. In practice, this means that like vegetables of the same plant family do not follow one another on the same ground. For instance, peas should not follow beans, tomatoes, potatoes, cabbage, cauliflower, and so on. For a four-year rotation the plots are four. No. 1 plot is cropped with

potatoes, No. 2 with peas, beans, onions, leeks, celery, No. 3 with root vegetables, No. 4 with brassicas and saladings, the first year. In second year No. 1 is cropped as for No. 2, No. 2 for No. 3, No. 3 for No. 4, and No. 4 for No. 1. In subsequent years the cropping is rotated similarly, until by the fifth year the rotation begins again, as for the first year. There are some exceptions to rotation. Perennial crops like asparagus, and onions may be grown on the same soil for several years. It is also permissible for swedes or turnips to follow carrots, since they are of different plant families. Insect pest and disease control are important aspects of vegetable growing, requiring some knowledge of their incidence and character, so that proper preventive or remedial measures can be taken. The chief preventive is good culture which fosters vigorous growth, robust health, and resistance in the plant. A short calendar of operations for the year follows.

January—Rough-dig all vacant ground when opportune. Lay stiff clay in ridges to be frosted. Wheel on organic manure,

AUTUMN FLOWERS

Crocus speciosus so called from the showy orange stigma, has the merits of being beautiful and hardy as well as plentiful. *Cyclamen hederifolium*, hardy autumn flowering, is not so widely known as it should be, and ivy, *Hedera Helix* variety *conglomerata*, a small, slow growing bush of deep green colour

WINTER BERRIES

The snowberry, *Symphoricarpos racemosus*, has been called the 'aspidistra of the shrubbery,' because of its tolerance of bad conditions. Its odd little flowers and white berries are attractive. *Hypericum elatum* is one of the few tall members of the genus, its dark fruits follow many small waxy flowers.

and spread. On sheltered border and in favourable weather make sowings of round peas and broad beans, and plant shallots and horseradish. Under glass start tomatoes, cucumbers, and melons in heat. Prepare hot-beds for early crops and mushrooms. Sow in boxes in frames leeks, onions, lettuce, and radish. Force rhubarb, chicory, seakale. Sow spinach and plant out lettuce under cloches. Make up seeds order. Treat vacant slug-infested ground with dry powdered Bordeaux mixture (1 lb. per 20 sq yds.)

February.—Continue winter cultivations when possible. Lime and apply slow-acting fertilisers, such as bone meal, basic slag, hoof and horn, etc. Put up seed potatoes in boxes in light, frost-proof quarters to sprout. Outdoors sow broad beans, parsnips, thyme and pot herbs, and parsley. Plant garlic, Jerusalem artichokes, and divide chives. In frames with gentle heat sow celery, onions, leeks, lettuce, Fr. beans, mustard and cress, and early cauliflowers. Plant out autumn-sown lettuce under cloches. Place cloches over early strawberries.

March.—Prepare seed-beds out of doors, and fertilise with complete fertiliser 7-10 days before sowing. Outdoors sow brassicas (Brussels sprouts, cauliflower, cabbage, kale, kohlrabi, etc.), spinach, onions, peas, leeks, turnips, carrots, and vegetables generally. Under glass in heat start celery, celeriac, angelica, marrows, capsicum (cardoon), and tomatoes for outdoors. Divide artichoke roots. Clean and mulch asparagus bed. Transplant autumn-sown onions.

April.—Weed seed-beds. Hoe frequently. Prepare marrow beds, celery trenches, and plant asparagus. Make successional sowings of saladings, brassicas, roots, etc. Sow beet late in month. Under glass start sweet corn, marrows, runner beans, etc. Prevent onion fly with calomel dust, flea beetles with D.D.T. and slugs with crushed metaldehyde and food bait (bran). Thin out seedling crops, and prepare beds for transplanted brassicas.

May.—Complete potato planting. Stake peas. Protect tender crops from wind. Watch for late frosts on clear

nights after sunny days. Outdoors sow runner beans, Fr. beans, beet, sweet corn, and successions of peas, saladings, etc. Sow colewort and cabbage for autumn-cropping. Earth-up potatoes. Begin planting out marrows, tomatoes, and cucumbers late in month. Transplant maincrop brassicas for winter-cropping, and leeks. Check early aphides with nicotine or derris insecticide. Use quick-acting fertiliser, such as dried blood, nitrate of soda, to feed leafy crops. Cut asparagus. Train cucumbers under glass.

June.—Hoe to control weeds, but mulch growing plants to conserve moisture, using rotted compost, peat, sawdust, etc. Plant out cabbage, tomatoes, ridge-cucumber, marrows, and capsicums out of doors. Sow vegetables and saladings for succession. Cease cutting asparagus. Continue earthing-up potatoes. Sow parsley for winter use, and early peas for autumn cropping. Prevent cabbage-root fly with calomel dust. Dust brassicas with derris or D.D.T. to prevent caterpillar attacks. Control thrips on peas with nicotine. In greenhouse, ventilate to keep even temps. Shade glass in very hot weather.

July.—Cultivate ground cleared of early crops, and prepare for winter greens. Mulch against drought. If you must water use a weak liquid manure solution. Sow turnips and beets after peas. Feed celery, globe artichokes, etc. Stake outdoor tomatoes. Take up shallots and garlic. Sow runner beans, early cabbage, prickly spinach, and salads for succession. Lift early potatoes. Spray maincrops with copper fungicide to prevent blight. Cut herbs for drying.

August.—Sow spring cabbage, cauliflower, kale, endive, winter lettuce, yellow turnip, colewort, and onions for overwintering. Lift early beets and carrots for storing. Earth up celery. Spray potatoes again against blight with copper fungicide. Disbud tomatoes and restrict to four trusses out of doors. Cut down globe artichokes and mulch with manure. Bend over tops of maturing onions. Under glass make sowing of Fr. beans, tomatoes, and cucumbers for winter fruiting.

September. Lift and ripen off onions. Begin harvesting potatoes, roots, etc. Dry herbs. Earth up leeks and celery. Lift chicory for blanching. Prevent weeds seedling. Transplant lettuce in frames for winter. Under glass sow quick-maturing carrots. Thin spinach. Plant out endive, spring cabbage. Sow corn salad in frames. Use derris and D.D.T. to deter caterpillars on brassicas. Dust with sulphur against mildews.

October.—Complete harvesting and storing of roots and potatoes. Lift shallots and scorzonera. Trench and humus-manure vacant ground. Sow cauliflower for wintering in frames. Under cloches sow lettuce (May King, Cheshunt Early Giant). Replant watercress beds. Remove decaying foliage of brassica crops from soil promptly. Make up compost heaps of plant debris. Make first sowing of broad beans in south.

November.—Early digging and trenching of vacant ground should go hand in hand with organic manuring and liming. Treat pest-infested soil with soil fumigant. Plan next year's rotation. Broad beans (Seville and Claudia Aquadulce) and round peas may be sown. Lift asparagus for forcing. Plant horseradish. Cover sea-kale and rhubarb with organic litter for forcing.

December.—Plant perennial vegetables, such as sea-kale, asparagus, etc. Protect celery from frost. Divide mint bed. Look over stored potatoes, carrots, etc., periodically, and remove diseased tubers; treat with synthetic hormone product to prevent premature sprouting. Clean up vegetable plots; hoe spring cabbage, etc.; overhaul potting shed and equipment. Rough-dig vacant ground. Under glass sow early horn carrots. If heat available begin sowing tomatoes for next summer cropping.

Fruit.—Fruits succeed on a wide range of soils given good root aeration and adequate but not too free drainage. Heavy soil needs to be lightened by use of basic slag or lime and organic material. Light soils need liberal manuring, mulching, and special attention to potash content. Aspect should be open, preferably southerly. Site must be frost-free. Fruit does better on hillside or slope than in valleys or frost pockets. Modern tree fruits are grown on selected rootstocks which modify growth and fruiting habit. Standards, planted 20-40 ft. apart, and half-standards, planted 18-25 ft. apart, are best for orchards, specimen planting, and long yields. For small gardens pyramid and bush trees, planted 12-15 ft. apart, and cordons, planted 2-3 ft. apart, are best. In stone fruits, trained wall trees are best, not cordons. Apricot, nectarine, and peach are usually grown as trained wall trees, but as bushes in warm dists. Medlars and nuts, planted 10-18 ft. apart, are useful. Soft bush fruits, such as currants and gooseberries, need 4-6 ft. apart, raspberries are planted 2-3 ft. apart in rows 6-8 ft. apart, and blackberries, loganberries, and other hybrid berries are trained on wire fences 10-12 ft. between plants, and 6 ft. between rows. Strawberries are best planted separately, 12-18 in. apart, in rows 2-3 ft. apart. Planting of all fruits can be done from Nov. to Mar. in mild open weather. Trees should be staked at time of planting; soil rammed firm around their roots; and a mulch of organic litter applied.

Manuring.—A good general plan is an application of organic manure (dung, compost, hop manure, etc.), especially to raspberries, strawberries; application of bone meal (2-3 oz. per sq. yd.) or basic slag (4-6 oz.) every second or third year; to all fruits. Dessert apples, red currant, and gooseberries need potash most, and should get 1½ oz. sulphate of potash and 1 oz. sulphate of ammonia per sq. yd. in March. Cooking apples, pears, raspberries, bramble fruits, and strawberries need 1 oz. sulphate of potash and 2 oz. sulphate of ammonia; while stone fruits, black currants, and nuts respond to ½ oz.

sulphate of potash with 2 oz. sulphate of ammonia per sq. yd. in spring.

Pruning.—It is impossible to detail the various systems of pruning followed here, but the basic principle for fruit-tree pruning is severe pruning encourages shoot or wood growth, light pruning encourages development of fruiting wood. It follows that where new wood growth is wanted, as in training trees in early years, pruning should be severe. This is also true in the case of the trained trees of Morello cherry, apricot, and peach, where new wood is needed each year to replace old. But once the framework of apples, pears, plums, sweet cherries has been built up, pruning should be light to encourage bearing. Generally, the weaker the year's growth the harder it may be pruned in winter. Summer pruning consists of tipping leading shoots in Aug. to help new wood growth to mature. Bearing trees generally need light pruning, thinning of crossing branches, and removal of dead wood. Care is needed as some trees bear on the tips of young shoots. Red currants are pruned like apples or pears. Black currants are pruned by removing about a third of the oldest branches at their base each year, letting new shoots take their place. Gooseberries may be pruned like black currants, or like red currants, especially if cordons. Raspberries are pruned by cutting away the fruited canes at the soil level each Nov. Non-fruited apples and pears often respond to bark-ringing (removal of narrow $\frac{1}{2}$ in. ring of bark in two half circles, 2-3 in. apart) in May. Plums, damsons, and stone fruits which fail to crop may respond to root-pruning, the roots being bared around the trees in winter, and all coarse roots 2-3 ft. from the stem severed.

Spraying.—Adequate control of insect pests and fungus diseases depends upon preventive spraying. All tree and bush fruits should be sprayed with a winter wash (tar oil, D.N.C. petroleum oil, or thiocyanate) while dormant, to kill eggs of aphids, etc., and to clean trees of moss and lichen. In spring there should be at least one pre-blossom and one post-blossom application of lime-sulphur to control scab and other fungus diseases, to which may be added an insecticide (lead arsenate, D.D.T., or nicotine) to control such pests as caterpillars, capsid bug, etc., in apples and pears. Black currants need lime-sulphur in early April to destroy big bud mite. Derris, nicotine, lonicaric acid, and petroleum oil are used for contact control of insects in summer, while sulphur fungicides are used for mildews.

Choice of Fruits.—Fruit varieties are propagated vegetatively. It is important to begin with healthy, vigorous stock of good strain from reputable growers. **Apples:** Dessert—Tydemans Worcester, Beauty of Bath, Worcester Pearmain, Epicure, James Grieve, Ellison's Orange, Lord Lambourne, Cox's Orange Pippin, Blenheim Orange, Laxton's Superb, Winter King. Culinary—Kenneth Early, Grenadier, Golden Noble, Lane's Prince Albert, Bramley's Seedling, Lord Derby, Edward VII., Crawley Beauty. **Pears:** Dessert—

Clapp's Favourite, Laxton's Superb, Williams's Bon Chrétien, Heurré Superfin, Dr. Jules Guyot, Heurré Hardy, Conférence, Durondeau, Doyenné du Comice, Winter Nells. Culinary—Beurré Clairfleur, Pit-maston Duchess, Vicar of Winkfield, Catillac, Uvedale's St. Germain. **Apricots:** Breda, Moorpark, Royal, Shipley's. **Cherries:** (plant in pairs) Elton Heart and Florence; Early Rivers and Waterloo. Bigarreau Napoleon and Governor Wood; Black Tartarian and Elton Heart. Bigarreau Schrecken and Monstrueuse de Mezel; Belle d'Orléans and Frogmore Early. **Plums:** Blaisdon Red, Belle de Louvain, Czar, Deuniston's Superb, Early Laxton, Jefferson, Kirk's Blue, Victoria, Purple Pershore, Giant Prune, Transparent Gage. **Damsons:** Merryweather, Fairleigh. **Black Currants:** Boskoop Giant, Mentip Cross, Seabrook's Black, Baldwin, Triple A, Cotswold Cross, Victoria, Davidson's Eight. **Red Currants:** Laxton's No. 1, Ruby Castle, Laxton's Perfection, Fay's Prolific. **White Currants:** White Dutch, White Transparent. **Gooseberries:** Careless, Lancer, Whinham's, Warrington, Whitesmith, Lancashire Lad, Jeveller. **Raspberries:** Lloyd George, Norfolk Giant, P's ne's Royal, Red Cross, Malling Promise, Golden Horner. **Strauberreries:** Royal Sovereign Paxton, Tardive de Leopold, Giant Prolific.

Market Gardening, including French Gardening.—Increased population, and consumption of fruit and vegetables, and the food situation during and after the Second World War have encouraged great developments in commercial cultivation. With competition from imports from abroad increasing, however, successful market gardening with economical and intensive cultivation demands skill, knowledge, and first class equipment. With adequate glass-houses, Dutch lights, and cloches the skillful home grower can produce quality food, and should be able to bring produce to maturity early enough for profitable returns. Capital outlay for a 10-ac. holding is between £600 and £1,000. At least one year should be spent working on an existing holding, and it is wise to take one year's instructional course at a co. farm institute beforehand. Site, soil, water supply, accessibility, and markets are the important considerations to be studied. Fr. G. demands considerable equipment, and capital outlay may approach £1500 per ac.

Garden of the Gods, dist. of Colorado, U.S.A., in the vicinity of Colorado Springs. It covers about 500 ac., and is remarkable for its strange and extremely beautiful formations of rock, some of which resemble in form cathedral spires, etc.

Gardiner, Alfred George (1865-1946), Eng. journalist and essayist, b. at Chelmsford. Son of Henry James G., wrote under the pen-name 'Alpha of the Plough.' He was editor of the *Daily News* from 1902 to 1919. His *Prophecy, Priests and Kings* (1908) is a series of caustic character sketches of contemporary celebrities, notably politicians. It was followed in 1913 by *Pillars of Society* in a similar vein and by *War Lords* in 1915. He produced a biography of Sir Wm. Harcourt in 1922, and one of George Cadbury, formerly proprietor of the *Daily News*, in 1923. A pleasant, vivid pen.

Gardiner, James, Colonel (1688-1745), Scottish soldier, b. at Carriden, Linlithgowshire. He was an officer of dragoons and was noted for his bravery. He was severely wounded at Ramillies and, in 1715, took part against the Jacobites in the rising of that year. He became colonel of the Inniskillens and fought at the battle of Prestonpans. Here he was deserted by his men and slain fighting.

Gardiner, Samuel Rawson (1829-1902), Eng. historian, b. at Ropley, Hampshire, and educated at Winchester, Christ Church, Oxford, at Edinburgh, and at Göttingen. He was elected fellow of All Souls' College, Oxford, in 1884, and of Merton in 1892. He held the position of prof. of modern hist. at King's College, London, until 1885. From 1886 to 1889 he was examiner in hist. to the univ. of Oxford. He was granted a civil list pension of £150 a year in 1882. G. belongs to the new school of historians who confine themselves to facts, putting aside partisanship and brilliant rhetoric. He has thrown a new light on the Stuart period, to which he devoted years of patient research, often among documents hitherto unstudied. His works include *The Thirty Years' War* (1874), *History of England from the Accession of James I. to the Outbreak of the Civil War* (1883), *Students' History of England* (1890, republ. with continuations, 1920), *History of the Great Civil War* (1894), and *Oliver Cromwell* (1899). See H. B. Learned, *S. R. Gardiner*, 1901, and R. G. Usher, *A Critical Study of the Historical Method of S. R. Gardiner*, 1915.

Gardiner, Stephen (c. 1493-1555), Eng. prelate who became bishop of Winchester and lord chancellor. In 1520 he was made master of Trinity Hall, Cambridge, where he had studied law. He became

also secretary to Wolsey, and having thus access to Henry VIII., he gained that monarch's favour by supporting his designs. He was sent to try to secure the pope's consent to the divorce of Catherine of Aragon, and later he conducted the case against the queen. He then became successively archdeacon of Norwich, archdeacon of Leicester, secretary of state, and bishop of Winchester. He has been looked upon as a bloodthirsty seeker-out of 'reformers,' and certainly he was zealous and consistent, but it is now estab. that he tried to save the lives of Cranmer and others, and that he was against the persecutions of Mary's reign. Facts seem to prove that he has been much maligned by inaccurate accounts, and that he was not the self-seeking ambitious man whose one aim was to become cardinal and archbishop of Canterbury. He remained faithful to his religion and suffered long imprisonment under Edward VI. In Mary's reign he was reinstated and made lord chancellor. He encouraged learning and wrote *On Obedience, Explication and Assertion of the True Catholic Faith touching the most blessed Sacrament of the Altar* (1551).

Gardiner, city of Maine, U.S.A., in the Kennebec co. It is situated on the Kennebec R., 8 m. S.E. of Augusta. The riv. is navigable by large vessels as far as this. It possesses a high school, public library, and city hall. The manufs. are paper, shoes, etc., and there are saw-mills, machine shops, and flour-mills. The chief exports are lumber and ice. Pop. 6400.

Gardner, Ernest Arthur (1862-1939), Eng. archaeologist, b. in London. From 1887 to 1895 he was director of the Brit. School of Archaeology in Athens. Yates prof. of archaeology, Univ. College, London, 1896-1929. He wrote *Ancient Athens* (1902), *A Companion to Greek Studies* (1905), *The Inscriptions of Attica* (1905), *Six Greek Sculptors* (1910), *Religion and Art in Ancient Greece* (1910), *The Art of Greece* (1925), and *Greece and the Aegean* (1933).

Gardner, tn. of the U.S.A., in the co. of Worcester, Massachusetts, and 24 m. N.W. by N. of Worcester city. There are manufs. of toys, baby carriages, silver goods, etc., and it possesses the largest chair factory in the world. Pop. 20,200.

Gare-fowl, or *Great Auk* (Icelandic *Geirfugl*, Gaelic *Gearbhul*), large sea-bird of the family Alcidæ, the *Alca impennis* of Linnaeus, similar in appearance to the razor-bill (*Alcatorda*). It inhabited the N. hemisphere (temperate region of the N. Atlantic), and has been extinct since 1844, 'owing to the ruthless trade in its eggs and skin.' The Gs. had wings so small that it was impossible for them to fly, but they were good swimmers. The chief breeding places were skerries off the coast of Ireland, Funk Is. off Newfoundland, and Spitzbergen. See S. Grieg, *The Great Auk*, 1885, and J. Milne, *Rolls of the Great Auk*, in the *Pield*, 1875.

Gareloch, inlet of the Clyde, situated in the S.W. of Dumbartonshire, Scotland. It is about 7 m. in length, and has an average width of a mile. The steamers

built in the Clyde shipbuilding yards are frequently brought here for the purpose of testing their compasses. The vil. of Garelochhead is a holiday resort.

Garfield, James Abram (1831-81), president of the U.S.A., b. at Orange, Ohio, and was forced, owing to the death of his father, to earn his own living at a very early age. He, however, did not neglect his education, and went to Hiram College, Ohio, and from there to Williams College, Massachusetts. He graduated at the latter place and then went back as a prof. to his old college. Of this he ultimately became president, and he still continued to study law and to practise. On the outbreak of the civil war he was appointed to command a volunteer regiment, and by his gallantry and ability quickly raised himself, until he was appointed a major-general. In 1863 he resigned his command and entered Congress, where he was quickly recognised as one of the leaders of the Republican party. He retained his seat in Congress until 1880, when he was put forward as the Republican candidate for the presidency. He was elected and took up office in March 1881. He identified himself with the movement for the reform of the civil service and alienated in this way many of his supporters. In July of the same year he was shot by a disappointed fanatic who had unsuccessfully sought office and d. in Sept. His speeches were collected into 2 vols. in 1882. See W. M. Thayer, *From Log Cabin to White House*, 1881, and T. C. Smith, *Life and Letters of James A. Garfield*, 1925.

Garfield, bor. of New Jersey, U.S.A., in the co. of Bergen. There are woollen mills and chemical works, also manufs. of clothing, paper, and essential oils. Pop. 28,000.

Garfish, see BONY PIKE.

Gargano, peninsula in the E. of Italy, in the prov. of Foggia. It extends into the Adriatic Sea for about 31 m., and is from 15 m. to 30 m. in breadth. Monte Calvo is a summit which rises to a height of 5295 ft. and is composed chiefly of limestone. The head of the peninsula is Testa del G.

Gargantua, see RABELAIS.

Gargle. The original or proper meaning of this word was a throat wash, but, as commonly used, it indicates a wash for both the mouth and throat. It is used by working the liquid round the mouth and allowing it to trickle down the throat, while the air is driven out of the lungs to prevent the fluid going the wrong way. Gs. may be composed of hot or cold water, either plain or flavoured, such as barley water or orange-flower water. They may also be of glycerine, plain or medicated with alum, iron, tannin, or carbolic acid.

Gargoyle, projecting spout on a building, designed in the shape of a grotesque monster, to carry the water from a gutter clear of the masonry. Among famous Gs. are those on the cathedral of Notre Dame, Paris.

Garhmukhtesar, tn. of India, in the United Provs. It is situated on the r. b. of the Ganges in the dist. of Meerut. The

inhab. are Hindus, with about 25 per cent Muslims. Pop. 8000.

Garhwal: 1. N. dist. of the United Provs., India. In 1803 it was ruined by the Gurkhas, who had overrun it, but in 1814 it was taken by Britain and thereafter prospered considerably, largely on account of its extensive tea plantations. Pop. (1941 census), 602,115. 2 (Tehri-Garhwal). Former small state separated from the dist. of G. by the Alaknanda R., which remained in the possession of its rajah until 1949. The prevailing religion is Hindu. In March (1949) the Gov. of India announced its intention to integrate Tehri-Garhwal and one or two other states either with the United Provs. or the E. Punjab. Area 4516 sq. m. Pop. (1941) 397,369.

E.N.A.

GIUSEPPE GARIBALDI

Garibaldi, Giuseppe (1807-82), It. patriot, liberator, and guerrilla leader, b. at Nice. A sailor's son, he took to the sea, commanding a brig by 1830. At this time (c. 1833) he became acquainted with Mazzini and the leaders of Young Italy, and was fired with enthusiasm for the It. national movement. For his share in the outbreak at Genoa (1834) he was obliged to flee to France. He then sailed to S. America, and there offered his services to the republic or prov. of Rio Grande do Sul, which was in revolt against the emperor of Brazil. He distinguished himself as a guerrilla warrior but was taken prisoner and suspended for two hours by the wrists for trying to escape. Soon afterwards he eloped with and married a beautiful creole, Anita Riveira de Silva, the companion of his E. campaigns and the mother of his children, Menotti, Ricciotti, and Teresa. In 1842 he offered

his help to the Monte Videans (1836-48) against the Argentine dictator, Rosas. He gives a full account of his various exploits in S. America in his autobiography.

Returning to Europe, G. took part in the campaign against the Austrians and Fr., and was the soul of the revolutionary gov. at Rome. Obligated eventually to retreat to San Marino G. was forced to land before reaching Venice, and his wife perished from exhaustion and exposure in his arms. In 1850 he went as an exile to U.S.A., living for a time in Staten Is. In 1854 he returned and settled in Caprera Is., near Sardinia, eagerly noting the results of Cavour's policy in Italy. He fought for Sardinia against Austria in 1859 and protested against the cession of Nice and Savoy to Napoleon III. in 1860. After the peace of Villafranca, secretly supported by Sardinia's request, G. organised an expedition against the Sicilies, in the hope of bringing about the union of Italy. This is perhaps his most famous undertaking. He landed at Marsala with his thousand volunteers, defeating the Neapolitan troops, which far outnumbered his own, at Calatafimi, and thus opened the way to Palermo. G. became dictator of Sicily, and crossing to Italy expelled Francis II. from Naples and entered the city in triumph. When Victor Emmanuel, king of Italy, appeared with his Sardinian troops in the kingdom of Naples, G. delivered up to his sovereign his army and absolute sway over the Neapolitan provs., retiring to Caprera in 1860. He was severely wounded at Aspromonte (1862), fighting against the royal troops, and taken prisoner, but pardoned shortly afterwards. On his second attempt to oppose the papal power (1867) he was utterly defeated by the papal and Fr. troops at Mentana, but was allowed to return to Caprera. In 1870-71 he attempted to help the Fr. Republic against the Gers., commanding the Fr. volunteers in Burgundy. He entered the It. parliament in 1874, finally consenting to accept an ann. pension from It. G. wrote the novels *Clelia* (1870) and *Cantoni il volontario* (1870), but had little literary talent. See memoirs (trans. by A. Werner in 1889 as *Autobiography of G. Garibaldi*); A. Mario, *Garibaldi e i suoi Tempi*, 1884; J. Marriott, *The Makers of Modern Italy*, 1889; G. Staveili, *Garibaldi nella letteratura italiana*, 1901; Sir G. O. Trevelyan, *Garibaldi and the Thousand*, 1909; and P. Filschauer, *Garibaldi: Der Mann und die Nation*, 1934.

Garibaldi, Giuseppe (b. 1879), It. general, b. at Melbourne; grandson of the great Giuseppe G. (q.v.) and eldest son of Gen. Ricciotti G. (1847-1924), under whom he fought in Greco-Turkish war of 1897. Fought also in S. African war; lived in S. and Central America and in Balkans. Early in the First World War he raised an It. legion of 14,000 which fought for France on the Argonne. In 1918 he enlisted in Italy, where he became an officer in the Fourth Army. Commanded the Alpine brigade in France,

1918; became brigadier-general. Resigned June 1919. In 1921 he organised the Free Italy Association against Fascism. Afterwards went to New York.

Gariep, see ORANGE RIVER.

Garigliano, riv. of S. Italy which has its source in Abruzzi, and empties itself into the Mediterranean at the gulf of Gaeta. The Eighth and Fifth Brit. and Amer. Armies in their offensive against the Ger. Gustav line crossed the G. on May 12, 1944. See ITALIAN FRONT, SECOND WORLD WAR CAMPAIGNS ON.

Garland, Hamlin (1860-1940), Amer. author, b. W. Salem, Wisconsin. Worked on mid-W. farms. In his realistic novels and short stories he took as his themes the lives of the people on the prairie farms, which he depicts as a narrow and monotonous fight for existence. Awarded the Roosevelt Memorial Association gold medal for literature, 1930. Among his many vols. some of the best are *Main Travelled Roads* (1890), *Prairie Folks* (1892), *The Book of the American Indian* (1923), *The Trail-makers* (1926), *Roadside Meetings* (1930), *My Friendly Contemporaries* (1932), *Forty Years of Psychic Research* (1936), and *The Mystery of the Buried Crosses* (1938).

GARLIO

B, bulb.

Garlio, or *Allium sativum*, illaceous plant which grows wild in S. Europe, especially in Sicily. It is a hardy perennial with bulbous roots, which are much used in cookery and occasionally in medicine.

Garlio Pear, see under CRATAEVA.

Garm, region of the Tajik, S.S.R., Soviet Central Asia.

Garment Design, see under DRESS-MAKING.

Garnet, Henry (1555-1606), Eng. Jesuit. He was educated at Winchester, studied law, became a Roman Catholic, went to Italy, where he joined the Society of Jesus and acquired a reputation for scholarship, then returned as provincial of the Jesuits

in England. He was tried on suspicion of being implicated in the Gunpowder Plot and found guilty, possibly on insufficient evidence, but his zeal in furthering schemes in connection with his order no doubt weighed against him, and he was hanged.

Garnet, name of a group of closely related minerals, which crystallise in the cubic system, usually in rhombic dodecahedra or in icositetrahedra, with imperfect cleavage. The chemical composition and hardness vary. Gs. are a good example of an 'isomorphous' group. They are found in crystalline schists, gneiss, metamorphic limestones, granite, serpentine, and sometimes in volcanic rocks and veins. Their usual colour is red, but there are brown, yellow, green, and black varieties. Of the semi-precious stones used in jewellery, some of the best known are the pyrope or anct. 'carbuncle' (red) from Saxony and Bohemia, the almandine (bluish-red) from Ceylon, Burma, Pegu, Brazil, and Scotland, and the uvarovite (green) from the Ural Mts. (Siberia) and Canada. Fine red specimens somewhat resemble rubies in appearance, but common Gs. have many flaws. The 'Syrian' Gs. most esteemed in commerce came originally from Syria in Pegu, and sometimes resemble oriental amethysts in colour. Besides being cut as gems, Gs. are used for abrasive and other purposes, (i. paper being a substitute for sand-paper, especially in America.

Garnett, David (b. 1892), Eng. novelist, b. at Brighton, Sussex, the son of the author, Edward G. (1869-1937), and Constance G., who is celebrated for her travels from Russian literature. His grandfather was Richard G. (d. 1871). G. was privately educated, and then went to the Royal College of Science, where he studied botany. During the First World War he worked with the Friends' War Victims' Relief. In 1922 his first novel was pub. *Lady into Fox*, a story with an original theme which made his reputation. It was awarded the Hawthornden prize and the James Tait Black Memorial prize. Two years later he followed up his success with *A Man in the Zoo*. From 1923 to 1932 he was closely concerned with the work of the Nonesuch Press, acting as literary adviser. Meanwhile he continued to write. *The Sailor's Return* appeared in 1925, *Go She Must!* in 1927. *The Old Dovecote and Other Stories* in 1928, and *No Love* in 1929. His theme, blending fantasy and reality, are treated with humour and imagination, for which he employed a clear and simple style. Having learnt to fly (see *A Rabbit in the Air*, 1932), he served with the R.A.F. during the Second World War. His *War in the Air* was pub. in 1941. After the war he returned to publishing. Other books include *The Grasshoppers Come* (1931); *A Terrible Day* (1932); *Pocahontas; or, The Nonpareil of Virginia* (1933); and *Beany-Eye* (1935). In 1938 he ed. the letters of T. E. Lawrence.

Garnett, Richard (1835-1906), Eng. writer and librarian, son of Rev. Richard

G., the philologist and one-time assistant keeper of printed books at the Brit. Museum. He was b. at Lichfield, Staffordshire, and in 1851 was appointed assistant in the reading-room of the Brit. Museum, becoming its superintendent in 1875. From 1881 to 1890 he had charge of the preparation of the great catalogue of authors, resigning his post of superintendent in 1881 in order to give all his time to this exacting labour. He introduced the 'sliding press' into the library. He was keeper of the printed books from 1890 to 1899, having been already appointed assistant keeper in 1875. Among his works are *History of Italian Literature* (1897); *Essays of an Ex-Librarian* (1901); *An Illustrated Record of English Literature* (with Sir Edmund Gosse), 1903-4; and his lives of Carlyle (1887), Emerson (1888), Milton (1890), Dryden (1895), Coleridge (1904), Tennyson (1906), contributed to the Great Writer series. His poems and plays include *Primula* (1858), *Io in Egypt* (1893), and *William Shakespeare, Pedagogue and Poacher* (1904). Among his other works are *The Twilight of the Gods and other Tales* (1888) and *Essays in Librarianship and Bibliography* (1899). G. contributed many articles to the *Encyc. Brit.*

Garnier, Jean Louis Charles (1825-98), Fr. architect, b. at Paris. At the age of twenty-three he won the Grand Prix de Rome. He spent the next few years travelling in Italy and Greece. He returned to Paris in 1853, having already established a reputation on the Continent. He was not in very affluent circumstances until, in 1861, in open competition, he proved successful with his design for a grand opera house for Paris. The work was not finished until 1875. Amongst other great buildings which he designed are the Casino at Monte Carlo and the Hôtel du Cercle de la Librairie at Paris. He was made a grand officer of the Legion of Honour in 1895. Throughout Europe he was recognised as the greatest architect of the age. See L. G. B. P. Larroumet, 'La vie de Charles Garnier,' in *L'Année des monuments français*, 1901-5.

Garnier, Marie Joseph François (1839-1873), Fr. officer and explorer, b. at St. Leger. In Cochinchina he served under Adm. Charner. He was the leading spirit in the journey of exploration which was undertaken nominally under the superintendence of a superior Fr. officer but really under the direction of G., who was responsible for nearly all the observations made in a country which had previously been practically unknown to Europeans. The journey was undertaken from Kélie to Shanghai. In 1873 he undertook the founding of a Fr. protectorate in Tonking. He captured the cap., but was slain in subsequent fighting.

Garnier, Robert (c. 1545-1600), Fr. poet, b. at Perté-Bernard. He became a law student, and whilst studying law wrote his first poem, which gained him a prize in the *prix floral* at Toulouse. He was held to be a great orator and was, even in his own generation, recognised as a poet of more than ordinary merit. Amongst the

chief poems which he wrote may be mentioned *Porée* (1568), *Hippolyte* (1573), *Antigone* (1580); *Bradamante* (1582), and *Les Juives* (1583).

Garnierite, nickel containing mineral occurring in New Caledonia. G is double silicate of nickel and magnesium, containing 24 per cent of the former metal. Its formula is $2(\text{Ni Mg})_3\text{Si}_2\text{O}_{10} \cdot 3\text{H}_2\text{O}$. It is worked upon a large scale in France for the preparation of nickel.

Garnishee, person in whose hands money or property belonging to a debtor or defendant has been attached at the suit of a creditor or plaintiff, and who has had warning or notice of such attachment (*q.v.*). A G, after receipt of such notice, must not part with the debtor's money or property except to answer the creditor's claim or until the attachment is dissolved. But there can be no execution against a G in respect of such property unless there has been a judgment entered against the prin. debtor, and, further, a G is entitled as against the creditor or plaintiff to set up the rights of third parties to whom he himself is under some liability in respect of the property.

Garofalo, see **TISI, BENVENUTO**

Garó Hills, mountainous dist. of India situated southward of Brhmaputra and to the W. of Assam forming its S.W. corner. The mts. rise to a height of 4600 ft. above sea level, and have the appearance of parallel ridges, with deep valleys between. The dist. covers an area of 3270 sq. m., and the inhab. the Garos, are a strong and energetic race, darkish brown in colour. The exports are cotton and forest products. Large quantities of coal and petroleum are to be found in the hills. The administrative headquarters are at Tura. Pop. about 200,000.

Garonne, riv. of France, which rises in the vale of Arau, on the S.p. side of the Pyrenees. Its course is generally N.W. Flowing through France, it passes the depts. of Haute Garonne, Tarn et Garonne, Lot et Garonne, and Gironde. Its tribs. are the Save, Gers, Tarn, Lot, and Dordogne. Below Bordeaux it is known as the Gironde. The riv. is navigable to Toulouse from Bousens. After a course of 400 m. it enters the Atlantic.

Garonne, Haute, dept. of S.W. France formed from parts of Languedoc and Gascony, and divided into three arrons. Toulouse, Muret and Saint Gaudens. Cap. Toulouse. Area 2457 sq. m. The S. is very mountainous, containing some of the highest peaks of the Pyrenees, including Mt. Perdiguère (10,560 ft.). The intervening valleys are very fertile. The centre of the dept. is formed by a hilly plateau, with an altitude of 1150-1500 ft. Chief riv., the G. with its tribs. the Pique, Save, Salat, Arize and Hers. Oats, maize, beans, vines and wheat are grown. Iron, marbl. and rock salt are mined, and there are mineral springs. Pop. 512,200.

Garos, see under **GARO HILLS**

Garrett, João Baptista de Almeida, see **ALMEIDA-GARRETT**

Garrick, David (1716-79), Eng. actor and playwright, descended on his father's

side from Huguenot refugees called De la Garrique. He was educated at Lichfield Grammar School and partly under Dr Johnson, with whom he came to London about 1737. He studied at Lincoln's Inn, and set up in the wine trade with his brother for a time, but soon gave up both

DAVID GARRICK

for the stage. His first public appearance was at Ipswich in 1741, in *Oromoko*. Later in the year he appeared in his famous role of Richard III. He went over to Dublin twice becoming joint manager with Sheridan in 1744, and roused much enthusiasm there. Don Felix in *The Wonder* was one of G.'s favourite parts, first played in 1756 and also at his last performance, 1776. In 1747 G. and Lacy were joint managers of Drury Lane Theatre and G. continued in this office till his retirement (1776). In 1749 he married the Viennese danseuse, Mlle. Violette. Quarrels among members of his company led to the famous rivalry between Drury Lane and Covent Garden, six of his performers joining the opposition house. In 1750 *Romco and Juliet* was acted by G. and Mrs. Bellamy at Drury Lane, and by Sptmgar Barry and Mrs. Cibber at Covent Garden. Drury Lane, however, triumphed in the end. In 1769 G. conducted a notable jubilee in Shakespeare's honour at Stratford-on-Avon. He did much to restore the original form of that great dramatist's plays and do away with the altered versions then in common use. With him ended the old custom of admitting spectators on the stage itself and he introduced various other reforms. With Goldsmith, Johnson, Burke and others he was a member of the Literary Club. Among his comedies and farces are *The Tying Palet* (1741); *Leithe* (1745), *High Life below Stairs* (1759), and *The Clandestine Marriage* (1766). Selections of his dramatic works were brought out in 1768 and 1798. One of Sir Charles Wyndham's great parts was that of David Garrick in the play of that name (adapted from the Fr. Sullivan by Robertson), the last revival being at his theatre in 1900. See T. Davies,

Memoirs, 1780; J. Boaden (ed.), *The Private Correspondence of D. Garrick, 1831-1832*; F. Hedgcock, *A Cosmopolitan Actor: David Garrick and his French Friends*, 1912; C. R. Williams, *David Garrick, Actor-Manager*, 1929; E. P. Stejneger, *David Garrick, Dramatist*, 1938; and lives by P. Fitzgerald, 1868; J. Knight, 1894; A. Murphy, 1901; C. Gaehde, 1904; D. Macmillan, 1934; and Margaret Barton, 1948.

Garrick Club, social and dramatic club which was named after the famous actor and dramatist of the eighteenth century. It was founded in 1831, its avowed objects being 'the general patronage of the drama, and the formation of a theatrical library, with works on costumes, making-up, etc.' The entrance fee is 20 guineas, and the ann. subscription is 15 guineas; membership is most exclusive, only the most successful actors and playwrights gaining admittance. The club possesses a collection of more than 600 theatrical portraits and other pictures, and numerous theatrical relics. It is situated in a magnificent building, at 15 Garrick Street, W.C.2. See G. Boas, *The Garrick Club*, 1948.

Garrick Theatre, in Charing Cross Road, London, W.C.1, was first opened by Sir John Hare in April 1889 with Pinero's *The Profligate*. It must be distinguished from the G. T. opened in Whitechapel in 1830, which was rebuilt in 1845 and used for *opéra bouffe* as late as 1879. Some of the more important plays produced at the present theatre were Grundy's *A Pair of Spectacles* (1890); Pinero's *Lady Bountiful* and Robertson's *School* (1891); and Grundy's *A Fool's Paradise* (1892). Pinero's *The Notorious Mrs. Elphinstone* was produced in 1895, in which year Mme Réjane appeared here in *Mme Sans-Gêne* and *Ma Cousine*. Later successful plays were Hopo's *Pinkerton's Peesage* (1902); *Where the Rainbow Ends* (1911); *Cyrano de Bergerac*, with Robert Loraine in the name part (1919); Eden Phillpotts's *The Runaways* (1923); *The Lady with a Lamp* (Jan. 1929); *The Stranger Within* (June 1929); *Happy Families* (Oct. 1929); and *My Wife's Family* (1931).

Garrison, William Lloyd (1804-79), Amer. philanthropist, leader of the abolitionists in the anti-slavery struggle. In 1826 he became editor of the Newburyport *Free Press*. He ed. the *National Philanthropist*, 1827, and pub. at Boston the celebrated *Liberator*, a jour. urging the abolition of slavery in the S., from 1831 to 1865. He was much influenced by Lundy, and joined him at Baltimore, 1829, in editing the *Genius of Universal Emancipation*. His vigorous denunciation of slavery involved him in a charge of libel, and brought about his imprisonment at Boston in 1831. In 1832 he founded the New England Anti-Slavery Society, the first of many similar organizations. The Amer. Anti-Slavery Society was formed in 1833 in Philadelphia. Of this G. was president 1843-65. His extreme views made him many enemies, and his life was often threatened, but he lived to see his hopes in great part realised. He pub. *Thoughts on African Colonisation*

(1832) and *Sonnets and Other Poems* (1843). *The Words of Garrison* appeared in 1905. See ABOLITIONISTS. See W. P. Garrison, *Life of W. L. Garrison*, 1892; F. E. Cooke, *An American Hero: the Story of W. L. Garrison*, 1910; and J. J. Chapman, *Garrison*, 1913.

Garrod, Heathcote William (b. 1878), Eng. scholar and writer. As an undergraduate at Oxford Univ. he gained the Hertford scholarship in 1899 for Lat., and in the same year the Craven scholarship for classical learning. He also won the Galsford prize for Gk. prose (1900) and the Newdigate prize for Eng. verse (1901). He graduated at Merton College, and in 1902 went to Corpus Christi College as tutor, returning to Merton to become tutor there in 1904. During the First World War he worked first in the Ministry of Munitions, and then in 1918 in the Ministry of Reconstruction. He was awarded the C.B.E. in that year. In 1923 he was appointed to the chair of poetry at Oxford, which he held until 1928. In 1929 he went to the U.S.A., where he was Charles Eliot Norton prof. of poetry at Harvard Univ., returning the following year to Merton, where he has held a fellowship since 1901. His lectures delivered at Harvard were pub. in 1931, with the title *Poetry and the Criticism of Life*. He has ed. a number of Lat. texts, including Statius, Manilius, and Horace, and also ed. the Oxford ed. of Keats's poetical works (1939). In addition to eds. of other Eng. authors his writings include *The Profession of Poetry and other Lectures* (1929); *Poetry and Life* (1930); *The Study of Poetry* (1936); *Scholarship: its Meaning and Value* (1946); and also monographs on Byron (1923) and Keats (1926).

Garron, see HORSE, Ponies.

Garrotte (Sp. for cudgel) is an appliance which is used in Spain for the execution of criminals. The condemned man is seated on a scaffold fastened to an upright post by an iron collar (the G.) and a knob worked by a lever dislocates his spinal column. Garroting is the name given in England to a form of robbery which became rather common in 1862-63. The Act of 1863, which imposed flogging for this offence, is generally accepted as having put a stop to it, though humanitarians contend that the outbreak of garroting was already coming to an end. See H. S. Salt, *The Fallacy of Flogging*, 1916.

Garstang, John (b. 1876), Brit. archaeologist. Educated at Blackburn Grammar School and Oxford Univ. Has been engaged in archaeological research since 1897, notably on Rom. sites in Britain, in Egypt, Nubia, and Asia Minor. After the First World War he was appointed director of the Palestine Gov.'s dept. of antiquities, which he was instrumental in founding in 1920. From 1927 he has devoted himself to archaeology as Rankin prof. at Liverpool Univ. Was leader of the Marston archaeological expedition to Jericho, and his discoveries there (1930-1931) have afforded the strongest evidence of the authenticity of O.T. narratives

(see also JERICOH). King's silver jubilee medal, 1935. Head of the archaeological dept. in Turkey, 1917. Pubs.: *Roman Ribchester* (1899); *The Third Egyptian Dynasty* (1904); *A Short History of Ancient Egypt* (in collaboration with Prof. Percy Edward Newberry) (1904); *The Land of the Hittites* (1910); *The Foundations of Bible History: Joshua, Judges* (1931); *The Heritage of Solomon* (1934); reports on the excavation of Abvdos, Merob, Jericho, and at Mersin in *Liverpool Annals of Archaeology* (1932-39); and has ed. bulletins of the Brit. School of Archaeology in Jerusalem.

Garstin, Sir William Edmund (1849-1925), Brit. civil engineer, b. in India, son of a civil servant there. Educated at Cheltenham and King's College, London. Returning E., he served for twelve years in the Indian public works dept. From 1892 to 1904 he was inspector-general of irrigation in Egypt, being also under-secretary for public works. He explored the Nile from source to delta, a 7000-m. journey, much of it through terrible malaria-ridden country, and presented a brilliant report. His investigations convinced him that, with so vast a loss of Nile water through enormous swamps and evaporation, the water of the lower riv. should be stored in great quantities during the ann. flood, and distributed through irrigation canals when the riv. reached its lower levels. The work of control of the flow of the riv. was carried out mainly under G.'s administration and in accordance with his plans. It comprised the construction of the Aswân dam and the barrages at Asyût and Esna, which were all parts of one system of water storage and control. The subsequent heightening of the dam and the construction of the Esna barrage were not completed before he retired. The Asyût barrage was constructed, according to G.'s directions, from the original design of (Sir) Wm. Willcocks (1898-1902). In addition G. caused the clearing of the White Nile of its floating forests of rotting vegetation (sudd) which made navigation difficult or impossible. Lord Cromer says that it would be difficult to exaggerate the debt of gratitude which the people of Egypt owed to G. (see *Modern Egypt*, vol. I, p. 658); and on another occasion he described G. as the greatest hydraulic engineer in this or any other country. The Egyptian Nationalist press styled G. 'the treasure of Egypt.' Knighted, 1897, and in 1904 he was appointed a director of the Suez Canal Company.

Garston, seaport on the Mersey about 6 m. S. of Liverpool. It has a quay about a mile long fitted with special machinery for the shipping of coal, which is the chief article of export. Pop. 29,000.

Garth King-of-Arms, one of the officers of the order of the Garter, the others being the prelate, chancellor, registrar, and gentleman usher of the black rod. See HERALDRY.

Garth, Order of the, was instituted by Edward III. about 1348. The colour of the emblem chosen was blue, and the motto *Honi soit qui mal y pense*. St.

George was its special patron, and it has been called the order of St. George. Originally there were to be twenty-five knights-companion, excluding the king, who were to assemble every year on the eve of St. George's Day in St. George's Chapel. Later distinguished foreigners were admitted into the order. The ensigns of the order at first consisted of garter, surcoat, mantle, and hood, later the collar and George, the star and the under-habit were added. The order has for its emblem the garter, which is made of dark blue velvet about an inch wide, with the motto in gold letters, and is worn on the left leg a little below the knee. The mantle now worn is of purple velvet lined with white silk, having on the left shoulder the *badge* of the order, a silver escutcheon charged with a red cross for the arms of St. George and encircled with the garter and motto. The surcoat and hood, which is now worn on the right shoulder, are made of crimson velvet. A cap, ornamented with ostrich feathers and a tuft of black heron's feathers fastened by a clasp of diamonds, is now worn instead of the hood. White silk stockings and white shoes with red heels completed the costume. The collar, introduced by Henry VII., consists of knots of cords alternated with red and white roses, and a figure of St. George piercing the dragon hanging from one of the roses. The star introduced by Charles I. is a badge with the cross of St. George encircled by the garter, the whole being surrounded by rays of silver. The under-habit was introduced by Charles II. Each knight has his stall in St. George's Chapel, Windsor, and the garter plates of the knights remain permanently. Those placed there in the reign of Henry VII. are valuable heraldic relics. The order still ranks first among the orders of knighthood of Europe. Knights of the Garter write K.G. after their names.

Garth, Sir Samuel (1661-1719), Eng. physician and poet, b. at Bowland Forest, Yorkshire; studied at Peterhouse, Cambridge Univ., and took his medical degree at Leyden in 1691. He came to London and was elected a fellow of the College of Physicians, 1693. In 1697 he delivered the Harveian oration at the College of Physicians, half of which is a panegyric of William III. He was a zealous Whig, the friend of Addison, of the second Christopher Codrington (1668-1710), the famous governor-general of the Leeward Is., of John Boyle, earl of Orrery, and, though of different political opinions, of Pope. Became physician in ordinary to George I., who knighted him (1714), and he soon acquired a large practice. He is, however, chiefly remembered as the author of *The Dispensary* (1699), a satire in the heroic couplet, which went through three eds. in a few months and was generally read for half a century. It ridicules the apothecaries by describing a mock-heroic battle between them and the physicians, and at the end of the poem G. mentions a scheme which had been mooted in the College of Physicians twelve years previously

for setting up a dispensary where the poor might obtain advice and prescriptions from the best physicians. For this poem G. probably borrowed from Dryden's *MacFlecknoe* and Boileau's *Lutrin*. It was much admired by Christopher Codrington, who wrote some commendatory verses for the third ed. which pour scorn on the critics, particularly on the 'city bard.' Sir Richard Blackmore (c. 1650-1729). Codrington's private copy of this third ed. is now in the library of the College of Physicians. Also wrote *Claremont* (1715), a poem on Lord Clare's villa; an Eng. verse trans. of Ovid's *Metamorphoses* (1717), to which Addison, Pope, and others contributed; a dedication in verse of Ovid's *Ars Amatoria* to the earl of Burlington; and a number of fulsome lampoons. It was through his intervention that an honourable burial was given to Dryden, over whose remains he pronounced a eulogy. See Samuel Johnson, *The Lives of the Poets*, vol. II, 1781, 1905 (ed. by G. Birkbeck Hill); T. Schenk, *Sir Samuel Garth und seine Stellung zum Komischen Epos*, 1900; and R. P. Bond, *English Burlesque Poetry, 1700-1750*, 1932.

Gartokh, or Gartok, in 'a Great Tibet in the Nari-Khor-um prov. It stands at a height of 14,210 ft above the sea in one of the loftiest mt. regions in the world. To the E. of the tn. are salt-mines, and the important gold-mining dist. of Thok-Jalung lies 85 m. to the N.E. An active trade is carried on in shawl wool, tea, etc. In accordance with the Tibet Treaty of 1904 it was thrown open to Brit. trade. In winter G. consists of only a few dozen people, but in summer trade passing through makes it a busy place.

Garvie, Alfred Ernest (1861-1945), religious author; b. at Zyrardow, Russian Poland, and educated privately and at George Watson's College, Edinburgh. He took his M.A. at Oxford in 1898, minister of Macduff Congregational church, 1893-95, and from 1895 to 1903 of Montrose Congregational church. Prof. of philosophy of theism, comparative religion, and Christian ethics in Hackney and New Colleges, London, 1903-7. Principal of New College, Hampstead, from 1907. His pub. include *The Ethics of Temperance* (1895); *The Ritschlian Theology* (1899); *The Gospel for To-day* (1904); *My Brother's Keeper* (1905); *The Christian Certainly* (1910); *The Christian Belief in God* (1933); *Revelation through History and Experience* (1931); *The Christian Faith* (1930); *Memories and Meanings of My Life* (1937); and *Christian Moral Conduct* (1938).

Garvin, James Louis (1868-1947), Brit. journalist and biographer, b. at Birkenhead, Cheshire, of Irish stock. His father was drowned at sea and his mother left in poverty. When his mother's circumstances improved, she provided him with a course in science and languages with a view to a civil service career. G. read omnivorously and was endowed with a Macaulay-like memory, and he acquired a wide knowledge of Eng. and European literature. He began work in the corn

trade as a bookkeeper and foreign correspondence clerk. His business training later served him in good stead. G. began journalism on the *Newcastle Chronicle*, was its leader writer and literary critic 1891-99. From the age of twenty-six he contributed to the *Fortnightly Review*, and for many years from 1900 wrote articles on foreign affairs, often under the pen-name 'Calchas.' Also contributed to the *National* and the *Quarterly*. Then joined the staff of the *Daily Telegraph* as leader writer, also doing descriptive reporting. In the N. he had been known as an Irish Nationalist, a fervent admr. of G. S. Parnell. Subjected by his new Conservative surroundings, he came into prominence as chief journalistic backer of Joseph Chamberlain's tariff reform policy in 1903. Left it to edit the *Outlook*. On a change of ownership of that paper he returned to the *Daily Telegraph*. His next move brought him in touch with Lord Northcliffe and the *Observer*, which the latter had (1905) bought for £5000 and who now consulted G. on running it as a paying proposition. G. became editor with a share in the paper. Later Northcliffe wanted either to buy out G. or that G. should buy him out; but when Lord Astor bought the paper, G. was estab. in the editorial chair and his long career on the paper only ended in 1942. Throughout the thirty-five years of his editorship, his influence, at times great and never negligible, extended far beyond his own country; and by his own profession he was acknowledged as one of its leaders, and by readers everywhere as a political writer and biographer of the front rank. In 1910, for a brief while, he returned to his faith in Irish nationalism, but on the breakdown of the conference he called on the country to 'break with the dollar dictator' (i.e. John Redmond). He was editor of the *Tall Mall Gazette* 1912-15. An adverse critic of the treaty of Versailles. Editor-in-chief of the *Ency. Brit.* 1926-29. Pub. *The Economics of Empire* (1905); *Imperial Rectiprocity* (1903); *Tariff or Budget* (1909); and *The Economic Foundations of Peace* (1919). His *Life of Joseph Chamberlain*, planned in four large vols., three of which were pub., was an achievement comparable to John Morley's *Life of Gladstone*, and it goes far to clearing his subject of many of the calumnies and myths which had obscured his memory. But perhaps it is chiefly as the greatest of Brit. 'columnists' that he will be remembered, especially for his cogent style which seems to owe something to Carlyle, and which had an element of the showman in it—an element which, however, was well calculated to attract attention to what he had to say. When in 1912 his connection with the *Observer* came to an end he accepted Lord Beaverbrook's offer to contribute to the *Sunday Express*, but after a year returned once more to the *Daily Telegraph*. C.H. in 1941; honorary doctorates of Edinburgh and Durham Univs. were conferred on him. See Katharine Garvin, *J. L. Garvin*, 1948.

Gas and Gases. The word gas was invented by J. B. van Helmont (c. 1640) to describe the G. now known as carbon dioxide. It was formerly supposed that the word was derived from the Dutch *geest* (Ger. *Geist*), spirit, but that this is an incorrect view is shown by van Helmont's words: 'I have called this spirit *gas*, as it is not distinguishable from the Chaos of the ancients.' The term is now used to describe one of the three states of aggregation of matter. In simple language these three states of aggregation may be defined thus: 'A solid has volume and shape; a liquid has volume, but no shape; a gas has neither volume nor shape' (Sir O. Lodge). 'Vapour' is the term applied to a G., which by comparatively small changes of temp. or pressure may be liquefied. The first G. to be studied in detail was atmospheric air. It was possibly suspected in the seventeenth century by Rey and Mayow that the increases in weight which a metal undergoes during burning in air is due to a combination of the metal with some constituent of the atmosphere. The recognition of this important fact and its full significance was greatly retarded by the influence exerted by the phlogistic school (see phlogistic theory under *HISTORY IN CHEMISTRY*). The discovery of oxygen by Priestley and Scheele, and of nitrogen by Cavendish, failed conclusively to determine what happened during combustion, until these facts were interpreted by Lavoisier, who gave the first satisfactory explanation of the phenomena of combustion, and thereby estab. the principle now known universally as the conservation of mass. The early workers on the nature of Gs. (or 'airs' as they were then called) were Cavendish, Black, Scheele, and Priestley, and to their credit must be set the discovery of oxygen, hydrogen, nitrogen, carbon dioxide, oxides of nitrogen, etc., and the investigation of their properties. Towards the end of the nineteenth century sev. 'rare' Gs. (q.v.) were identified and isolated by Ramsay, Rayleigh, Travers, and other workers. These Gs. are argon (now used in G.-filled lamps), krypton, xenon, neon (familiar in advertising signs), and helium (found first in the sun and subsequently in the atmosphere and on the earth near radioactive springs). The properties of Gs. have been studied extensively, and the fruits of these investigations are (a) the atomic theory of matter, (b) the kinetic theory of matter, and (c) the electrical theory of matter. Dalton, Gay-Lussac, and Avogadro are associated with the important discoveries that led to the first theory; Bernoulli, Maxwell, and Clausius with the second theory; while J. J. Thomson and Rutherford are two of the most famous scientists associated with the discoveries that estab. the third theory. There are four fundamental rules or laws governing the behaviour of Gs., viz.:

1. **Gay-Lussac's Law.**—The volumes of reacting Gs. bear a simple relation to each other and to the volume of the resulting product.

2. **Boyle's Law.**—The volume of a given

mass of G. varies inversely as its pressure, provided that its temp. remains constant. Mathematically this is stated as follows: $PV = \text{a constant}$, where P is the pressure and V is the volume of the given mass of G. at the given temp.

3. **Charles's Law.**—The volume of a given mass of G. increases by $\frac{1}{273}$ of its volume at 0°C . for a rise of 1°C ., when the pressure of the G. is kept constant.

4. **Avogadro's Law.**—Equal volumes of all Gs. measured under the same conditions of temp. and pressure contain equal numbers of molecules.

The above laws apply to 'perfect' Gs. (see below) only. They are approximately obeyed at ordinary temps. and pressures by the so-called 'permanent' Gs., e.g. oxygen, air, hydrogen, helium, etc., that are only liquefied at temps. far below 0°C .

Kinetic Theory of Gases (q.v.).—The striking successes of this theory are (1) the explanation of the pressure, volume, and temp. relations of a G. mentioned above, (2) the determination of the sizes, speeds, and 'free paths' of the molecules of Gs., (3) the explanation of the phenomena of viscosity, diffusion, and conduction of heat in Gs., (4) the explanation of the specific heats of Gs., and (5) the interpretation of the laws of thermodynamics (q.v.). The mathematical calculations underlying this theory begin by postulating a *perfect gas*, viz. a G. whose molecules are assimilated to perfectly elastic particles of negligible dimensions that exert no force of attraction on each other. These molecules are in constant motion, and their velocities are only changed when they collide with each other. The molecules travel in straight lines between collisions. Subsequently the properties and behaviour of real Gs. are explained, and the following data give an idea of some of the results of this theory: (1) *diameter of molecules*: hydrogen 2.4×10^{-8} cm.; oxygen 3.0×10^{-8} cm.; nitrogen 3.2×10^{-8} cm.; helium 1.9×10^{-8} cm.; (2) *average velocity* at 0°C . of molecules: hydrogen 162,800 cm. per sec.; oxygen 42,000 cm. per sec.; nitrogen 45,400 cm. per sec.; helium 120,400 cm. per sec.; (3) at 0°C . and 760 mm. of mercury pressure, the number of molecules in 1 c.c. of a G. is 2.9×10^{19} . Some idea of the state of affairs in a G. may be gathered from the fact that a molecule suffers something like 8,000,000,000 collisions per second at normal temp. and pressure. The walls of the containing vessel are bombarded by the molecules of the G. and this bombardment accounts for the phenomenon of the pressure exerted by a G. At the absolute zero of temp. (see below) the molecules of every substance are at rest relative to each other.

Densities and Molecular Weights of Gases.—Since equal volumes of Gs. under the same conditions contain equal numbers of molecules, the densities are in the same ratio as the molecular weights. This principle of Avogadro furnishes a method of determining molecular weights of substances in the gaseous condition. If hydrogen be taken as the unit in determining densities, then since the molecular

weight of hydrogen is 2, the molecular weights of Gs. are twice the respective densities. In order to determine the density of a G. two methods are available: (1) by weighing a known volume of the G., (2) by measuring the volume of a known mass of G. The former method is the most usual, and is carried out by weighing a globe or vessel (whose volume is previously determined by weighing it full of water) full of the G. at a known pressure, and then reweighing it after it has been exhausted by means of a molecular pump. When the density of one G. has been determined, that of any other can be found by comparing its density with that of the first G. This comparison can be made very accurately by means of the micro-balance. The micro-balance consists essentially of a light balance beam delicately pivoted inside a glass vessel that has two outlet tubes attached to it and a manometer for measuring the pressure of the enclosed G. The beam itself has a solid piece of quartz fixed on one end and a larger hollow quartz ball on the other end, so that when the vessel is filled with a G., the upward thrust of the G. will be greater on the hollow ball than on the solid piece of quartz (Principle of Archimedes). The denser the G. the greater the difference between the upward thrusts on the two halves of the beam. The first G. is introduced, and the pressure p_1 required for equilibrium of the beam is recorded by the manometer. The vessel is then exhausted and filled with the second G., and the pressure of the latter is adjusted to p_2 , in order again to restore equilibrium of the beam. Hence at pressure p_2 the second G. must have the same density as the first G. has a pressure p_1 . Now Boyle's law tells us that if the temp. remains constant the pressure of a G. varies directly as its density. Hence the density of the second G. at pressure p_1 will be $d_2 = \frac{p_1}{p_2} d_1$, where d_1 is the known density of the first G. at pressure p_1 .

In order to determine the density of a vapour, Victor Meyer's method is used. It consists essentially in volatilising a small known mass of the substance, and collecting and measuring its volume by the volume of air it displaces from the apparatus. Vapour densities are of importance in determining the molecular complexity of substances. Hydrogen, chlorine, and nitrogen, for example, are shown to be diatomic, i.e. to contain two atoms in the molecule. Zinc, cadmium, and mercury, on the other hand, are monatomic. It is interesting to notice that in many cases the number of atoms in the molecule varies with the temp. In the case of sulphur, for example, the vapour density at 500° C. shows that there are six atoms in the molecule, whilst at 1100° C. there are only two atoms in the molecule.

Specific Heats of Gases (see SPECIFIC HEAT).—The first law of thermodynamics (q.v.) tells us that work (q.v.) may be performed at the expense of heat energy, and that the amount of work so performed is equivalent to the amount of

heat energy supplied to do this work. When a G. is heated it may expand and do work; in this case only part of the heat supplied will be available for raising the temp. of the G. As the G. may be allowed to expand in an infinite variety of ways, it follows that when a given amount of heat is supplied to a given mass of a G. its rise of temp. may be one of an infinite variety of degrees. In other words, a G. has an infinite number of specific heats. Two of these are of considerable importance, viz. the specific heat of a G. at constant volume and the specific heat of a G. at constant pressure. For hydrogen $C_p = 3.41$; $C_v = 2.40$, where C_p and C_v are respectively the specific heats of a G. at constant pressure and constant volume. For monatomic Gs. the kinetic theory of Gs. deduces that $C_p/C_v = \frac{5}{2}$; for diatomic Gs. $C_p/C_v = \frac{7}{2}$; for triatomic Gs. $C_p/C_v = \frac{9}{2}$. Although these theoretical deductions are made for perfect Gs., the success of the theory may be gauged from the following typical results for this ratio for Gs. that approximate to a perfect G. under ordinary conditions: argon (monatomic) 1.667; hydrogen (diatomic) 1.407; nitrous oxide (triatomic) 1.324.

Diffusion of Gases (see DIFFUSION).—Diffusion takes place more readily in Gs. than in solids or liquids, by reason of the greater velocities of the molecules in the gaseous state, and because the force of attraction between the molecules of a G. is exceedingly small. Graham's researches on the diffusion of Gs. led to the conclusion that the rate of diffusion is inversely proportional to the square-root of the density of the G. Hydrogen, being the lightest G., will diffuse most quickly, but when any Gs. are mixed together diffusion results in a uniform mixture of the Gs. In this way the noxious Gs. produced in industrial centres are rapidly distributed and the composition of the air is thereby maintained almost constant.

Liquefaction of Gases.—When a G. contained in a vessel is subjected to a continually increasing pressure, the volume may continually decrease, the contents remaining homogeneous, or a separation into G. and liquid may result. The deciding factor is the temp. It has been found that for every G. there is a temp., known as the *critical temp.*, above which it is impossible to liquefy the G. however much it is compressed. The behaviour of Gs. during compression is well illustrated by the case of carbon dioxide, which was studied exhaustively by Andrews. In the accompanying diagram the abscissae represent volumes and the ordinates pressures. The curves are known as *isothermals* (q.v.), and represent the changes that take place when carbon dioxide is compressed at constant temp. Reference to the diagram shows that when the G. was compressed at a temp. of 13.1° C., separation of liquid carbon dioxide began at a pressure of 48.9 atmospheres. Condensation continues without further increase of pressure until liquefaction is complete, after which the volume of the liquid decreases only slightly for a large increase of pressure.

Similar results were observed at 21.5°C ., but when the compression took place at a temp. of 31.1°C ., no abrupt changes of volume were noticed and there was no separation of liquid. Similarly at higher temps. no liquefaction takes place; indeed Andrews found that it was impossible to liquefy carbon dioxide at any temp. above 30.92°C ., which is therefore known as the critical temp. for this G. The pressure required to cause liquefaction at this temp. is called the *critical pressure*. Although the problem of the liquefaction of Gs. received early attention and the possibility of the liquefaction of air was vaguely hinted at by Lavoisier, the cause of the 'resistance' offered by the so-called permanent Gs. was not understood until the above critical phenomena had been explained. The early experimenters included Mouge and Clouet, who liquefied sulphur dioxide, Davy and Faraday, who liquefied chlorine, and Bussy, who in 1821 showed that when liquid sulphur dioxide was allowed to evaporate a much lower temp. was obtained. This observation has been of prime importance in later work on the liquefaction of Gs., for it has enabled experimenters to cool the 'recalcitrant' Gs. below their critical temps. when liquefaction can be obtained by compressing the Gs. sufficiently. Cailliet in 1877 liquefied oxygen and carbon monoxide by subjecting the G. to a pressure of 300 atmospheres, cooling it by evaporating sulphur dioxide, and then suddenly releasing the pressure. Pictet also succeeded in liquefying oxygen, and thought he obtained evidence of having prepared liquid hydrogen. Wroblewski and Olszewski in 1883 liquefied oxygen, previously cooled by liquid ethylene at -130°C ., and then liquefied hydrogen previously cooled by liquid oxygen. Many of the so-called permanent Gs. were also solidified. More recent work is that of Linde, Lampson, Dewar, and Kammerlingh Onnes. The same principle was adopted by each worker, viz. the G. is compressed and then cooled. After cooling it is allowed to expand by passing through a porous plug (Joule-Thomson effect), whereby the temp. is further reduced. The cold G. is used to cool more of the compressed G., and the process of cooling continues at 'compound interest,' until finally liquid is formed. The last G. to be liquefied was helium (Kammerlingh Onnes, 1908). It is interesting to note that this G. and other rare Gs. were isolated by the fractional distillation of liquid air. The following are the boiling-points of some of the so-called permanent Gs. under a pressure of 760 mm. of mercury: hydrogen -252.7°C ., oxygen -183.0°C ., nitrogen -195.8°C ., argon -185.7°C ., helium -268.0°C . Liquid Gs. are stored in Dewar glasses ('vacuum flasks'), which are double-walled, the space between the walls being evacuated in order to minimise conduction and convection of heat to the liquid, and the inner surfaces of the walls are silvered in order to prevent radiation to and from the liquid G.

Van der Waals's Equation.—The 'characteristic' equation for a perfect G.,

obtained by combining the laws of Boyle and Charles, is $PV = RT$; P = pressure, V = volume, R = a constant, and T = absolute temp. of the G. The value of R depends on the mass of G. under consideration; for a mass of G. equal to the molecular weight in grams it has the value 8.3×10^7 , where the volume of the G. is measured in c.c., and its pressure in degrees per sq. cm. T is measured from the absolute zero of temp., viz. -273°C ., the lowest possible temp., since the molecular velocities of all substances would vanish at that temp. Real Gs.—even the so-called permanent Gs.—only obey this equation approximately at ordinary temps. and pressures, whilst at temps. not far above their critical temps., or at high pressures, the deviations from the behaviour of a perfect G. are serious. This is due to two causes: (1) The molecules of a real G. are of finite size, (2) the attraction exerted by the molecules on each other is not zero. The importance of these two factors is relatively small when the pressure of the G. is small and the temp. is considerably above its critical temp., for then the volume occupied by the incompressible material (the molecules themselves) is very small compared with the volume occupied by the G., and the distance between the molecules is relatively great. A vapour is defined as a G. at a temp. not far removed from its critical temp., and its properties differ considerably from those of the perfect G. Van der Waals's equation is an attempt to obtain a characteristic equation for a real G.—an equation that will be true for all temps. and pressures, so that it does not differentiate between a G., a vapour, and a liquid, but attempts to account for the observed differences in their properties.

This equation is $\left(P + \frac{a}{V^2}\right)(V - b) = RT$.

a and b are constants for the G. We can compare this equation with that of the perfect G., viz. $PV = RT$, and interpret the term $\frac{a}{V^2}$ as representing the effect on the pressure of the molecular attraction resisting the expansion of the G. The constant b cannot differ considerably from the liquid volume: it is in fact equal to four times the total volume of the molecules. These terms are relatively unimportant at ordinary temps. and pressures for Gs. like air, hydrogen, etc., and hence these Gs. approximate to perfect Gs. under such conditions. Qualitatively van der Waals's equation has been successful in accounting for the deviations from the perfect G. laws, and for the existence of a critical temp. Its quantitative success is fairly good for carbon dioxide, but its success for other Gs. is not striking. Following van der Waals many attempts have been made to obtain a characteristic equation for a fluid, and of these the equations proposed by Clausius, Chappuis, Dieterici, and Loes are the most noteworthy.

Partington, *General and Inorganic Chemistry*, 1948; and Sir J. Townsend, *Electrons in Gases*, 1948.

Gas Authority, British. The authority set up under the Gas Bill, which was passed on July 30, 1948, to provide for the organisation of the entire Brit. gas industry under public ownership and thereby complete the gov.'s plans for the nationalisation of fuel and power. From the appointed day (May 1, 1949) the functions of gas undertakings were transferred to twelve area gas boards and all gas companies were to be dissolved as from the vesting date. The boards were set up to develop and maintain an 'efficient, co-ordinated, and economical system' for the supply of gas in their areas and the manufacture and disposal of coke. The boards also have power to manufacture and sell other products of carbonisation and to carry on any other activities 'which appear to be requisite, advantageous, or convenient, to the discharge of their duties, or in order to make the best use of their assets'. The boards have sole responsibility for fixing tariffs for the manufacture and distribution of gas and other products—subject to general directions by the minister of fuel and power. But in matters affecting capital development, research, training, and education must act in accordance with a general programme approved by the minister. The Act also provides for the setting up of a Central Gas Council to advise the minister, assist the boards to discharge their functions, and, when authorised by them, act on their behalf in matters of common interest. On the whole the council is more of an advisory body than is the Brit. Electricity Authority, the Gas Act providing for a greater measure of decentralisation. The council consists of a chairman and deputy chairman appointed from persons having experience of gas supply, industrial, commercial, and financial matters or the organisation of workers, and the chairmen of the twelve area boards. The chairman and vice-chairman of the council receive salaries of £6000 and £5000 respectively; the chairmen of the area boards £4500 plus an expenses allowance up to £500. Under the Act the G. A. took over more than 1000 statutory and non-statutory undertakings, including those of local authorities (which latter accounted for about one third of the nation's gas supply). The total compensation payable to gas companies was estimated at about £200,000,000, whilst local authorities were compensated on the basis of the net outstanding debts of their gas undertakings, these being estimated at £25,000,000. In addition £2,000,000 was made available for division between all local authorities affected as compensation for severance (i.e. estab. charges and overheads). Holders of gas securities receive compensation, not on stock exchange values, but on the income which could reasonably have been expected if the industry had not been nationalised, multiplied by a number of years' purchase agreed between the stockholders and the minister of fuel and power. Gas com-

pensation stock is a 3 per cent stock, dated 1900-95, issued at par and redeemable at par.

Gas, Coal, see GAS MANUFACTURE.

Gascoigne, George (c. 1525-77), Elizabethan poet and dramatist, the son of Sir John G. He was educated first at Canterbury and then went to Cambridge. On his return to London he became a student at Gray's Inn. He led a wild and reckless life, and was disinherited in consequence by his father. He then joined Sir Humphrey Gilbert and took service under the prince of Orange against the Spaniards. On his return he accompanied Queen Elizabeth on one of her royal progresses, and to celebrate the event wrote a masque entitled *The Princely Pleasures, at the Courts at Kenelworth* (1576)—his well-known satire in blank verse, *The Steele Glas*, appeared in the same year. This satire on the vices and foibles of the age shows monarchs, soldiers, prelates, merchants, and peasants as they really are, without flattery or idealisation, as in the crystal glass 'wherein all men choose to look.' He is also the author of the *Supposes* (1573), a trans. of the *Suppositi* of Ariosto and the earliest extant comedy in Eng. prose; *Jocasta* (1573), a version of the *Phœnix* of Euripides, the second earliest tragedy in blank verse; *The Glass of Government* (1575), and *Complaynte of Phylomene* (1587). Mention may also be made of his prose romance, *The Pleasant Fable of Ferdinand Jeronim* (1587), which, in its sentimental colloquies and alliterative style, is a forerunner of *Euphues*; *Dan Bartholomew of Bath* (1573), a kind of novelette in verse on the hero's passion for an inconsistent beauty, and the *Fruit of Follies*, in which Bartholomew reappears as the Green Knight—both being disguises of G. himself, and of *Certain Notes of Instruction concerning the Making of Verse or Rhyme in English* (1575), said to be the first attempt at a treatise on prosody in the language. He is, however, much more entertaining in undisguised verse narrative of his own experiences, as in the *Voyage into Holland* (1573), and *Dulce Bellum Inexpertis* (1575) the last named giving a vivid picture of his experiences in Flanders. His works were ed. by W. C. Hazlitt (1569-70) and J. W. Cunliffe (1907-10). See G. Whitstone, *A Remembrance of the well employed life and godly end of George Gascoigne, Esquire*, 1577 (ed. by E. Arber, with *The Steele Glas*, 1866); and F. E. Schelling, *The Life and Writings of George Gascoigne*, 1893.

Gascoigne, Sir William (c. 1350-1410), Eng. lawyer; eldest son of Wm. G., b. in Yorkshire. In 1397 he became one of the king's solicitors and was appointed attorney to the banished duke of Hereford. He was made chief justice of the king's bench in 1400, and in 1403 was commissioned to raise forces against the insurgent earl of Northumberland. The stories told about him, that he committed Prince Henry for contempt of court and that he refused to judge Archbishop Scrope on the ground that he had no

jurisdiction over spiritual persons, prove that he was regarded as a just judge, possessed with a high sense of the dignity of his office and indifferent, in the pursuit of his duty, to his personal interest.

Gascony (Fr. *Gascoigne*), old prov. in the S.W. of France. It derived its name from the Vasques, or Vascones, a Sp. tribe which crossed the Pyrenees about 580. It now forms the depts. Landes, Gers, Hautes-Pyrénées, and part of Basses-Pyrénées. Formerly it was a dependency of Guleenne, and its cap. was Auch. Part of it belonged to the sovereigns of Navarre, and it was united to France in 1598.

Gas Cookers. Among the earliest attempts to use gas for cooking were those of J. Sharp about 1835, when he constructed ovens heated by gas for baking. In one that he constructed for a Leamington hotel a dinner was prepared for a hundred persons.

The modern gas cooker is a very efficient and well-designed appliance, consisting of an oven and a hot-plate, with boiling and simmering burners and a grill. The hot-plate can be placed either above the oven or alongside it. Cookers can be free-standing or built into cupboard fittings. Thermostatic control of the oven gives precise reproducible cooking conditions and eases the cook's tasks. A low-temp. cabinet for keeping food and plates warm or for long-period slow cooking can be an integral part of the cooker or fitted independently of it. G. C. are finished in easily cleaned enamel with safety taps of chromium or plastic material, and ovens are well insulated to prevent heat loss. From 8,000,000 to 9,000,000 homes in Great Britain use gas for cooking.

Gascoyne-Cecil, James Edward Hubert, and Robert Arthur, see SALISBURY, MARQUESS OF.

Gas Engines are internal combustion engines (*q.v.*) using a gaseous fuel. The

in submarine engines. The first practically important gas engine was made by Lenoir in 1860. In construction this resembled an ordinary single-cylinder horizontal steam engine. Slide valves worked by eccentrics controlled the admission of air and gas and the escape of the combustion products to the air. As the piston moved forward it drew in an explosive mixture of air and gas, and at mid-stroke the inlet valve closed and the mixture was ignited by an electric spark. During the remainder of the stroke, work was done because of the rapid rise of pressure of the hot products, and simultaneously the products of a previous explosion on the other side of the piston were expelled. In the course of the backstroke the products formed by the explosion described were expelled, and a fresh explosive mixture drawn in on the other side, and so on. An indicator diagram from Lenoir's engine is shown in Fig. 1. The action takes place in the direction shown by the arrows.

FIG. 1. LENOIR CYCLE

The curve AB represents the gas and air being drawn in at an almost uniform pressure. Then there is a rapid rise of pressure as the mixture explodes, shown by BC; after which, while the products continue to expand, the pressure gradually diminishes, as shown by the curve CD. Finally the backstroke expels the pro-

first real gas engine was built in 1820 by Wm. Cecil of Cambridge, who used the explosion of a mixture of hydrogen and air in the cylinder to drive the piston. This engine did not achieve commercial importance, but it is interesting to note that during 1939-45 the Gers. used hydrogen peroxide as working substance

ducts at atmospheric pressure as represented by the horizontal line DA. On account of its excessive consumption of gas—nearly 100 cu. ft. per h.p. per hour (about five times the quantity used in a modern gas engine), due to the small expansion of the explosive mixture, and the low pressure on the piston—the engine was

soon superseded, though a number of Lenoir engines were actually in use for many years.

In 1866 N. A. Otto and E. Langen built a vertical engine with a cylinder open at the top, in which a heavy piston was forced up by explosion of a gas-air mixture at the bottom, and did work on descending by its own weight. This engine was not a success, but ten years later Otto made the first practical use of a cycle of operations suggested by Barnett in 1838 and worked out by Beau de Rochas in 1862. During the induction stroke a mixture of air and gas was drawn into the cylinder, compressed during the return stroke, ignited by a gas flame at inner dead centre, and driving the piston forward by expansion, the burnt gases being expelled during the return stroke. This is the 'four-stroke' or Otto cycle. The main features which gave this engine its superiority over all previously built, and which were clearly realised by Otto, are that compression precedes ignition, and ignition is accurately timed.

Fig. 3 shows the Otto cycle diagram. AB represents the first or charging stroke of the cycle, when the mixture is being

FIG. 3. OTTO CYCLE

taken in at what is practically atmospheric pressure. BC corresponds to the compression stroke. Ignition takes place at C, and the pressure rapidly rises as shown by the steep curve to D. DEF indicates the working stroke. From D to E indicates the ordinary expansion and consequent gradual fall of pressure. Towards the end of this stroke the exhaust valve opens, allowing the waste gases to escape, with the resultant sudden decrease in pressure, as shown by EF. So CDEF represents the full effect of the working stroke. Then as the piston moves back over the exhaust stroke, and gradually sweeps the chamber clear, the pressure falls back to the atmospheric level, as shown by FA.

The irregularity of motion arising from the fact that only one stroke in four is a power stroke may be partly overcome by using a large flywheel, or two or more cylinders may be used on the same crankshaft, and their action so timed that uniformly distributed impulses are given to the shaft, but in any case an engine working on the four-stroke cycle will have greater weight per h.p. developed than

one working on a two-stroke cycle. A two-stroke gas engine was invented in 1880 by Dugald Clark. Gas and air were mixed and slightly compressed in a separate cylinder (the 'displacer') and discharged into the working cylinder at the end of the power stroke, as the piston overran and uncovered the exhaust port-holes in the cylinder wall. Owing to the compression of the charge in the displacer the charge sweeps out the burnt gases. On the return stroke the piston covers up the exhaust ports, and the charge is compressed, ignition occurs at inner dead centre, the expansion drives the piston forward, and as soon as the exhaust ports are uncovered the new charge is drawn in. Against the advantage of the engine producing one power stroke in every two must be set the addition of the displacer cylinder, but this may be of comparatively light construction, as it deals with the charge at ordinary temp. and low pressure, just sufficient to sweep the combustion products out of the working cylinder. The fact that some of the incoming gases may be mixed with the exhaust and lost, is of minor importance when waste gases are used, as these are produced in large quantities at low cost. All modern G. E. work on either the four-stroke or the two-stroke cycle, and, in addition, may be single-acting or double-acting. In the latter combustion takes place on either side of the piston alternatively.

The temp. developed at the explosion in G. E. may reach 2000°C , and exceeds the melting-point of the iron used in the cylinder and piston. It is therefore necessary to enclose the cylinder in a jacket in which cooling water is circulated. But as heat is thereby extracted from the working substance the efficiency is appreciably reduced. Moreover steep temp. gradients are set up in the wall, from the explosion temp. to that of the cooling water, and, further, the cylinder wall is alternately heated (at explosion) and cooled (at expansion), and this temp. variation only penetrates a thin layer of the inner wall. This uneven and varying heating gives rise to cracks in the material and may lead to complete breakdown. Two methods have been suggested for dealing with this problem. In one method, due to Messrs. Crossley, a small spray of water is introduced into the cylinder during suction, the mist is converted into steam at the explosion thereby absorbing heat from the gases, but the steam also expands. Tests have shown an appreciable increase in efficiency over that of an engine working with water jacket only. The other method, suggested by Clark, consists in the injection of a further charge of air at the end of the suction stroke, thus increasing the compression without raising the explosion temp. Tests showed an increase in thermal efficiency from 27 per cent to 34 per cent.

The usual vertical or horizontal ball governors (see STEAM ENGINES) are used on G. E. in three different ways, acting on a lever which (1) cuts off the entire fuel supply for one or more strokes until

normal speed is restored ('hit and miss,' used on small engines only), or (2) cuts off part of the fuel (gas), thus reducing the thermal value of the mixture ('quality governing'), or (3) throttles the mixture on entering the cylinder, thus reducing the pressure. This is the method of 'quantity governing,' and is now used on all large engines.

Ignition of the gases was effected in the Otto engine by a gas flame admitted

80-300 r.p.m. Modern developments mainly concern the cooling and governing systems. Two types of continental two-stroke engines merit special mention, the Koerting double-acting engine in which the long piston acts as part of the valve gear by covering and uncovering the exhaust port as explained above, and the Bechthausen engine in which there are two pistons in the cylinder, moving alternately towards and away from

Crossley-Premier Engines Ltd

CROSSLEY-PREMIER 1500 B.H.P. GAS ENGINES IN DUPLICATE SET

This is the largest British-made set in the world, operating on natural gas, in Trinidad. Each engine has twelve cylinders arranged in four groups of three. Two of these groups are placed vis-à-vis fashion on each side of a centrally disposed flywheel, to the arms of which the rotating field of the 1000-kw. alternator is bracketed.

to the cylinder by a valve operated and timed by the engine itself. This method was later superseded by the hot-tube method, in which part of the gases pass through a short porcelain or platinum tube kept hot by a gas flame. Modern engines use ignition by electric spark, the spark gap being placed in the cylinder, and usually supplied by a high-tension magneto (see MOTOR CARS).

Starting of small G. E. can usually be done by hand, but for engines larger than 30 h.p. it is necessary to have some other means of starting. Some engines are started by introducing a small explosive charge, but more often a special compressor is used or the valves are so set as to make the engine start as a compressor.

G. E. are made in sizes up to about 3000 h.p., and usually run at speeds of

one another. The Fullagar engine works on a similar principle.

Gases, Nascent, see NASCENT STATE.

Gaskell, Elizabeth Cleghorn (1810-65), Eng. novelist, b. at Chelsea. She was the daughter of Wm. Stevenson, a Unitarian minister and keeper of the treasury records. Most of her youth was spent at Knutsford, Cheshire, and this quaint tn. supplied her with her material for *Cranford*. In 1832 she married the Rev. Wm. G., a Unitarian minister of Manchester, and the marriage proved a very happy one. In 1848 she became famous by the pub. of her novel *Mary Barton*, in which she reflects with insight and sympathy the life and feelings of the manufacturing working classes. The book was a

great success and was praised by Carlyle, Maria Edgeworth, and Landor. She was a friend of Dickens, and was intimately acquainted both with Carlyle and Thackeray. It was at Dickens's invitation that she wrote for *Household Words*, and in this paper appeared, from 1851 to 1853, *Cranford*, which, according to Lord Houghton, is 'the purest piece of humorous description that has been added to Brit. literature since Charles Lamb.' She has some of the characteristics of Jane Austen, and if her style and delineation of character are less minutely perfect,

ELIZABETH ELZHORN GASKELL

they are, on the other hand, imbued with a deeper vein of feeling. She was the friend of Charlotte Brontë, to whom her sympathy brought much comfort, and whose life she wrote (1857). Her other novels were *Lizzie Leigh* (1853), *Ruth* (1855), *North and South* (1855), *Sylvia's Lovers* (1863), and *Mr. Harrison's Confessions* (1865). Her last work was *Wives and Daughters* (1867), which appeared in the *Cornhill Magazine*, and was left unfinished. The fullest ed. of her works is that of C. K. Shorter (11 vols., 1900-19). See E. A. Chadwick, *Mrs. Gaskell: Her Life, Her Works, and Her Times*, 1910, and *Elizabeth Elzhorn, Mrs. Gaskell and Her Friends*, 1930; also lives by J. J. van Dulleman, 1924; G. A. Payne, 1929; A. S. Whitfield, 1929; and G. de W. Sanders, 1930.

Gas-liquor, watery fluid which, together with coal-tar (*q.v.*), forms the liquid product of the distillation of coal. This liquor, which separates as a layer above the tar, consists chiefly of a solution of ammonium salts, partly condensed from the hot gases and partly derived from the subsequent washing of the gas in the scrubbers. The carbonate and chloride are the most important of the salts present and occur to the extent of about 4 and 1.5 per cent respectively. Smaller quantities of the sulphide, thiosulphate, and sulphate are also present. G. was at one time the most important source of

ammonia from the commercial point of view. This product is obtained from it by decomposing with lime, and blowing over the ammonia with steam. If the sulphate, which is largely used as a fertiliser, is required, the gas is passed into sulphuric acid, and the salt crystallised out. Nowadays G. is of minor importance as a source of ammonia, which is mostly prepared synthetically from hydrogen and nitrogen.

Gas Manufacture. Gas is made by the destructive distillation of that variety of coal, rich in hydrogen, known as bituminous coal. A typical bituminous coal has the following composition: Carbon, 77 per cent; hydrogen, 5 per cent; sulphur, 1.7 per cent; nitrogen, 1.7 per cent; oxygen, 7 per cent; ash, 3.5 per cent; moisture, 3.4 per cent.

The products of the distillation of coal may be divided into three main classes: (a) Solids such as coke and gas carbon; (b) liquids consisting of tar and ammoniacal liquor; (c) gases consisting of the unpurified coal gas. The coal-tar contains, among many other bodies: (1) Benzene and its homologues, from which aniline, the source of coal-tar colours, can be derived; (2) carboxylic acid, from which picric acid, used as a dye and a powerful explosive, is made; (3) naphthalene, used for disinfecting; (4) pitch, extensively used for road-making. From the products obtained by the distillation of the tar (*q.v.*) many valuable drugs, perfumes, and colouring matters are obtained.

The gases may be divided into (1) light hydrocarbons, such as methane, acetylene, ethylene; (2) other combustible gases, such as hydrogen, carbon monoxide; (3) impurities such as nitrogen, hydrogen sulphide, carbon disulphide, and other organic sulphur compounds, carbon dioxide, ammonia. Of the last class, ammonia and hydrogen sulphide are completely extracted by purification processes, and frequently most of the organic sulphur compounds are also removed.

The series of operations involved in G. M. embraces the processes of distillation, condensation of the products of distillation which are liquid or solid at atmospheric temp., exhaustion of the uncondensed gas from the retorts, wet purification, by washing with water, dry purification, estimation of the volume of the purified gas, and distribution to the mains from which the customer draws his supply. From the accompanying diagram an idea of the order in which operations in G. M. are carried out, and the arrangement of the plant, can be gained.

Retorts. The distillation of coal is carried out by the following systems: (1) Horizontal retorts; (2) continuously operated vertical retorts; (3) intermittent vertical retorts or chambers; (4) coke ovens. Although in some large gas undertakings the last mentioned are now being installed for the production of tn. gas, they are mainly used for the production of hard coke for the steel industry, and most of the tn. gas supplied by the gas industry is made in horizontal or vertical retorts.

Horizontal Retorts.—These are made of fire-clay or silica; their cross sections are usually D-shaped, a form adopted on account of the large heating surface presented by the base and the fact that it remains unchanged after continued heating. To the open ends of each retort a cast-iron mouthpiece is bolted; this carries a socket to receive the pipe through which the gases pass after leaving the retort. The retorts are heated externally, being arranged in 'beds' of from three to twelve. Each bed of retorts has a separate furnace. The retorts are heated by the combustion of producer gas which is made by the passage of air through red-hot coke in a furnace or 'producer' placed below the bed of retorts. The oxygen of the air is

of coke. Formerly horizontal retorts were charged by hand, but they are now almost entirely effected by machinery operated by compressed air or hydraulic or electric power. Various types of machines are available for the purpose, some of which charge from one side of the retorts only, others charging simultaneously from both sides. In some of these machines the principle of the conveyor chain is employed, while in others, of the projector type, the coal is thrown into the retort from a rapidly rotating belt by centrifugal force. The coke is discharged from the retorts by means of a telescopic ram which enters the retort at one end, pushing the red hot coke out at the other.

Vertical Retorts.—Carbonisation in

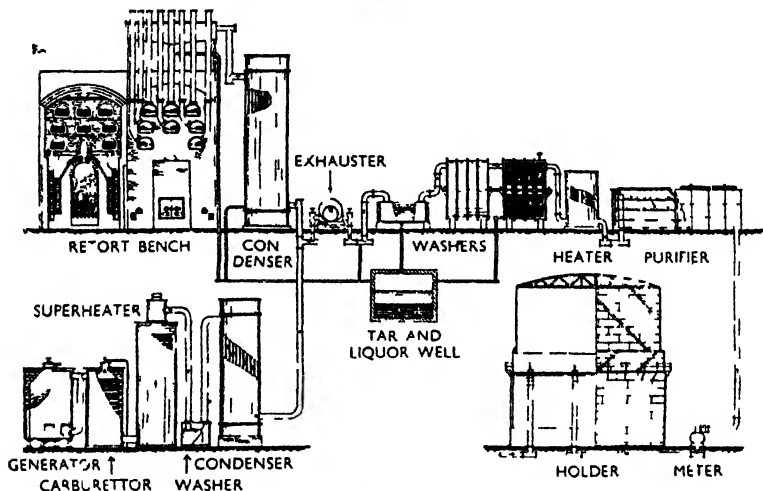

DIAGRAM OF A COAL GAS PLANT

The lower left hand position shows carburetted water gas plant, which is not always used.

converted into carbon monoxide, and the mixture of carbon monoxide and nitrogen enters the combustion chamber surrounding the retorts at a high temp., it is here supplied with sufficient air to complete the combustion of the carbon monoxide to carbon dioxide, a reaction which is accompanied by the evolution of a great quantity of heat. It is usual to have an admixture of steam with the primary air supply which forms carbon monoxide and hydrogen by contact with the hot coke. This system of heating possesses the following advantages. (1) A great economy of fuel; (2) a high temp., (3) a uniform distribution of heat around the retorts. In modern installations the heat in the waste gases is used to preheat the secondary air used for combustion of the producer gas in recuperators, thus effecting a considerable economy in fuel. With a modern recuperative setting it is possible to carbonise 100 lb. of coal by the use of only 12 lb.

vertical retorts may be continuous or intermittent. In the case of the former coal is fed continuously into the top of a retort by means of gravity, and is carbonised in its passage through the retort, coke being extracted by a slowly moving mechanical extractor at the base. As the coal is carbonised it swells considerably, and in consequence the retorts are wider in both dimensions at the bottom than at the top. The retorts in cross-section are either rectangular (e.g. Woodall-Luckham system) or oval (e.g. the Glover-West system) and are of various sizes to carbonise from 3 to 12 tons per day. The actual amount of coal passing through the retort depends upon the class of coal being carbonised and the calorific value of the gas produced. Steam is introduced at the base of the retort for the primary purpose of cooling the coke before it is discharged, but in so doing it produces water gas, thus increasing the gaseous yield. With continuous

vertical retorts there is great possibility of flexibility in output and calorific value through variations in the rate at which coal is carbonised and in the amount of steaming. Steam is generated in waste-heat boilers in which the heat of the waste-gases is utilised. Carbonisation in intermittent vertical chambers is not unlike that in horizontal retorts, except that coal is fed into the retort by gravity from overhead charging machines, and the coke is similarly discharged by gravity into a coke car, which is then cooled by means of water in a quenching tower. Intermittent vertical retorts or ovens are made in various sizes to accommodate charges of from 1 to 5 tons. Full accounts of various installations of continuous and intermittent vertical retorts may be found in the *Transactions of the Institution of Gas Engineers*.

Hydraulic Main.—The gas passes from the retort to the hydraulic main. This is a long horizontal tank supported above the top of the retort stack, through which is maintained a constant slow stream of water, the level of which is not allowed to vary. The ascension pipe dips about 1 in. into the water, which acts as a seal to allow any retort to be charged singly without the possibility of gas produced in the other retorts of the same bed escaping through the open retort. Some of the high boiling constituents in the gas condense in the ascension pipe, which must be periodically cleaned. In the hydraulic main, where the gas bubbles through water, condensation takes place to a still greater extent, and also solution of a considerable quantity of ammonia. The products of condensation form a black, viscous fluid of peculiar smell called coal-tar, which is a mixture of an extremely complex character. The tar, being heavier than the ammonia liquor, forms a layer at the bottom of the main, and the ammonia liquor is run off from the top of it at a constant rate into a storage tank. The gas leaves the main at a temp. of about 60° C., and is reduced to the temp. of the air by condensers which are air-cooled or water-cooled, or both. Water condensers are more efficient, because the degree of cooling can be better regulated with water than with air. The efficiency of a condenser is judged by the efficacy with which it removes naphthalene; this compound condenses to a white glistening solid, which causes great trouble when it is deposited in the works or distributing pipes.

The Exhauster.—Since the stream of gas has to work against the pressure of the seal in the hydraulic main, the pressure of the gas in the retort must be greater than the pressure in the combustion chamber surrounding it. Some of the gas would naturally percolate through the porous wall of the retort and be consumed in the chamber. The exhauster is a rotary gas pump, which serves the purpose of sucking the gas out of the retort and thus neutralises the effect of the water pressure. The exhauster also serves to force the gas through the purifying plant. The amount of gas produced is increased

through the use of an exhauster by about 10 per cent and, moreover, the quality of the gas is improved, because it leaves the heated retort more quickly. After leaving the condensers, the gas contains the following impurities which must be removed: (1) Hydrogen sulphide; (2) carbon bisulphide; (3) carbon dioxide; (4) ammonia.

Wet Purifiers or Washers.—These contain ammonia liquor through which the gas is made to flow in finely divided streams. The compounds hydrocyanic acid, carbon dioxide, and hydrogen sulphide are acidic, so they combine with the ammonia (a strong base) to form salts which are non-volatile. The greater proportion of these impurities are therefore removed. The final removal of the ammonia is effected in the scrubber or washer.

Dry Purifiers.—The final purification is effected by passing the gas over wooden trays made in the form of grids and covered with the purifying material. Oxide of iron, called bog iron ore, is used as the purifying agent. The oxide of iron removes the last traces of hydrogen sulphide. Sulphide of iron is formed, and the spent oxide is revived by exposing it to the air, the oxygen of the air displacing the sulphur from the sulphide. When the sulphur has accumulated to the extent of about 50 to 60 per cent the material does not suffer revivification on exposure to the air; it is then sold to manufacturers of sulphuric acid to be roasted in kilns for the production of sulphur dioxide. The gas passes from the purifier to the gas-holder where it is stored. In small gas-works the holder is a simple cylindrical vessel inverted in a tank of water. Large gas-works have adopted a telescopic cylindrical vessel, thus saving much ground space, as the same sized tank serves for a holder of much greater capacity than the simple form. The tankless holder consists of a tall cylinder or polygon in which the gas is confined by a large sealed piston which rises and falls according to the amount of gas in the holder. Such a holder gives the same pressure whatever the height of the piston. The holders of this type now constructed in Great Britain have an aggregate capacity of about 74,000,000 cub. ft. An advantage of these holders is that, not being stored over water, the gas does not go into the mains saturated with water vapour, as is the case with ordinary holders.

Gas for fuel or power is prepared by the incomplete combustion of coal or coke. There are two methods of producing gaseous fuel, entirely different in principle: (1) Air is passed upwards through a deep layer of red-hot carbon. The carbon combines with the oxygen of the air to form carbon monoxide, CO. The nitrogen of the air is unaffected, so the resulting gas consists of a mixture of carbon monoxide and nitrogen, with a small percentage of carbon dioxide, C₂. This mixture is called *producer* or *Siemens' gas*. (2) Steam is passed through the red-hot carbon, when the following reaction takes place, $C + H_2O = CO + H_2$. The mixture of CO

and H is called *water gas*, which evidently differs from producer gas in that it is wholly combustible. The reaction by which water is produced is endothermic in character, because the amount of heat required to decompose 1 gramme molecule of steam is greater than the amount of heat liberated when C combines with O to form CO. This explains why steam directed upon incandescent coke will produce water gas only for a very short time. The heat required for the reaction is absorbed from the hot coke which is cooled to such an extent that at first a gas of different composition from water gas is formed, and quickly the process ceases altogether. This difficulty is overcome by blowing air and steam alternately through the coke for periods of a few minutes each. During the first stage the carbon is converted into carbon dioxide, a reaction which liberates a large amount of heat. This heat is employed in raising the temp. of the remaining mass of fuel which soon attains the temp. appropriate for the reaction $C + H_2O = H_2 + CO_2$. This reaction, being endothermic, abstracts heat from the hot fuel which cools down, so that the process must be reversed by blowing air in, and so on. Hence in all processes for the manufacture of water gas, two alternating operations are involved: (1) The temp. of the fuel is raised to about $1200^\circ C$. by blowing a current of air through it; (2) steam is injected until the temp. falls to about $900^\circ C$. If the temp. falls below $900^\circ C$, the reaction $C + 2H_2O = CO_2 + 2H_2$ predominates.

Coal gas, water gas, and producer gas are all widely employed for industrial purposes, since they form clean, reliable, and easily manipulated fuels. By the Gas Regulation Act of 1920 coal gas is now sold not by the cubic foot as previously, but by heating power measured in therms (see also *BELLUR*). One therm is equal to 100,000 Brit. thermal units, i.e. it is the amount of heat required to raise the temp. of 100,000 lb. of water one F. degree. See A. Meade, *New Modern Gasworks Practice*, 1934, and A. Key, *Gasworks Effluents and Ammonia*, 1935. See also GAS AUTHORITY, BRITISH.

Gas Meter. The G. M. was invented about 1815 by Glegg. Consumers' G. Ms. are either wet or dry. The wet type has a measuring drum enclosed in a case containing water up to a level known as the water-line. The drum, which contains div. plates set at an angle, is caused to revolve by the gas pressing upon the surface of the water, arrangements being made to compensate for fluctuations in water level due to movement of the drum. The rotation of the drum spindle is communicated to a train of wheels and registered on dials.

The dry meter, which is much more extensively used, usually has a case of tinned iron, and is divided into one horizontal and two vertical compartments by div. plates. In each vertical compartment is a movable diaphragm with prepared flexible leather sides, thus making four chambers in the lower part of the meter. The gas enters and leaves the chambers

alternately through valves which are made to open and close at the correct time. The alternate expansion and contraction of the diaphragms, like ordinary bellows, by the pressure of the gas is communicated by levers and cranks to the recording mechanism. There are various forms of prepayment or slot meters for extending the sale of gas among the smaller consumers. By means of a simple mechanism attached to the meter, and operated by the insertion of a coin, an amount of gas appropriate to the value of the coin is allowed to pass through the meter, after which a valve closes until another coin is inserted. Meters, as tested under the provisions of the Gas Act, 1948, are stamped as correct when their registration does not vary from the standard by more than 2 per cent in favour of the seller or 3 per cent in favour of the consumer, a total range of 5 per cent.

Gas, Olefant. see ETHYLENE.

Gasolene is that fraction of petroleum boiling at about $115^\circ F$, and is used for burning in vapour lamps, as a fuel in internal combustion engines, and as a solvent in the arts. See PETROLEUM.

Gasometer, see under GAS MANUFACTURE.

Gasparri, Pietro (1852-1934), It. cardinal, b. at Ussita. Educated, Pontificio Seminary, Rome. Prof. of canonical law, Catholic Institute, Paris, 1880-98. In 1895 went to S. America as apostolic delegate, where he remained until 1901. Entrusted, 1904, by Pius X. with codification of canonical law. Cardinal, 1907; secretary of state, 1911. Conducted negotiations leading to treaty between Vatican and It. Gov., which was signed Feb. 11, 1929.

Gaspé Peninsula, E. section of the prov. of Quebec, Canada, between gulf of St. Lawrence and Chaleur Bay. It consists mainly of forest land and has good fisheries. Area 4450 sq. m. Pop. 41,000.

Gas, Poison, see CHEMICAL WARFARE.

Gas Poisoning, see under POISONS and RESUSCITATION.

Gasquet, Francis Aidan (1846-1929), Eng. historical writer, b. in London. He was educated at Downside College, Bath, and from 1878 to 1884 was superior of the Benedictine monastery and college of St. Gregory, Downside. Up to his death was the abbot-president of the Eng. Benedictines and president of the international commission for the revision of the Vulgate, in virtue of which he was created cardinal-deacon by Pius X. in 1914. On the occasion of his sacerdotal jubilee Pius XI. raised him to the dignity of cardinal-priest. He was the leading authority on pre-Reformation monasticism in England. His works include *Henry VIII. and the English Monasteries* (1888-89), *A Short History of the Catholic Church in England* (1903), *English Monastic Life* (1903), *Vita Antiquissima B. Gregorii Magni* (1903), *Henry III. and the Church* (1905), *Collectio Anglo-Premontrensis* (1908—vol. 1. had been previously pub. in 1904), *Parish Life in Medieval England* (1908), *The Greater Abbeys of England* (1908), *Monastic Life in*

the Middle Ages (1922), and *His Holiness, Pope Pius XI.* (1922). He ed. Count Montalembert's *Monks of the West* (1896).

Gassembdi, or GasSEND, Pierre (1592-1655), Fr. philosopher and mathematician, b. at Champtocé in Provence. He studied at Aix with a view to entering the Church, but abandoned the idea and took up the study of philosophy. He made an examination of the Aristotelian systems, and pub., in 1624, *Exercitationes paradoxicae adversus Aristoteles*, in which he protests against the acceptance of the dicta of Aristotle as final in all matters of philosophy. In 1615 he was made prof. of mathematics at the Collège Royal in Paris. While in Paris he wrote *De vita Epicuri*, a commentary on Diogenes Laërtius's tenth book, and *Synagoga philosophiæ Epicuri* (1649), which contains a complete sketch of the system of Epicurus. G. was a disciple of Bacon and on friendly terms with Galileo, keeping pace with the moderns in natural and physical science just as he referred to the ancients. His *Institutio astronomica* is a book on the science of his own day, while *Tychonis Braheii, Nicolai Copernici, Georgii Puerbachii et Joannis Regiomontani Vita* contains a complete hist. of astronomy down to his own time. See Huguerel, *Œte de Gassembdi*, 1737. His life is also given by Damiron, *Mémoire sur Gassembdi*, 1839. An abridgment of his philosophy was written by his friend, the traveller, Bernier (*Abregé de la Philosophie de Gassembdi*, 2nd ed., 7 vols., 1684). See also P. Fenzl, *Die Metaphysik Gassembdis*, 1908; P. Humbert, *L'Œuvre astronomique de Gassembdi*, 1936; and study by La Mothe-Vayer, 1943.

Gasset, Jose Ortega y, b. in 1883 and for some years prof. of the univ. of Madrid. Like so many of his univ. and literary contemporaries, he is considered to be one of the true inspirers of the Sp. revolution which came to a head in 1931. Six vols. of his collected essays bear the title *The Spectator*. In his review *La Revista de Occidente*, and in other works, he showed himself to be a sharp critic of the monarchical gov. and of the dictatorship in Spain. The best known of these books are *Meditations of Quixote* (1914) and *Invertebrate Spain* (1922, Eng. trans. 1937).

Gas Space Heaters. As a fuel gas is clean and produces neither smoke nor soot. No fuel storage space is required, nor is the removal of ash involved. A gas fire will give an immediate and flexible supply of heat; the temp. of a room heated by a gas fire can be kept under close control merely by the operation of the tap on the fire. Since a gas fire is normally fitted to a flue, it will promote adequate and positive ventilation of the room in which it is installed; a coal fire, on the other hand, needs a much larger flue to dispose of the smoke produced and, in consequence, causes a much higher rate of ventilation than is needed. This results very often in unpleasant draughts and an undesirable wastage of heat up the flue.

Most of the heat from gas fires is by radiation, but later types, called convectors

fires, produce in addition a certain amount of convected heat in the form of warmed air, which is directed into the room and which further increases the total heat output of the fire. Gas fires of both the radiant and convector types are designed to give an efficient and wide distribution of heat, the first type in the form of well distributed radiant heat, and the latter with an additional circulation of warm air. The output of heat from a gas fire, as compared with the heat input in the form of fuel consumed, is about 50 per cent in the case of the normal fire, and 60 to 65 per cent in the case of a well-designed convector fire. The modern gas fire is silent in operation, and requires very little attention to maintain it in good working order; it has radiants, which are much more robust than the older types. Automatic ignition is usually provided.

From an artistic point of view gas fires can be made to harmonise with any scheme of decoration. They may be designed to be fitted at hearth level or raised to a convenient height to form a panel nearly flush with the face of the wall. Small portable gas fires are also available to give local warmth by radiant or convected heat, or a combination of the two. These, as a general rule, need no flue. Another form of domestic gas heater is the flueless radiator, which either stands on the floor or is fixed to the wall; this heats mainly by convected warm air which gives a background of warmth to the whole house. Many premises of a commercial and industrial character are heated by gas convectors of a larger size than the domestic type, and also by overhead heaters of various designs which employ radiation to warm the occupants of the premises. Gas space heating appliances lend themselves admirably to automatic controls arranged to maintain the temp. of the premises at a desired level.

Gastein, valley in the prov. of Salzburg, Austria. Its two prin. vils. are Hofgastein and Wildbadgastein. Hofgastein is the cap. of the valley and also a watering place. Wildbadgastein is noted for its thermal springs.

Gaster, Moses (1856-1939), Rumanian philologist and Heb. scholar, b. at Bucharest, educated at Bucharest Univ. Lecturer of Rumanian language and literature at that univ. 1881-85, but exiled from Rumania for agitating on behalf of the persecuted Jews. In 1886 and 1891 he was lecturer at Oxford on Syriac and Byzantine literature; and in 1887 he was appointed chief rabbi of the Sephardic communities of England. Held Rumanian orders 'Bene Merenti' (1st class), for literary achievements. His earlier works include *History of Rumanian Popular Literature* (1883); *Rumanian Translation of the Hebrew Prayer-book* (1883); *Græco-Slavonic Literature* (1887); his later, *The Hebrew Version of Secretum Secretorum of Aristotle* (1908); *The Jewish Divorce* (1911); *Rumanian Fairy Tales* (1923); *The Samaritans* (1925); *Samaritan Eschatology* (1932); *The Manasse Book* (Eng. trans. 2 vols., 1934); and contributions to the *Ency.*

Brit. and Hastings's Encyclopædia of Religion and Ethics.

Gasteropoda (Gk. *gaster*, stomach, and *pod*, *poie*, foot), name given to one of the three large classes into which molluscs are divided and, as the name indicates, all its genera are characterised by the ventral position of the foot. Gasteropods are subdivided into Isopleura, symmetrical, and Anisopleura, unsymmetrical forms. The former contain the simplest and most primitive molluscs, such as *Chiton*; they are elongated in form, the mouth being at one end and the anus at the other end of the body; the pedal and visceral nervocords run parallel to one another the whole length of the body; and the gills, kidneys, genital ducts, and circulatory organs are bilaterally symmetrical. *Neomenia* and *Pronomenia* are small flat forms whose shells consist only of minute plates and spines in the skin; species of *Chetoderma* are more elongated and cylindrical, but their shells are also rudimentary; *Chiton* has eight dorsal shell-plates, fitted one behind the other. In the Anisopleura the head and foot are bilateral, but the viscera are twisted, bringing the gills, kidneys, and anus to the right side; the reproductive organ and genital duct are single. The free-swimming forms known as Heteropods sometimes acquire a superficial symmetry. The Streptonœura, as their name implies, are Anisopleura in which the nerve loop is twisted, owing to the asymmetry of the viscera already mentioned—they include *Patella*, the limpet, *Littorina*, the whelk, *Purpura*, the dog-whelk, etc.; the Euthœneura, or straight-nerved, include the Opisthobranchs, *Aplysia* (the Sea Hare), *Bulla*, *Loris*, *Colis*, etc.; and the Pulmonata *Helix*, the snail, *Arion*, the black slug, etc. Gasteropods are voracious animals, being furnished with powerful rasping organs which enable them to prey on other marine molluscs, while the terrestrial forms, such as snails, work havoc among flowering plants and vegetables; many of them—whelks, etc.—are used for human consumption and as bait. Fossil gasteropods occur in the Cambrian rocks, and many modern types have their origin in Cretaceous times.

Gaston de Fox, see FOIX and FOIX, GASTON.

Gastroctomy. This operation consists in 'cutting out the stomach,' that is, removal of part or the whole of the stomach wall for the purpose of excising an ulcer or a cancer. The operation of gastroenterostomy consists in making a passage from the stomach to the small intestine—in fact, short-circuiting the duodenum—so as to prevent the food passing over and stopping the healing of an ulcer of the stomach wall or duodenum. Gastrostomy consists in making a mouth to the stomach, and is an operation performed in order to prevent the food passing through the throat and gullet. Gastrotomy is a term incorrectly applied to laparotomy (cutting open the abdomen), meaning an exploratory operation inside the abdomen.

Gastric Catarrh, running or excess of

moisture (mucus) from the wall of the stomach. It is due to changes in the wall arising from the contents of the stomach, to injurious substances circulating in the blood, or to changes in the nerve supply.

Treatment.—As G. C. is caused or maintained by the food supply, a restricted diet or entire abstinence from food is indicated, and alcohol should be avoided. Discomfort may be prevented by sipping hot or cold water.

Gastric Juices, colourless acid fluid, secreted by certain cells in the stomach, containing enzymes and hydrochloric acid in addition to small amounts of organic and inorganic materials. The prin. enzyme, or ferment, present is pepsin, which is derived from a precursor, propepsin. The latter, on coming into contact with acid, is converted into the ferment which acts upon the protein of the food. Pepsin therefore can only act in acid solution, and both the ferment itself and the hydrochloric acid of the G. J. are secreted by special cells in the stomach. The amount of the secretion, and also its composition, is determined by the nature of the food. Pepsin acts on protein matter, converting it into soluble forms, albumoses and peptones, which are passed on to the intestine, there to undergo further change. Another ferment, rennin, is also present in G. J.; it brings about the clotting of milk by catalysing the change of caseinogen into casein.

Gastritis, see STOMACH; (in horses), see HORSE, Diseases.

Gastrolobium, a genus of leguminous plants, contains over thirty species, all of which are evergreen shrubs found in W. Australia.

Gastronomy, the science of eating, is inseparable from its application and is therefore an art as well as a science. The first gastronomical experiments were probably purely accidental, but for over three thousand years deliberate experiments have been made. The earliest gastronomists discovered that cooked fish and meat were more appetising than raw foods. More recent experiments have given us the *saucis tartare* with the sole, mint sauce with lamb, and red currant jelly with game. In the experimental field the Fr. have been the foremost gastronomists, and have discovered many attractive and unusual food combinations. Like most arts that of G. has frequently been debased, for at many periods in hist. it has degenerated into gluttony. For the consumer the best expression of the art is in the enjoyment of appetising dishes eaten with the fullness of appreciation that is accompanied by restraint. Modern G. as a science has to consider not only the combination of appropriate flavours, but also the food value of the dishes. This value is generally expressed in calories, the units of heat which may be supplied to the body by the food. It is estimated that a working man of average size needs from 2500 to 3000 calories per day, and tables have been prepared to show the numbers of calories to be obtained by given weights of various foods; for instance, a large egg

yields about 100 calories. Consequently in the preparation of menus for the day's meals, the foods have to be selected to give sufficient but not too much heat energy, and then by means of subtle flavouring and exquisite cooking the science and art of G. are combined. See also COOKING; DIET; FOOD AND FEEDING. See A. Brillat-Savarin, *Physiologie du goût*, 1825; Sir F. Colchester-Wemyss, *The Pleasures of the Table*, 1931; and E. and Lorna Bunyard, *The Epicure's Companion*, 1937.

Gastrula, in zoology an organism of which the stomachal cavity is the most prominent. From a physiological standpoint G. represents the simplest type with cellular differentiation. It appears in the development of almost all groups of the animal kingdom as a free swimming larva, and to which the adult sexually mature (Coelenterate) closely approximates. Amphioxus shows the development excellently. A hollow ball of cells (blastophore) suffers invagination of one part of its wall upon another, yielding a thin-bell-shaped G. in which the external layer of cells (ectoderm) and the internal (endoderm) surround a central cavity (arch-enteron) which communicates with the exterior by means of the blastopore or the orifice produced by the narrowing of the aperture of invagination. Haeckel believed that in G. he had found the stage common to the development of all cellular organisms.

Gas Turbine Engine, see under AERO-ENGINES and JET PROPULSION

Gas Water Heaters. Modern G. W. H. fall under two main headings: instantaneous and storage. In the former water is heated as it passes through the appliance; the supply is instantaneous and continuous so long as the hot-water tap is turned on. In the latter a quantity of water is heated and stored for use as desired. Single point instantaneous heaters serve one hot tap; multipoint heaters can deliver hot water to every hot tap in the home. They have a high thermal efficiency, but the rate of gas must be sufficient to provide the heat needed to cope with the rate of flow of the water. The multipoint heater is connected up to a cold-water supply, and to the hot-water pipes of the house. It incorporates a small pilot jet, and operates automatically by the opening and closing of the hot tap at bath, basin, or sink. A common type of multipoint heater delivers about two gallons of hot water per minute at bath temp. The provision of an automatic device prevents gas passing to the main jets should the pilot be extinguished. Bathrooms in which instantaneous G. W. H. are fitted must have adequate ventilation.

Storage G. W. H. can be subdivided into two types: the circulator and the self-contained storage heater. The circulator is designed for connection by external flow and return pipes to an independent storage cylinder which should be lagged, or it can be inter-connected with an existing system to work as an alternative to, or in conjunction with, a solid fuel boiler. In the latter case the existing storage cylinder is

used. The self-contained storage heater consists of a completely lagged storage vessel and a heating unit as one appliance and can, if required, be connected to an existing system to work as an alternative to a solid fuel boiler. In both cases the rate of draw-off is determined by the head of water available, by the bore of the draw-off pipe to, and the size of the tap concerned.

With storage water heaters water is heated until the full quantity is stored at the predetermined temp. in a tank or cylinder, which should be insulated; the gas consumption is then automatically reduced by thermostat to a rate sufficient to maintain the water at that temp. When hot water is drawn off the gas rate is automatically increased. Instantaneous and storage heaters are made in sizes to serve the kitchen sink or the whole house; some types provide hot or boiling water for kitchen needs. In the home gas is also used for heating the water in boilers and washing machines used for clothes washing. Large gas-fired plants provide hot water for commercial premises or heat the water in swimming baths. Specially designed heaters provide a continuous supply of boiling water for use in cafés, restaurants, etc.

Gatacre, Sir William Forbes (1843-1906), Brit. soldier, b. near Stirling. In 1898 he went to Egypt to command the Brit. brigade in the advance up the Nile for the recovery of Khartoum, and took part in the operations which ended with the capture of Omdurman. In the S. African war he made an attempt to seize the railway junction at Stormberg. The attempt was unsuccessful and G. was blamed by Lord Roberts for his want of judgment. In 1900 he failed to come to the assistance of the troops at Reddersburg and was recalled.

Gatchina, or **Gatshina**, see TROTSKY.

Gate and Gateway, military term of the Middle Ages which was used technically to denote the huge barrier which defended the outer entrance to a castle or fort. It was usually made of solid oak, and was swung by means of huge hinges inside an arched 'gateway'. Above the gateway was perforated stonework, through which might be dropped boiling pitch and molten lead on to the heads of the besiegers. The gateway was further defended by a portcullis which often stood down even when the gate was opened. Towers from which a flanking fire could be brought to bear on the attacking party also formed a further protection. The gateway usually stood on the brink of the moat and was still further protected by a drawbridge.

Gate of Tears, strait of Bab-el-Mandeb, in the Red Sea, so called from the shipwrecks associated with it.

Gateshead, municipal co. and parl. bor. of Durham, England. It is situated on the opposite bank of the Tyne to Newcastle, a tn. with which it is very closely connected. It is reached and served by the N.E. Region of Brit. Railways. The tn. has been very largely restored since the great fire of 1854, which destroyed a very large part of it. The riv. is bridged

in five places, and so connects the tn. with Newcastle. The Shipcote dist. in the centre of the tn. has many buildings noted for their architectural beauty; these include the Shipley Art Gallery and the Central Public Library. There is a fine grammar school, besides technical and art schools. The Queen Elizabeth Hospital (maternity and general wings), opened in 1943, and the Infectious Diseases Hospital, both at Sheriff Hill, provide the most modern hospital services. In Saltwell Park, 67 ac. in extent, G. has one of the finest tn. parks in the N. of England. The tn. has large iron works and foundries, shipbuilding yards, tanneries, and soap works. The industrial feature of the tn. is the Team Valley Trading Estate, of 700 ac., estab. by the gov. and planned for factory accommodation. It has its own internal railway connecting with the local railway station, and recreational centres, etc., for employees. It has attracted many new industries and assisted in the post-war (1945) industrial development of G. G. is thought by some to have been the Rom. military station of *Gabrosentum*, named in the Itinerary (*q.v.*). There has been some doubt as to the origin of the place-name, but it is probably derived from two A.-S. words meaning 'head of a road,' for it was literally the 'head' of the Rom. road that led from Chester-le-Street to Newcastle. G. was first mentioned under its modern name towards the end of the eleventh century, in connection with the burning of the church and murder of the bishop of Durham by the populace—a tragic incident which arose out of the murder of an Eng. nobleman who had protested to the bishop against the exactions of his tax-gatherers. The tn. obtained a charter from the bishop of Durham as lord palatine in 1164, and the common seal of the bor. is referred to in a charter of 1480, the inscription on which ant. charter was 'Sigillum commune de Gatyshedde.' Rivalry and disputes subsequently arose with Newcastle over fishing and trading rights, and in the reign of Edward VI. the two tns. were united for a short time. G. remained under the nominal headship of the bishop of Durham until the end of the seventeenth century. It became a parl. bor. in 1832 and a co. bor. in 1889. The tn. was not given an M.P. until 1832. Some damage was done to the tn. by bombing raids in the Second World War, chiefly to homes and small industrial concerns, but there were few fatal casualties. Pop. (estimated 1946) 113,400.

Gates, Horatio (1728-1806). Amer. general, b. at Malden in Essex, England. He took part under Braddock in the expedition to Fort Duquesne, which ended in disaster (1755). He escaped with difficulty and settled down in America. On the outbreak of the War of Independence, he sided with the colonists and quickly made a name for himself. He obtained the N. command and forced the surrender of a Brit. army at Saratoga (1779). He then aimed at the chief command of the Amer. Army. In 1780 he was badly defeated at Camden by Corn-

wallis, and as a result of a court-martial was superseded. He finally retired to Virginia, and thence to New York, where he d.

Gath, one of the royal cities of the Philistines. It was situated near the borders of Judah, and is held to be the bp. of Goliath. During the early years of the Lat. kingdom of Jerusalem it was fortified by the crusaders. It fell into the hands of Saladin in 1191, but was recaptured in the next year by Richard I. The exact site of the tn. is not now known, but Tell-es-Sail is supposed to occupy it.

Gatineau, riv. of Canada, a trib. of the Ottawa, which has its source in some lakes, situated in about lat. 48° N. and long. 75° 30' W. The direction of its course is chiefly S.S.W., and it eventually enters the Ottawa, after flowing 400 m.

Gatling, Richard Jordan (1818-1903), inventor of the Gatling gun, a species of machine gun. He was an Amer. citizen and an inventor of some note. He turned his attention in many directions and patented a sowing machine (for seeds) and a steam plough. In 1861 he patented his gun, which was of great service during the Amer. civil war, but was greatly improved in 1865. By means of a revolving handle a constant rifle fire was kept up from eight to ten rifle barrels which revolved on an axis.

Gatooma, one of the six municipalities of S. Rhodesia, is situated in the centre of a rich gold-mining area. It is the headquarters of the electrical supply commission and of the administration for the Hartley dist. Farming, cattle ranching, and pedigree cattle breeding are carried on, and a large cotton research station has been opened. The climatic conditions are specially suitable for maize, cotton, and tobacco growing. Pop. (white) 1500, (native) 4000.

Gatty, Margaret, see under EWING, JULIANA HORTATIA.

Gatty, Nicholas Comyn (1874-1916), Eng. opera composer, b. at Bradford, Sheffield, and educated at Downing College, Cambridge. Studied at the Royal College of Music (principally composition, with Sir Charles Stanford). For some years was organist at the Duke of York's Military School, Chelsea. Musical critic to the now defunct *Pall Mall Gazette*, 1907-14. His opera *Greysteel* was produced in Sheffield in 1906, and this was followed by *Duke or Devil* at Manchester in 1909. *The Tempest* was produced at the Surrey Theatre, London, in 1920, and *Prince Ferolan* (a Carnegie award) at the Old Vic in 1921. Other works: *Macbeth*, a tragic opera; *King Alfred and the Cakes*; and *Romance*, pianoforte waltzes.

Gatun, tn. in the Panama Canal zone, where part of the canal works are situated. A lake, in the vicinity, has been converted into a reservoir by the construction of the G. dam. The dam is 1½ m. long and ½ m. wide at its broadest point.

Gau, see GA.

Gauchos, name given to the inhab. of the pampas of Argentina. They are chiefly of Sp.-Amer. origin, but the strain is tinged with Indian blood. Their

horsemanship is superb, and they are also exceedingly clever with the lasso. The habits of the people themselves are sordid. Gambling and profligacy are rife amongst the male portion of the inhab., whilst the women are treated very badly. They are, however, externally polite and hospitable.

Gaudeamus, Lat. student song of very ant. origin. The name is derived from the first word of the song, 'Gaudeamus igitur, juvenes dum sumus' ('Let us then rejoice while we are young'). It is still extremely popular in the student world, not only in Germany, but in Scotland also. A modified version of an adaptation dating from 1776 appears in *The Scottish Students' Song-book*.

Gauden, John (1605-62), supposed author of the *Eikon Basilike*. He was b. at Mayfield, Essex, a place of which his father was vicar. He received his education at Bury St. Edmunds and later at St. John's College, Cambridge. He became chaplain to Robert Rich, earl of Warwick, who was one of the parli. leaders. At first his sympathies were with the Parliament, but the excesses of the advanced parliamentarians drove him to change his opinion. He became bishop of Exeter after the Restoration, and later became bishop of Worcester. His claims to the authorship of the work already quoted are not absolutely definite, but have much to be said for them. The authorship was, and still is imputed by some to King Charles I. See E. Almack, *A Bibliography of the King's Book*, 1896.

Gaudens, Augustus Saint-, see SAINT-GAUDENS.

Gaugamela, vil. in Assyria, situated near the ant. site of Nineveh and near the modern tn. of Mosul. The battle which is usually called Arbela was fought near here, and the tn. from which it receives its name is in reality some 40 m. further E. At this battle Alexander the Great defeated the Persians under Darius III., 331 B.C.

Gauge, term applied to the width of a railway track. The G. is different in most countries, and depends upon the measurements adopted by most of the railways. The measurement is made from inside to inside of the head of the rails. The chief measurements for the prin. countries of the world are India, 1 metre; 3 ft. 6 in. in parts of Australia and S. Africa, Egypt, and the Sudan; 4 ft. 8½ in. in Great Britain; 6 ft. in U.S.A. Tramway Gs. are usually 4 ft. 8½ in. Narrow G. lines are used for the sake of economy in preference to standard G., because the rolling stock is lighter and cheaper; more important is the fact that with the contraction of G. the engineer is able to sharpen his curvature, and thus, in rugged country, adapt his routes to the folds of the hillsides. High speeds, however, are not possible.

Gauging, art of measuring the amount of liquid in a receptacle, or the holding capacity of any vessel. In the wine, beer, and spirit trade special men are engaged to estimate the amount of stock in hand.

Gauguin, Paul (1848-1903), Fr. painter. An original artistic genius, influenced at

first by Cézanne and perhaps by van Gogh, with whom he worked at Arles. Spent his later years at Tahiti and elsewhere in the tropics, leaving many records on canvas of his life in 'a riot of light and vegetation, among a gentle people...'. Almost his whole life was a struggle against dire poverty, especially after he gave up a business career in Paris. He early married a handsome Dane, Mette Gad, whose ideals were very different, and whom he left with four children, and some paintings by more acceptable artists of the day which his wife was able to sell for about £400 in 1885. He continued to correspond with her, and evidently intended to return when he had earned enough to raise them above poverty. She and her relations are recorded to have had no faith in G.'s art, widely celebrated to-day. That art passed from impressionism to what G. called 'cloisonism,' an invention of his own. As an admirer remarked, G. 'Indulged in colour combinations of unsurpassed liberty.' The roads were red, the fields violet, tree-trunks green, and foliage yellow; yet 'the ensemble gives one a feeling of truth' (Raymond Cogniat, 1947). His debt to the work of Cézanne can be exaggerated, and belongs chiefly to the earlier canvases (see G. Macke, P. Cézanne). Nor did G. care for the expositions of his supposed theories. 'If others have favoured me with a system,' he wrote in 1897, 'I have none, and don't want to be accused of that.' Yet letters to his friend Montfroid, such as one eloquently describing his last important work—'D'oh venons nous! Quo sommes nous? Oh allons nous?'—show that he had a closely reasoned understanding of the product of his mind and hand. See also FRENCH ART. See lives by P. G. Rotonchamp, 1906; B. Becker, 1931; R. Burnett, 1936; and R. Cogniat, 1947; also *Lettres à D. de Montfroid*, ed. by V. Segalen, 1918, and *Letters to his Wife and Friends*, ed. by M. Malinque, 1948.

Gauhati, or Gowhaty, tn. of Assam, India, standing on the Brahmaputra, 70 m. E. of Goalpara. It is the cap. of the Kamrup dist. and the largest tn. in Assam, and, until superseded by Shillong in 1874, was the centre of Brit. administration. It is still an important trading centre, and is remarkable for the number of ruined temples, etc., in its vicinity. The temple of Kamakhya is a Hindu place of pilgrimage. Pop. about 10,000.

Gaul, Gilbert William (1855-1919), Amer. painter; b. at Jersey city, New Jersey. Associate, National Academy of Design, 1880; academician, 1882. Painted 'Indian Girl' (1880) and 'Old Beau' (1881). Speciality, battle-pictures—especially scenes from civil war, e.g. 'Charging the Battery,' 'Saving the Colors,' 'Battery H in Action' (in the Toledo Museum), 'Silenced,' 'Exchange of Prisoners' (in Democratic Club, New York), and 'Guerillas returning from a Raid.' Later pictures: 'Golden Prospects' (1910); 'Ration Day,' and 'Peace Conference' (1912).

Gaul, see FRANCE.

Gaulle, Charles de (b. 1890), Fr. soldier, b. in Lille, Nov. 22. His father was a prof. of philosophy and Fr. literature at a well-known Catholic college in the rue de Vaugirard, Paris. In 1910, after winning honours in his general education at the Collège Stanislas, he entered the military academy of St. Cyr. At twenty-one he passed out as second lieutenant, and was given a commission in the 33rd Infantry Regiment. His commanding officer was

Press Portrait Bureau

GENERAL DE GAULLE

Pétain (q.v.), then a colonel. Became a company commander in Pétain's regiment during the First World War. Fought at Douaumont (q.v.), Verdun, and was captured by the Gers. After the armistice he served as a major under Weygand (q.v.) during the 1920-21 Bolshevik campaign in Poland. Then he returned to St. Cyr as prof. of military hist. His success led to his being sent to the École de Guerre, the Fr. staff college, where he became aide-de-camp to Pétain, the commander-in-chief. In 1927, in conformity with Fr. service policy, he was returned to active duty as a commander of a light infantry battalion. Two years later he was sent on a secret mission to Iraq, Persia, and Egypt. In 1932, as general secretary of the Committee of National Defence, he reached a post from which he could propound his theories on mechanisation. In 1937, after a short course at the centre for advanced training, he was given command of the 507th Regiment of Tanks, from which he rose, with the rank of colonel, to command the tank

brigade of the Fifth Lorraine Army. On May 15, 1940, the day before he was allowed to demonstrate his theories on the battlefield around Laon, he became brigadier-general in command of the 4th Armoured Div. He then tried to induce Pétain, Weygand, and Reynaud (Prime Minister) to allow him to defend the Marne, the Seine, or Paris. Reynaud finally consented to let him establish his defences around Bordeaux, and the seat of gov. was moved there. But he was now fighting virtually alone. The Fr. Gov. had decided to capitulate. He strove to steel Reynaud's courage to continue the fight in Africa, and flew to London to ask for the necessary shipping. His request was granted, but it was too late. Reynaud had resigned, and de G. realised that the only place to continue the struggle for France was from London. He founded there a Fr. National Committee, over which he presided, and himself assumed the title of leader of all Free Frenchmen, and began to organise a Fr. Army and Navy in Britain. He failed in an attempt to seize Dakar, but was successful in bringing the Chad and Fr. Equatorial Africa over to the Allies.

He was commander-in-chief of the Fighting Fr. Forces controlled by the National Committee until 1943, when he became president of the Committee for National Liberation. After the entry of the Allies into Paris he became head of the Fr. Provisional Gov. and chief of the armed forces. The elections of 1945 confirmed him as president of the gov., minister of national defence, and head of the armies. In 1946 he resigned on the pretext that his task was ended. He re-entered the political arena in 1947 as leader of the Rassemblement du Peuple Français, an organisation which, though contesting national and municipal elections, did not describe itself as a political party, but was rather a coalition of individuals and parties opposed alike to socialisation of property and anti-clericalism. It included many disident members of the Mouvement Républicain Populaire, the original Gaullist party, which, however, continued its separate existence (see also FRANCE, History). The political platform of the Rassemblement du Peuple Français contained as its only firm plank the personality of de G. presented as the only non-Communist leader able and willing to restore order and discipline. This emphasis on 'order', combined with de G.'s frequent invocations of 'the glory of France', could not fail to invite comparison with Boulanger (q.v.) and with authoritarian and paternalist despots such as Pilsudsky, Franco, and Pétain.

His reputation as a professional soldier was enhanced by the pub. of *Vers l'armée de métier* (1934), in which he advocated a small highly trained professional army more nearly approximating to the *Reichswehr* of von Seeckt than to the large conscript army, predominantly infantry, on which the military traditions of the Third Republic rested. He favoured the concentration of armoured troops in armoured

divs. as against the general staff policy of parceling them out as army tank brigades in a supporting role, and his ideas on the tactical employment of armour were, ironically, most conclusively demonstrated by such commanders as Guderian in the Polish and Fr. campaigns of 1939 and 1940. His two most important military works are *Au fil de l'épée* (1932, Eug. trans. as *The Philosophy of Command*) and *Vers l'armée de métier* (1931, trans. as *The Army of the Future*). The latter is still regarded by some as the most important work on mechanised modern warfare. His predictions in this book were extraordinarily accurate, even to indicating the places where the Gers. would break through the Fr. lines in the war that was to come. But the traditionalists, brought up on the tenets of Foch and Joffre, were against him, and none would listen to his revolutionary ideas. Besides the above he has pub. *La Discorde chez l'ennemi* (1921) and *La France et son armée* (1938, trans. into Eng. 1945). See Barres, *Charles de Gaulle*, 1942.

Gaunt, John of, see JOHN OF GAUNT.

Gauntlet (Fr. *gant*, a glove) was the name given to a steel glove forming part of the armour of knights. The back of the hand, on such gloves, was made of plates joined together in order to allow of the closing of the hand. The phrase 'to throw down the gauntlet' is a synonym for issuing a challenge. 'To run the gauntlet' is a punishment where the culprit runs between two rows of persons, each of whom strikes him as he passes. The use of the word (i. here) is due to a mistaken derivation from *gallope*—Swedish *gala*, street, and *lopt*, a course.

Gaur, see GURU.

Gaur, species of bison found in most of the regions of India and Burma. The hill tribes have succeeded to a slight degree in domesticating it, but, on the whole, it is much more frequently found in the wild state. It is almost black in colour, and has a high convex ridge between the horns. The ears are large, but the animal has no dewlap. Often the bull attains a height at the withers of 6 ft., but the back slopes very much, so that it is much lower at the loins. The animal is very shy and is usually found in large herds.

Gaur, anct. city of Bengal now in ruins. It is situated on the R. Bhagirathi. From 1100 until the decline of the Muslim power it was the residence of the viceroys and kings of Bengal. It is about 70 m. E.S.E. of Bhagalpur. See G. H. Ravenshaw, *Gaur: its Ruins and Inscriptions*, 1878.

Gauss, Karl Friedrich (1777–1855), Ger. mathematician. He was b. of humble parentage at Brunswick and quickly attracted attention by his ability. In 1801 he pub. *Disquisitiones arithmeticae*. Six years later he became director of the Göttingen observatory, an office which he retained until his death. His work gave great impetus to astronomical observation and he did much work on the theory of magnetism. He erected an observatory free from iron from which he con-

tinued his researches on the subject of the magnetism of the earth, which had world-wide effects. He founded the Magnetic Association. The word 'gauss', unit of magnetic flux density (hence 'degaussing', in relation to the protection of ships' hulls against magnetic mines in the Second World War), is adopted from his name. Between the years 1863 and 1871 his works were pub. in 7 vols., and in 11 vols., 1870–1924.

Gautama, see BUDDHA AND BUDDHISM.

Gautier, Léon (1832–97), Fr. literary historian and paleographer, b. at Le Havre. From 1893 chief of the historical section of the national archives. As prof. at the École des Chartes he furthered research into the literature of the Middle Ages. His works include *Les Épopées françaises* (1865–68, 1878–97) and *Histoire de la poésie liturgique au moyen âge* (1886).

Gautier, Théophile (1811–72), Fr. poet, critic, and novelist, one of the most famous personalities of the nineteenth century. He was b. at Tarbes in the Pyrenees, but came to Paris while still a child, and was educated at the Lycée Louis-le-Grand and at the Collège Charlemagne. With the intention of becoming a painter he entered de Rioult's studio, where he remained two years. But he was a great lover of poetry, and Sainte-Beuve had just made known to the modern world the romantic writers of the sixteenth century—the poets of the *Pléiade*. The reading of these and of the writers of the new romantic school, especially Victor Hugo, raised G.'s enthusiasm to a high pitch. Pétrus Borel, struck with some verses he had written, introduced him to Victor Hugo, who found in G. something more than discipleship—a fervent fanaticism. Sainte-Beuve too was astonished by the work of this young writer, not yet eighteen, who already showed an almost unsurpassable gift of style, drawn very evidently from Marot, Ronsard, du Bellay, etc., whose tradition, abandoned by Mallherbe and those who followed, he now, with the new poetic school, determined to carry triumphantly forward. He threw himself with extravagant fervour into the movement and became an extreme opponent of the classic school. His defiance of conventionality led him even into grotesqueness of personal appearance—a cherry-coloured waistcoat, green trousers, grey overcoat lined with green satin, a luxuriant forest of black hair—this was the 'get-up' which he triumphantly describes as 'pas mal combiné pour irriter et scandaliser les philistins.' And indeed 'shocking the philistines' became one of his prime motives, to the detriment later of some of his work. He became one of a band of 'brigands de la pensée' calling itself 'Jeune-France.' In 1832 he produced his first long poem, *Albertus*, an extravagant theological legend remarkable for its perfection of style, its colour and imagery. Then followed *Comédie de la mort* (1833); *Les Jeunes-France* (an attack upon the 'faux romantiques'; 1833); and *Mademoiselle de Maupin* (1835), a novel which shocked public opinion by the

contempt for morality displayed therein. At this point G. became a journalist and for thirty years his chief work was that of art critic and *feuilletoniste*. In *Émaux et camées* (1852) G.'s style reaches its climax of perfection; here is seen, fully realised, that 'science of form' which was his religion. In these exquisite little poems in verse of eight syllables, the words have what he held they should always have, like precious stones, a beauty and a value all their own. It might be said of him that he did not abandon the career of a painter, but that he merely changed his tools. This feature is most pronounced in his collection *Émaux et camées*, in which everything is regarded from the point of view of the painter. 'Le style, c'est l'homme' is true of G.—his subject interested him far less than the form in which he presented it. He was not inspired by great ideas, he was an artist with a supreme love of beauty and great power of humour, irony, and charm. His theory and creed of the supreme importance of form in art at the cost both of sentiment and ideas was the side of G.'s work which inspired those who were later known as the Parnassians. If this doctrine was essentially false and harmful in its influence, G. certainly exerted a very wholesome influence on literature in liberating Romanticism from what was in danger of deteriorating into an over-subtle and morbidly introspective sentimentalism. His *Ménagerie intime* (1869) is an informal biography, full of grace and lightness of touch, in which his favourite cats figure delightfully. His other works include *L'ortuino* (1835); *Jettature, Une larme au diable* (1839); *Le Capitaine l'arçasse* (1843); *Spirite* (1866); *Travaux Montés* (1848) and other travels; *Illustration de l'art dramatique en France* (6 vols.) (1872); and the posthumously pub. *Histoire du romantisme*. His daughter Judith (1846-1917), who became the wife of M. Catulle Mendès, wrote novels in her name of Judith Gautier. See lives by D. Gay, 1857; H. Murzer, 1902; Helen Pitcher, 1922; R. Jasinsky, 1933; and A. J. A. Hot, 1933. See also H. van der Tuyn, 1933. *Libron psychologique esthétique et littéraire de Théophile Gautier*, 1933.

Gautland, see GOTHIC LAND

Gauze, cloth transparent fabric used for dress purp. The name is thought to have been derived from the fact that Gauze in Palestine was the place of its origin. The warp threads of the material are crossed between each thread of the weft which passes through a succession of loops in the warp. If the threads are kept apart, with no tendency to slide, and the transparent character of the fabric is maintained. Other materials have this gauze-like quality, e.g. muslin, etc. The gauze is most extensively carried on in France and Switzerland.

Gavarni, Paul (1816-81) Fr. caricaturist. His real name was Hippolyte Guillaume Sulpice Chevillier. He was b. at Paris and became a mechanical engineer, but he abandoned this profession and became caricaturist for *Le quart du monde* and *Le Charivari*. His work gradually assumed a more serious tone and there

entered into his caricatures a slight bitterness. He visited London in 1849, out of which visit came his work in *L'Illustration*. He illustrated also a number of books pub. about this time, amongst which may be mentioned the works of Balzac, Sue's *Wandering Jew*, and the Fr. trans. of Hoffmann's tales. See E. and J. de Goncourt, *Gavarni, l'homme et l'œuvre*, 1873; H. Brance and O. Uzanne, *Dauvignier et Gavarni*, 1906; and study by J. Robiquet 1932.

Gavazzi, Alessandro (1809-89), b. at Bologna and became a Barnabite monk. He became prof. of rhetoric at Naples and allied himself with the liberal policy of Pope Pius IX. He worked hard, with the papal sanction, amongst the people of Rome, and was appointed almoner-in-chief to the national army. After the fall of Rome G. separated from the church of Rome being after this date a strenuous advocate of the Italian Rite Church (Protestant). He visited England and Scotland and lectured there, as he did also in U.S.A. and Canada but his reception was the opposite of enthusiastic. He was associated with Garibaldi at Palermo serving him as chaplain in 1860.

Gavelkind, tenure in G., which is only met with in Kent, is a species of socage tenure dating from the earliest days of the feudal system of land holdings. The distinguishing characteristic of lands held in G. is that they descend not to the eldest son but to all the sons together. It was abolished by the Law of Property Act, 1925 (see also GUYARDINE, and cf. BOROUGHTON 1931-32).

Gaveston, Piers (d. 1312), Earl of Cornwall, son of a knight of Gascony and the favourite of Edward II. He was the foster brother of Prince Edward, and his great influence over Edward when he became king was the cause of much trouble at home. He was on one occasion made regent of England, but was finally banished. His return was the signal for an outbreak on the part of the barons, and he was captured at Scarborough by the earl of Pembroke and executed.

Gavle, or Gelle, a port of Sweden in the gulf of Bothnia at the mouth of the Gelle R., 93 m. N.W. of Stockholm. The town is situated on two islands as well as on the river-banks. It has a good harbour, there is an old castle and a fine town hall. The chief exports are iron goods, joinery, timber and wood pulp. It has shipbuilding yards and factories of machinery, tobacco, and cloth. Pop. 43250. The town has an area of 7600 sq. m. Pop. 276,900.

Gavotte, name of a Fr. dance, said to be derived from the Gavots, the inhab. of the Pays de Gap. The music of the dance is in common time, beginning on the third beat of the bar. It is in two sections, each of which is repeated. The classical composers often introduced Gs. into their suites.

Gawain (Welsh, *Gwalchmai*), one of the knights of the Round Table, nephew of King Arthur and son of Lot, king of Norway and the Orkneys. About 1150 William of Malmesbury speaks of G.'s

tomb in Wales and says he was king of Galloway. Then Geoffrey of Monmouth made his name famous, relating many of his exploits and the story of his death fighting for Arthur. He is here a most courteous and virtuous knight, and Wace, in his *trans.*, carries on this tradition and says that 'his worth was greater than he took credit for, and that he performed more than he promised.' In Chrétien de Troyes' continuation of the Anglo-Norman tales G. is still a model of all the knightly virtues, and he is the hero of a great part of *Perceval*. In the *Tristan* and *Lancelot* of a later period the 'gay, gracious and gude' knight becomes cruel, treacherous, and 'light o' love.' Malory, deriving his material from this source, and Tennyson, following Malory, present G. in this light. Some writers identify G. with the Irish hero Cuchullin (*q.v.*), and trace to Ireland this undeserved change of reputation, ascribing it to misconception arising out of the fact that G., whom tradition made to be a knight 'out of faerie,' as Chaucer puts it, was the champion of women and came from that part of the anc. Irish 'other world' called the 'Isle of Women.' See Jessie L. Weston, *The Legend of Sir Guinevere*, 1897, 1900; J. D. Bruce, *Evolution of Arthurian Romance to 1300*, 1923-24; and Columbia Univ. Press, *Celtic Myth and Arthurian Romance*, 1927.

Gay, Delphine, see under GIRARDIN, ÉMILE DE.

Gay, John (1685-1732), Eng. poet, b. at Barnstaple and educated at the grammar school there. He was apprenticed to a silk mercer in London, but having a strong taste for poetry and no aptitude for business, he was soon set free. Little is known of his life until 1713, except that in 1708 he pub. his first poem, *Wine*. From 1712 to 1714 he was secretary to the duchess of Monmouth. In 1713 he wrote *Rural Sports*, a georgic, which he dedicated to Pope, whose fame was by this time estab. This brought him the patronage and life-long friendship of Pope, with introduction into the company of wits associated with him: Arbuthnot, Swift, Bolingbroke, and Congreve. These friendships stood him in good stead ever after; all loved and helped the happy, simple-hearted, improvident 'good fellow and mediocre poet who was always suffering from the 'large promise with performance scant' of aristocratic patrons. In 1714 he pub. *The Shepherd's Week*, a series of pastorals written at Pope's request to satirise the pastorals of Anabrois Phillips. He also pub. the poems *The Fan* (1714); *Trimia* (1716, written with Swift's help); *The Wife of Bath* (1713), an unsuccessful comedy; *The What d'ye Call It?* (1715), a dramatic skit; and *Three Hours after Marriage* (1717), a play which was a complete failure. His *Fables* (1727, 1738) are his best work; they are little masterpieces of their kind. But the work which made him famous was a lyrical drama, *The Beggar's Opera*, first produced by Rich in London in 1728 and afterwards performed throughout the Brit. Isles, making 'Gay rich and Rich gay'

(see also LYRIC THEATRE). It is a satire on the corruptions of society. *Polly* (1729), its sequel, was prohibited, unacted. G. wrote sev. ballads; two of the best known are *Black-eyed Susan* and *Trous when the Seas were Roaring*. He lost all his money and spent the later years of his life in the home of the duke and duchess of Queensberry. He was buried in Westminster Abbey. The *Poetical Works* have been ed. by G. C. Faber (1926). See E. Curll, *The Life of Mr. John Gay*, 1733; W. Cox, *The Life of John Gay*, 1797; W. M. Thackeray, *English Humorists of the Eighteenth Century*, 1853; L. Melville, *Life and Letters of John Gay*, 1921; F. W. Bateson, *English Comic Drama, 1700-1750*, 1929; and P. F. Gays, *John Gay, His Place in the Eighteenth Century*, 1938.

Gaya, dist. and city of India, in the prov. of Bihar and Orissa, Bengal, and the Patna div. The city is 87 m. S. of Patna, and contains a high school, hospital, and printing presses (pop. 105,200). The dist. is 4712 sq. m. in area. Opium is the chief crop; mica mines are worked in the S.W. Other industries are the manuf. of brass utensils and black stone ware, the weaving of carpets and blankets, and the production of shellac. The grand trunk road traverses the S. and branches of the E. Indian Railway run to G. Pop. 2,755,300.

Gaval, or *Boz frontalis*, species of ox found in the highland regions of N.E. India. The animal is often found wild, but just as frequently in a semi-domesticated condition. Compared with the gaur (*q.v.*) it is a smaller animal, and its horns are much straighter. The forehead has no frontal crest. The G. and the gaur frequently interbreed.

Gay-Lussac, Joseph Louis (1778-1850), a Fr. chemist and physicist, was b. at St. Léonard, Haute-Vienne. In 1797 he entered the École Polytechnique, where he met Berthollet, who appointed him demonstrator to his class and assistant in the government works at Arcueil. In 1809 he was elected prof. of chem. at the École Polytechnique. In 1832 he was chosen prof. of general chem. at the Jardin des Plantes Paris. He is famous for his chemical and physical investigations. In 1804 he made a balloon ascent with Biot to ascertain whether the terrestrial magnetism ceased out of contact with the earth. In a second ascent he observed the regular decrease of pressure, temp., and moisture in the air. He also affirmed that the air has the same composition at the greatest height as at the surface of the earth. In 1804 and 1805 he made experiments with Humboldt and discovered that water is composed of oxygen and hydrogen in the ratio 1 : 2. He also made a study of other gases and pub. in 1808 his *Law of Volumes*. In 1811 with Thénard he discovered that potassium could be obtained by a purely chemical process. In 1813 he pub. some valuable information about iodine, and in 1824 he discovered and investigated fulminic acid, and also experimented in fermentation. He is also famous for his experiments regarding the

manuf. of sulphuric acid, glass, and chloride of lime. The more important of his papers are scattered through journals, often difficult of access. The most complete list of them will be found in the catalogue of scientific papers of the Royal Society. Two of his most important works are *Recherches physico-chimiques faites sur la pile* (1811) and *Cours de physique* (1832). Accounts of some of his discoveries and views are to be found in J. Thomson's *History of Chemistry* (vol. ii.), 1830; H. Kopp, *Entwicklung der Chemie*, 1871; J. B. Dumas, *Leçons sur la philosophie chimique*, 1878. See also P. Lenard, *Grosse Naturforscher*, 1929.

Gaza, Theodorus (1398-1478), Gk. teacher, b. at Thessalonica. Was teacher of Gk. at Ferrara, and afterwards prof. of philosophy in Rome. Later he was given a benefice in Calabria by Cardinal Bessarion. His most important work is one on Gk. grammar, pub. in 1495, and he also trans. Aristotle, St. Chrysostom, Theophrastus, and other writers.

Gaza, now called Guzzeh, was the most southerly of the five chief cities of the anc. Palestine. Situated about 3 m. from the sea, where the trade routes from Egypt and Petra met, G. was long an important fortress and trading tn. It is now cap. of the S. Prov. and is an airport. The prin. surviving monuments of G. are the orthodox church of St. Porphyry; the great mosque—Jami' al-Kebir—also originally a Christian church and restored after the damage suffered in an earthquake (1927); the Jami' al-Sayid Hashim, containing the tomb of Hashim; and the sanctuary of Abu al-'Azam ('father of strength'), with the reputed tomb of Samson. The Tel-el-Amarna tablets mention G. for the first time, and in biblical times it was the scene of many struggles between the Israelites and the Philistines owing to the fact that through the land of Peleshet the low-lying plain between Mt. Carmel and Egypt lay the only route practicable for armies between Egypt and Babylon. It was the Philistine tn. of which Samson carried away the gates (Judges xvi. 3). G. was famous under the Philistines for the worship of the fish-divinities Dagon and Derketo, who probably had Minoan affinities. Besides the main transit route from Egypt to Damascus an important route reached the sea at Gaza from the Yemen through the Hejaz; this, the frankincense route, was vital for G. because the immense demand for frankincense and myrrh could only be met in the one way, and when Alexander the Great took G. the booty included immense stores of frankincense in the city's warehouses. G. was then the largest city in Palestine and Syria. Although G.'s first traditional bishop was the Philemon to whom St. Paul addressed the epistle of that name, paganism continued almost up to the time of the Arab conquest. In 634 G. was occupied by the caliph 'Omar and became important to Muslims, partly because the prophet's grandfather Hashim (a direct ancestor of the Sherifian dynasty) is buried there, partly because it is the bp.

of Ibn Idris al-Shafi, the founder of the Shafi rite or school of Sunni Islam. During the Crusades G. was bitterly contested between the Saracens and the crusaders, but suffered a terrible blow in 1244, when the Christians and Muslims, in alliance, were defeated by the Khwarizmians. Under Rom. rule G. had been prosperous, being then called Miuoa, but its power began to decline in later years, until it was of no account in the fourteenth century. In the sixteenth century the Mamelukes were finally defeated here by the Turks, and in 1799 it was taken by Bonaparte. Finally it was the scene of two battles (March 26-27, 1917) between the Brit. and the Turks in the First World War, and was very largely destroyed by the Turks and by subsequent bombardments. It was occupied by Gen. Allenby's troops on Nov. 7, 1917. Of late years the cultivation of barley has caused a partial return of prosperity. It was made an episcopal see by Constantine the Great, and has a mission with schools of the Church Missionary Society, including a hospital. Recent (1930-31) researches by the Brit. School of Egyptian Archaeology estab. that the obvious site of G. would be at the mouth of the Wady Guzzeh, the estuary of which riv. is too malarial for permanent occupation. This site, the site of Tell-el-Ajjul, is practicable only in the rainy season, beginning Jan., and, according to Flinders Petrie, was occupied from the Neolithic to the Bronze Age, and appears to have been the old G. After the age of the Shepherd Kings, it was evidently abandoned like Ostia and the Gk. cities of S. Italy. Pop. 29,300.

GAZELLE

Gazelle, or Gazella, genus of antelopes, the majority of which are inhab. of the deserts of the Old World. They have narrow upper molar teeth, like sheep, and their muzzles are covered with hair. There is frequently a gland below the eye and the tail is rather short. The horns are generally compressed and lyrate or

recurved, or cylindrical and spiral with distinct rings for a considerable portion of their length. The Gs. are amongst the most elegant of all antelopes and are characterised by their sandy colour and a white streak on the side of the face from the base of the horn nearly to the nose. The genus is represented in S. Africa by the springbok.

Gazetteer. In modern Eng. this term signifies an alphabetical arrangement of place-names, in other words, a geographical and topographical dictionary containing more or less abundant information, comprising statistics, descriptions, and historical details. In the eighteenth century the word was used in the sense of a writer in the gazettes or newspapers (Fr. *gazetier*), and in 1703 the *Gazetteer's or Newsmen's Interpreter* was pub. by Lawrence Echard, followed in 1704 by a second part, called *The Gazetteer*. Although expressed by a new word, the idea was of ant. date, and considerable fragments of the sixth-century geographical dictionary of Stephanus Byzantius remain to this day. Echard's method was soon adopted by other compilers, viz. Bryce, who pub. his *Grand Gazetteer* in 1759, and Crutwell, with his *Universal Gazetteer* 1708. More modern works have now superseded these, including Longman's (*Times*), Blackie, Chambers, Lippincot, Jack, Oliver & Boyd, etc. etc. Foreign general Gs. are represented by Ritter's *Geog. Statist. Lexikon* (1808) and *Le Nouveau Dictionnaire de géographie universelle* of Vivien de St. Martin. Cassell & Mackenzie (1893) for Great Britain; Lewis, Wilson & Brabner for England and Wales; F. H. Groom for Scotland; and Lewis & Leggatt for Ireland, come under the heading of special Gs. Among foreign Gs. may be mentioned Neumann for Germany, Hunter for India, Allavilla for Italy, Semenov for Russia, Rosenberg for Sweden, and Weber for Switzerland, as also a series of departmental Gs. for France. In India alone the Brit. Gov. bore the cost of the compilation of numerous Gs. for the different states. Hunter's *Imperial Gazetteer of India* is on a magnificent scale, and remarkable for its accuracy. The individual states of the Amer. Union also have special Gs.

Gazna, see GHAZNI.

Gdansk, see DANZIG.

Gdynia, seaport of Poland, 12 m. N.W. of Danzig. It was estab. in 1920 as a port of the Polish Corridor after the First World War, and at once became a serious rival to Danzig. It commands 70 m. of Polish coastline, and was rapidly modernised. A quarter of a century ago Gdinger, as it was called, was merely a Pomeranian fishing vil. of no significance to Europe, well sheltered from the Baltic by the long sandy Hel Peninsula, with splendid bathing beaches. But, in 1924, after it had changed its name to G., and its nationality from Ger. to Polish, Polish engineers had effected a great change. Channels were dredged and a new large breakwater constructed, and part of the new harbour had been carved from the land itself, while

new docks were built and new quays equipped. G. now had a water area of 790 ac. and an ann. capacity of 7,000,000 tons. Rivalry with Danzig was now so intense that the authorities of Danzig sought to obstruct any transfer of traffic to the new port. Through the League of Nations they argued that as Danzig had been created a free city in order to provide Poland with a port, Poland's use of G. destroyed the basis of this provision and therefore there remained no reason for the continued separation of Danzig from the Ger. Reich. The League refuted these contentions, particularly on the ground that experience had taught the Poles that they could not rely on the impartiality of Danzig in an emergency. Moreover in G. as nowhere else the creative tendencies of modern Poland found their outlet and the tn. could justly be described as a reflection of the merits and faults of the present-day Pole. With the Ger. militarisation of Danzig, however, G. became directly menaced. G. was occupied by the Gers. in 1939, but was taken by the Russians in 1945. Pop. 120,000. See further under POLISH CORRIDOR.

Ge, see GEA.

Gean, see MAZZARD.

Gear-cutting, process of cutting teeth from a blank disk, as distinct from casting the gear-wheel in a mould.

Gearing refers to the apparatus which communicates the energy from one part of a machine to another. It may consist of toothed wheels, endless bands, or of friction rollers, etc. A description of the various gears used will be found under the articles dealing with the various types of machinery. The relative velocity of wheels in gear is proportional to their diameters. Thus if two wheels with diameters of 60 and 20 in. respectively be geared up, then the relative velocity of the latter to the former will be as 3 is to 1. Expressed as a formula we might put it that if N and N_1 represent the number of turns in a given time, and D and D_1 the diameters of the wheels making the revolutions, then $N_1 = D \cdot D_1$. The number of wheels

geared up together may, of course, be more than two; in which case the relative velocity is always considered as between the first and the last wheel in the series. The direction of motion of the last wheel will also obviously depend on the number of wheels in the system. Straight G., by means of spur wheels, generally, is used when the planes of motion are parallel. When the planes intersect, then bevelled G. by the aid of bevel wheels must be used. Further, if the planes neither intersect nor run parallel, i.e. are skew planes, then skew bevel wheels must be used, giving of course a skew bevelled G. The shape of the teeth on any wheel must be such that the friction caused by them, when in gear with another wheel, shall be as small as possible. The teeth are spaced, naturally, at equal distances apart, and this distance is known as the pitch. The pitch can be found by multiplying the diameter by π (roughly

3 1416 or $\frac{22}{7}$) and dividing by the number

of teeth. Thus, Pitch = Diameter $\times \frac{22}{7}$ Teeth

The teeth of a wheel may be made in any curve provided that the perpendicular common to the outlines of the teeth in contact passes through the point where the pitch circles touch.

Among other types of G. that may be mentioned are Helical G., in which the pitch surfaces are cylindrical or

For illustration

STRAIGHT GEARING

conical, and the teeth intersect the surface in helical lines. This is a modification of tooth G., which enables the wheels to work more smoothly than in the ordinary G. and greatly strengthens the teeth. For speed reducing, screw and worm G. may be used. In this the teeth of the wheel consist of portions of many screws. This is the worm which drives the wheel usually consists of from one to three complete threads. Thus for each revolution of a worm which has only one thread, the wheel would move just one tooth forward. So if the wheel has 100 teeth, then the worm would revolve 100 times to drive the wheel round once. A special form of G., known as Houldsworth's differential G., is used in spinning machinery for regulating the speed of bobbins. In reality it is only a special modification of bevelled G., consisting as it does of four equal bevel wheels mounted on axes to fit into each other. By an ingenious keying arrangement as the bobbins fill with thread the speed diminishes, so preserving a constant tension on the thread. Friction G., used in lifts and other places where a rapid connection is necessary, consists of rollers or wheels which are pressed together in the direction of the line joining their centres. Where a constant velocity ratio is desirable and when the pressure transmitted is great, pitch chain G. is used. This consists of a chain running in projections or sprocket wheels, which minimise friction. The pins forming the arrangement are provided with rollers. Various by the actions of these rollers have been proposed among which may be mentioned prophetic Keybold chains. Toothed ancestor usually made of brass, cast buried there, iron, although sometimes in

high speed G. raw hide teeth are used, and occasionally wooden teeth are employed. The rollers in frictional G., on the other hand, although sometimes made of iron, usually have at least one with an acting surface of wood, leather, or compressed paper. See also under MOROR GEAR, MOROR CYCLES; MACHINERY. See W. Unwin, *Elements of Machine Design*, 1877; Sir A. Kennedy, *Mechanics of Machinery*, 1886; C. W. MacCord, *Kinematics*, 1901; and H. E. Merritt, *Gears*, 1914.

Gebel-al-Tarik, see GIBRALTAR

Gebel, or Gebir, supposed author of certain works on alchemy and chem which are written in Arabic or Lat. So little is known of him that his existence has been doubted. He has frequently been identified with Jabir ibn Hayyan, a famous Arabic alchemist who lived at Kufa and Bagdad in the eighth or ninth century. His bp has been given variously as Kufa, Tarsus, and Harran in Mesopotamia, and some have asserted his death to have taken place in 776. But the Lat writings from internal evidence appear to have been written in the early part of the thirteenth century, and it has therefore been denied that a man of the name of G. ever lived. It is presumed that they were written by various hands. The chief writings which go under this name are *Summa perfectionis*, *Summa collectionis complementi secretorum naturae*, and *Liber investigationis*, which were trans into Eng by Russell in 1678. Recent researches on the subject have led to the conclusion that the Arabic works ascribed to Jabir ibn Hayyan must have been written about a century after the time of their supposed author. They are intimately connected with the doctrines of the Ismailite sect. The Lat works are not worthy as the clearest and most important of medieval chemical treatises. See E. Darmstadter, *Die Alchemie des Gebel*, 1922 and E. J. Holmyard, *The Arabic Works of Jabir ibn Hayyan*, 1923.

Gebhardi, Johann Ludwig Levin (1699-1764), Ger. historian, b. at Brunswick. His most important pub. is *Der Kaiser-pauschen Kaiser- und Königl. Häuser historische und genealogische Beschreibung vollständig ausgeführt* (1730-31). He also wrote *Reges Francorum Meritorum documentorum auctoritate asserti* (1736), and other works of a similar character.

Gebweiler, see GIBWEILER

Gecko, name given to all lizards belonging to the family Gekkonidae of the order Lacertilia, they are small in size, dull in colour, and the soft skin is covered with granular tubercles. Most of them have adhesive digits, which enable them to run along smooth, horizontal, or vertical surfaces with astonishing rapidity. Gs are found in nearly all hot climates, and in Egypt and India frequently enter houses, their name indicates the sound emitted by certain species. *Phyllodactylus* is the most widely distributed genus, *P. mauritanicus* being found in S. Europe. The individuals of *Ptychozoon* are remarkable for the web-like expansions which serve them as parachutes.

Ged, William (1690-1749), inventor of stereotyping, b. at Edinburgh, where he worked as a goldsmith. He patented his invention in 1725, when he entered upon a partnership with a London stationer, Jenner, and a typesetter, James. He stereotyped two prayer books for Cambridge Univ. (1731) and an ed. of Sallust (1744), but his enterprise was not successful. Consult a narrative by his daughter and a life by Nichols (1781).

Geddes, Sir Auckland Campbell, first Baron (b. 1879). Brit. prof. of anatomy and politician. His reputation rests on his organisation, during the First World War, of a scheme of national service. Prof. of anatomy at McGill Univ., Montreal, prior to the beginning of the First World War. In 1916 he was appointed director of recruiting, in 1917 chief of the national service ministry, in 1919 president of the board of trade. M.P. for Basingstoke and Andover from 1917 to 1920. Ambas. to U.S.A., 1920-24.

Geddes, Sir Eric Campbell (1875-1937). Brit. man of business and politician, b. in India; elder brother of Sir Auckland G. He went to America early in life to do railway engineering work. In 1906 he became general manager of the N.E. Railway Company and, in the First World War, was appointed deputy director-general of munitions and, later, director-general of military railways. He then entered Parliament, and became successively controller of the navy, First Lord of the Admiralty, and minister of transport. In the post-war Coalition Gov. he was entrusted with 'the axe' to cut departmental expenditure. In 1922 he left politics to become chairman of Dunlop Rubber Company and of Imperial Airways.

Geddes, Jenny, Edinburgh woman who, on July 23, 1637, hurled her stool at the head of Laud's bishop as he was going from the desk of St. Giles's to read the collect for the day, exclaiming as she did so: 'Dell cotic the wame o' thee, false loon, would you say mass at my beg!'.

Geddes, Sir Patrick (1854-1932), Brit. scientist and sociologist. Educated at the univs. of London, Paris, Edinburgh, and Montpellier; prof. of botany at Univ. College, Dundee. He wrote many important articles on biological and sociological subjects (including *Cities in Evolution*, 1913), and, with Sir J. Arthur Thomson, *Evolution of Sex* (1890). Held the chair of sociology and ethics at Bombay in 1919. He wrote *The Life and Work of Sir Jagadis C. Bose*, F.R.S. (1920).

Geel, com. of Belgium in the prov. of, and 27 m. E. of, the city of Antwerp. It is known as a colony for the insane, as feeble-minded people have from earliest times been sent here to be under the control of, and employed by, the citizens. There is an infirmary for the temporary accommodation of those in need of medical assistance. The tn. has a trade in dairy produce, has tanneries, breweries, and dye-works, and manufs. of woollen goods, lace, and tobacco. Pop. 22,200.

Geelaks, see GILYAKS.

Geelong, city in co. of Grant, on Corio Bay and Barwon R., Victoria, Australia.

Corio Bay has thirteen wharves, where ships of tonnage load and discharge; there are facilities for shipping wool and wheat to overseas markets, also large silos for bulk handling of wheat; connected by rail to all parts of the state. Industries include textile, cement, salt, rope and cordage, stoves, spirits, medicines, unbreakable glass, fertilizers, motor-cars, canneries, aerated waters, fibro-plaster and wool scouring works. The city contains a city hall, hospitals, orphanages, churches of all denominations, free public libraries, art gallery, gov. tourist bureau, six colleges, textile college, technical and high schools, law courts, fire brigade stations, theatres, large wool stores, wool exchange, and large woollen mills. There are many sporting arenas—Kardinia Park Oval, main football and cricket ground, accommodates 30,000. Johnstone Park, adjoining the city hall, is beautifully laid out, and contains memorial art gallery, band stand, and peace memorial. Well planned botanical gardens overlook the bay and the modern shark-proof swimming enclosure and children's pool. Electric trams and also buses run to the suburbs and beach. Pop. (including suburbs) 55,000.

Geeraardsbergen (Grammont), tn. of E. Flanders, Belgium, with a fifteenth-century tn. hall. A traditional fête called *Krakelingen en Tonnenbrand* (Crackers and Bonfires) is held on the first Sunday of Lent. Pop. 11,200.

Geer, Louis Gerhard, see DE GEER.

Geestmunde, see WESERMÜNDE.

Gegenbaur, Karl (1826-1903), Ger. comparative anatomist, b. at Würzburg, where he was educated. In 1855 he was appointed prof. of zoology and comparative anatomy at Jena, but after three years lecturing confined himself to the latter subject. From 1873 to 1901 he held a similar post at Heidelberg. He made his reputation chiefly on *Grundriss der vergleichenden Anatomie* (1874) (trans. into Eng. by F. Bell and E. Lankester, 1878). His publs. include *Lehrbuch der Anatomie des Menschen* (1883); *Vergleichende Anatomie der Wirbeltiere* (1898-1901); *Erlebtes und Erstrebes* (1902); and a short autobiography (1901). He ed. the *Morphologisches Jahrbuch* from 1875.

Gehenna (Heb. *Ge Hinnom*, valley of Hinnom), word used by the later Jews to designate a place of torment for the wicked after death. The valley of Hinnom is a deep, narrow gorge, a few miles S.W. of Jerusalem, where some of the later kings of Judah practised the 'Abomination of the heathen' (cf. 2 Kings xvi. and xxiii.; Jeremiah vii.). When King Josiah re-established the national worship of Jehovah, it became the cesspool of Jerusalem, where the bodies of criminals were burnt. Hence it came to be used as a symbol for hell. In the N.T. there is a clearly marked distinction between the state of the dead (R.V., 'Hades') and the place of punishment (R.V., 'Gehenna').

Geibel, Emanuel von (1815-84), Ger. poet, b. at Lubeck. He graduated at Bonn (1836), travelled considerably in the Grecian archipelago, and lived a quiet and studious life among literary friends in

various Ger. tns. In 1843 he received a royal pension, and in 1852 was appointed prof. of aesthetics at Munich by Maximilian II. of Bavaria. G. composed two tragedies, *Brünhild* (1858) and *Sophonisbe* (1868), and a comedy, *Meister Andrea* (1865). His fame rests chiefly in his lyric poems, which won him great popularity. These were pub. in *Gedichte* (1840); *Juniuslieder* (1848); *Neue Gedichte* (1856); *Spätherbstblätter* (1877); and *Gedichte aus dem Nachlass* (pub. posthumously), 1896. He trans. poems from Sp. and Fr. classics, in collaboration with Ernst Curtius, Paul Heyse, and others, and also wrote trans. from the Gk. and Lat. poets. An ed. of his collected works appeared in 8 vols. in 1884. His correspondence with P. Heyse was ed. by E. Petzet (1922). His biography has been written by K. I. Goedeke (1869); C. Litzmann (1887); C. Leimbach (1894); K. T. Gaedertz (1897); and A. Kohut, 1915. See also M. D. Prodels, *E. Geibel und die Französische Lyrik*, 1905, and B. Pompeck, *Heine und Geibel*, 1901.

Geiger, Abraham (1810-74), Jewish theologian, b. at Frankfort-on-Main. In 1832 he became a rabbi at Wiesbaden. He subsequently officiated as rabbi at Breslau (1838-63), Frankfort (1863-70), and Berlin (1870-74). He assisted in starting the *Zeitschrift für Jüdische Theologie*, and from 1862 till his death he ed. the *Jüdische Zeitschrift*. His pub. include *Uebersicht und Uebersetzungen der Bibel* (1857); *Siddurim und Phariseer* (1863); and *Das Judentum und seine Geschichte* (1864-71). See also by L. Geiger, 1910.

Geiger Counter, device for the detection and counting of fast electrified particles (e.g. from radioactive materials). The potential between two electrodes is just insufficient for a discharge to pass unless the gas between is ionized by the passage of a particle.

Geijer, Erik Gustaf (1783-1847), Swedish historian, b. at Ransäter, in Vermland. He was one of the founders of the Gothic Society (1816), was appointed a member of the academy (1824). His poetical works were of a high order and include *Såla Skalden*, *Fåkingen*, *Skaldestycken* (1835); *Odalbonden*, etc. His chief historical works are *Svea Rikes Häfder* (1825), intended to be a complete hist. of Sweden from the earliest mythical times, but of which only the introductory vol. was completed; and *Svenska Folkets Historia* (1832-36), a hist. of Sweden down to the abdication of Queen Christina in 1654. He ed. the papers of Gustavus III., which he left to the univ. of Upsala. His collected works were pub. in 10 vols. (1873-77) with a biographical sketch. See also by B. Malmström, 1848; J. Neilsen, 1902; H. Borelius, 1909; and J. Landquist, 1924.

Geikie, Sir Archibald (1835-1924), Scottish geologist, b. at Edinburgh, where he was educated at the high school and univ. In 1855 he received an appointment on the Geological Survey, and in 1867 became director of the Geological Survey for Scotland. After having

lectured in geology at the Edinburgh Univ. 1870 to 1881 he was appointed director-general of the Geological Survey of the United Kingdom and head of the dept. of practical geology in the London Museum. He was knighted in 1891, and received the Order of Merit in 1911. His chief pub. are *The Story of a Boulder* (1858); *Scenery of Scotland* (1865); *Memoir of Sir R. Murchison* (1875); *Text book of Geology* (1882); *The Ancient Volcanoes of Great Britain* (1897); *The Founders of Geology* (1897); *Scottish Reminiscences* (1904); *Landscape in History* (1905); and *Charles Darwin as Geologist* (1909). His autobiography, *A Long Life's Work*, was pub. in 1921.

Geikie, James (1839 1915), Scottish geologist, brother of Sir Archibald (4., also b. and educated in Edinburgh. He served on the Geological Survey of Scotland from 1861 to 1882, when he succeeded his brother as Murchison prof. of geology at Edinburgh. His writings include *The Great Ice Age in its Relation to the Antiquity of Man* (1874); *Historical Geology* (1875); *Prehistoric Europe* (1881); *Outlines of Geology* (1886); and *Structural and Field Geology* (1905). His literary sympathies are manifest in his excellent trans. of *Songs and Lyrics of Heine* (1847).

Geiler von Kaysersberg, Johannes (1445-1510), Ger. preacher, b. at Schaffhausen, and studied at Freiburg and Basle. He was a great pulpit orator and preached in the Strassburg Cathedral from 1478 till his death. His chief writings are *Das Narrenschiff* (1511); *Das Irig Schiff* (1510); *Christliche Pilgerschaft zum Ewigen Vaterland* (1512); and *Das Evangelienbuch* (1515). An ed. of his *Schriften* was pub. at Freiburg (1877-83). See biographical studies by L. Lecheux, 1876; W. Lindemann, 1877; and E. Roder von Dierburg, 1921. See also C. Schmidt, *Histoire littéraire de l'Alsace du quinzième siècle*, 1879.

Geisha, Jap. dancing or singing girl. The G. usually learns to dance when a child of about seven, and is contracted by her parents to a master or mistress for a period of three years; frequently poverty-stricken parents sell their children outright to the owners of "geisha houses." The G. is kindly treated and beautifully dressed by her patrons, who arrange for her public appearances at restaurants and tea-rooms, and themselves receive the profits. The dancing is mainly posturing and is without rhythm. One or more of the Gs. depict a story in dance, while others play upon the *shamisen* and sing the theme of the story. But with the adoption of European forms of entertainment the institution is dying out.

Geislingen, tn. of Württemberg-Baden, 17 m. N.W. of Ulm, with glass, iron, and metal works, and wood and ivory carving. Pop. 14,300.

Gela, anct. Gk. colony on the S. coast of Sicily, founded by Rhodians and Crotons in 960 B.C. It rapidly grew in importance, and in 582 founded the colony of Agrigentum. The colony became very prosperous during the rule of Cleander (505), and when his brother,

Hippocrates, became tyrant the whole of Sicily came under its sway. Under Gelon Syracuse was taken. Aeschylus was buried here in 456. The tn. was captured by the Carthaginians in 405, and was destroyed by Phalaris of Agrigentum in 280.

Gelasius I., pope (492-50), the successor of Felix III. He was a native of Africa, but the date of his birth is unknown. He was autocratic in his rule, sternly repressed Pelagianism, and removed the name of Acacius, bishop of Constantinople, from the diptychs. He succeeded in driving out the Manichaeans from Rome. On his death he was canonised, Nov. 18 being set aside in the calendar as St. G's Day. Sev. of his letters are extant, and also a treatise on the Eutychians and Nestorians, *De duobus in Christo naturis adversus Eutychen et Nestorium. Liber Sacramentorum*, and *Decretum Gelasii de libris recipiendis et non recipiendis* have erroneously been ascribed to him, though he may have written parts of the former. The classical definition of the relation between church and state was made by G. at the end of the fifth century. According to him, in Christian society the spiritual and temporal powers are entrusted to two different orders, each deriving its authority from God. Each of these powers is supreme in its own sphere, and within its own sphere is independent of the other power. Yet the two authorities are not completely separate. Both seek and serve the welfare of the same men and women, living in the same society. The principle is that while each is supreme in its own sphere, each is subordinate in relation to the sphere of the other. In spiritual matters the civil ruler is subject to the bishop; in temporal matters the bishop is subject to the civil ruler. See study by K. W. Grzelak, 1922.

Gelasius II., pope (1118-19), formerly John of Gacta. He succeeded Pascal II., but shortly after his election he was expelled from Rome by the Emperor Henry V., who set up an anti-pope, Gregory VIII. (Burdinus), with the help of the Normans. G. returned to Rome in July 1118, but was soon compelled to withdraw to France, where he d. in the monastery at Cluny.

Gelatine, substance derived from bone and cartilage by treatment with boiling water. It is allied to the proteins, and is yet different from them. It contains carbon, hydrogen, nitrogen, oxygen, and sulphur, is levorotatory, precipitated from solution by tannic acid, and readily undergoes putrefaction. The most characteristic property of G. is that of dissolving in water at high temps. and solidifying to a jelly on cooling. It is prepared mainly from bones, which are treated first to remove the fat, and then with hydrochloric acid to dissolve out mineral matter. The bones are then bleached with sulphur dioxide and finally extracted with water at a temp. of about 80° C. Impure G. is known as glue (g.r.), whilst the purest form is a fish-G. known as isinglass. G. is used for making soups and

jellies, in photography, for making substitutes for leather and ivory, and in many other ways.

Gelderland, prov. of the Netherlands, bounded on the S.E. by Germany, on the S.W. by the R. Maas, and on the N.W. by the Zuider Zee, with an area of about 1939 sq. m. The chief rivs. of this prov. are the Rhine, Yssel, Maas, and Waal. The chief occupation of the people is agriculture, and in some parts the soil is fertile, producing wheat, fruit, and tobacco, while the manuf. of cotton goods and paper is also carried on. This prov. was originally part of the Holy Rom. Empire, but after many vicissitudes was at the beginning of the nineteenth century divided between Prussia and Holland. The cap. is Arnhem, which was the scene of a great battle in 1945 between Brit. airborne troops and the Gers. For details of the fighting in the battle of Arnhem and at Nijmegen see WESTERN FRONT IN SECOND WORLD WAR. Pop. 1,019,700.

Gelée, or **Gellée**, **Claude**, see **CLAUDE**. **Gelimor**, king of the Vandals (530-34), was the great-grandson of Genseric. He was successful in deposing Hilderic in 530 and in obtaining the throne for himself. He was, however, defeated in 533 at the battle of Carthage, and his kingdom overthrown, he himself retiring to Galatia.

Gellert, **Christian Fürchtegott** (1715-69), poet, b. at Hainichen in Saxony. In 1751 he became a prof. at Leipzig, where he had been educated. His works are important as marking the dawn of a new era in Ger. literature, as they broke away from the formalities of earlier writers and prepared the way for Goethe and Schiller. His writings, particularly his fables, were popular even outside his own country. He wrote *Fabeln und Erzählungen* (1748-1751) and *Tagebuch aus dem Jahre 1761* (1863). His works were ed. by J. L. Klee (1839) and F. Behrend (1910). See J. W. von Goethe, *Dichtung und Wahrheit* (vii-viii.), 1811-22 (trans. 1897), and K. May, *Das Weltbild in Gellerts Dichtung*, 1928; and lives by J. A. Cramer, 1744; H. Döring 1833; H. O. Nietschmann, 1901; and F. Fleisshauer, 1923.

Gellert, Prince Llewellyn's dog, who was left one day in charge of the prince's child and was successful in killing a wolf who came to attack it. When Llewellyn returned and saw the blood he imagined that G. had slain his child, and immediately killed the dog. He then discovered his mistake when he found the child quite safe and lying under the cradle. A tomb stands to the dog's memory at Beddgelert near Snowdon. See W. R. Spencer, *Gellert's Grave*, 1850 (1); W. A. Clouston, *Popular Tales and Fictions*, 1887; and D. E. Jenkins, *Beddgelert, Facts and Folklore*, 1899.

Gellgaer, urb. par. near Cardiff, Wales. Excavations carried out in 1900-1 yielded further information on Rom. forts in Britain.

Gellius, **Aulus**, see **AULUS GELLIUS**.

Gellivara, see **GÄLLIVARE**.

Gelnhausen, tn. of Hesse, Germany. It stands on the Kinzig to the N.E. of Frankfurt, and on an ls. in this riv. may be seen

the ruins of a castle built in the twelfth century by Frederick Barbarossa. Pop about 4800.

Gelon, tyrant of Gela and Syracuse. He came of a noble family of Gela, of which city he became master in 491 B.C. as successor to Hippocrates. In 485 B.C. he became master of Syracuse and took with him to that city many of the inhabitants of Gela and Camarina. He refused help to the Greeks when Xerxes warred against them and gained a victory over the Carthaginians at Himera in 480 B.C. He died about 478 B.C. beloved by all his people.

Gelsenkirchen, city of Westphalia, Germany, about 5 m. N.E. of Essen. It is in the most important coal-mining district of the Westphalian Rhineland industrial zone, and is on the Ems and Rhine-Herne canal. There are large iron and steel works and glass and chemical in-

form. An essential property of a G. stone is a high degree of hardness, so that it may stand the abrasion to which it is subjected at the hands of the jeweller in order to render it an article of personal decoration. The more precious stones, such as the diamond, ruby, emerald, etc., possess this quality, in particular the first named, which is the hardest G. in existence. These rare and more costly precious stones are seldom, if ever, treated by engraving, their high value resting on their brilliance of sparkle and colour and lustre. Most G. stones are harder than quartz, though a few such as the opal, moonstone, and turquoise are inferior to it in hardness; but the degree of hardness of a precious stone is soon ascertained by the lapidary when cutting it.

Gravels and other deposits of a similar nature frequently contain G. stones, where

ANCIENT ROMAN RINGS SET WITH GEM STONES

dustries. Synthetic oil plants were established in preparation for the Second World War. It was so repeatedly and heavily bombed by the R.A.F. in 1940 that the Germans made efforts to transfer its factories to Germany or Poland. It was finally overrun by the Wehrmacht in the spring of 1945 (see further under WESTERN FRONT IN SECOND WORLD WAR). The neighbouring town of Buer was incorporated in G. in 1929. Pop. 332,500.

Gem (Lat. *gemma*, 'a bud' from the root *gen* meaning 'to produce' or 'precious stone'). Strictly speaking, the word G. is applicable only to such hard and precious stones as have been worked by engraving, but this is in its narrowest sense, and the word is applied to precious stones that have been cut and polished as jewels, such as the diamond, emerald, ruby, sapphire, etc., and it is sometimes extended even to include the pearl. The stones of the G. engraver are almost entirely confined to the variously coloured and striped varieties of chalcedony, quartz. The hard stone, usually known as onyx, is the chief material employed for cameos and seal engraving, and other stones, important from the G.-engraver's point of view, are jasper, agate, chalcedony, bloodstone, etc. The ancient Egyptians seem to have developed the art of G. engraving, and abundant remains of seals of high antiquity have come down to us. The scarabæus, or sacred beetle, was the form in which their early seals were cut, with the intaglio design engraved in a flat base, and the early Greeks and Etruscans followed this

they occur as crystals, or fragments of crystals, which have been reduced in many instances to the form of pebbles. The great majority of precious stones occur in a crystallised form, which form, however, is soon destroyed in cutting. Amongst the few ornamental stones which occur without crystalline form may be mentioned opal, turquoise, and amber. Although some stones, notably diamonds, are valued for their lack of colour (diamonds, of pure 'water') in most this is the prime element of attraction, and the beauty of many Gs depends entirely upon their colour, which, however, is often due to the presence of pigimentary matter, and is not an essential property of the mineral. Tourmalines and sapphires, for instance, are often partly coloured. The most common mineral pigments are probably compounds of iron, manganese, and copper. Exposure to light makes some stones change or lose their colour altogether, certain kinds of turquoise and topaz are particularly liable to this. Artificial light also makes some stones appear to change colour, as typified in sapphires and amethysts, which frequently acquire an inky, murky tint when displayed in artificial light. A cut stone depends largely on the amount of light reflected from its facets for brilliance, the light being reflected back or refracted from the facets at the back. The highest refractive power of any G-stone is possessed by the diamond. The peculiar lustre and fiery flashes exhibited by this stone are due to its high refractive index and dispersion. G-stones present variety

in chemical composition. The diamond is composed of one element only; ruby and sapphire are oxides; turquoise is a phosphate, and so on. In ancient times stones were held in esteem for their supposed medicinal and magical powers as much as for their beauty and rarity. For example, up to comparatively recent times the toadstone was worn for its occult power, and stones such as jade are often valued for a similar reason at the present day. Uncivilised peoples value small stones, especially those of a peculiar shape and colour, as amulets or charms. Many of the superstitions regarding stones have come down to us, and the belief in 'lucky' stones is prevalent even nowadays.

A considerable trade has been carried on in modern times in the making of artificial Gs. for jewellery purposes, and paste copies of existing Gs. are manufactured with comparatively little difficulty. The most famous maker of paste was James Tassie, a Scotsman, who settled in London in the latter half of the eighteenth century, and was successful in copying over 15,000 of the most famous and artistic Gs. of both ancient and modern times. He also produced a series of portraits in cameo, which were in great request at the present day and command quite high prices. Imitation stones are chiefly produced from a heavy glass lead of high refractive powers, and they are easily coloured by the addition of various metallic oxides.

Attempts to make diamonds artificially have been numerous within recent years, but with the sole exception of those of Henri Moissan, all have resulted in failure. The artificial diamonds manufactured have not been larger than microscopic specimens; but in lustre, crystalline form, density, and hardness they are identical with the natural stone. Artificially made but genuine rubies and sapphires have also been put on the market. They have been obtained by heating barium fluoride with alumina, in the presence of a trace of potassium bichromate in the case of rubies; and of cobalt oxide in that of sapphires. These synthetic Gs. are thus composed of the same elements as the natural rubies and sapphires, but experts in the trade can detect them readily by means of tests which would not occur to the layman, e.g. under a strong microscope round air-bubbles can be detected in the manufactured Gs., while, when present in natural stones, they are irregular in shape. A great many of these Gs. are made to-day in France, Germany, and Czechoslovakia to meet the demand for less expensive jewellery. They were produced as early as 1904 by the Fr. chemist Verneuil in his laboratory. Artificial pearls are made by inserting an irritant in the oyster-shell, and thus 'blister pearls' are produced. The cutting and polishing of Gs. is a difficult and delicate operation, and one requiring much skill on the part of the worker, especially when dealing with large stones, which may possibly be of great value. Small diamonds are often treated in what is known as 'rose' cut, that is,

the upper surface is shaped to triangular facets of nearly equal size throughout. Stones that are too thin to be cut as brilliants are often treated in this way.

See J. Wodjaski, *Book of Precious Stones*, 1909; Sir A. H. Church, *Precious Stones, considered in their Scientific and Artistic Relations*, 1913; H. B. Bridgman, *Gems*, 1916; F. B. Wade, *Diamonds*, 1916, and *Text-book of Precious Stones*, 1918; G. F. H. Smith, *Gem Stones*, 1923; C. W. Cooper, *Precious Stones of the Bible*, 1924; E. H. Kraus and E. F. Holden, *Gems and Gem Materials*, 1925; H. B. Walters, *Catalogue of the Engraved Gems in the British Museum*, 1926; M. Weinstein, *Precious and Semi-Precious Stones* 1930; and G. F. Herbert-Smith *Gemstones and their Distinctive Characters*, 1912, 1949.

Gembloux, tn. in the prov. of Namur, Belgium, 24 m. S.E. of Brussels. It was here that Don John of Austria defeated the army under Antony de Goignies in 1578. Pop. 4900.

Gemini (Lat. 'twins'), constellation and third sign of the zodiac. The sun enters this constellation at about March 20. This constellation derives its name from two bright stars in close proximity, a Gemminorum (of the first magnitude) and β (Gemminorum (of the second magnitude), known respectively from the time of classic antiquity as Castor and Pollux (q.v.). The feet of the twins are crossed by the Milky Way, and the constellation contains a fine star cluster, M 35. There are two or three notable double stars in G., notably α and γ Gemminorum, and a nova was photographically discovered on March 16, 1903, by Prof. Turner at Oxford.

Geminiani, Francesco (1680-1762). It. violinist and musical composer, b. at Lucca. He studied music under Scarlatti and Corelli, following the latter very closely. In 1714 he visited England, where he very quickly became famous. A few years later he went to Dublin, where he devoted his time to music, and later on returned to London, where he d. It is said of grief, owing to the loss of a MS. He is the composer of many concertos and sonatas.

Gemistus Pletho Georgius (c. 1335-1450). Gk. Platonic philosopher, b. at Constantinople. Founded a sect on the principles of Neoplatonism. His treatises on Plato and Aristotle and on Zoroaster were pub. posthumously. Works printed in J. P. Migne's *Patrologia Graeca*, clx. (1866). See W. Gass, *Gennadius und Plethon*, 1911, H. F. Tozer's article on Pletho in the *Journal of Hellenic Studies*, vii., 1886; and A. Rieckel, *Die Philosophie der Renaissance*, 1925.

Gommi Pass, mt. pass which crosses the Alps in Switzerland. It rises to a height of 7641 ft., and connects the canton of Valais with that of Bern. Near it, on either side, are the tns. Leukerbad and Kandersteg.

Gemsbok, or *Oryx gazella*, species of antelope which inhabits the desert regions of S.W. Africa. It stands about 4 ft. in height, and its general colour is greyish. The horns of the male animal measure

42 in. in length, while those of the female may reach 46 or 47 in.

Gem State, see IDAHO.

Gendarmes, originally a cavalry regiment of France, and up to the time of Louis XVI. served as the king's body-guard. After the Fr. Revolution their functions were necessarily altered, and they are now a military police, consisting of infantry and cavalry. They are a part of the army, although they are better paid than the rest of the army, and may be called out on active service if needed. They have various duties, among them those of policemen. In Palestine, after the First World War, the Brit. Gov. organised a Jewish and an Arab gendarmerie to keep the peace.

Gender, distinction made in grammar between words to indicate a difference of sex in the objects denoted by those words. As a general rule in the Eng. language this grammatical distinction agrees with the natural distinction known as sex. Thus names denoting the male sex are masculine G., those denoting the female sex feminine G., and those denoting inanimate objects are neuter G., that is, neither masculine nor feminine. These are cases of natural G., that is to say, the sex and G. agree. This rule is departed from, however, sometimes when inanimate things are personified, as when a ship or engine is made feminine, and the sun and time are made masculine. These are cases of grammatical G., sex and G. being different. In O.E., and also in Lat., Ger., and Gk., this grammatical G. is much more common, many inanimate objects being either masculine or feminine G., while in modern Fr. and other romance languages the neuter G. does not exist.

Gene, the theoretical unit of heredity (q.v.), as demonstrated by J. G. Mendel's experiments in the breeding of plants, 1865. See T. H. Morgan, *Theory of the Gene*, 1926.

Genealogy, word of Gk. derivation, denoting family. It is the science by means of which the descent or pedigree of a family may be ascertained. Though perhaps hardly of sufficient importance to rank as an independent science, it forms a very important part of hist., and there is a growing interest shown in matters pertaining to genealogical research. G. has formed the basis of all true hist. from the earliest times, and many of the old Gs. have arisen from the desire to explain the origin of the various groups included by them. The first Gk. records were those of ancestry, and a wide scope for G. was afforded by the progress of civilisation in states, and, more particularly, by the institution of corporations and guilds in tns. In modern times the laws of inheritance and the desire to assert the privileges of an hereditary aristocracy have combined to give G. its importance; more especially those laws of inheritance governing the descent of real estate. It is long, however, before Gs. are found in the possession of private families and scarcely one, though very distinguished, can trace its ancestors even to the middle of the eleventh century. Only after the close of the Middle Ages did Gs. multiply in

men's houses and become collected in vols., but from the sixteenth century onwards they are found in plenty in MSS. and printed vols. Antiquaries have, for some centuries, made G. a favourite study, and their researches have been of the utmost value to the historian and biographer. A host of works are occupied with the G. of Eng. noble families, at the head of which stands Dugdale's great works on the Eng. language. Genealogical research has made great advance during the last generation, and its study at the present time is growing rapidly, not only in England, but in the U.S.A., and, to a certain extent, in Germany. Much genealogical material has become available by the pub. of par. registers, marriage licence allegations, and such-like; and particularly the mass of evidence contained in the vols. issued by the Public Record Office. See H. F. Waters, *Genealogical Gleanings*, 1901; D. G. Jordan and S. J. Kimball, *Four Family Tree*, 1929; J. H. Round, *Family Origins*, 1930.

Genée, Adeline (Genée-Isitt) (b. 1878), Dan. *première danseuse*, b. at Aarhus, Jutland. A pupil of M. and Mme Alexander Genée; made first appearance as prin. dancer at Opera House, Copenhagen, 1895; *première danseuse* Royal Opera, Munich, at eighteen. First appearance in Empire Theatre, Leicester Square, Nov. 1897, in *Monte Carlo*. Left Empire Nov. 22, 1907. Retired from stage in 1914, but reappeared for charity sev. times during the First World War. At Alhambra, Leicester Square, Jan. 1916. President, Association of Operatic Dancing of Great Britain, March 1928. In 1916 London Univ. conferred on her the honorary degree of doctor of music.

General: 1. Title of a. officer in the Brit. Army who holds the rank next below a field-marshal. There are also other ranks bearing the title G., such as lieutenant-general and major-general, both of which are ranks below G. In some other armies there is a lower rank, brigadier-general. 2. In the Rom. Catholic Church the title is popularly given to the head of certain religious orders under the pope. To the G. all the members of the order and all the officials are responsible, and he holds office as a rule for three years, though in the case of the Jesuits it is for life. The G. is only responsible to the pope himself, and is accorded certain privileges in Rome, where he usually resides. 3. The highest official of the Salvation Army.

General Assembly, highest eccles. court in the Presbyterian Church of Scotland, Ireland, and the U.S.A. In the G. A. of the Estab. Church of Scotland sit representatives from each presbytery, from the univs., and from the royal burghs. This assembly meets every year in May, and sits for about ten days as a general rule. It contains both laymen (elders) and clergymen, and has judicial and legislative power, and cases brought from lower courts are settled in this one. It is also connected with the state, as a lord high commissioner always attends to represent the king. In the other Presbyterian

churches the G. As. are very similar, the only difference being in their constitution and in certain unimportant particulars.

Generalisation, term in logic and philosophy denoting the inclusion or grouping under one general head of a number of individual objects or persons, ignoring all incidental differences and minor qualities and considering them solely from the point of view of their common characteristics. In logic the genus is a higher class including the lower class or species. Hence it follows that the wider a G. is the less specific it becomes.

Generalissimo, title given to a man who is commander-in-chief of sev. armies having under him other commanders, or of sev. divs. of the one army acting separately. This name is only used on the continent of Europe.

General Paralysis, or General Paresis, consists in a gradual loss of power of mind and body. It mainly attacks adult males between the ages of thirty and fifty. The onset may be aggravated by monotonous mental occupation, anxiety, or mental strain, and often becomes more apparent after injury, but the primary cause in many cases is syphilis. It affects the face and speech, muscular power, and the condition of the eyes.

Insion.—The condition of the pupils is often one of the first symptoms to be noticed; they show diminished response to bright light, though still contracting when the eyes converge on a near object (Arnyle Robertson pupils).

Muscular power.—The gait becomes irregular, often resembling that of a drunken man, and in a late stage the muscles are so seriously affected that the patient is bedridden. The difficulty is particularly noticeable when the patient tries to walk, or even stand, in the dark, and when the eyes are shut. The speech becomes thick and indistinct, especially when pronouncing long words and complicated sentences, and a peculiar convulsive tremor affects the upper lip if there is the least excitement. The handwriting is also affected. The face becomes dull and apathetic, or absolutely fatuous. The mental affections are often amongst the first symptoms, and always occur sooner or later. Patients become granitose, and imagine themselves to be much richer or cleverer than they are, with consequent extravagance of ideas and expenditure of money. This is one of the most fatal and incurable forms of paralysis and mental affection, as recovery is of very rare occurrence. The course of the disease is apt to be prolonged, lasting from one to two, or even to ten or twenty, years. A prolonged course of anti-syphilitic treatment is indicated, until the Wassermann reaction becomes negative. Good results have also been obtained by raising the patient's temp. for a period, either by hot-air baths or by inoculating him with malaria.

General Staff, body of officers who direct the general training of the various armies, collect and distribute intelligence, prepare schemes of attack and defence, and are charged with maintaining the army in the highest state of general efficiency.

General Steam Navigation Company Ltd., shipping line which owes its origin to a group of steam packets which in 1820 plied between London and Margate. The company was founded under its present name in 1824. In 1842, when steamships had been greatly improved, Queen Victoria journeyed in the G.S.N.C. vessel *Trident* from Scotland to London. In 1902 the company became a limited liability company, and in 1909 it occupied the offices at 15 Trinity Square, London, where it is housed to-day. Between the two world wars offices were reopened or estab. in Germany, Holland, Belgium, France, and Italy. During the two world wars nearly all the company's vessels were engaged on war services, and many were lost. To-day the company maintains regular cargo services between the United Kingdom and most of the near continental ports, and also to the Mediterranean. It also operates, during the summer months, the well-known 'Eagle Steamers' which carry out day excursions from Tower Pier to Southend, Margate, Ramsgate, Clacton, etc. The company is part of the P. & O. group. In 1949 the company owned about fifty sea-going vessels, with a total gross registered tonnage of about 50,000 tons. See L. Cope Cornford, *Century of Sea Trading, 1824-1924*, pub. on the occasion of the centenary of the company, 1924.

General Strike (1926), see **STRIKE**, **GENERAL** (1926).

Generations, Alternation of, see **ALTERNATION OF GENERATIONS**.

Genesis (Heb. *bereshith*), opening word, the first book in the Pentateuch (the Torah).

Contents.—This tells of the creation of the world and of man; the full offering of the first sacrifices; the genealogies of the lines of Cain and Seth; the flood; the blessing of Noah, the div. of the races of mankind, etc. G. is really an introduction leading up to the legislative portions of the Pentateuch, gradually becoming more detailed until the descent into Egypt. It is occupied with the hist. of the Patriarchs from the calling of Abraham—in fact about four-fifths of the book is taken up with this—and more than half with Jacob and his family.

Sources.—Although the supply of the material for the construction of the book may have been largely drawn from myth (parable) and legend (tradition), it must not be forgotten that writing was practised by regular scribes long before the call of Abraham, and records on tablets of clay may have been in existence, giving an account of the events. We must either call upon the imagination or revelation for the account of the creation, and unless we deny the possibility of the latter we must regard it as psychologically the most probable.

Date.—Without assuming that Moses was the author, we find that many of the events of G. were well known to the earlier prophets, and the book may have been compiled during the literary activity of the schools of prophets in the days of

Samuel. While, however, everything points to a gradual process of editing, the exact time cannot be determined.

Authenticity.—While parable and tradition may have been freely used, we must not forget that the destruction of the records of the Hyksos kings of Egypt by the dynasties that succeeded them renders the want of all reference to the hist. of Joseph of little probative force, and, all things considered, the odds against Abraham and his allies at Damascus (a common objection) were hardly greater than those against the Gks. at Marathon. The order observed in the G. story of Creation need not be regarded as the actual chronological order of the creation of things.

Genet, Jeanne Louise Henriette, see CAMPAN.

Genet, see GENETTE.

Genetics is concerned with the origin of individuals, varieties, and species, and with the causes of similarities and differences between individuals and their ancestors. The term G. was suggested in 1906 by Bateson, who did much to establish and forward the study of the science by his careful observations and experimental work in connection with the breeding of plants and animals (see BREEDING and BOTANY).

G. is intimately connected with the study of heredity (see HEREDITY and BIOLOGY) and with cytology (see CELL), for its great problems are those of the ways in which offspring inherit certain characteristics and yet at the same time have individual differences. How these arise, how resemblances are contained in the egg, manifest themselves at various stages during development, and are again passed on to generations of descendants, are problems for the geneticist to solve. The elucidation of certain problems arising in the study of groups of individuals has been made possible by biometric methods. The science of G., which owes much to T. H. Morgan and his collaborators, reached its culmination in 1934, when the cytologist, Painter, of the Univ. of Texas, proved by ocular demonstration that the genes are in fact arranged in linear order along string-like chromosomes, as had long been surmised by geneticists on theoretical grounds as a result of their experiments in hybridisation. The manner in which the genes are passed on by the chromosomes is complex, but our understanding of it is remarkably accurate and complete. The main facts—the Mendelian 'ratios' (see MENDEL and MENDELISM), or proportions in which various kinds of offspring are produced, in all their complex variety—are as firmly based as any of the facts of biology. Results of research in G. have been successfully applied to eugenics, to scientific breeding, and to the study of evolution. It may be mentioned here that the study of G. (as the word is understood in the W. world) is forbidden throughout the Soviet Union, because one Lysenko recently denied the validity of the whole of G. and of the chromosome theory of heredity. In the early days of the Soviet regime G. was pursued as a matter of course, but

later the authorities explained to scientists that it was not their function to investigate, but solely to serve the material wants of mankind. This meant that scientific research would eventually be directed by politicians through their chosen scientists, one of whom was Lysenko. Lysenko, partly by reintroducing some old agr. practices as if they were his own discoveries and by using the language of dialectical materialism, so imposed upon the Soviet authorities that finally they handed over the control of biological research to him—despite his dismissal of the science of G.

See W. Bateson, *Problems of Genetics*, 1913; W. E. Castle, *Genetics and Eugenics*, 1916; E. B. Babcock and R. Clausen, *Evolution in Relation to Agriculture*, 1918; F. A. Crew, *Animal Genetics*, 1925; T. Dobzhansky, *Genetics and the Origin of Species*, 1941; H. Kalmus, *Genetics*, 1948; and H. Riley, *Genetics and Cyto-genetics*, 1948.

Genette (Arabic *jarnēh*), or **Genet**, name given to a genus of carnivorous mammals belonging to the Viverridae; they are allied to the civet, but differ in being smaller and in the comparative faintness of their musk-like odour. Their fur is soft and often beautifully marked, the general colour being grey. They range over the S. of Europe, Syria, and Africa. *G. vulgaris*, the common G., runs wild in France and Spain, and is sometimes domesticated and trained to kill rats and mice.

Geneva (Fr. *Genève*; Ger. *Genf*): 1. Canton in the S.W. of Switzerland, bounded by the lake of the same name, the canton of Vaud, and France. The Rhone and numerous mt. streams water the country, which is lush; but the soil has been made fertile by persistent cultivation. The chief industries are fruit-growing and the manuf. of articles of jewellery and clocks and watches. G. was admitted into the Swiss Confederation in 1815. Area 109 sq. m. Pop. 174,800.

2. City in Switzerland, cap. of the canton of the same name. It is of great antiquity and is mentioned in Caesar's *Commentaries*. It acknowledged Rom. supremacy in 120 B.C. In 456 it came under Burgundian sway, and was incorporated with the kingdom of the Franks in 534. G. is one of the most conspicuous places in Europe, owing to the celebrated part it has played in European civilisation as the centre of Calvinism. Calvin went to G. in the year 1536, and by his work there made it one of the chief religious centres throughout Europe. Since the end of the eighteenth century it has become the centre of a remarkable scientific activity. It is famous as having given birth to Rousseau, De Saussure, De Luc, and many other celebrated men, and its educational institutions and scientific collections are deservedly noted. Prior to 1847 G. was surrounded by walls, and its streets were narrow and ill drained; but after that year the tn. was entirely rebuilt in modern style. Its monuments are of no very

great magnificence, though it has some antique and picturesque buildings, and a fine statue of Rousseau is erected in its public pleasure grounds. It is also beautifully situated, the course of the Rhone through the town forming two is. The prin edifices are the cathedral of St Peter, the academy founded by Calvin and now converted into a univ., the fine theatre, ranking next in size to the Paris Opera House the Athenaeum and sev museums

tions in his *Nouvelle Heloise*, and Byron in *Childe Harold* and *The Prisoner of Chillon*. Mont Blanc, though 60 m distant, is visible from the lake, and is often reflected in its waters. At the upper end of the lake the Rhone enters it turbid and yellow, but at the tn of G leaves it limpid and azure tinted. It has many historical resorts on its shores which attract both tourists and winter residents.—Vevy, Montreux, Coppet, Ferney, etc

Swiss Federal Railways

GENEVA, WITH ROUSSEAU ISLAND

The snow covered peak on the left is Mont Blanc

notably the Museum of Natural Hist containing the Swiss archæological collections. An Institute of higher international studies was founded in 1927. It was chosen as the seat of the League of Nations, for which a magnificent new palace was built following the choice of designs, after an international competition held in 1927. The main block is in Ariana Park on the heights above Prégny. Mr Rockefeller's gift of 2,000,000 dollars for the library enabled the city to replan its promenades and parks. The former building was bought back by the Swiss Gov for 4,000,000 francs (Swiss). Its chief industry is the manu of watches, clocks, jewellery, and musical tocs in which articles it carries on a considerable retail trade. Diamond cutting and enamelling are also carried on to some extent. Pop 124,000.

3. The lake of G is situated between Switzerland and France, the larger portion belonging to the former country. It is in the form of a crescent and is 45 m long and 9½ m broad its total area being 225 sq m. At certain periods of the year the surface of the lake is subject to sudden rises and falls, probably due to differences of barometric pressure on different parts. These phenomena are known as *seiches*. Mirages are also at times observed on the lake. The S. kr shore has the Savoy Mts in the background, and is of a solemn and stern character, while the shore on the side of the Pays de Vaud has become quite a classic spot on account of its association with men of note. J. J. Rousseau men-

tions it in his *Nouvelle Heloise*, and Byron in *Childe Harold* and *The Prisoner of Chillon*. Mont Blanc, though 60 m distant, is visible from the lake, and is often reflected in its waters. At the upper end of the lake the Rhone enters it turbid and yellow, but at the tn of G leaves it limpid and azure tinted. It has many historical resorts on its shores which attract both tourists and winter residents.—Vevy, Montreux, Coppet, Ferney, etc

4. City of Ontario co, New York, U.S.A., situated on the N shore of Lake Seneca. It is the seat of the State Agric Experiment Station and of Hobart College (Protestant Episcopal) which was opened in 1822 also the William Smith College and the Smith Observatory. G was settled about 1787 near the site of an Indian vil and chartered in 1896. Gen Lafayette held a reception here in 1825. There are large nurseries, and manu of motors, engines, optical instruments, canned foods, etc. Pop 15,500.

Geneva (spirit), see GIN.

Geneva Conferences (Naval Disarmament) 1. Conference of 1927, the sequel to the Washington Conference of 1922 (q.v.). Like the latter it was initiated by the U.S.A. It met at Geneva in 1927 for the purpose of closing the gap left by the Washington Treaty, which dealt only with capital ships and aircraft carriers. The problem of cruisers, destroyers, and submarines, however, remained unsolved. Furthermore, the prospects of the Geneva

Conference were clouded at the outset by the refusal of France and Italy to send delegates on the ground that naval disarmament could not be discussed in isolation. Great Britain and the U.S.A. found themselves divided by an unbridgeable gulf: parity in tonnage, which was accepted by both, was not necessarily parity in fighting strength. Great Britain argued that her imperial interests required a large number of medium and small cruisers. Amer. interests demanded a relatively small number of large and heavily armed cruisers. To this demand Great Britain refused assent, and the conference broke down. Its sequel was the London Conference in 1930 (q.v.). See G. Engely, *The Politics of Naval Disarmament*, 1932.

2. Conference of 1932. After the London Conference of 1930 Britain and the U.S.A., both of whom had reduced their land forces to little more than token size, were concerned to find some way of reducing the world burden of armaments, and the unrest to which it gave rise. The chief impediment was France's unwillingness to reduce her armies without full guarantees of security; and the question was by this time further complicated by Germany's growing insistence on equality of rights in the matter of armaments. These were the factors which wrecked the Disarmament Conference that opened at Geneva in 1932. At this conference Britain and America advocated the restriction or elimination of offensive weapons, but could not agree as to what weapons came under that description. An Amer. proposal that all armaments should forthwith be reduced by one-third proved unacceptable. When the Ger. delegation angrily withdrew from the conference Britain was able to secure their return by inducing France to yield a grudging assent to Ger. equality in principle; but a Brit. proposal which tried to express this in exact figures was never accepted, and the conference was given its death-blow in Oct. 1933 when Hitler announced Germany's withdrawal not only from the conference, but from the League of Nations as well. See *Disarmament: a Review of the Acts of the League of Nations and of Governments of Deliberation and the Trend of Public Opinion and Action relating to the World Disarmament Conference of 1932* (Disarmament Committee, Geneva), 1932.

Geneva Convention. This convention or treaty was originally adopted at a national conference held at Geneva, Switzerland, in 1864, but was afterwards replaced by the convention of July 6, 1906, also adopted at Geneva. It was an international agreement, chiefly respecting the succour of the wounded in time of war, and it forbade all cruel methods of warfare. It was signed by twelve delegates from various countries, and later received the adherence of every civilised power excepting the U.S.A. In 1870-71, during the Franco-Ger. war, it formed a Red Cross Society, which was very prominent and helpful, the Geneva cross flag adapted from the insignia of the old

military Order of St. John being recognised as neutral. International conferences promoting the same objects were also held at Paris and Berlin. The adoption of the new G. C. of July 1906 resulted in a new ed. being adopted at the Peace Conference of 1907. The last G. C. (Oct. 1907) consists of thirty-three articles, under the following nine divisions: (1) wounded and sick, (2) medical units and establs., (3) personnel, (4) material, (5) convoys of evacuation, (6) the distinctive emblem, (7) application and carrying out of the convention, (8) prevention of abuses and infractions, (9) general provisions. The principles of the G. C. were, by the Hague Convention of 1899, extended to naval warfare. See J. B. Scott (ed.), *The Hague Conventions and Declarations of 1899 and 1907*, 1918, and A. R. Werner, *La Croix-Rouge et les Conventions de Genève*, 1913.

Geneva Protocol (1924), or protocol for pacific settlement of international disputes, represents an attempt by the League of Nations to find a solution of the ambiguities and vagueness of the Covenant of the League (see COVENANT OF THE LEAGUE OF NATIONS). It was adopted by the fifth assembly of the League, and though it was rejected by the govts. concerned, it is of historical importance in that it reveals in clear relief the salient problems concerning Europe in the post-war period. In the protocol the League sought to tighten up the sanctions (i.e. penalties) against aggressive wars, and also to increase the number of occasions on which those sanctions should become applicable; and these reforms involved a determined attack on the problem of disarmament. But the Brit. representatives at the Council of the League would agree to nothing which should compel them to state in advance their country's quota contributions to the military, naval, and air forces (necessary to ensure the fulfilment of the obligations of the Covenant), nor surrender the right to determine for themselves those contributions. Thus, though the protocol added nothing to the legal sanctions (of Article 16 of the Covenant), it raised the moral obligations imposed on League members. In its next aspect the protocol, in a proposed amendment of Article 12 of the Covenant, ruled out absolutely the legality of war except when the nation in question was, in self-defence, resisting an act of aggression, or when it was acting on behalf of the League against a refractory state. The test of aggression in the protocol was the refusal to submit a dispute to the procedure of pacific settlement provided by Articles 13 and 16 of the Covenant as amplified by the protocol, or, in other words, a party to a dispute would not only have to refer to one or another form of arbitration, but be compelled to comply with the judicial sentence or arbitral award which resulted therefrom. From the Brit. point of view, however, the fundamental weakness of the protocol was that the Brit. Parliament was asked, in effect, to surrender to what might be a group of unknown men in no way

responsible to it those powers of peace and war which it had claimed to exercise for centuries, and that is why Great Britain refused to ratify the protocol. See D. Hunter Miller, *The Geneva Protocol*, 1925; G. Butler, *A Handbook of the League of Nations*, 1925; and P. J. N. Baker, *The Geneva Protocol for the Pacific Settlement of International Disputes*, 1925.

Geneviève (or **Genoveta**), **Saint** (c. 422-512), patron saint of Paris. According to tradition she was b. at Nanterre, then went to Paris, where she became famous for her benevolence and for her predictions of the future. Her festival is celebrated on Jan. 3, and relics connected with her are preserved at the church of St. Étienne du Mont. The great frescoes of Puvis de Chavannes in the Panthéon in Paris illustrate her life works.

Geneviève of Brabant, an eighth-century saint and heroine of medieval legend. Said to have been the wife of the palatine Siegfried, she was falsely accused of adultery and condemned to death, the punishment being commuted to exposure in a forest. The story goes that she wandered Diana-wise for some years when she was found by Siegfried during one of his hunting expeditions, and her innocence acknowledged. She is honoured as a Rom. Catholic saint.

Genghis (or **Jenghiz**) **Khan** (1162-1227), Mongol emperor; the son of Yesukai, his mother's name being Yulun. He was b. by the R. Onon, and was only thirteen when his father d. His name was Temuchin, which he changed in 1206 to Jenghiz, in Chinese 'Cheng-sze' (perfect warrior). His victory over the Nahan Mongols left him undisputed ruler in Mongolia, and after crushing the Merkit Khan on the R. Irtysh, he moved towards N. China, then occupied by the Kin Tatars. By 1213 three of his armies were sweeping from victory to victory, wiping out cities till the whole country N. of the Yellow R. was in his hands, except Yenking (Peking). G. moved back to the W. and crushed the Khitans and the Shah of Khwarizm (Khitva), whose ter. on the Oxus was the key to the Caspian and so to Europe. G. or his sons then in turn conquered Bokhara, Samarkand, and Merv, sacking and destroying the tre. and putting all the inhab. to death. His powerful rival, Mohammed of Khwarizm, d., and G. pursued his son, Jelaleddin, to Herat and thence to India. Meanwhile other armies had invaded Russia with the same astonishing success, and when G. d., in 1227, on a journey in Mongolia, his empire stretched from the Yellow Sea to the Dnieper. See Sir R. K. Douglas, *Life of Jenghis Khan*, 1877; H. Lamb, *Genghis Khan, the Emperor of all Men*, 1933; and R. Fox, *Genghis Khan*, 1937.

Genil, see JINN.

Genista, genus of hardy leguminous shrubs found in the old world and represented in Britain by three species. *G. tinctoria*, the dyer's green-weed, found in Brit. fields, pastures, and thickets, is noted for the yellow colour obtained from its flowers and used in dyeing wool. The seeds act as a mild purgative. *G. pilosa*

is rare and local. *G. anglica*, a spinous plant, is common in England and Scotland. Altogether at least seventy species are known. *G. virgata* and *G. cinerea* are tall brooms growing up to 12 ft. high with small pointed leaves, silvery underneath, covering themselves with cascades of fragrant little pea-flowers of brilliant yellow in late June and early July. The chief difference is that the first-named flowers a little earlier. The honey-scented white blossom of *Plagianthus Lyalli* now flourishes under the name *Hoheria glabrata*. These are all S. plants from Madeira and S.W. Europe, but are reasonably hardy and can stand a limy soil. Dwarf kinds are useful for the rockery. *G. Hispanica* is a particularly useful kind in pots. The *Planta genista* was the badge of the Plantagenet kings.

Genius. In auct. Rom. mythology, each individual, at birth, is endowed with or has allotted to him a special protecting, guarding spirit, influencing his character and with whom rests the power of good or ill fortune, happiness, and misery. As the spirit, from birth, presides over the generating principle (Lat. *genius* is from root *gen-*, *gignere*, to beget), the G. is masculine; the women looked to her Juno, especially Juno Lucina, the guardian and protectress of women in childbirth. Though not a household god, offerings and sacrifices were made to the G. of the father of the family (*paterfamilias*), and the marriage bed is named *genialis*, and dedicated to the spirit. It is by his G. that a Rom. swore. The Gk. *dæmon* is sometimes taken as a parallel, but the idea of evil or good *dæmones* was purely Gk., and the G. is peculiarly Rom., or, rather, It. When the early Rom. religion became influenced by the pantheon of the Gks., and a more personal view of the various deities came into vogue, they, too, had *genii* designed to them, and the custom spread of having a G. of cities, of trades, and guilds, and especially of the people or nation itself; thus, there was a *genius publicus populi Romani* as well as a *genius urbis*, i.e. of Rome. The personal G. of the emperors was publicly worshipped. Eng. has taken the word 'genil,' generally altered to 'genie,' as a trans., usefully representing the pronunciation of the Arabic *djinn* or *jinn*, the beneficent or maleficent spirits of their folk-lore and mythology.

Genk, town in the prov. of Limbourg, Belgium, 5 m. E.N.E. of Hasselt. There are important coal-mines at the hamlets Waterschel, Zwartberg, and Winterslag. In 1920 the first coal of the Kempen (Campine) basin was mined here. Brewing and the manuf. of fibre are carried on. Asparagus is largely cultivated in its sandy soil. Pop. 33,800.

Genlis, **Stéphanie Félicité, Comtesse de** (1746-1830), Fr. writer, b. at Champpeüri, near Autun. In 1770 she became lady-in-waiting to the duchess of Chartres, and was made governess to her daughters, and in 1781 the duke appointed her as tutor (*gouverneur*) to his sons, and despite the scandal and the resignation of the other tutors, she carried on their education

until 1793, when she had to leave France. After the Restoration she wrote in defence of monarchy and of religion. When she was past eighty years of age she wrote her memoirs. She lived to see the events of July 1830, and her former pupil raised to the throne. She d. on Dec. 31, aged eighty-four. Her methods of education seem to have been considerably in advance of her time, and we hear of her illustrating her hist. lessons by magic-lantern slides, and teaching botany while out for walks. Her works are numerous and of some historical value; they include *Théâtre de l'éducation* (1779-80); *Adèle et Théodore* (comedies for children, 1782); *Mémoires inédits sur le dix-huitième siècle* (1825); and a romance entitled *Mademoiselle de Clermont* (1802). See M. de Chabreuil, *Gouverneur de princes 1737-1830*, 1900; L. Chabaud, *Mesdames de Maintenon, de Genlis et Campan*, 1901; G. Mauvras, *L'idylle d'un gouverneur*, 1904; and study by J. Harmand, 1912.

Gennadius II., or **George the Scholar** (c. 1400-70), Gk. patriarch of Constantinople. It is uncertain whether he is the 'Scholarius' that accompanied the Emperor John Palaeologus to Florence in an effort to unite the churches of E. and W., and afterwards became a monk in Constantinople, and an opponent of union. After the capture of Constantinople by the Turks (1453) G. was made patriarch by Sultan Mohammed II. After four or five years he retired. An Aristotelian, he wrote much. He d. in the monastery of St. John the Baptist near Serrae, Macedonia.

Gennaro, San, see JANUARY'S SR.

Gennesaret, Sea of, see under GALILEE.

Genoa: 1. Prov. of Italy, situated between the N. Apennines and the gulf of Genoa. It embraces the coast of the Riviera, and contains some of the most beautiful as well as the best cultivated and richest dists. of the country. It has an excellent climate, and fruit abounds there. It covers an area of 1582 sq. m.; pop. 975,700, consisting chiefly of seafaring folk. 2. (It. *Genova*), city of Italy, situated on the gulf of the same name. It is a large maritime and commercial tn., and a very important seaport. The city is surrounded by a wide extent of country, and presents an enchanting view from the water as it rises towards the summit of verdant and richly cultivated hills. It has some fine streets, though some of its thoroughfares are very narrow and ill lighted, and it contains many grand palaces and churches. Of the former, the most famous are the ducal palace, formerly inhabited by the doges but now used for meetings of the Senate; and the Doria, the residence of the celebrated Andrea Doria during his presidency of the republic, and presented by him in 1522. Sev. others also are of great interest on account of their architectural beauty, magnificent interiors, and historical fame, and many of them contain galleries of paintings with works of Van Dyck, Rubens, Albrecht Dürer, etc. The most noteworthy churches are S. Maria di Carmignano, of great architectural beauty; Ss. Annun-

ziata, and S. Lorenzo, the cathedral, built in 1100, a grand old pile in the It. Gothic style, which has been restored at frequent intervals. A number of these buildings were damaged or destroyed in the Second World War (see below).

The commerce of G. is widespread and important, and its manufs. considerable. Household furniture, cabinets, silks, velvets, laces, and coral and silver filigree work are manufactured on a wide scale, and have a noted reputation. The chief industrial estabs. of the city are iron-works, cotton and cloth mills, tanneries, paper factories, etc. The Genoese are skilful and hardy seamen, and ship-building has long been a noted activity. G. is the nearest port for Switzerland and for southern Germany since the important improvements in railway connection in the construction of the St. Gothard railway, which increased its commercial prosperity. An outer harbour was constructed before the Second World War, with another basin for coal vessels, and a still further extension was completed subsequently. The minimum depth of the harbour is 30 ft., and the largest ships can enter. It has two dry docks, a graving dock, and a floating dry dock. Industry developed enormously before the war; armoured cruisers both for the It. Navy and for foreign govts. were constructed in the Ansaldo yards (see below), also merchant and passenger steamers in the Odero yards. The four main railway lines which centre on G. have all been electrified. The schools of G. are numerous, and the univ., founded in 1471, has faculties in law, medicine, science, engineering, and philosophy. A library, observatory, and physical and natural hist. museum are attached to it. Its charitable institutions are said to be the finest of their kind in Italy, including hospitals of various kinds and asylums for the poor. The chief focus of traffic and the centre of the Genoese tramway system is the Piazza Ferrari, which is a large irregular space embellished with a fine equestrian statue of Garibaldi, unveiled in 1893. The Via Roma is another important centre of traffic leading to the Piazza Corsica, where stands the colossal equestrian statue of Victor Emmanuel II.

G. was at one time occupied by the Gks. It came into the possession of Rome at the close of the third century B.C. After the fall of Rome it passed eventually into the hands of the Franks. Finally, in the tenth century, asserting its independence and developing into a powerful republic. Long rivalry between the republics of G. and Venice terminated in favour of the latter. The republic came to an end with the outbreak of the Fr. Revolution and became part of the Ligurian Republic. In 1815 it was united with the kingdom of Sardinia.

G. was the scene of an unsuccessful world economic conference in 1922, at which twenty nine countries were represented, among them for the first time Soviet Russia and the nations defeated in 1918, excepting Turkey.

In the Second World War the port was

bombarded by Brit warships on Feb 8, 1942, widespread damage being done to the docks and industrial estates. Oil tanks, marshalling yards, and merchant ships also were hit and large fires caused in the Ansaldo electric and boiler works, the main power station and dry docks round the inner harbour. The fifth (Allied) Army occupied G on April 27 (1945) after partisans had seized part of the city. Considerable and widespread damage was sustained from the air raids

are among the many churches which suffered more or less serious damage, particularly S Maria del Servi. The portion of the ducal palace occupied by the Procura del Re and the Tribunale were destroyed together with the central block. The sixteenth century portion of the Imperial palace, the roof of the Palazzo Spinola and most of the Lamba Doria Palazzo were destroyed. In the Palazzo Doria del Principe a Fiasolo the fountain of Neptune by Taddeo Carlone

GENOA

I N A

The two largest islands in the bay are the islands of San Pietro and San Paolo.

directed against the harbour and communications. More than fifty churches, a dozen oratories, 130 palaces, villas and over a score of other buildings of less artistic importance in the city were damaged, though generally speaking the real losses amongst the monuments on the 'protected list' were fewer than might have been feared. The most serious and irreplaceable losses were the splendid interiors of the medieval palaces. The buildings destroyed beyond repair include the churches SS Giacomo e Filippo, S Maria in Pissone and convent and S Pietro alla Foca, the oratories della Morto e Misericordia, Regina Lucia a Mirasol and di S Martino, the archiepiscopal palace, the Garofoli palace and the Palazzo Solia palace, and the Teatro del Falcone in Palazzo Reale and the Teatro Paganini. The damage to the cathedral was not severe, but the Franciscan statue was destroyed. The church of SS Annunziata sustained considerable damage, part of the nave, six chapels and frescoes by Carlone and Chiassone being destroyed. S Maria del Servi, S Maria Assunta di Carignano, S Pietro in Bianchi, S Matteo, and SS Crocefamille

was shattered and the finely decorated interior of the choir was seriously damaged. A great part of the Palazzo Chiassone was ruined, frescoes by Andrea and Ottavio Semino in the Palazzo Doria and the central dome of the gallery of the Palazzo Rosso frescoed by Tassio in the Palazzo Doria. Bombs damaged various parts of the interior of the Palazzo Doria and the roofs of the Palazzo dell'Università were all severely damaged. Among the buildings which were most seriously hit were the Brera, the Marc'Antonio, and the Palazzo della Repubblica. The royal tomb built in Feb 1942 destroyed many seventeenth and eighteenth century paintings by Tassio and the Scuola degli Stessi in the Sala della Direzione when the Oratorio Galliera was struck. The Civic, Baroque and Missionary libraries lost respectively 65,000 and 30,000 vols. 10,000 vols were lost by the library of the Economic and Commercial Institute and many by the juridical faculty of the Univ. Pop. 610,300. See I. Donover, *La storia della repubblica di Genova* 1913, T. S. Mills *The Genoa Conference*, 1922, and M. Sibona *Genova* 1925.

Genoa, Gulf of. This is the name generally given to the Mediterranean N. of Corsica, where the coast of Italy retreats with a curve. It receives numerous small rivers, the chief inlet being the gulf of Spezia, on which is situated the city of Genoa.

Genovesa, Saint, see GENÈVIÈVE.

Genovesi, Antonio (1712-69), It. writer on philosophy and political economy, b. at Castiglione. He started his career as an ecclesiastic, but very soon abandoned theology in favour of the law, which in turn was also given up for philosophy. In 1754, one of his patrons, Bartolomeo Intieri, a Florentine, founded the first It. or European chair of political economy on condition that G. was made first prof. His works include *Elementa Metaphysica* (1743, et seq.); *Logica* (1745); and *Lezioni di Commercio*, the first complete It. work on economics. See G. M. Monti, *A. Genovesi e G. H. Galanti*, 1926.

Genre Painting takes for its subject the familiar scenes of everyday life while 'historical painting,' in contradistinction to which the term has come to be used, takes great events.

Gens, historical and ethnological use, a tribe or clan, or any group of primitive people forming a distinct branch of a race. The term was especially applied to a clan or house in anc. Rome which included a number of families bearing the same name and descended from a common ancestor, and also sharing certain legal privileges and obligations, and also religious rites. Originally these *gentes* were exclusively patrician, but later they included plebeians. The name of the *gens* to which a Rom. belonged was indicated always by the middle of the three names which it was customary for a Rom. to possess.

Genseric, or Gaiseric (428-477), king of the Vandals, b. about 390, and was the son of King Godigisel. He succeeded his brother Geoderic. He at once invaded Africa from Spain, besieged the Rom. general Bonifacius in Hippo, and conquered the prov. with much pillage and slaughter. In 455 he invaded Italy, sacked Rome, and brought back Eudoxia, the empress, captive. Majorianus, the Rom. emperor, in 460, and Leo I., the E. emperor, in 468, failed in their attempts at vengeance, and G. conquered Sicily, Sardinia, and the Balearic Isles. As an Arian he was a cruel persecutor of orthodox Christians. He was short and lame, but he long remained the great warrior king of the Vandals.

Gentbrugge, tn. in the prov. of E. Flanders, Belgium, forming an E. suburb of Ghent. It has manufs. of textiles, paper, nails, and rubber. There is a central workshop of the Belgian railways. Market gardens and flower nurseries surround the tn. Pop. 17,700.

Gentiana, cosmopolitan genus of plants. Supposed to have been named after King Gentius of Illyria, who is said to have discovered their medicinal qualities. The gentians grow chiefly in Alpine regions, and are noted for the brilliancy of colouring in their flowers, and their intense bitterness, which makes them of great

medicinal value. *G. lutea* is a perennial bearing yellow flowers, and is frequently cultivated; it is the species most used in medicine. Native Brit. species include *G. Amarella*, *G. campestris*, *G. verna*, and *G. Pneumonanthe*.

Gentianaceae, natural order of dicotyledonous plants cosmopolitan in distribution. It contains between seven and eight hundred herbs and shrubs, famed for their bitterness and the bright yellow, red, or blue of the flowers. The inflorescence is cymose, and the flowers are hermaphrodite; there are typically five united sepals and petals, five epipetalous stamens, two united carpels to form a superior ovary with numerous ovules; the fruit is a capsule or berry. Two of the chief genera are *Gentiana* and *Mentyanthes*.

Gentile da Fabriano, see FABRIANO.

Gentile, Giovanni (1875-1944) It. philosopher, b. at Castelvetrano, Sicily, son of Giovanni G. Educated at the univ. of Palermo. In 1918 he became prof. of the hist. of philosophy in the univ. of Rome. He was made senator the same year. In 1920 he founded the *Giornale critico della filosofia italiana*. He was in the Fascist ranks from the first, and became minister of education when Fascism captured the gov. Also Fascist minister of science and arts; president of the Academy of Sciences and Arts, Florence. His philosophy, which he implemented in his ministerial work, is a transcending of that of Croce, being even more lyrical and objectless in its professions. It is, in practice, the philosophy of Fascism, with its roots in Vico, who believed in a something corporate, not composed of our individual selves, that makes for national glory. With Croce, precedent and idea have some controlling force; with G., apparently none—the dominant will is sufficient reason. Shot by partisans in the streets in 1944. See E. Chiocchetti, *La filosofia di Giovanni Gentile*, 1925; and G. De Ruggiero, *Filosofi del Novecento*, 1934.

Gentili, Alberico (1551-1611), It.-Eng. jurist, b. in San Ginesio, in the march of Ancona. He was a doctor of civil law of the univ. of Perugia, but left Italy in consequence of having adopted Protestantism. In 1588, through the patronage of the earl of Leicester, he became regius prof. of civil law at Oxford. His chief work is the *De Jure Belli libri tres* (1598), but his earliest known work was the *De Legationibus*, pub. in 1585. The *De Jure* was an enlargement of the *De Jure Belli commentatio prima*, pub. in 1588, and two other treatises of the following year. They treat of the laws of war, the causes of making it, the mode of carrying it on, and the rights of conquerors and conquered—all opportune topics at the time England was threatened by the Armada (1588), when the conduct that would be pursued by the Eng. Catholics on the question whether a Papist was right in serving his prince in arms against the pope raised important issues. According to Prof. Westlake, G. rushed into print in 1589 without giving himself time to elaborate his important subject with the fullness he afterwards gave it in the largely expanded

work of 1598. This classic, indeed, is admittedly superior to the work of Ayala (*q.v.*), being far more complete and free from the irrelevant consideration of tactics and military administration. But it is inferior to the work of Ayala in principles, notably in his manner of dealing with the cardinal problem of whether a war can be *justum bellum* on both sides, so as to have legal effects, i.e. in changing the property of things captured. Nothing, too, is to be derived from it in mitigating the ferocity of war; and, again, he agrees that it is both just and expedient to kill hostages. The best Eng. ed. of the *De Jure* is that of T. J. Holland (1877). See also *The Collected Papers of John Walslake on Public International Law*, 1911.

Gentleman. The term 'G.' is of very vague and shifting meaning to-day, but though it has almost become a polite synonym of 'man,' as 'lady' has of 'woman,' every one recognises that, properly regarded, it implies something of good manners, good taste, good education, and good feeling for others. In a more usual and general sense it is applied to one of a certain social position, and its definition may range from the celebrated one of the witness in *Twelfth Night's* trial as a 'man who kept a gig,' to that of one who, by birth, education, wealth, or manners, occupies a certain place in society without, nowadays, much reference to his profession, business or trade. It is of more interest to turn to the hist., which has been much confused since, in the sixteenth and seventeenth centuries, a fiction of official heralds made 'gentlemen' and 'gentry' a separate order or rank and confined its members to those who had the right to bear a coat of arms as recognised by the college of heralds. Antiquaries and historians have much disputed whether in England there ever was a distinct order corresponding to the lesser noblesse of France or Germany (*Adels*). Certainly there never was a distinctive mark attached to a name, signifying such a rank as is found in the nobiliary particles *de* in Fr. or *von* in Ger. Early Eng. records in which '*de*' occurs imply the place where the man or family lived, and in the fifteenth century was dropped; thus William de Pedlington became Wm. Pedlington. Apart from this, the definite early meaning was that of its derivation, a man of 'gentle' birth, *lat. gentilis*, and so in genealogies, etc., *gentes*. See Wm. Harrison's *Description of England*, II. 5, 1577; and J. Selden's *Titles of Honour*, 1671; the most interesting researches of Sir George Sitwell, 'The English Gentleman,' *Ancrator*, April 1902; and for an exhaustive collection of quotations, etc., A. Smythe Palmer, *The Ideal of a Gentleman*, 1908.

Gentleman's Agreement, modern political term denoting an informal agreement based on verbal assurances or the exchange of mere letters unsupported by the signing of any formal treaty.

Gentleman's Magazine, *The*, was estab. in 1731 by Edward Cave, and was the first example of the use of the term

magazine. The magazine began by reproducing matter from the weekly journals, with a supplementary section giving the prin. news of the month, a list of births, marriages, and deaths, etc., and a register of books pub. A few years later original matter began to appear, including the 'Debates in the Senate of Lilliput.' It was valued for its plates and engravings, and especially for its biographical, historical, and antiquarian articles, which give its old vols. much interest. Samuel Johnson joined the staff in 1738, and his writing, from notes taken by others, of the reports of debates in Parliament is a well-known landmark in the hist. of parl. reporting. The magazine, with its familiar editorial name of 'Sylvanus Urban,' continued on the original lines till 1868, when a new series of lighter type was begun.

Gentlemen-at-Arms, in full the 'King's Bodyguard of the Honourable Corps of Gentlemen-at-Arms,' consists at present constituted of thirty-nine 'gentlemen,' being officers of the army who had received a decoration for war services, with a clerk of the cheque and adjutant, a sub-officer (or harbinger, sent in advance to procure lodgings), a standard-bearer, a lieutenant, and a captain, the last of whom must be a peer and a member of the ministry retiring with the gov. The corps was estab. as a purely military body in 1862, and discharges as the first bodyguard of the sovereign at palace functions and royal ceremonies. It directly descends from the body of 'pensioners,' founded by Henry VIII. in 1509, who were the younger sons of noble families.

Gentz, Friedrich von (1764-1832), Ger. publicist and statesman, b. at Breslau. A trans. of Burke's essay on the Fr. Revolution (1791) was followed by other trans. and the founding of a jour. in which his brilliant articles soon became famous. He served for a time under the Prussian Gov., but in 1802 various causes combined to make him leave Berlin, and he went to Vienna and entered the service of the Emperor Francis. A brief visit to London brought him into touch with Pitt and Granville, and with his wonderful grasp of affairs he used his pen unsparingly against Napoleon. Throughout the war between Austria and France he was employed by Stadion in writing proclamations, etc., and, when Metternich succeeded the latter, he became his chief adviser. He was secretary to the congress of Vienna (1811-15), and to all those that followed, and remained a power until his death. Though he received large sums for his writings, he was quite fearless, and always wrote from conviction; his writings are valuable both as hist. and literature. See E. Guggia, *Friedrich von Gentz*, 1901, and C. J. Burckhardt, *Gestalten und Mächte*, 1911.

Genus. In biological nomenclature, when sev. species resemble each other so distinctly that their 'general character' indicate relationship, they are grouped together in a G. Similar genera are grouped together to form a family. Systematic classification is as natural as possible, but it is often difficult to know

where to draw the line; but in all cases the characters which distinguish one G. from another must be greater than those distinguishing the species of the genera. The family Ranunculaceae is made up of many genera of which *Ranunculus*, *Clematis*, *Aquilegia*, and *Thalictrum* are a few examples. They belong to one family, but differ from one another in sufficiently characteristic details, so that each may constitute a G. They are further subdivided into species; thus we have *Ranunculus aquatilis*, the water buttercup; *R. scabra*, the lesser celandine; *R. acris*, the common buttercup, etc.

Geochronology, young branch of science, which draws its methods from geology, botany, zoology, and physics, and whose chief objective is the development of time-scales in years which extend back into the distant past beyond the historical calendar. The first field of application of G. is in prehistoric archaeology and human palaeontology; the second is that of biological evolution in relation to time. See F. E. Zeuner, *Dating the Past: an Introduction to Geochronology*.

Geodesy (Gk. *gō*, and *baivō*, to divide) is essentially the science and art of surveying on a large scale in order to ascertain the true form and dimensions of the earth. To this end the most rigorously exact methods of measurement at all stages must be employed. Angular measurements involve the use of theodolites of the most perfect construction, graduation, and workmanship, while linear measurements may be made by compensated metal rods, glass rods, pine rods, steel wires, steel or invar tapes or chains under precise tension, all carried on specially designed and accurately levelled supports and read by microscopes in conjunction with standard thermometers. Corrections are applied for the earth's curvature, reduction of observations to mean sea level and standard temp., variations in gravity, instrumental and personal errors, etc. Small errors, which would be negligible in a small survey, multiply enormously over countries whose areas may cover hundreds or thousands of sq. m. Hence the need for the extremely high standard of accuracy involved in geodetical surveying and the explanation of its being accepted as the basis for all forms of surveying—of which there are many—treated more fully later.

The problem of the earth's figure—quite apart from utilitarian aspects—has occupied men's minds from very early times. Probably the earliest recorded effort was that of Eratosthenes, a Gk. mathematician, who, in the third century B.C., on Egyptian soil, essayed to measure an arc of the meridian between Syene and Alexandria. Assuming the earth to be spherical, and the respective lats. and the measured distance between the two places having been ascertained, the altitude of the sun at Alexandria was observed by the gnomon at midsummer, and the radius of the meridian, together with the length of the earth's meridional circumference, could accordingly be calculated. Considering the crude instruments then

available the result of this early operation was surprisingly accurate.

More than a thousand years now intervened, until at last man's scientific instincts again slowly awoke. In the determination of this interesting problem of the figure of the earth, measurements of arc, undertaken in various countries and in different lats., have been of great service and afford a gratifying example of goodwill and international co-operation in those early days strangely at variance with the trend of affairs to-day. France, Russia, Prussia, Sweden, Denmark, Hanover, Persia, S. Africa, India, and Great Britain have each in turn contributed a share to the investigation of the problem. The grand Fr. arc, passing through Paris and extending from Dunkirk to Formentor, covered over twelve degrees of lat.; the prolonged arc of the great Indian triangulation reached to nearly twenty-four degrees; while the great Russian arc, carried up from Bessarabia to the far N., exceeded twenty-five degrees. Notwithstanding all this, the geodetic measures which most materially contributed to the historic determination of the figure of the earth are singularly few. They are: (1) The arc de Pérou measured by the Fr. academicians P. Bouguer and C. M. de la Condamine in the middle of the eighteenth century; (2) The Fr. arcs measured by Delambre and Méchain about the end of the eighteenth century and by Biot and Arago early in the nineteenth; (3) The Brit. arc from Dunnose in the Isle of Wight to Saxnord in the Shetlands; (4) The great arc of meridian of India; (5) The Russo-Scandinavian arc from Hammerfest to the mouth of the Danube; (6) Various triangulations in central Europe by Schumacher, Gauss, and Bessel; (7) Maclear's arc at the cape of Good Hope. Many efforts have also been made by different observers to determine the figure of the earth from the behaviour of pendulums at different lats. in different parts of the globe; but the results have been both unexpected and inexplicable. Observations on arcs of meridian have revealed similar discrepancies. By the middle of the eighteenth century it was definitely accepted for the N. hemisphere that the further one goes N. the greater is the distance corresponding to a degree of lat.; the flatter therefore is the earth towards the poles. But the result of the abbé de Lacaille's measure of an arc of meridian at the cape of Good Hope was a contradiction—as it seemed to show that the S. hemisphere was prolate, the degree decreasing in length as the pole was approached! A somewhat similar discrepancy was found in England—the curvature of the S. half of England appearing to be less than the N. half! The origin of these and other abnormal results has been interpreted in local deviations of the vertical. Every observed lat. and long. is affected by local irregularities in the direction of gravity due to the unequal distribution of mass in the crust of the earth. These discordances are embarrassing—and although many geodetical conferences have taken

place an agreed general statement on such matters appears still to be lacking. Local deviations of gravity have their effect on azimuths as well as on lat. and longs.

The principle of triangulation forms the sole foundation for all large-scale geodetic surveying, in which the greatest attainable accuracy is essential. This principle rests on the basic mathematical fact that every triangle has six parts—three sides and three angles; and that if any three of these parts (one of them, at least, being a side) are known, the remaining three parts can be calculated without any further measurement, either of sides or angles. With this new information, contiguous new triangles can be constructed by taking angular observations from the terminal points of the new sides to well-continued indefinitely. The first requisite, defined prominent natural objects such as church steeples or now artificially constructed stations with flag-staffs or other permanent signals—this process being therefore, of any geodetical survey is to start the triangulation with a very carefully selected base line, say from 5 to 10 m. long, reasonably level, measured with extreme accuracy as already generally described, and subject to complicated corrections and adjustments. The usual method of meridional triangulation is for a chain of 'well-conditioned' triangles to be formed in the required direction, as in France, Spain, and Austria; while in Italy, Sweden, Norway, Germany, Russia, and U.S.A. oblique chains of triangles are formed. Occasionally, as in India, the combination of triangles forms successive polygonal figures, the sides of the triangles seldom exceeding 40 m. in length. The whole area of India has now been surveyed. (For corresponding progress in Great Britain and Ireland see ORDNANCE SURVEY).

So far as is known, the principle of triangulation was first applied by Snellius, a Dutchman, in 1615, with the primitive instruments then available. The subsequent observations of Richer caused Huygens and Newton to question the hitherto current assumptions that the earth was a perfect sphere, and actual measurements of terrestrial arcs were accordingly undertaken, as already described, and are going on in many parts of the world to-day. Although for the purpose of geodetical surveying the figure of the earth is provisionally regarded as spherical (in order to admit the direct application of spherical trigonometry), it is now established, as a result of the extensive surveys already made, that the figure of the earth is an irregular *geoid*, which closely approximates to that of an oblate spheroid. This latter is a regular geometrical solid generated by the rotation of an ellipse about its minor axis, the relation of the minor (polar) and major axes in the case of the earth being about 300 to 301.

The importance of geodetic surveying has been increasingly recognised, and advances in scientific knowledge and in the construction of instruments of remarkable precision have led to the formation of an International Geodetic Association which, among other matters,

prescribes methods and the limits of allowable errors in the conduct of operations. Base lines are measured on either (1) the long-length or (2) the short-length systems. The former includes the apparatus of Jadarin, Wheeler, Guillaume ('arpentier', etc.); the latter that of Colby, Bessel, Borda, Struve, Ibanez, etc. There have been alternating vogues, but now the long-length system appears to be generally favoured. Neither instruments nor observers are infallible; and, whatever the accuracy of either, certain corrections and adjustments of the original observations always require to be made.

As regards steel base tapes, these consist of corrections due to (1) temp., (2) elasticity, (3) sag, and (4) slope; reduction to sea-level datum being a later consideration. In calculating the lengths of the sides in a system of spherical triangles three methods may be employed: (1) spherical trigonometry, (2) Delambre's method, (3) Legendre's method. Most of the triangles of the United Kingdom Ordnance Survey were computed by Delambre's method and checked by Legendre's method, while all three methods were used in the calculations in connection with the meridional arc which formed the basis of the metric system. Instrumental and observational errors constitute another class requiring corrections. They may take the form of discrepancies between results obtained by different methods and different series of measurements. They involve the 'weighting' of observations and the theory of probabilities, and are generally adjusted by what is known as the method of 'least squares'—a complicated and laborious mathematical operation unsuitable for detailed description to the general reader.

The rigid application of this most accurate method to the geodetical survey of the Brit. Isles—if adjusted in one mass, the whole of the angles being simultaneously involved—would have entailed the solution of 920 equations of condition and the same number of unknown quantities as a part of the work. Avoiding this, the triangulation was divided into twenty-one 'figures,' the equations being reduced to a maximum of seventy-seven, with an average of forty-four in a figure. Each section (or figure) had its own staff of computers and they were thus enabled to complete the work within their lifetime. Having accomplished its primary aim of determining the figure of the earth the geodetical survey movement, as a whole, has fulfilled other important functions—for example, the preparation of accurate maps of probably every country in the world, and the establishment, both in the field and on the maps, of permanent stations, or 'trig-points,' between which subsidiary topographical or other surveys could be subsequently fitted in. Material for geological and archaeological survey, also, was incidentally accumulated, with great benefit in the case of Ireland. Theodolites used in a geodetical survey vary in size according to the importance of the station to which they are assigned and the quality of the work they have to do. In

the United Kingdom Ordnance Survey the diameter of the horizontal circles ranged from 10 to 36 in. The instruments rested on a firm foundation accurately centred over the station point which was permanently marked for future identification and protected (not always successfully) from ignorant despoilers.

The important question of scaffolding and of signalling arrangements between stations can only briefly be referred to here. When it is necessary for the purpose of commanding particular points to elevate the theodolite a framed triangular scaffold may be used around this an independent rectangular scaffold for the observer and inside the instrument scaffold a wooden tube would be provided

Geodorum, name given to a few species of Orchidaceæ which are found in the W. Indies; they are called earthy scented orchids.

Geodynamics, study of the nature and the working of the forces whereby the rocks of the earth's surface are formed and changed. This involves investigation of the relations between the interior and the surface of the earth and a discussion of the various agencies which mould the terrestrial forms. The subject includes the effects of volcanoes, earthquakes and other disturbances on the distribution of oceans and continents on the outline of the coast, on the form and bottom of the ocean bed, their effects on climate and on the lives of plants and animals on the earth's

RAISED BEACHES, SPITSBERGIA

to shield the plumb line—preferably made to rotate so that the leeward side can remain open for inspection. The scaffolds for the U. S. A. Great Lakes Survey ranged from 10 to 124 ft high, with an average height of 56 ft—the signal standard is being from 10 to 30 ft higher. It is found desirable that all arcs at a station should have one point in common to which all angular measurements may be referred; this is known as the referring object. On mt. tops two rectangular plates of metal are placed parallel, so that light seen between them against the sky appears as a vertical line about 10 sec. in width; this method of referring object would be set up at a distance of from 1 to 2 m. away from the observatory. See also GEOGRAPHY, GREENWICH OBSERVATORY, LEAST SQUARES, ORDNANCE SURVEY, SURVEYING, THEODOLITE TRIANGULATION, etc. See also A. R. Clarke, *Geodesy* 1880; H. Helmert, *Die mathematischen und physikalischen Theorien der höheren Geodäsie* 1884; J. H. Kingston White, *The Ordnance Survey of the U. K.*, 1886; J. H. Gore, *Geodesy* 1911; A. H. Hinks, *Maps and Surveying*, 1912 and A. L. Higgins, *Higher Surveying* 1914.

surface and the interrelation of all these to one another. A vast cycle of change is presupposed and a knowledge of the present order of nature is made to provide a solution of the mysteries of the past. For convenience of study the subject is divided into (1) Hypogene or plutonic action (2) Epigene or surface action.

The former section deals with the changes of the interior of the earth and these are conveniently divided into

(a) *Volcanic Action*—This will be described in detail elsewhere but vulcanism is one of the great forces by which the topography of the earth's surface is altered. The building up of a volcanic cone as a result of continued activity, the destruction of life and property, the alteration of hydrography through the filling of river valleys are surface phenomena, but beyond the visible effusion of lava dust and vapours many deep-seated changes of great importance are occurring.

(b) *Lithquake*—Rupture or collapse of rocks under great strain is usually the determining factor of this form of seismic disturbance, which frequently results in altered surface features.

(c) *Slow Depressions and Upheavals.*—Measurements prove that certain parts of the earth's surface are at the present day showing signs of depression. The W. side of Japan has within recent times had many of its one-time fields replaced by beaches and banks of shingle. S. Sweden is sinking. Parts of Britain possess sun-merged forests which are sometimes uncovered by a low spring tide. The North Sea is a region of but recent subsidence—recent from a geological point of view. On the other hand, old raised beaches or strand lines point to upheavals in many areas.

(d) *Mountain Making.*—The contraction on cooling of the earth's crust has resulted in complex strains which in some areas have crumpled, folded, and contorted the upper strata. The Alps and many other mt. masses are the results of great folding effects.

(e) *Metamorphism.*—The high temp. and enormous pressure existing within the earth's interior, coupled with mechanical movement, cause great alterations in the composition and structure of the constituent rocks.

2. *Epigene or Surface Action.*—This will differ from hypogene in that its cycle is relatively short and its effects are more readily visible. The most important surface agents are:

(a) *The Air.*—The atmosphere causes well-marked effects; by its transporting action the sand dune is built up and the loess area formed, and the bombardment by wind-borne particles results in extensive erosion.

(b) *Water.*—Rain acts as a solvent and leads to the disintegration of the hardest rocks. Rivs. and brooks transport solids from the higher grounds and build up immense tracts of alluvium in their lower valleys, e.g. deltas, etc. Their continued action deepens the valleys and dissects the masses of high land. Frozen water in the form of ice streams or glaciers scrapes, grinds, and tears the surface over which it flows, while the destructive mechanical action of the sea is visible everywhere.

(c) *Plants and Animals.*—These act both directly and indirectly. The former are capable of modifying climate, and their constant utilisation of CO₂ is closely linked with other existences. One important effect of animal life is seen in the building up of the immense coral reefs of tropical seas.

(d) *Man.*—Man enters largely into the scheme of G. His activities result in many alterations of surface features; both directly and indirectly he is increasingly controlling and modifying many of the other epigene agencies.

Geoffrey of Monmouth (d. 1154), bishop of St. Asaph and author of a Brit. hist. The exact date of his birth is unknown, but it was about 1100. His first ed. of the famous *Historia Britonum* of Nennius was pub. in 1139, though the text now preserved apparently dates from 1147. According to the author the book was a trans. of a Celtic MS. which Walter, arch-deacon of Oxford, had brought from Brittany, but the probability is that it

was a mixture of historical fact and tradition culled from Nennius and the author's own fertile imagination. There is no mention, for example, of Merlin in the work of Nennius, and though there was probably a bard of that name—Myrddhin in Welsh—who may have been a contemporary of Arthur, he owes most of his attributes to the fertile invention of G. of M. In any case the result was immediate success, and his influence on the literature of the next hundred years was unmistakable. The Arthurian legend was the most popular and laid the foundation of an abundance of poetry and prose, becoming immortalised in Sir Thomas Malory's *Morte d'Arthur*, printed by Caxton in 1485. It is from the work of G. of M. that sprang the *Bruts* of Wace and Layamon. The *Prophecies of Merlin*, long attributed to him, is now held by many critics to be not genuine. See E. K. Chambers, *Arthur of Britain*, 1927.

Geoffrin, Marie Thérèse (née Rodet) (1699-1777), Frenchwoman, b. at Paris, who was for a time the leader of a brilliant literary salon in Paris. At an early age she married Pierre François G., a lieutenant-colonel in the National Guard, and it was not until a few years before his death in 1750 that she became a leader in society. Twice each week she would entertain at dinner artists and literary men of her acquaintance, towards whom it pleased her to play the mentor. Hume and Horace Walpole were among those who visited her, also Stanislas Poniatowski, whom she afterwards visited in 1766 as king of Poland. Her great delight seems to have been to gather round her the encyclopædists, she herself being one of the contributors to the *Encyclopédie*. Her *Lettres* and a work entitled *Sur la conversation* were pub. by Morellet. See *Correspondance inédite du roi Stanislas Auguste Poniatowski et de Madame Geoffrin, 1764-77*, ed. by the comte de Mouy, 1875; P. de Ségur, *Madame Geoffrin et sa fille*, 1897; and Janet Aldis, *Madame Geoffrin, her Salon and her Times, 1750-77*, 1905.

Geoffroy Saint-Hilaire, Étienne (1772-1844), Fr. naturalist, b. at Etampes, in the dept. of Seine-et-Oise. From 1793 to 1798 he was prof. of zoology at the natural hist. museum in Paris, then he went to Egypt with the scientific expedition sent out by Napoleon Bonaparte. In 1809 he was appointed prof. of zoology in the Faculty of Sciences and pub. a number of works on his theory of the unity of all organic composition, a subject on which he had a famous controversy with Cuvier. His works include *Philosophie anatomique* (1818-20); *Sur le principe de l'unité de composition organique* (1828); and *Philosophie zoologique* (1830). See life in Fr. by his son (1847), and Currier et Geoffroy Saint-Hilaire, 1890, by Ducrotay de Blainville.

Geoffroy Saint-Hilaire, Isidore (1805-1881), Fr. naturalist, b. at Paris. He was the son of Étienne Geoffroy Saint-Hilaire, and helped his father in his work until 1833, when he went to Bordeaux to organise a faculty of sciences, remaining

there as prof. of zoology. In 1850 was appointed prof. of zoology to the Faculty of Sciences. In 1854 he founded the Acclimatisation Society in Paris, becoming the first president. He pub. the life of his father in 1847. Other works include *Histoire des anomalies de l'organisation chez l'homme et les animaux* (1832-37); *Essais de zoologie générale* (1841); and *Histoire naturelle générale des règnes organiques* (1851-62, unfinished).

Geognosy, see under GEOLOGY.

Geographical Distribution. The problem of G. D. of animals and plants over the earth's surface has been the subject of close study in modern times. The greatest impetus to such study was given by Darwin's *Origin of Species*, which destroyed the idea that each species was the result of a separate act of creation. The allied species being regarded as having a common origin, it followed that they had a common place of origin, and an explanation of how they came to inhabit the different quarters of the globe in which they are at present found necessarily involves an explanation of many unsolved problems of biology. Both flora and fauna will thrive only in the environment adapted to them, but it is found that animals and plants are absent from countries that appear quite suitable to their development. The existence of natural barriers offers some explanation of this. Thus, Australia is cut off from terrestrial communication with the rest of the world, and so possesses a fauna peculiar to itself, but fossil evidence indicates that Amer. opossums may have been related to the marsupials of Australia and it is supposed that Antarctica was once continuous with New Zealand, Australia, and S. America. Madagascar and Australia were probably cut off from the mainland mass in a comparatively recent geological period. Such isolated regions tend to contain specimens of the fauna which flourished before the separation. The Himalayas mark a great distinction in the fauna to the N. and S., while in Africa the Sahara desert does the same. On the other hand, the mammals of the W. Indies are practically the same as those of America, and the inference is that they have in some way migrated from the mainland. Peculiarly enough, however, the W. Indies possesses one mammal which 'belongs to an order, Insectivora, entirely absent from S. America, and to a family, Centetidae, all the other species of which inhabit Madagascar only.' (Alfred Russel Wallace). Similar interesting problems are offered by the fact that the fauna of Japan more closely resembles that of the Atlantic states than of the Pacific states of N. America; that the mammals and birds of N. America approximate more to those of Europe than of S. America, that the fauna of Madagascar has much in common with that of the Malay Archipelago, and so on. In considering such questions attention must be paid to the processes by which the distribution of species can take place. Natural locomotion is, of course, the usual means, and birds possess the greatest

power in this respect. Apart from normal methods, however, there are other agencies at work. The wind can convey the spores and seeds of plants many hundreds of miles. Winds are also of great account in conveying insects, while birds are often blown immense distances out of their course, and the eggs of fish, frogs, etc., are often conveyed by the wind moving the surface of the water. Sea currents are an important factor in the distribution of plants and animals. Darwin (see *Origin of Species*, c. xli.) conducted a series of experiments that showed the great vitality of seeds after immersion in salt water for periods varying from 28 to 137 days, and also the power that seeds possess of floating for prolonged periods upon the surface of the water. In addition, animals are conveyed by sea currents upon such natural rafts as icebergs and icefloes, drifting trees, etc. Birds may convey seeds or insects upon their feathers or in the earth adhering to their feet, while many seeds pass unharmed through the digestive organs of birds and beasts and are thereby transported to new lands.

Distribution is, on the other hand, prevented by many methods. Mammals migrate slowly, and mts., deserts, and marked differences of temp., are barriers to their distribution. Forests hinder the migrations of camels, giraffes, zebras, etc., treeless regions those of apes and monkeys. Climate also impedes dispersal, while the presence of a natural enemy has also to be taken into account. The tsetse fly, for example, which conveys the parasitic trypanosome causing the disease nagana, has prevented the introduction of horses, dogs, and cattle into a certain area in Africa, while another fly acts in the same way in Paraguay. The more evenly the various species are distributed over the globe the less easy it is to map out the regions they inhabit, and the less valuable are the possible deductions to be made therefrom. The cryptogams, whose spores are carried in all directions by the wind, are so widely distributed that they are usually left out of all biogeographical schemes. In the same way it is difficult to mark off fixed limits for sea animals, although attempts have been made to do so by classification into littoral, pelagic, and abyssal fauna, according as the animals inhabit the sea near the shore, the open sea, or the depths of the ocean. Again, birds, having greater power of locomotion, are more widely distributed than other mammals. N. America and Asia were great centres of evolution and, as successful new species were evolved, the survivors of dying-out races were driven to the S. ends of the land masses.

Distribution of Animals.—The following is the scheme of distribution of animals adopted by A. R. Wallace in his *Island Life*. It is based principally upon the distribution of land mammals, but corresponds with a considerable degree of accuracy to that of birds. It includes six divs.: (1) Palaearctic region, including Europe, temperate Asia, and Africa to the N. of the Sahara. (2) Ethiopian region, including Africa, S. of the Sahara, and

Madagascar. (3) Oriental region, including India, S. of the Himalayas, S. China, and the Malay Is., as far S. as the Philippines, Borneo, and Java. (4) Australian region, including Australia, New Guinea, Celebes, Lombok, and the Is. of the Pacific, New Zealand being regarded as a very peculiar sub-region. (5) Nearctic region, including N. America as far as Mexico. (6) Neotropical region, including central and S. America with the W. Indies. The above scheme, though favoured by its simplicity, is nevertheless hardly sufficiently accurate. For example, it ranks the div. between the Nearctic and Palearctic regions, whose faunas have much in common, as high as that between the Australian and Neotropical, where the faunas are of quite different character. For this reason modifications of it have been advocated by Hesperin and other biologists. These systems will be found fully dealt with in R. Lydekker's *Geographical History of Mammals* (1896). The following is the system now usually adopted: (1) Arctogeic realm, divided into five regions—(a) Holarctic region, including the Palearctic and Nearctic regions of Wallace's div., with the exception of parts of Mexico and California; (b) Oriental region as in Wallace's system; (c) Ethiopian region as in Wallace's system, except Madagascar and adjacent isles which form the (d) Malagasy region; (e) the Sonoran region, embracing the N.W. parts of Mexico and Lower California. (2) The Neogeic realm, corresponding with the Neotropical region of Wallace's system. (3) The Notogeic realm, including Australasia, divided into four regions—(a) Australian region, i.e. Australia proper, Tasmania, and New Guinea; (b) Austro-Malayan region, containing the Is. between New Guinea and Ball; (c) Polynesian region, containing New Zealand and certain isles of the Pacific; (d) Hawaiian region, including the Sandwich and others.

In the Holarctic region are found such distinctive mammals as the bear, sheep, gibbon or wolverine, marmot, reindeer, beaver, bison, skunk, and raccoon. The Oriental region includes the elephant, hyena, tiger, leopard, panther, tapir, rhinoceros, monkey, apes, crocodiles, as well as deer, cattle, and pigs. The Ethiopian region includes the elephant, hippopotamus, giraffe, zebra, rhinoceros, antelope, panther, leopard, lion, gorilla, chimpanzee, and lemur; the Malagasy region is characterised by a prevalence of lemurs, and by the absence of the African mammals, while the Sonoran region shows a mixture of Arctogeic and Neogeic forms. In the Neogeic realm are to be found anteaters, llamas, sloths, armadillos, tapirs, and peccaries, marmosets, opossums, alligators, crocodiles, humming-birds, etc., while there is an absence of sheep, horses, and goats. In the Notogeic realm we find in the Australian region an abundance of marsupial or pouched animals, such as the kangaroo, wallaby, etc., as well as the monotremes (duck-billed platypus and spiny anteater), which are peculiar to this region; in the Austro-Malayan region a mingling of Aus-

tralian and oriental forms, in the Polynesian and Hawaiian regions an absence of mammals, the two latter regions being distinguished only on account of the difference of their birds. The peculiar nature of the Australian fauna, which consists of a great variety of marsupials and lacks almost all species of mammals existing in the rest of the world, has been explained by Wallace as being due to the fact that the marsupials formerly spread over the rest of the world, but were gradually displaced by later types of mammals and only managed to survive in Australasia owing to their isolation. The boundary line between the Australasian and other systems is the deep channel between the Is. of Ball and Lombok, and is known as Wallace's line.

The Distribution of Plants.—The distribution of plants has been the subject of many attempts at classification, but has not yielded any scheme which is so clearly defined as that given for animal life. As early as the middle of the eighteenth century, we find the Linnæans attempting to account for the distribution of plants over the surface of the globe. At the beginning of the nineteenth century Alexander von Humboldt paid great attention to the question of botanical geography, and suggested the use of distribution maps, while J. F. Schouw, a Dan. botanist, enunciated a system in 1833, dividing the earth's surface into eighteen kingdoms occupied to a greater or less extent by characteristic flora. He, however, made no attempt to deal with the origin and hist. of the various plant forms, but regarded them rather as created to a great extent in the locality in which they are found. Some years later, Meyen divided the globe into zones, adopting lines of lat. as the zone frontiers. His system comprised the following eight zones: (1) Equatorial, lying between 15° N. and S. lat.; (2) Tropical, extending N. and S. from the 15th parallel to the tropics of Cancer and Capricorn; (3) Sub-tropical, from the tropics to 31° N. and S. lat.; (4) Warner Temperate, between 31° and 45° lat.; (5) Cold Temperate, between 45° and 59° lat.; (6) Sub-Arctic, from 59° N. lat. to Arctic Circle; (7) Arctic zone from Arctic Circle to 72° N. lat. (8) Polar zone, above 72° N. The Antarctic region was left out of account in this scheme as possessing no land flora. It was subsequently modified by the substitution of isotherms for parallels of lat. as the zone-boundaries, but was only a very general div. of the earth's flora. The first zone was characterised by palms and bananas and extremely luxuriant vegetation, the second by tree-ferns and figs, the third by myrtles and laurels, the fourth by magnolias, the fifth by forests of deciduous trees, the sixth by conifers, the seventh by dwarf birches, alders, and willows, and by lichens, the eighth by saxifrages and cryptogams.

After Meyen, de Candolle proposed a scheme of grouping plants, the main principle of which was the consideration of the temp. necessary for their growth. In it plants were divided into *megatherms*,

mesotherms, and *microtherms*, according as they required a tropical, moderate, or cool temp. This scheme had the advantage of being applicable to vertical as well as horizontal distribution, but is now obsolete. The first real step towards classifying the distribution of plants upon modern lines was, however, made by Bentham in 1869, in his presidential address to the Linnean Society. He recognised the existence of three floral realms (1) the N. including conifers and deciduous forest trees, together with the ranunculuses (buttercups), spreading over Europe, N. and Central Asia, and the greater part of N. America; (2) the Tropical, lying between the N. and S. realms and characterised by evergreen 'Polypetale' (i.e. with the petals of the flowers not fused), and palms; (3) the S., containing the flora of the lower part of S. America, S. Africa, and Australasia, much more complex than the N. realm, and broken up into many scattered floras, which also sent extensions northward across the equator into the N. realm, as exemplified by the flora of Mexico and California. Bentham's successors were led to study the question of distribution from a historical aspect, and arrived at the conclusion that the tropical flora during the Tertiary period extended far beyond its present limits. In particular De Saporta studied the fossil flora of the Eocene period in Provence, and found that it was closely akin to that of India, China, and the Philippines. These and other investigations led to a scheme of distribution based upon the state of the flora of the Tertiary period, in which Drude and Engler have specially distinguished themselves. The scheme made out by Drude is much the simpler. He distinguishes sea flora from land flora, and divides the latter into three main groupings (1) the Boreal group, including the N., Inner Asiatic, Mediterranean, E. Asiatic, and Central N. Amer. sub-groups; (2) the Tropical group, including the Tropical African, E. African is., Indian, and Tropical Amer. sub-groups; (3) the Austral group, including the S. African, Australian, New Zealand, Andine, and Antarctic sub-groups.

Engler's system is far more complicated. He first distinguishes four main 'elements' in the flora of the Tertiary period, viz.: (1) The Arcto-Tertiary, characterised by abundance of conifers and numerous genera of trees and shrubs now common in N. America, Europe, and Extra-tropical Asia; (2) the Palaeotropical, characterised by many families prevalent in the tropical parts of Africa and Asia, and by the absence of certain families found in the Arcto-Tertiary element; (3) the Neotropical or S. Amer., which had, according to Engler, very much the same character as the present flora of Tropical Brazil and the W. Indies; (4) the Old Oceanic, consisting of forms capable of traversing wide stretches of water and of developing upon is.

Upon the lines of these 'elements' of Tertiary flora Engler divided the flora of the present day into four 'kingdoms,'

each being further subdivided as follows: (1) N. Extra-tropical, including the nine divs.: Arctic, Sub-Arctic, Central European, Central Asiatic, Micronesian is., Mediterranean, Manch.-Jap., Pacific N. America, and Atlantic N. America; (2) Palaeo-tropical, including the ten divs.: W. African, Afro-Arabian, Malagasy, Further Indian, Tropical Himalayan, E. Asian, Malayan, Araucanian, Polynesian, and Sandwich is.; (3) S. Amer., including the five divs.: the Mexican Highlands, Tropical Amer., Andean, the Galapagos, and Juan Fernandez; (4) Oceanic, including the eight divs. Antarctic S. America, New Zealand, Australian, Kerguelen, Amsterdam is., the Cape, Tristan d'Acunha, and St. Helena. Since Darwin drew attention to the operation of natural selection, it has been generally accepted until quite recently that species and genera few in number were relics of unsuccessful and moribund races. J. C. Willis, however, has given conclusive evidence that this is not necessarily the case, for just as natural selection requires long periods for the conclusion of its operations, long periods of time are also essential for the dispersal of new species. If natural barriers prevent this dispersal, the new species will remain local and cover only a comparatively small area. Even so, it may maintain its position without decreasing if it be well estab., but any new species not adapted to the environment will be killed almost immediately by the operation of natural selection. On the other hand, if no natural barriers hinder the distribution, the species, given sufficient time, will gradually spread. Thus the areas occupied by plants may give an indication of the relative ages of the species, the oldest being those which have had time to become widely distributed. Moreover, in the case of is. separated early in geological hist. from the mainland, birds probably were some of the most active agents of plant dispersal, but in the course of time the birds became better adapted to conditions of life on the is. and visited the mainland less frequently until at the present time birds take very little part in plant dispersal beyond the boundaries of such is. Consequently, new species arising in such isolated positions have more limited means of dispersal and will spread very slowly, if at all.

On account of the cooling of the N., plants and animals have migrated southwards. At some time in the future a northward migration will almost certainly be evident, for as species living near the present N. temp. barriers become acclimatised, or better adapted species are evolved, these barriers will recede. The importance of time for distribution cannot be too strongly emphasised.

Geographical Societies. The Royal G. Society was founded in 1830; in 1831 it incorporated the African Association, and in 1834 the Palestine Association. Three medals are awarded by the society annually to distinguished workers in geographical causes. The society publishes the *Geographical Journal* every month. Its building is in Kensington Gore, London. Other important G. S. are the Liverpool G. Society, (founded 1891), the Manchester G. Society (founded 1881), under the patronage of the king, which publishes an ann. journal; the Tyne-side G. Society, the Royal Scottish G. Society (founded 1884) which publishes twice each month the *Scottish Geographical Magazine*; and the G. Association, which publishes a quarterly, *Geography*.

Geography is that branch of science which deals with the phenomena of the earth's surface. The early Gk. concept of the earth was that of a flat disk in the shape of an ellipse bounded by an ocean riv. This concept was generally held during the Homeric period. The Phœnicians were among the first people to explore unknown lands, and they navigated the whole of the Mediterranean and the Euxine, and passed through the straits of Gibraltar into the Atlantic. They planted colonies in Asia Minor and along the shores of Africa, one of which, Carthage, founded in the ninth century B.C., was later to dispute with Rome the supremacy of the world. Certain Phœnician explorers were also reputed to have circumnavigated Africa during the seventh century B.C. Thales of Miletus is claimed as the first advocate of the spherical earth, which was afterwards adopted by the Pythagorean philosophers, mainly upon the theoretical ground that the sphere was the most perfect figure. Herodotus of Halicarnassus (b. 484 B.C.) has left us in his *History* a complete account of the earth's surface as known in his time, when it was held to be bounded by the Atlantic on the W., the Red Sea and Indian Ocean on the S., and Persia on the E. The conquests of Alexander, however, opened up new realms to human knowledge, and the conqueror himself sent forth expeditions to survey the various regions he had subdued. About the same time, Pythias of Massilia led an expedition into the Atlantic, through the Eng. Channel to the North Sea, and it is reputed

to have reached Thule, which is supposed to be the modern Iceland. Aristotle (384-322 B.C.) devoted considerable attention to the subject of G., and urged three reasons for holding the earth to be a sphere: (1) the tendency of all objects to fall together towards a common centre; (2) the fact that the earth's shadow upon the moon during an eclipse was circular; (3) the shifting of the horizon and appearance of new constellations during a journey from N. to S. He also extended Parmenides' idea of the earth's zones, defining the temperate zone as extending from the tropics to the Arctic Circle, though it is not clear in what sense he used the latter term. Aristotle was also aware of the connection between seas, rain, and rivers, and studied the effect of climate upon the character of the different races. Further progress in scientific G. was made by Eratosthenes (b. 276 B.C.), who was the first to use the parallels of lat. and long. He held the earth to be a sphere revolving in space, but to him the inhabited portions only included S. Europe, S. Asia, and N. Africa.

During the Rom. empire G. became more a question of actual description of the known world, and Strabo, at the very beginning of the Christian era, summarised all the knowledge of the earth's surface that had been acquired up to the time of Augustus. To Strabo succeeded Ptolemy (b. A.D. 23), who had himself travelled extensively in Germany, Gaul, Africa, and Spain, and also collected all the information he could from the work of other writers. His work, *Historia Naturalis*, contains accounts of Scandinavia, the course of the Niger, and Mt. Atlas, as well as giving a clearer notion of the G. of Asia. His work was carried on by Claudius Ptolemaeus (c. A.D. 150), who verified the lat. and long. of the principal places and corrected all estimates of distances.

Exploration and Cartography.—During the Middle Ages the knowledge of G. was submerged in the obscurity that overspread all science, but happily Ptolemy's works lived on in Islam. It was only when the journeys of Marco Polo (1271-1295), the Venetian explorer, in the Far E. had again aroused interest in the subject, and subsequent explorations had led to a knowledge of the extension of land from E. to W., that Ptolemy's works were rescued from their obscurity and retranslated into Lat. by Angelus (1410). The fifteenth century saw a great impetus given to G. discovery. In 1486 Diaz discovered the Cape of Good Hope, while in 1497 Vasco da Gama doubled it and proceeded to India. In 1492 Columbus made his momentous voyage across the Atlantic and discovered America, and this feat was speedily followed by an exploration of the coasts of Africa, Asia, and America, while Magellan passed to the S. of America and succeeded in circumnavigating the globe. The rapidly accumulating mass of knowledge led to an improvement in the production of maps, and to the development of the cartological side of G., the New World being

first shown on Juan de la Cosa's map in 1500, while Mercator, in 1569, showed the world upon the system of projection which still bears his name. Ptolemy's work rapidly grew obsolete under such a wealth of discovery, and in 1524 Apian published his *Cosmographus Liber*, basing it upon Ptolemy's system of mathematics and measurements, while Münster followed in 1514 with *Cosmographia Universalis* which is a descriptive work containing

pendulum, barometer, the application of the system of triangulation, thus rendering possible the production of reliable maps. The method of showing heights by contours is due to Ph. Buache (1737), while hachures were devised by Lehmann in 1799. The next important step in the history of scientific G was made by the great Ger. philosopher, Immanuel Kant, who lectured on physical G at Königsberg from 1765, and dealt with the subject under the

SIR HUMPHREY GILBERT'S MAP

This map appeared in his *Discourse* (1576)

an account of the manners of various peoples and the different industries. The next important book on G was published by Varenus in 1650. He treated G as a science dealing with the form, dimensions, and substance of the earth, the distribution of water, mts., woods, deserts and atmosphere with the celestial properties, i.e. lat. and long., climatic zones, etc., while he gave only a secondary consideration to the human side of the science. He was not content with a mere narrative of phenomena, but sought for their explanation, and his system dominated G for more than a century.

In the nineteenth century geographical discovery had progressed on all sides. During the sixteenth century endeavours were made to discover a N.W. passage to India in which Frobenius, Davis, Hudson, and Baffin took part. Sir Humphrey Gilbert wrote a famous *Discourse* (1578), arguing for the existence of such a passage. In the seventeenth century the Dutchmen, Tasman and Van Diemen discovered Australia, and in the eighteenth century Capt. Cook reached New Zealand and discovered many of the Polynesian Is. (see *TERRA AUSTRALIS INCOGNITA*). During the same period cartography had also greatly improved owing to the use of better instruments, the introduction of the telescope,

five headings of (1) Mathematical G, including the form, size, and movements of the earth, (2) Moral G, the customs of different races, (3) Political G, dealing with countries according to their governments, (4) Mercantile G, the G of commerce, (5) Theological G, the study of the various religions in its geographical aspect.

Geophysics—The beginning of the nineteenth century led to the foundation of that branch of G known as geophysics, due to the researches of Newton, Engler, Leibnitz, Laplace, and others, upon the phenomena of gravitation, tides, and the earth's density, while geology was established by the investigations of Desmarquest, Werner, and Hutton upon the nature of rocks and the shiftings due to volcanic disturbances and denudation. These researches were collated by Sir C. Lyell in his *Principles of Geology* (1830-33). Botanical G was promoted by the works of Linnaeus and the two Forsters, father and son, who accompanied Cook on his voyages and directly interested Alexander von Humboldt (1769-1859) in the study. Humboldt has many claims to be considered the greatest of all geographers. He was a great traveller and acquired a mass of first-hand knowledge as well as doing immense work in classifying the knowledge collected by others. He showed that

the forms of land exercise deciding influence upon climate and upon the plants and animals, including human races, that inhabit them. The results of his investigations were pub. in his great work *Kosmos* (1845-58), which remains a classical work on G. He also introduced the use of isotherms and isobars, and by directing attention to the question of vertical relief and the mean height of countries he founded the science of geographical morphology. Humboldt was almost equalled in the immensity of his labours by his contemporary Karl Ritter (1779-1859), who laid stress upon the importance of comparative G. and endeavoured to show the effect of terrestrial relief and climate upon human hist. His colossal work, *Vergleichende Geographie*, begun in 1817, was never completed, only Asia and a portion of Africa being dealt with. He adopted the theological argument of Christian theologians, and endeavoured to show that the earth had been created so as to meet the needs of mankind in every respect and looked upon the arrangement of land and sea and its general configuration as instruments for guiding man along the line mapped out by divine providence. His bias in this direction led him to devote himself more closely to the historical aspect of G. The undue stress laid by Ritter upon the historical side was corrected by Peschel, who carried on Humboldt's work, and again brought into prominence the physical aspect of the science. His successors have more or less each presented their own personal point of view, devoting special attention to and bringing into special relief one particular aspect of the science. The evolutionary theory had necessarily a great effect upon the view of geographers, and led to the conception of the earth's origin and its gradual cooling through long geological ages, and the effect of its celestial environment upon the form assumed by land and water, thus serving to complete geographical knowledge and invest the subject with a new philosophical dignity.

Geographical Discoveries in the Nineteenth and Twentieth Centuries.—During the nineteenth century the work of geographical discovery went on unabated and many expeditions were sent forth. Amer., Eng., and Fr. expeditions under Wilkes, Ross, and d'Urville visited the Arctic seas in 1840 and led to a whole series of similar expeditions. In 1880 Baron Nordenskjöld sailed round the N. of Europe and Asia. The interior of America was explored by Humboldt and others. Africa was penetrated by Bruce, Speke, Livingstone, Emin Pasha, and other explorers. Sturt and Eyre explored the interior of Australia, while the continent was traversed from Melbourne to the gulf of Carpentaria in 1860 by Burke and Wills. Among explorations interesting to note is the journey of Prince Peter Kropotkin in the Trans-Baikal prov. of Siberia and N. Manchuria in 1864, which led to a new conception of the mt. system of Asia. In 1871 Przhevalsky commenced his exploration of Tibet, in which he was followed by many Russian, Brit., and Fr. explorers.

The last quarter of the nineteenth century also saw many important explorations in W. China, Indo-China, and Inner Asia. Between 1884 and 1897 Sven Hedin carried out some highly interesting explorations in the Pamir region, and on the N. boundary of Tibet, while the exploration of Africa is associated with the name of Stanley. Special attention has been given to the exploration of the Arctic and Antarctic regions and to the discovery of the poles. The chief expeditions to this end were conducted by the duke of Abruzzi, in 1899, which reached 86° 23' N. lat. by Nansen, 1893; 86° 14' N. by Andrée, a Swedish engineer, who left Spitzbergen in a balloon with two companions in 1897 and was not heard of again till 1930, when his skeleton was discovered, with those of his companions, and by Scott in 1901 towards the S. pole. Both poles have, however, now been reached, the N. by Peary in 1909, and the S. by Amundsen and Scott in 1912. In addition, mention should also be made of the deep-sea explorations that have been carried out during recent years by the Brit. ships *Challenger* (see CHALLENGER EXPEDITION) and *Discovery I.* and *Discovery II.* (see DISCOVERY COMMITTEE), the Ger. *Valdivia*, and the U.S.A. steamer *Albatross*. See also OCEAN AND OCEANOGRAPHY. Of recent years much exploration and geographical survey work has been carried on by means of aeroplanes, while motor vehicles have been used in exploration of the Sahara (Haardt and Audouin-Dubreuil, 1923), and the Gobi desert (Andrews, 1928), etc. In 1928 Amundsen's dirigible *Norge* crossed the N. Pole on a flight from Spitzbergen to Alaska, and in 1925 he was lost on an expedition for the relief of the wrecked dirigible *Italia*. In that year useful observations on meteorological and navigation conditions were made by Capt. Sir Hubert Wilkins on a flight from Alaska to Dead Man's Is., Spitzbergen. Three years later he lost his life when hunting in a kayak, whilst attempting to organise an air-route from the United Kingdom to Canada via Greenland. In Sept. 1936 the famous Fr. explorer, Jean-Baptiste Charcot (q.v.), was lost when the Fr. polar research ship *Pourquoi Pas* foundered off Iceland. In the same year a Soviet hydrographic expedition claimed to have mastered a new sea-route near the Nordenskjöld Archipelago. The Soviet Gov. estab. a polar station in the vicinity of the N. Pole in 1937, and Prof. Otto Schmidt headed a Soviet expedition in 1937-38. His report stated that the N. polar summer climate was considerably milder than was expected, and that the Polar Sea was more than 3000 ft. deeper than Nansen's researches had seemed to indicate.

Modern Conception of Geography.—From the foregoing outline of the development of geographical knowledge it will be seen that the conception of G. has greatly altered from time to time, and can indeed be hardly said to be rigidly defined at present. In general G. may be said to be the study of the phenomena of the earth's surface and of its inhab. It can be

divided into the following branches: (1) Mathematical G., dealing with the figure and dimensions of the earth, its position relative to other celestial bodies, its movements as a planet and the effect of such movements upon its crust; (2) Physical G., sometimes called physiography, dealing with the actual physical condition of the various portions of the earth's surface and capable of subdivisions into geomorphology or the constitution of the lithosphere, oceanography, that of the sea, and

refers both to the hist. of the development of geographical ideas, a branch of the hist. of philosophy, and to the progress of actual geographical discovery, a branch of human hist. How far these branches are to be carried is not easy to determine. Mathematical G. borders upon mechanics, geomorphology is closely allied to geology, and biogeography leads naturally to biology. Another div. may be made between general G. and regional G., sometimes termed chorography, which is simply the

RUSSIAN EXPLORERS AT THE NORTH POLE, 1937

Babuschkin, Schevelev, Schmidt, and Papanin

E. N. A.

climatology, the phenomena relating to the atmosphere; (3) Biogeography, or the G. of animals (zoogeography) and of plants (phytogeography), the former including the study of mankind (anthropogeography), which is again divided into political and commercial G. according as the subject is treated from the point of view of the gov. or commerce of the country in question. The discussion of the relation of man to his environment is also known to-day as economic G., and the accepted basis upon which to found such discussion is a knowledge of the structure or 'build' of a country (*see below*). The elucidation of the many questions involved in the foregoing dis. leads to a study of the processes by which the present situations have arisen, which is termed historical G. or paleogeography, a distinct subject from the hist. of G., which

application of geographical study to a limited area, and in its turn leads to topography, the description of a special place or locality. For fuller information relating to any of these special branches the reader is referred to the various articles and to the books mentioned in the bibliography below.

Economic Geography and the 'Build' or Structure of a Country.—It is remarked above that a knowledge of the structure or build of a country is the best basis for discussing economic G. 'Build' is defined by Prof. Griffith Taylor as the essential geological pattern, whether anet. shield, crustal trough (syncline), or ridge (anticline), raised relic of an old range or young mt., either with broad or narrow folds. This aspect of G. has been presented in the better text-books in Europe since 1910, but is by no means universally

adopted in America. Its chief advantage, however, is that it enables us to account for the distributions of various commodities such as metals, coal, oil, or water-supply in a way impossible by any method which ignores structure. A study of structure or build shows, for example, that erosion is much more rapid on the exposed surfaces or mts. and plateaux, with their swift rivers and streams eating into the steep slopes, and that it is only when such land-forms are worn down to their roots to form peneplains that they become relatively stable. It tells us, too, that the most permanent portions of the earth's crust are the very ancient land-surfaces known as coigns or shields. These shields flank the Atlantic and Arctic oceans, while the greatest elevations of today flank the Pacific and Indian oceans, and the most important shields occur in Brazil, E. Canada (the Laurentian), E. Siberia (Angara), Russia, and W. Africa. Many geologists believe that the tetrahedral earth-plan is a relic from the original cooling and contraction of the molten earth, and certainly the tetrahedral theory affords some explanation of the world-plan—the central Asiatic land-mass with the three great continental 'peninsulas,' America to the S.E., Euro-Africa to the N.E., and Australasia to the N.W. (as shown on a form of polar projection with the N. Pole at the centre). The climatic arrangements of the world-plan are determined primarily by lat. and secondarily by aspect. A study of the arrangement of the vegetation in the Amer. 'peninsula' shows that it is identical with that in Africa, except that the gulf of Mexico and the Caribbean Sea have very deeply embayed America on the tropic of Cancer. Again such study serves to explain the remarkable monsoon climate for which India is noted; and again why there is always a belt of warm temperate forest and savannah about 500 m. wide on the E. or windward side of the desert belt which stretches from the Sahara almost to China. Early man, says Prof. Griffith Taylor, 'had no greater love for the desert or tundra than the average man of to-day. Hence his chief abiding places would be found in the belt between the desert and the forests. The park-land type of country, just on the drier edge of the forests, would seem to be best suited to early man. Probably the primitive negroid peoples would prefer the warmer savanna woods, while the higher races would expand on the edge of the temperate forests. These belts would also be the great corridors of migration until man tamed cattle and horses, when the drier steppes would be equally available. With the use of bronze and iron tools, some progress would be made in cutting down the deciduous forests of the temperate zone, but as regards tropical forests, man has not even yet made much impression on them. . . . These belts of vegetation have varied in position during the life of man on the earth. Every one knows of the swing from tropic to tropic of the sun during each half-year. The effect of this swing is first felt as a change of temp.

and this brings about a similar seasonal swing in the wind-belts and also in the rain-belts. There is thus a direct connection between the change in a temp. belt and the change in a rainfall belt.' (Griffith Taylor, *Environment, Race, and Migration*, a valuable work on the 'fundamentals of human distribution,' pub. by Toronto Univ. in 1937.) Consult also G. Taylor, 'Climatic Cycles and Evolution' in the *Geographical Review* for Dec. 1919; W. H. Hobbs, *Earth Evolution*, 1922; and J. Joly, *The Surface History of the Earth*, 1925.

While it is thus evident that G. as a branch of knowledge is capable of progressive div. into various subsections, each of which can be treated in itself, it is nevertheless necessary to point out that the tendency is rather towards unification. This is due to the influence of Peschel and Ritter in Germany, whose views have gradually made their worth felt also in England and America. While the old system of G. as taught in schools consisted simply in treating each portion of the globe with reference to its physical, political and commercial features quite objectively without any special scheme or order, the modern system endeavours to show the immediate or underlying connection each geographical fact has with the pupil himself. Hence it is customary to begin with those geographical features which intimately concern the pupil, such as the surroundings of the class-room, thence to deal with the immediate vicinity, and afterwards to enlarge the scope of the study until it deals with the characteristics and interrelation of the general features of the earth's surface and their influence on mankind and animal and plant life, leading on to the reasons for the distribution of mankind in tn. and country and to the study of geographical hist. This new system of dealing with the subject has given G. a place among the highest branches of knowledge, and many univs. now have special profs. of G., and grant degrees in the subject.

Geological Societies. The chief G. Society in Great Britain is the G. Society of London, founded in 1807 and incorporated in 1826 (address, Burlington House, London, W.1). Among foreign G. S. some of the prin. are the G. Society of America (New York), Société Géologique de France (Paris), Deutsche geologische Gesellschaft (Berlin), and the Società Geologica Italiana (Rome). International Congresses of geology are held at intervals, the first having taken place at Bologna in 1876. Much work of a G. nature is carried out by members of crystallographical, petrological, mineralogical, and palaeontographical societies, while smaller bodies (natural hist. societies, etc.) afford a focus for local activities.

Geological Survey. This institution, with its attendant museum, has had a complex origin and hist. The Geological Society of London, founded in 1807, was the first geological society in the world. It preceded the G. S., formed in 1835, and can, in fact, be credited largely with the

initiation of the idea. Its presidents have included such famous men as Murchison, Lyell, Sedgwick, Buckland; among its secretaries were de La Beche and Darwin. In its *Quarterly Journal* numerous contributions have become classics. Prof. Daly of Harvard, U.S.A., in speaking of it has said: 'Most of the fundamental and therefore endlessly stimulating ideas of geology were born in Britain, and, before their golden worth was assured, each announcement of principle had to go through the purifying furnace of debate in the Geological Society of London.'

Following the formation of the London Geological Society similar organisations have sprung up in cities all over the world. Industries associated with geology have also their societies—as, for example, the Institute of Petroleum Technologists and the Institute of Mining and Metallurgy. Not all their members have been professional geologists, but men with a certain amount of leisure and a great amount of curiosity: Hutton, Lyell, Agassiz, and Darwin were amateurs; Murchison and de la Beche were originally soldiers. Medical men and schoolmasters, among others, were also keen members. The first officially instituted G. S. was that of Great Britain. Its emergence was largely due to the immensely valuable pioneer work of the London Geological Society and to the enlightened policy of Col. T. F. Colby (1784-1852), director-general of the Ordnance Survey. In 1831 Sir Henry de la Beche, at the direction of the Ordnance Survey, produced a geological map of Devon and in 1835 the G. S. was estab. as a subsidiary of the Ordnance Survey, with de la Beche, then foreign secretary of the London Geological Society, becoming director. G. Ss. of other countries were estab. later, and those of the U.S.A., Canada, Germany, and France have reached a high standard of efficiency.

The G. S. of Great Britain is not merely one centralised official body. It has a nucleus of at least fifty professional geologists with a staff of technical assistants, these in turn supported by a large background of amateur workers and investigators, generally organised into local and regional associations and field clubs. The purpose of the G. S. is to collect information regarding the rocks, minerals, and resources of Britain (including water supplies), to produce various types of maps and reports and to give geological advice not only to the various gov. depts. but also to any individual inquirer—the results of such work being pub. in the printed memoirs issued annually, and in the regional handbooks prepared from time to time, some account of which will be given later. In addition to the promotion of a growing mass of geological science the survey work is of great practical value in relation to agriculture, mining, road and railroad development, and the proper utilisation of natural resources, including water—a matter of steadily increasing importance.

Accessory to all this a museum of economic geology was estab. in 1837, and

in 1851 the Museum of Practical Geology and the School of Mines were opened. For the purpose of co-ordinating the work of the G. S. with its visual illustration in the new museum the country was divided into a number of regions. To each of these regions one bay in the museum was allotted. So far as possible the regions were based on natural divs., but arbitrary boundaries were obviously necessary on account of limitations of space. Thus the area known as the Hampshire basin, although naturally divided from the Weald, was extended westwards and northwards to the boundaries fixed for adjoining regions. This area thus includes the whole of Dorset, the greater parts of Wiltshire and Hampshire, and the Isle of Wight. In this region are exposed all the formations in the Jurassic, Cretaceous, Eocene, and Oligocene systems, as well as a variety of superficial deposits. From the earliest days of geological investigation this area has been an attractive field—its pleasing scenery, its holiday resorts, the economic value of many of the strata, and its abundant fossils have all been contributory factors to our knowledge. The quarrying of high-class Portland building stone has disclosed many fossils and interesting rock specimens. A small part of the area, a little tract on the Wiltshire border, near Bath, is of historic interest since it figures in the oldest geological map—that of the neighbourhood of Bath, pub. in 1799 by Wm. Smith, a surveyor, the 'father of English Geology.' In the early part of last century pioneers like de la Beche, Buckland, and Conybeare were investigating the strata of the Dorset coast and making known the remarkable fossils found there. Mary Anning, the daughter of a cabinet-maker of Lyme Regis, became famous for her work in collecting and developing the remains of Saurian reptiles in the Lias afterwards studied by Owen and other anatomists. She discovered the first complete skeleton of *Ichthyosaurus* recorded in this country, also a new Saurian reptile that is now the well-known *Plesiosaurus*, and the remains of a flying reptile.

In the second half of last century (from 1878 to 1886) the Lias ammonites were the subject of a monograph, pub. by the Palaeontographical Society, by Thomas Wright, a Cheltenham surgeon. In recent years detailed examination of the cliffs near Lyme Regis and Charmouth by Dr. W. D. Lang has provided some of the most exact results obtainable by modern methods on the study of fossils. The beds of Inferior Oolite in Dorset have been studied intensively by S. S. Buckman, who firmly established the value of ammonites in determining the exact geological age of minor divs. of strata and made interesting deductions as to the conditions under which the beds were deposited.

Plant remains found in the pipeloy in the cliffs near Bournemouth were long ago studied by the palaeo-botanists Ettingshausen and Starkie Gardner; while in recent years further critical researches on plant remains have added much to our

knowledge. Beds of sev. ages in the Isle of Wight are well exposed in cliff faces.

The chalk occupies the greater part of the area included with the Hampshire basin. Prof. Charles Barrois of Lille was the first to show that the same zones estab. in France could be traced through England.

There are now in Great Britain depts. for England and Wales, Scotland, and Ireland, acting under a director-general at headquarters in London, and the Ordnance and Geological Surveys, although collaborating, are distinct. What changes, if any, may arise from the recent declaration of an Irish republic are not yet known.

The G. S. issues coloured geological maps on the scale of 1 in. to 1 m. (1 in 63,360), 6 in. to 1 m. (1 in 10,560), and 25·314 in. to 1 m. (1 in 2500); there is also a special index map, on the scale of 4 m. to 1 in. Descriptions of the maps are pub. and the survey issues periodical memoirs describing the work done and containing the director's report—special reports being pub. regarding water supply. Detailed handbooks, with maps and photographs relevant to the work done in each of the sixteen regions, have been pub. for the Dept. of Scientific and Industrial Research by H.M.S.O., at the price of 1s. 6d. The latest ed. (1948), with additional photographs, is pub. at 2s. 6d. The U.S. G. S., organized in 1879, and with headquarters at Washington, D.C., is united with the topographical survey. Folios of maps are pub. on scales corresponding to those of Great Britain, containing topographical, orographical, economic, and geological charts. Bulletins are issued annually and special pubs. are devoted to water resources. Special agronomic or soil maps are issued (as also in Japan and Germany before the Second World War) and great importance is attached to the collection of photographs and material for educational purposes. The surveys of other countries also issue ann. reports (possibly interrupted during the Second World War), which may be purely scientific or of economic or statistical importance; while the colonial surveys pub. special reports regarding mining developments of the colony.

Much survey work is now carried on by aeroplane (e.g. for the Brit. Ordnance Survey), O. G. S. Crawford having emphasised the fact that many features (met. earthquakes, etc.) can plainly be discovered in this way even when unnoticeable to an observer on the ground.

For the hist. of geological science in Great Britain see H. B. Woodward, *History of the Geological Society*, 1907; also Sir A. Geikie, *Life of Murchison*, 1875, and *Life of Sir A. Ramsay*, 1895; A. E. Trueman, *An Introduction to Geology*, 1938; Sir A. Seward, *Geology for Everyman*, 1943; D. Leitch, *Geology in the Life of Man*, 1945; F. K. Zeuner, *An Introduction to Geo-chronology*, 1946; and Board of Education and Science Museum, *Applied Geo-physics*.

Geology (Gk. γῆ, the earth, and λόγος, a discourse), the science which investigates the structure and hist. of the earth. It deals with the nature and origin of the

rocks which form the earth's crust, and treats of the progress of our planet from its earliest beginnings down to its present condition, of the birth of oceans and continental areas, of mutations of climate, and of the appearance and disappearance of successive faunas and floras. As an inductive science G. is comparatively young, although, as the writings of Pythagoras, Strabo, and others show, from very early times, the phenomena with which it deals claimed some attention. The belief of oriental cosmogonies in the alternate destruction and renovation of the world, may well have been caused by the observation of the occurrence of sea shells in rocks far removed from the sea. In the tenth century fossil shells were regarded as evidence of geographical changes, although some held that they were the result of 'plastic force' or were special creations. That they were relics of the Noachian deluge was an idea which prevailed throughout the seventeenth and eighteenth centuries. The philosophers on the Continent, Palissy (1580), Leibnitz (1680), Moro, and Generelli (1740), and others held advanced views and had propounded theories which are now fundamental. Especially in Italy did the science progress, and in England the spread of these advanced views is shown by the pub. of J. Michell's *Cause and Phenomena of Earthquakes*, 1780. The eminent prof. of mineralogy at Freiburg, A. G. Werner, had in 1775 determined the order of succession of the strata in the Harz Mts. He maintained that his classification was applicable to the sedimentary strata of the whole world, and although this was found to be inadequate, and in some respects erroneous, it nevertheless estab. a definite geological principle. Werner regarded the igneous rocks as chemical precipitates, James Hutton (1788) upheld the igneous origin of these rocks, and a great controversy arose between the 'Wernerites,' or 'Neptunists,' as they were termed, and the followers of Hutton, the 'Vulcanists.' The latter held that the records of the past were only to be interpreted by understanding the methods of nature at the present. The Huttonian theory was ably expounded by John Playfair (1832) in his now famous *Illustrations*, and was also strongly supported by the experimental researches of Sir James Hall. Hutton's work had been done on the Scottish rocks, which were mainly igneous, and which, while showing excellently the effects of denudation and decay, were devoid of stratification. It was left to Wm. Smith (1790), an Eng. land surveyor working in the neighbourhood of Bath, to lay the foundations of stratigraphical G. Smith remarked that each group of the stratified rocks which came under his observation was characterised by its contained fossil remains. By thus establishing the fundamental geological principle, that rocks in different localities and possibly laid down under different geographical conditions can be correlated in time by the use of fossils, Smith gained for himself the title of 'the Father of Geology.' Charles Lyell held Huttonian ideas, and his *Principles of*

Geology (1830-33) is still a standard work of reference. The cry that the present is the type of all preceding ages, as far as is revealed by the fossiliferous strata, gained for his school the name 'Uniformitarian.' The pub. of Charles Darwin's *Origin of Species*, (1859), as well as affecting the paleontological side of the science gave an evolutionary tinge to the physical and stratigraphical side. The attention given to the petrographical side of G. was revived

TALUS FORMED BY ACTION OF FROST,
NIPIGON RIVER, ONTARIO

by the researches of Henry Clifton Sorby (1826-1908), who showed that much information was to be obtained from the examination of thin sections of the rocks under the microscope, and thus opened up a field of inquiry from which much has been gleaned and from which more may be expected. The sev. depts. of G. may now be outlined.

Geognosy.—This treats of the materials of which the planet consists, and is sometimes treated under the name *Petrology* (q.v.), of which *Petrography* and *Petrogenesis* are the two branches. The earth consists of a globe having a cool and solid crust, but with a high internal temp., and surrounded by two outer coverings or envelopes, an outer one of gas (atmosphere) and an inner one of water (hydrosphere). The atmosphere extends some 500 m. from the earth's surface, while the hydrosphere with an average depth of about 14,000 ft. covers about three-fourths of the surface of the globe. The solid crust or lithosphere has a mean density of 2.7, and since the density of the earth as a whole is 5.6, the inference drawn is that the planet consists of two portions—a lighter solid crust and a heavier interior (barysphere). The evidence for the internal heat of the globe

lies in the existence of volcanoes, hot springs, and the downward increase of temp in borings, wells, and mines. Below a zone of invariable temp., the temp rises on an average of 1°F for every 60 ft of descent. Inferring this increase continuous, the most intractable bodies would be molten at a depth of 50 m., and thus the theory was held that the earth had a molten interior surrounded by a solid crust. The impossibility of this condition was shown by Prof. Hopkins of Cambridge while Lord Kelvin showed that the earth is more rigid than a ball of steel of the same diameter and argued that it was probably solid to the centre. The solidity of the interior is accounted for by the suggestion that fusion of the rocks by the intense heat is prevented by the enormous pressure which exists at the depth. In any event, the rigidity of the barysphere is beyond doubt and its mean density must clearly be greater than 5.6. There is reason to

tion of the past. Thus the records of the past action of various natural agents of change, as preserved to us in the rocks of the earth's crust, may be interpreted by the study of the operations of nature now in progress which study constitutes dynamical G. The agencies of geological change are divided into two main groups (i) Epigene or Subaerial, (ii) Hypogene or Subterranean. The subterranean agencies may be subdivided as atmospheric, aqueous, organic, and chemical. The winds of the atmosphere are concerned in the removal from one place to another of all loose material. In this way we get the formation of sand dunes and links, and the curious clay formation 'loess'. Changes of temp causing alternate expansion and contraction of the rocks result in their ultimate destruction. The aqueous agencies of change are the most important of epigene agents. The rain washes away fragments of disintegrated rocks into the

UNDERGROUND WALLS

Water and rain and melting snow sink into the soil until arrested by some impermeable bed such as clay or shale. The level of ground water rises after a wet season and sinks after a dry one, leaving shallow wells without a water supply. Springs occur along the sides of slopes where the top of the impermeable layer is exposed.

believe that it consists chiefly of a mixture of nickel and iron, though toward its periphery there may be a zone of metallic sulphides and oxides. The lithosphere down to a depth of 10 in. consists mainly of oxygen (about 47 per cent) and silicon (about 27 per cent) in the form of silicates, etc. The age of the earth has been estimated from the thickness of the stratified deposits. From observation of the rates of geological changes at the present, assuming them a measure of past changes and taking the maximum thickness of the sedimentary strata to be about 530,000 ft., geologists have calculated the age of the planet to be over 500,000,000 years. Lord Kelvin from physical arguments assigned at least 100,000,000 whilst more recently, from radioactive considerations the age has been estimated at some 2,000,000,000 years. This result has been confirmed astronomically. The rocks of the earth's crust may be subdivided into three main groups, viz. Aqueous, Igneous and Metamorphic. The composition of the rocks and their macroscopic and microscopic characters are treated under Petrography, while the study of Mineralogy treats of the mineral constituents.

Dynamical Geology—Geologists believe in the constancy of nature and consider that the study of the present order of nature provides a key for the interpreta-

tion of the past. Continual weathering of the rocks by rain causes the surface of the land to be worn down and the material transported to the seas. Rain water percolating the rocks is assisted in their destruction by frost. The water is frozen in cracks and crevices and by the expansive force the rocks are shattered into fragments. Especially does this occur on mountain tops, giving rise to jagged peaks whose slopes are covered by a 'talus' of shattered fragments. Springs may arise from the rain which falls on previous strata and may issue as perennial or intermittent or as cold or thermal springs. Occasionally spring waters hold minerals in solution and may deposit the excess locally as calcareous travertine, or as siliceous sinter. Owing to underground waters dissolving and wearing away the rocks, caves are formed in which we may find stalactites and stalagmites. Streams and rivers are concerned in the work of denudation by eroding their beds, transporting the material swept into them by rains and floods, and by the deposition of this material in places where the waters come to rest. Thus lakes may be silted up and deltas and alluvial flats formed. Glaciers show the work of frozen water. By carrying off rock material as 'moraines' and by carving valleys out of rocks, they assist in the work of denudation. The waters of the sea act

in three ways: by erosion, transportation, and deposition of sediment. Waves and breakers erode the shore, and this material together with that brought down by rivers, is carried by ocean currents, and finally deposited on the ocean floor within about 200 m. of the shore-line. The organic agencies at work are those depending on plant and animal life. Plants by their growth and decay continually add to the soil and also protect the rock surface. Carbonaceous and coal deposits are formed by plants, and also siliceous deposits, such as the diatom ooze on the ocean floor. Animals aid in the building up of the earth crust by adding their coverings or skeletons. Thus are formed globigerina and radiolarian oozes, and the coral is. and reefs. Finally, chemical agencies are concerned in cementing loose deposits into solid rocks. In forming littoral concretions and deposits of calc-sinter, and in giving origin to mineral oils and rock salt. The hypogene agents of change are volcanoes, earthquakes, and slow crust movements. These agencies are engaged in accentuating the relief of the globe, and act antagonistically to the leveling tendency of epigene agents. The volcano piles up masses of volcanic *effluvia*, the earthquake shakes entire districts, while the secular crust movements warp the crust into vast regional waves of alternate elevation and depression, or give rise to mt. ranges. Thus the two sets of agencies, epigene and hypogene, keep the earth in habitable equilibrium; the ruins of the lands deposited as sediments on the ocean floor by the one being raised above the surface of the ocean by the other, to undergo the same sequence of degradation, deposition, and renewal.

Geotectonic geology deals with the structure of rock masses. Viewing first the igneous rocks, we find they are grouped as (a) extrusive, and (b) intrusive. The former type are chiefly lavas and ashes ejected near the surface. Lavas have a scoriaceous upper and lower surface, vary in thickness, and produce a certain amount of contact metamorphism on the underlying beds. Steam holes or vesicles in the lava may become filled by secondary mineral matter giving amygdaloidal structure. The ashes ejected from volcanoes vary in coarseness from fine dust and tuff to agglomerate formed within the cone from bombs and lapilli. The intrusive types of igneous rock are newer in age than the rocks into which they are intruded, and are represented by volcanic necks, dykes, bosses, laccolites, and intrusive sheets or sills. These latter differ from an extruded lava sheet in having no scoriaceous surfaces, not varying so markedly in thickness, and having rocks both above and below altered by contact metamorphism. Regarding now the secondary or derivative rocks, we observe their characteristic bedding or stratification due to the method of accumulation, i.e. by deposition under water. Individual beds when followed are found to be wedge-shaped, i.e. they thin out. Followed laterally, a bed may change its character, e.g. limestone passes into shale, shale into sandstone, and

sandstone to conglomerate. If the strata are horizontal, then the beds outcrop parallel to the contour lines. This is not always so, but the beds generally dip at a certain angle due to folding. The strike of a bed is at right angles to the true dip, and is designated by the compass bearing. The beds are folded into anticlines and synclines due to crust movements. In mt. regions where the tangential pressure appears to be greatest, the beds are often overfolded and inverted, giving the type of folding known as isoclinal. In the Alps and mt. chains of similar type, such as the Himalayas and the Andes, the folding and

PART OF FOLDING MOUNTAIN, ATHABASCA GAP, ROCKY MOUNTAINS, SHOWING A COMPLEX SYNCLINE

inversion is so great that a typical fan structure is developed. Jointing occurs in both sedimentary and igneous rocks, smaller joints being due to drying and contraction of sediment in the aqueous rocks, or to cooling and contraction in igneous rocks. Master joints, due to torsional stresses, traverse both igneous and aqueous rocks, when followed across country. Faulting or dislocation of the beds is also due to earth movement and pressure. Evidence goes to show that these disturbances have occurred over and over again, beds being upheaved, folded, tilted, and denuded, and then being depressed, and sediment deposited upon the denuded surface, giving rise to unconformities.

Paleontological geology deals with fossils or organic remains preserved in the rocks and endeavours to gather information from them as to the history of the earth and its inhabitants. Fossils are of great use in determining the age of strata, and given that the type fossils of a formation are known, it is possible to show the existence of any break which occurs in the stratigraphical succession, or any abnormal sequence which may occur as the result of folding. From the study of the fossils it can be shown that the progress of life forms has not advanced at the same rate in all quarters of the globe, a certain stage being reached in one place many thousands of years before it was reached in another part of the globe, although the same general succession of organic types may be found in each region. The testimony of the rocks is in favour of the doctrine of evolution, although very many discrepancies arise owing to the imperfections of the geological record.

Historical Geology.—The fossiliferous strata of the S. of England were the first strata to attract minute study. Following on his researches on these strata, and

on other rocks in England and Wales, Wm. Smith pub. a table of the stratigraphical succession, in which the London clay was regarded as the top series, passing downwards into the Chalk, Greensand, Oolite, Lias, New Red Sandstone, Coal Measures, Old Red Sandstone, and the Greywacké Rocks. In later years these Greywacké rocks were investigated by Murchison and Sedgwick. Sedgwick, working from the base of these old rocks, called his system the Cambrian, while Murchison, working from the base of the Old Red Sandstone, named his system the Silurian. Later it was found that the Upper Cambrian of Sedgwick was the same as Murchison's Lower Silurian, and it was suggested by Prof. Lapworth that they be grouped as Ordovician. Rocks older than Cambrian are unfossiliferous, save for the pseudo-fossil *Eozoon canadense*, and are termed pre-Cambrian. Sev. alterations were made in the upper part of Wm. Smith's classification. The newer rocks, the Tertiary, were subdivided by Lyell into Eocene, Miocene, and Pliocene, according to their percentage of living types of mollusca. Since then the groups Oligocene and Pleistocene have been added. The Old Red Sandstone below the carboniferous system was studied and their fossil fishes described by Hugh Miller and Agassiz. The Devonian strata of Lonsdale were found to be homotaxial with the Old Red Sandstone, certain fish and crustaceans being common to the two sets of strata, and thus beds of marine and fresh-water origin were found to have been deposited during the same geological period. The 'New Red' rocks were divided, at a later date, into the Permian and the Trias. As accepted at the present day the scheme of chronological classification is as follows:

Quaternary or Anthropozoic	(Recent and Prehistoric) (Pleistocene)
Tertiary or Kainozoic	(Pliocene) (Miocene) (Oligocene) (Eocene)
Secondary or Mesozoic	(Cretaceous) (Jurassic) (Triassic)
Primary or Palaeozoic	(Permian) (Carboniferous) (Devonian) (Silurian) (Ordovician) (Cambrian)
Archaean	pre-Cambrian

The Kainozoic group is sometimes divided merely into Neogene and Palaeogene, while the Mesozoic and Kainozoic groups are spoken of collectively as the Neozoic, and the Palaeozoic is occasionally divided into the Protozoic (Cambrian, Ordovician, and Silurian) and the Deuterozoic (Devonian, Carboniferous, and Permian). This Brit. scheme is followed in more or less detail by geologists of all

countries, and formations of other lands can be arranged approximately under Brit. types.

Petrology.—This div. of the science has rapidly become one of the most important. Of its two branches, petrography deals with the study of rocks as they are, while petrogenesis is concerned with the modes of origin of rocks. Modern petrological methods are largely chemical or physico-chemical, while microscopic examination of rock-sections is an essential part of the technique. In England the Igneous rocks have been classified according to their crystalline character into Plutonic, Hypabyssal, and Volcanic. In America, however, the rocks are classified according to their chemical composition. The nomenclature is somewhat complicated, but much may be expected from the careful analysis of the rocks. For further treatment see PETROLOGY.

Geomagnetism, the earth's action as a magnet. The effective and practical study of G. in England is chiefly associated with the name of Edmond (or Edmund) Halley (q.v.) the astronomer, though the attraction of iron by lodestone was known to antiquity, and is mentioned by Plato and later writers. In our time the study has been pursued by Crichton Mitchell, and, before him, by Hellmann and Sylvanus Thompson. While still at St. Paul's School Halley decided to devote his life to astronomy, but G. was his chosen secondary interest. In 1672, when only sixteen years of age, he measured the magnetic declination in London. At Oxford he planned an expedition across the equator to observe the S. stars and, in 1676, he was enabled, through the Royal Society, to go to St. Helena, where he observed the declination. The Royal Society pub. his famous theory of the distribution of the declination in 1683. Halley's aim was 'to reconcile the observations by some general rule,' not, as Descartes did, by 'causes altogether uncertain' (as are the casual lying of iron mines and lodestones in the earth), 'which,' he thought, 'put a stop to all further contemplation.' His conclusion was that 'the whole earth is one great magnet, having four magnetic poles, or points of attraction, near each pole of the equator two, and that, in those parts of the world which lie near adjacent to any one of these magnetic poles, the needle is governed thereby, the nearest pole being always predominant over the more remote.' In 1692 he extended his theory to explain the secular variation, the whole period of which he conjectured to be '700 years or thereabouts,' but he expressly left the 'nice determination of this and other particulars in the magnetic system' to be resolved by remote posterity. We now know that, despite the irregular distribution of the earth's magnetic field, there are only two magnetic poles, to which converge all the magnetic meridians, and Halley's own later knowledge would have enabled him to draw many of these meridians, and to discover the

fact. The first actual chart of the earth's magnetic meridians was made in 1817 by Thomas Yeates. The 'irregularities of the earth's field imply a more detailed irregularity in the inner causes than Halley's hypothesis suggested, and the secular variations are regional in character, not so regular and world-wide as he supposed' (S. Chapman). The causes of the main field, of its irregularities, and of its secular variations are still unknown. In 1698 Halley was granted a ship by William III. 'to improve the knowledge of the longitude and variations of the compass.' After a magnetic survey of the N. and S. Atlantic he returned in 1700, and next year pub. his first chart of the declination over the Atlantic. In 1702, having collected further observations by mariners in other oceans, he produced a world magnetic chart. 'These charts are his greatest contributions to G., and give the declination in a way very convenient to navigators. In time, as he foresaw, their practical value came to an end, owing to the secular magnetic variation, but the value of his observations as a record of the declination at the epoch 1700 remains unimpaired. One remarkable gap in his geomagnetic work was his apparent total neglect of the magnetic dip, and this in spite of the importance then already given by Wm Gilbert to the phenomenon. For two centuries, says Prof. Chapman, Halley had no comparable successor in this sphere, and the magnetic survey of the globe was not renewed with his zeal until in 1905 a young Amer., Louis Bauer, with the support of Carnegie, resumed the task. See also MAGNETISM. See G. Hellman, *Zur Geschichte der Erdkunde*, 1897; A. Crichton-Mitchell, *Terrestrial Magnetism*, 1932; *Correspondence and Papers of Edmond Halley* (together with an unpublished memoir by one of his contemporaries), ed. by E. F. MacPike, 1932; and S. Chapman, 'Edmund Halley and Geomagnetism' in *Nature*, Aug. 28, 1943.

Geometric Mean, middle of three quantities which are in geometrical progression (q.v.). Thus, if a, x, b are in geometrical progression, x is the G. M. between a and b . From the definition of geometrical progression it follows that $\frac{x}{a} = \frac{b}{x}$ and $x = \sqrt{ab}$. In higher mathematics the definition is extended so that the G. M. of n quantities is the n th root of the product of the quantities. Thus the G. M. of $a_1, a_2, a_3, \dots, a_n$ is $\sqrt[n]{(a_1 a_2 a_3 \dots a_n)}$. The G. M. of two quantities is also their mean proportional.

Geometric Progression, series of quantities such that the ratio of any one of them to the one immediately preceding is the same throughout the series. This ratio is called the common ratio of the series. Thus 3, 6, 12, 24, ... etc.; 6, -2, 1, -1/2, ... etc., and a, ar, ar^2, ar^3, \dots etc., are series in G. P., whose common ratios are respectively 2, -1/2, and r . In the last series the n th term is $a r^{n-1}$ and the sum of n terms is $a \frac{1-r^n}{1-r}$. In cases where r is

less than 1, it is found that the sum of an infinite number of terms of the series is the finite quantity $\frac{a}{1-r}$. A recurring decimal

is an example of such a G. P., and is hence reduced to its equivalent fraction. G. P. forms the basis on which calculations of annuities and compound interest are made.

Geometries, Finite. Name given a class of (is., in each of which there is a finite number of elements called *points*, falling into subsets called *lines*. The mutual relations between lines and points are closely analogous to those of lines and objects in ordinary projective geometry. See O. Veblen and J. W. Young, *Projective Geometry*, vol. 1., 1910, vol. 2., 1918, Boston, U.S.A.

Geometry may be defined as the investigation of the properties of space.

Historical.—As the name implies, its origin may be traced to what was necessary for the management of land. The frequent inundations of the Nile in Egypt destroyed landmarks, and so altered the value of land that the priests were driven to invent some method for finding areas. The first known attempt to classify these results was by a priest Ahmes in the "Rhind" papyrus, which is at present in the Brit. Museum. Ahmes was the first geometer to give deductive proofs, and this work was continued by Pythagoras. Euclid (285 B.C.), though himself not so great a mathematician as some of his less known contemporaries, collected and arranged in a logical order in his *Elements* all the known theorems, and his work, with few alterations, has remained to the present day. Apollonius (247 B.C.) did much towards the investigation of the sections of a cone, and amongst those whose names stand out in the early hist. of the subject may also be mentioned Archytas, Plato, and Archimedes, and somewhat later Menelaus and Ptolemy, though it is probable that some famous propositions now ascribed to them were previously known. Much time of the early geometers was spent in famous problems such as the quadrature of the circle, the duplication of the cube, and the trisection of an angle. In more recent times the further development of the subject attracted the attention of eminent mathematicians whose names are too numerous to mention here. It may be remarked that analytical methods were introduced and developed by Descartes in the fifteenth century; and as astronomy became more thoroughly studied the geometry of spherical triangles was introduced.

The subject is best discussed under two main heads—Pure and Analytical.

PURE GEOMETRY in its turn naturally divides into two parts, Elementary and Higher.

(1) **Elementary.**—Pure G. embraces roughly the ground covered by Euclid's *Elements*, which forms an ordinary school course in plane and solid G. The latter treats of the ordinary space in which we move and is termed three-dimensional. A plane is two-dimensional, the upward direction out of the plane or third dimension being lost. Similarly, a line is of one

dimension, the direction sideways out of the line, in addition, being lost. A point has no dimensions. The terms length, breadth, and thickness are popularly ascribed to the three dimensions. The conception of some unknown fourth dimension has occupied much attention, but that is hardly within the scope of the present discussion. It is sufficient to say that the algebraical methods of analytical G. can be applied to some extent to problems in four dimensions. Euclid's *Elements* filled thirteen books, of which numbers VII. to X., dealing with arithmetical and irrational quantities and parts of XI., XII., XIII., dealing generally with solid G., are not usually read. Of the rest, Book I. deals with lines and angles, finishing with certain propositions on areas; Book II. deals entirely with the areas of squares and rectangles; Book III. with circles; Book IV. with polygons; Book V. is an introduction on proportion to Book VI., which deals with ratios. The retained parts of Books XI. and XII. deal with elementary properties of solid G. The whole series of propositions is based on certain assumptions and definitions. Euclid divided the assumptions into two parts. The first part contained what are now known as axioms 1 to 9; the second part, axioms 10 to 12 and the three postulates. An axiom may be defined as a self-evident truth, incapable of proof, which serves as a basis for future reasoning. Without some such assumptions, no G. is possible, but there is much doubt as to exactly what may be justifiably assumed. Euclid has been criticised for making further assumptions in his propositions which are not mentioned initially in his list, and for mixing certain axioms with his definitions. What is now the twelfth axiom, in particular, on which proof of theorems on parallel lines are based, is unsatisfactory, and in most modern eds. has been replaced by what is known as Playfair's axiom, but this, though more fundamental, is still open to some objections. The present method is to divide the assumptions into axioms and postulates, the latter being what must be necessarily assumed in construction, but it is questionable whether this is an improvement or not.

Until the beginning of the century the selected part of Euclid's *Elements* was accepted universally in almost its original form as a school text-book, and although it is not used now, those at present in use are little more than revised eds. A few propositions have been entirely omitted, the order has been altered in places, and some new methods have been introduced. There is no doubt that the alterations constitute a definite improvement. The new methods are worthy of notice. The idea of a locus is introduced, that is, of the path of a moving point. A circle is defined as 'the figure enclosed by a line traced out by a point which moves in such a way as to be always a given distance from a certain fixed point.' The principle of applying one figure to another is extended, and the *hypothetical construction* is introduced. It is assumed as axiomatic that a perpendicular can be drawn on a line from a point

within it, a finite straight line bisected at a point, and an angle bisected by a straight line, whereas Euclid never used any one of these for a proof until he had found a method for its construction. The order of his propositions suffers in consequence, and some proofs are unnecessarily long. Thus Euclid, I 5, the proposition known as the *Pons asinorum*, because its length made it a serious difficulty presented to the beginner, is now comparatively simple.

FIG. 1 CONICS

Mention in passing may be made of the method of proof known as the *Reductio ad absurdum*, which Euclid used often and is still retained. It occurs principally in converse propositions, but it is not confined to these. In such a proof what is to be proved is assumed wrong and an obvious absurdity deduced. This absurdity occurs in every case but the one to be proved, and hence the proof is established.

Euclid's solid geometry is very elementary in nature, and is confined to a few propositions on planes and lines (which follow at once from the methods of plane geometry), and on simple solids, including the five regular polyhedra. It is obviously impossible to deal with the propositions in detail here, and the student must be referred to the many school text books.

(2) *Higher Pure Geometry*—On finishing the ordinary school course the student is usually introduced to the *conic section*, and though these curves are generally best treated by the methods of projective geometry a description here is advisable. As the name implies, they are the curves obtained by cutting a right circular cone by planes. When the cutting plane makes an angle with the horizon less than that made by a generating line (AD and BO are called *generating lines*) the resulting curve is called an *ellipse* (in the figure EGF). When the cutting plane is parallel to a generating line, the curve is a parabola (NKM in the figure), and when it makes a greater angle with the horizon, the curve is an *hyperbola* (QPR and UIY in the figure). It is best explained here that the geometrical conception of a cone differs from the popular conception in that it is produced on the other side of the vertex O. Hence there are always two branches of an hyperbola. A particular form of hyperbola is two straight lines when the cutting plane passes through O. Similarly, a circle is a particular case of an ellipse. A sphere may be inscribed in the cone to touch the plane of the ellipse at the point S, called the *focus*, and it may be proved that any point on the ellipse is such that its distance from S is in a fixed ratio to its distance from the straight line l, called the *directrix* (the intersection of the planes l K l and XYZ). The same is true for a second focus H, where another inscribed sphere touches the planes from below. The two foci of the hyperbola S₁ and S₂, and the one of the parabola may be similarly found, and the same properties are true for these points. Thus a conic may also be defined as the locus of a point which moves so that its distance from a fixed point bears a constant ratio to its distance from a fixed straight line, the cone being an ellipse, parabola, or hyperbola according as the ratio is less than, equal to, or greater than unity. The point midway between the two foci of an ellipse

FIG. 2 ASYMPTOTES

or an hyperbola is called the *centre*, and these two are known as *central conics*. The extreme importance of the geometrical properties of these curves may be gathered on realising that comets, planets, and satellites move in orbits which are conic sections. Further, apart from questions of friction with the air, any body freely projected from the earth moves in a parabolic path. It may be mentioned also that as an hyperbola recedes from the centre it gradually approaches two lines known as its *asymptotes*, which pass

the cone as the centre of projection, and by suitably choosing the plane of projection, a conic may be projected into a circle; hence all harmonic properties of the circle give immediately the same harmonic properties for the conic. Descriptive properties of the circle allow of the same extension.

An example will best illustrate the principle. The pencil formed by joining

FIG. 5. HARMONIC PENCILS

any number (say four) of points A, B, C , and D (Fig. 5) to any other point O on the circle is equal to the pencil $O(ABCD)$, where O' is any other point on the circle; since the angles subtended by the arcs AB, BC, CD at O and O' are equal. Hence by projection the pencil $O(ABCD) = O'(ABCD)$ for the ellipse. In a similar way the converse proposition may be established: that if two pencils of different centres, in the same plane and not in perspective, are projective (that is, can both be obtained from one figure by projection from two different points), the locus of the intersection of corresponding rays is a conic section. It may also be proved that when two ranges in the same plane, not collinear and not in perspective, are projective with one another, the lines joining corresponding points all touch a conic. The similarity between these two propositions suggests a further discussion on the *Principle of Duality*. A figure in projective G may be considered to be generated by a point or a straight line in a plane; and a point or a plane in three dimensions. Thus a plane curve may be the locus of a point, or the envelope of a straight line (that is, the line in every position touches the curve). Propositions, therefore, occur in pairs. The following are series of parallel propositions:

Four points, A, B, C , and D , no three of which are collinear, are said to be the *vertices of a complete quadrangle*, and they may be joined in pairs by six sides. E, F, G are termed *diagonal points*.

It is proved that if FG intersects DC in H , then $(EHDC)$ is an harmonic range.

The three pairs of opposite sides of a complete quadrangle are cut by any transversal in three pairs of corresponding points of an involution ($q.e.$).

Four lines a, b, c , and d , no three of which are concurrent, are said to be the *sides of a complete quadrilateral*, and they intersect in pairs in six points called *vertices*, e, f, g are termed *diagonal lines*.

It is proved that if h is the line joining the points of intersection of f, g , and c and a , then $(shdc)$ forms an harmonic pencil.

The rays which join any point to the three pairs of opposite vertices of a complete quadrilateral are pairs of corresponding rays of an involution pencil.

The properties of a series of points $A_1A'_1, B_1B'_1$, etc., on a line in *involution* are discussed elsewhere. A similar correspondence between pairs of propositions is seen in the *Theory of Pole and Polar and Reciprocation*. The polar of a point with respect to a conic may be defined as the locus of the intersection of pairs of tangents at the ends of any chord through the point. The point is called the *pole*, in reference to the polar. When the point is outside the conic the polar is the chord of contact of the two tangents drawn to the conic. In the case of a circle the polar is a straight line drawn perpendicular to the radius through the inverse point (see *INVERSION*). It is proved that any line through the pole is cut harmonically by the circle and the polar, and hence poles and polars are projective. Thus all such properties for the circle follow immediately, by projection, for the conic. If a certain figure is made up of points x, y, z, \dots and lines a, b, c, \dots , the *reciprocal* figure is formed with respect to any conic, known as the *base conic*, by forming x, y, z, \dots the polars of x, y, z, \dots and A, B, C, \dots the poles of a, b, c, \dots . A curve may be the locus of a point or the envelope of a line, and the reciprocal curve will be the envelope of the polar or the locus of the pole. It is proved that a conic reciprocates into a conic, and with a circle as base conic, a conic may, in particular cases, be reciprocated into a circle. No many propositions give rise to corresponding propositions by reciprocation. Projective methods may be used in much the same

FIG. 6. VERTICES

way for solid G , but, in general, solid G is best treated by analytical methods. See B. Russell, *Foundations of Geometry* (1897), and O. V. Durell, *New Geometry for Schools* 1939. It was mentioned above that projective G was in some respects non-Euclidean. The general term non-Euclidean is given to those geometries

which are not based on Euclid's assumptions, and those which deal with non-Euclidean space. Among later geometers much discussion arose over the validity of some of these assumptions, notably that dealing with parallel lines, and other alternative assumptions were made. Thus Lobatchewski substituted for it: that all lines drawn from a point may be divided into two classes, with reference to another

FIG. 7. CO-ORDINATES

line—intersecting and non-intersecting—and that the two classes are divided by a parallel line. The two dividing lines cut the given line on two separate points at infinity, and both make acute angle with the perpendicular to the line, and thus he developed a series of propositions. Again, it is questionable whether the statement that a straight line is the shortest distance between two points is essentially true; there may be space beyond our conception in which it is not so; and in which, too, the angles of a triangle formed by the shortest distances joining three points are not equal to two right angles. Such space would be an example of non-Euclidean space. Riemann's system of non-Euclidean geometry commands a great deal of importance to-day in modern theories of the universe and in the theory of relativity. It contains two fundamental conceptions, viz.: (i.) that of a manifold, (ii.) that of the measure of the curvature of a continuous manifold possessed of what he calls flatness in the smallest parts (see A. N. Whitehead, *Universal Algebra*).

ANALYTICAL GEOMETRY differs from pure G. in that problems are solved by algebraical methods. It necessarily enables solutions to be found in certain cases where the methods of pure G. are much less convenient. This branch of the subject is also known under the heading *co-ordinate geometry*, since the position of a point is determined by its co-ordinates or distances from certain fixed axes. In its most elementary form it is familiar to most under the name *graphs*. The student first learns to plot the position of a point with reference to two fixed perpendicular axes (in plane G.). By measuring a distance 4 units along Ox and then 3 units parallel to Oy , the point A is obtained (Fig. 7). It is said to be the point (4, 3) or the point $x=4, y=3$. The first of the two co-ordinates is known as the *abscissa*, and the second as the *ordinate*. If the first number is negative it is measured in

direction Ox^1 . If the y -co-ordinate is negative, it is measured along Oy^1 . Hence B, C, and D are respectively the points $(-4, 3)$, $(-4, -3)$, $(4, -3)$. Now consider the equation $3x+4y=12$. It is possible to find any number of sets of value for x and y to satisfy the equation. Take each pair of values in turn and plot out the corresponding point on the graph, and it will be found that all these points lie on a straight line. $3x+4y=12$ is then said to be the *equation of the straight line*. In a similar way it is found that every equation of the first degree in x and y represents a straight line. It obviously follows that a set of values for x and y which satisfy two such equations at once must represent the point of intersection of the two lines. Hence the algebraical solution of two equations gives the co-ordinates of the point of intersection of the lines they represent. By similar methods the loci corresponding to equations of the second degree in x and y may be traced, and the algebraical solution of any pair of equations gives sets of values for x and y which represent the points of intersection of the loci. Such is the practical beginning of co-ordinate G. It may easily be established that a straight line must be represented by some equation of the first degree, that the straight line $Ax+By+C=0$ cuts the

axes in points $(-\frac{C}{A}, 0)$ and $(0, -\frac{C}{B})$, that it makes an angle $\tan^{-1}(-\frac{A}{B})$ with the axis

of x , and so on. Various formulæ are developed for the distance between two points, the distance from a point to a line, the angle between two straight lines, and so on. A corresponding list of formulæ may also be found for *oblique axes*, that is, where the original axes are taken inclined at an angle ϕ instead of a right angle, and the co-ordinates are measured parallel to the axes.

FIG. 8. CARTESIAN METHOD

The method of representing a point by its distances measured parallel to axes is known as the *Cartesian method*. Any point may also be represented by the distance OP and the angle POM , known as the *polar co-ordinates*. The connection between the two systems may easily be seen from Fig. 8 to be $x=r \cos \theta$ and $y=r \sin \theta$, and hence the polar equation of any locus may be deduced from the Cartesian equation, and vice versa.

In Cartesian coordinates a circle of centre (h, k) and radius a has an equation $(x-h)^2 + (y-k)^2 = a^2$, and where the point O (the

origin) is the centre, this becomes $x^2 + y^2 = a^2$. From the locus definition of a circle its equation is found to be of the form $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ (where $a = b$ and $h = 0$; a, b, c , etc., are constants), i.e. of the second degree; when the axes are suitably chosen, an ellipse, parabola, and hyperbola may respectively be represented by $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$, $y^2 = 4ax$, and $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$. From these equations series of formulae may be formed for tangents and normals at any point, the polar of a given point, and so on, and thus the G. of conic may be treated from an algebraical point of view. Equations of the third and fourth degree in x and y , which result in more complicated curves, may be treated in a similar way.

Mention must also be made of *homogeneous co-ordinates*, by which a point is represented by three co-ordinates with respect to a triangle, known as the triangle of reference. The method has the advantage of giving equations in symmetrical form. In *trilinears*, the co-ordinates α, β, γ are the distances from the sides of the triangle, and are connected by the relation $a\alpha + b\beta + c\gamma = 2\Delta$. In *arcals* the co-ordinates x, y, z are the ratios of the perpendicular distances to the altitudes of the triangle, and are connected by the relation $x + y + z = 1$. Here also a straight line and a conic are represented by equations of the first and second degrees respectively. In *tangentials* a line is represented by three co-ordinates and a point by an equation. Solid G. is in many respects analogous with plane G. A third axis Oz is taken perpendicular to the plane containing Ox and Oy , and a point thus has three Cartesian co-ordinates x, y , and z . The equation $Ax + By + Cz + D = 0$ of the first degree now represents a plane. A straight line is the intersection of two planes, and hence is represented by two equations of the first degree. The three polar co-ordinates (r, θ, ϕ) are connected with x, y , and z by the equations $x = r \cos \phi \cos \theta$, $y = r \cos \phi \sin \theta$, and $z = r \sin \phi$ (Fig. 9). In Cartesian, the equation of a sphere of centre (h, k, l) and radius a is $(x - h)^2 + (y - k)^2 + (z - l)^2 = a^2$, and when O is the centre, the equation is $x^2 + y^2 + z^2 = a^2$. The general equation of the second degree is a solid of which all plane sections are conics and is called a *conicoid*. A particular case is the *ellipsoid*, whose equation is $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$. From these equations formulae for tangent planes, normals, etc., are developed very much as in plane G. Many solid G. methods are, in fact, analogous with those of plane G., and many of the simpler surfaces may be derived from conics. Thus, surfaces of revolution are obtained by revolving some plane curve about an axis in the same plane. The *hyperboloid of two sheets* and an *elliptic paraboloid*, for example, may be generated by the motion of a variable ellipse and a parabola respectively, and finally the *hyperboloid of one sheet*, the *hyperbolic paraboloid*, the cone and the cylinder, and others known as *ruled surfaces* may be generated by the

motion of a straight curve. A curve in space may be represented by two equations, and hence the properties of such a curve are obtained by expressing the three co-ordinates as functions of a single variable. Such a curve is treated as a polygon, whose sides are indefinitely small. The plane of any two consecutive sides does not in general contain the next consecutive side. These are called *tortuous curves*. By supposing x, y, z, w to be the four co-ordinates of a point in four dimensions, a similar series of results may be

FIG. 9. SOLID GEOMETRY

obtained. See E. H. Askwith, *Course of Pure Geometry*, 1921; L. M. Tweedy, *Junior Geometry*, 1928; and I. Todhunter (ed.), *The Elements of Euclid*, 1862 (Everyman's Library, 1933). For plane analytical G. the student may be referred to H. J. Smith, *Co-ordinate Geometry* (for elementary work), and A. Clement-Jones, *Introduction to Algebraical Geometry*; for solid G. to P. Frost, *Solid Geometry*, 1875; G. Salmon, *Analytical Geometry of Three Dimensions*, 1862; A. R. Forsyth, *Geometry of Four Dimensions*, 1930; D. M. Y. Sommerville, *Analytical Geometry of Three Dimensions*, 1934; and A. Robinson, *An Introduction to Analytical Geometry*, 1940.

Geonim, see GAON.

Geophysies, see under GEOGRAPHY.

Geopolitics, modern version of political geography, or anthropogeography. As such, though not novel, it has accumulated a respectable amount of scientific material. In its political aspect it serves as a weapon of modern National Socialism, a rationalising ideology of imperialist expansion. It is this aspect of G. which has naturally aroused wide interest and no little misunderstanding. Regarded as a world outlook, G. is a comprehensive *Weltanschauung*, which has fired the imagination and gained the loyalty of a small yet significant group of enthusiastic adherents. This latter is the least discussed side of G., but is probably the most crucial, for it explains the appeal of this pseudo-science to immature and susceptible minds and also indicates clearly its power and danger. The difficulty of analysing G. arises largely from the fact that the above

noted aspects are inextricably intermingled in the minds of its advocates and enemies alike. Used by the Ger. publicists to justify the moral basis of *Lebensraum* (q.v.), *Geopolitik*, in the hands of Prof.-General K. Haushofer, became a new fashion, which soon raised its chief exponent to the role of 'the man behind Hitler.' But Haushofer's definition of G. as 'a study of the dependence of political events on the character of the earth was not his invention, though it seems to imply some novelty; and but little that was added to it by his Institut für Geopolitik will survive criticism. The significance of political geography was recognised as long ago as the time of Herodotus and Thucydides. Bodin and Montesquieu, Ranke and Tüttler all showed conclusively the importance of climate and environment in the hist. of mankind. Dietrich von Bülow's *Spirit of the New System of War* (1799) is a study in geopolitical vein. That the geographical approach to hist. and politics was well estab. long before the emergence of *Geopolitik* may be seen from the pages of H. T. Buckle, Taine, and particularly Treitschke, the historian of the Bismarckian age, and Otto Hintze, master of Prussian hist., whose discussion of the antithesis between the political destiny of the democracies (i.e., Britain, and that of Prussia, the militant continental state encircled by competing land powers, has long been an accepted textbook on the Continent. The later development of the study of G. came with Friedrich Ratzel, who expounded the first great scientific theory of the environmental basis of society, and Rudolf Kjellén, who popularised Ratzel's writings. All this material provided a working basis for the wider investigation of G. in the period following the First World War; and while no doubt the Haushofer school was greatly indebted to this pre-existing material, even on an elementary plane, it contributed to the revitalisation of the collated factual data, and, of course, in Germany it awakened a wider interest in climate, natural resources, configuration, and topography considered primarily in terms of strategy. After the days of Ratzel's *Seven Laws of Expansionism* G. built up an imposing catalogue of rules and concepts. Many of them are but platitudes or half truths, though obscured in a flashy journalistic terminology, which makes works on G. difficult reading for the uninitiated; but in these voluminous utterances are sometimes implied genuine realities, which should not be lightly dismissed merely because they have been applied unscrupulously for political ends. Exponents of *Geopolitik* seized, after Versailles, on the idea of 'space-conquering forces' (borrowed from Ratzel), and claimed that *Geopolitik* was the liberator from prov. nationalism and the expression of a still inarticulate longing for a new world order. It may be noted here that the Ger. geopolitical school was officially launched in 1924, the year in which Germany overcame inflation, and its inauguration heralded the dawn of a new imperialism, accompanied by the resus-

citation of such aspirations as the *Drang nach Osten*. From Kjellén's *Realpolitik*, too, Haushofer's school learned that if G. was to become a lodestar of a synthetic science the idea of a state must be widened far beyond the merely legal concept. Sir Halford Mackinder's doctrine of land power—a corrective of Mahan's thesis—as expounded in his *Geographical Basis of History* (1904)—concocted world politics as essentially a conflict between oceanic and continental powers. His *Democratic Ideals* (1919) was an unheeded yet salutary warning against the emergence of a land bloc that would prove invulnerable to sea power. It was reiterated at the time of the Versailles peace conference, but the system as dictated by the great sea powers in the Versailles Treaty neglected the potentialities of such great compact land masses. Haushofer's doctrine has been well described as 'Mackinder in a strait jacket.' It was on its use as a political weapon that the *Geopolitik* of Haushofer's school of fanatic disciples won historical significance. See S. Neumann, 'Fashions in Space,' in *Foreign Affairs*, vol. xxi., No. 2; R. Hennig, *Geopolitik, die Lehre vom Staat als Lebenswesen*, 1928; O. Maull, *Das Wesen der Geopolitik*, 1936; S. von Valkenburg, *Elements of Political Geography*, 1939; and Efffeld, *Geopolitics*, 1944.

Geoponic, name given to various Gk. and Rom. writers on agriculture, also known as *Scriptores rei rusticae*. The Alexandrian writers were great compilers of treatises on agriculture, *Πορωτικά*, and they were used by later writers, such as Cassianus Bassus, who wrote at the end of the sixth century A.D. A great source from which such compilations were made was that of Mago of Carthage, frequently condensed and trans. Cato the Elder wrote a practical treatise, *De Agricultura*, of which parts survive, but the chief authorities, still full of useful advice and of inestimable value for knowledge of past systems of farming, are the *Libri Tres Rerum Rusticarum* of M. Terentius Varro, and the *De Re Rustica* of L. J. M. C. Columella, from which Palladius compiled his work in the fourth century A.D.

George, Saint (d. 303), the patron saint of England, was b., according to hagiologists, in Cappadocia of a noble Christian family, became a soldier, served the Emperor Diocletian with distinction, rebuked the emperor for his persecution of Christianity, and suffered a martyr's death at Nicomedia. Eusebius (*Historia Ecclesiastica*, vii. 5) writes of a nameless martyr under Diocletian in Nicomedia, and a still earlier record speaks of the martyrdom of the Holy George in 225. The existence of the saint has been doubted, and Gibbon identified him with George of Laodicea, an Arian bishop of Alexandria, which in view of Eusebius's testimony is chronologically impossible. His authenticity was doubted in the early Church, but the shrine of the martyr at Lydda was a place of pilgrimage to crusaders, and his fame was recognised by the Moslems. Near Lydda was the traditional site of the rescue of Andromeda from the sea-monster by Perseus, and

naturally the Christian martyr absorbed the pagan legend to himself, with the story of St. G. and the Dragon, known from the sixth century and rendered famous by the *Golden Legend*. St. G., who was the patron saint of Genoa, was not adopted formally by England till the reign of Edward III. April 23 is the date assigned to his feast.

George I. (George Louis) (1686-1727), king of Great Britain and Ireland. Inherited from his father possessions which in 1692 had been made into an electorate. He married his cousin Sophia Dorothea of Zell (or Celle), who in 1694 was divorced by him because of her alleged misconduct with Count Königsmark. The morals of Ger. courts at this period took their tone from the profligacy of Versailles; but in Hanover conjugal infidelity was held to be a privilege of the male sex. Count Königsmark was assassinated and Sophia remained in seclusion till her death in 1726. The mother of G. was Sophia, the grand-daughter of James I., and although the possibility of succession to the Eng. throne seemed remote, the question of Protestant succession gave the succession to the Hanoverian line by the Act of Settlement, 1702. During the war of the Sp. Succession G. sent forces to the allies at Blenheim and made a strong alliance with Marlborough. Realising the importance of the Crown of England, he persisted in keeping on very friendly terms with the Whigs. In 1714 the death of his mother (Sophia) and of Queen Anne laid the way open for his succession to the Eng. Crown. The intrigues of Bolingbroke were unsuccessful, owing to the sudden death of the queen. G. was proclaimed. He came immediately to England. His succession may be regarded as the final step in the Protestant revolution, and the stability of his crown may be gauged from the utter failure of the Jacobite rebellion of 1715. His accession was important from many points of view. In the first place, he understood no Eng. his ministers did not understand Ger., hence his presence at Cabinet meetings was futile. Accordingly he stayed away, and the power passed into the hands of a Prime Minister (Walpole). Secondly, he insisted upon choosing his ministers from the ranks of the Whig party. He did not realise the importance (as had William III.) of being entirely independent of party politics; thus he prepared the way for the rule of the Whig oligarchy, which was only overthrown by his great-grandson George III. Thirdly, he regarded England merely as a great country of which he was the nominal ruler, and which was to raise the prestige of Hanover and fill his pockets and the pockets of his Ger. followers with Eng. gold. He was not, however, by any means devoid of power. The great event of his reign was the bursting of the South Sea Bubble, which gave Eng. commerce a great shock, but produced also the greatest of our peace ministers, Walpole. George d. one year after his unhappy wife, whilst travelling to Hanover. *See* W. E. H. Lecky, *A History of England in the Eighteenth Century*, 1882; I. Melville, *The First George in Hanover and England*, 1908;

J. F. Chance, *George I. and the Northern War: a Study of British-Hanoverian Policy, 1702-21*, 1909; J. M'Carty, *A History of the Four Georges*, 1905; and Sir H. M. I. Terry, *A Constitutional King—George the First*, 1927.

George II. (George Augustus) (1683-1760), king of Great Britain and Ireland, only son of George I. In 1705 he married Wilhelmina Caroline of Anspach. In 1707 he was created earl of Cambridge, and in 1708 he was present at Oudenarde. During his father's reign he was on bad terms with the sovereign during the greater part of the time. Bad feeling between father and son seems to have been one of the Hanoverian hereditary qualities. During the greater part of the reign of George I. he was regarded as the official centre of the opposition, and Walpole expected dismissal when George I. d. In accordance with his sentiments as Prince of Wales, G.'s first act was to dismiss Walpole, and invite Sir Spencer Compton, Speaker of the House of Commons, to take his place. Sir Spencer, however, was so incompetent that he actually asked Walpole to help him in writing the king's speech. The queen, Caroline, who was Walpole's friend, at once pointed out the absurdity of this. G. was convinced by her arguments, and when Walpole himself promised to propose a large addition to the king's ann. income, or civil list, the old minister was reinstated, and received the loyal support of the king until his resignation. G. was a man with the character and habits of a drill sergeant. He was a man of method, very economical, and with a prodigious memory. He was stubborn and very obstinate at times, but when he realised that the influence which was brought to bear upon him was that of a greater and wiser mind than his own, he submitted to it quite easily, and it is to his credit that he was, in spite of his qualities to the contrary, capable of recognising this. The politics of the greater part of his reign were quiet. Walpole, with his policy of 'Let sleeping dogs lie,' and his ability of reducing corruption to a fine art, gave the country a much-needed peace, but, at the same time, by his methods and by his inability to work with capable men, raised up an opposition. In 1737 Caroline d., and, with her influence removed, matters became much more difficult for Walpole. The war of the Austrian Succession led to his resignation in 1742, and the policy of the war itself was directed by the king and cabinet purely from the Hanoverian point of view, without any consultation of the people of England. G., like his father, recognised Hanover as the dearest of his two possessions. That G. did not lack military skill or courage is obvious from his presence and victory at Dettingen (1743). The importance of the reign lies to a very great extent in the facts that G. realised that he must play the part of a constitutional monarch, and that it was not possible to change his ministers and policies at will. Secondly, the rebellion of 1745 proved that personal loyalty to the Hanoverian succession was not yet a factor in practical

politics, and that the Protestant Ger. succession was to a very great extent regarded as a business transaction. The traditional bad feeling between the king and the heir apparent was maintained by the conduct of G. and Frederick, Prince of Wales (d. 1761). G. himself d. in the middle of the Seven Years war. See H. Walpole, *Memoirs of the Reign of King George II.* (ed. Lord Holland), 1846; Lord Horvey, *Memoirs of the Reign of George II., from his accession to the death of Queen Caroline*, 3 vols., 1884; and R. J. Lucas, *George II. and his Ministers*, 1910.

George III. (George Frederick William) (1738-1820), son of Frederick, Prince of Wales, and grandson of George II., whom he succeeded in 1760. He was b. on June 4, 1738. After the death of his father he was educated chiefly under the care of the dowager Princess of Wales (his mother) and the earl of Bute (q.v.). The lines of his education decided his policy as a king, and he was educated chiefly, at least in policy, on the lines of the *Parrot King*, a book written by Bolingbroke. During the period which had followed the accession of George I., the political power of the country had passed into the hands of the Whigs. The Whig oligarchy had been everywhere supreme, and it was by the great Whig families that the policy of England was dictated. This had to a large extent been the result of the policy adopted by George I. G. was imbued with the idea that the great work of his life must be the overthrow of this power and the re-establishment of the power of the Crown. During the reign of George II. the power of the Crown had been relegated to a very distant position, but at the same time the power of the Whig oligarchy had also received some very shrewd blows. The power of Wm. Pitt had been a very hard morsel for the Whig magnates to swallow; that they had been forced to accept the Pitt-Newcastle administration showed that their power was waning. G.'s mind had, as Prince of Wales, been set against the system by which the king chose his ministers from that party which was most powerful in Parliament. He wished to break up party, to choose his own ministers and to formulate his own policy—in effect, to be his own Prime Minister. The earliest phase of the struggle resolved itself into a contest between the great Whig families, between whom had sprung up a strong sense of rivalry. The king looked on from behind, and, whilst striving to attain his desire, at the same time held back until such time as he could associate himself and his party with some phase of national life upon which party feeling was strong. He endeavoured to regulate affairs by means of the party known as the King's Friends, and also his earlier attempts to choose his own ministers and ministry must not be overlooked. His first choice, the earl of Bute, was unfortunate, but Bute retired early in 1763, and did not again return to office. The Amer. question, leading to the War of Independence, gave the king an opportunity which was not to be overlooked. The king was

probably honest in his inability to see anything unconstitutional in the attitude which he adopted towards the Amer. colonists. In this he was very largely at one with the nation; the nation as a whole was just as mistaken as G. Why the Amers. should not contribute to the cost of a war which had been fought in their defence, and why it was unconstitutional for Parliament to levy taxes on the Amer. colonies, were two points which the king and the nation could not understand. The king chose his own minister (Lord North) and plunged into the war, believing that it was a justifiable one, and certainly never entertaining any doubt but that the result would be victory. The disasters of the war found him unmoved; the coalition of France, Spain, and America failed to open his eyes to the danger. As he himself said at a later period, he fought the Amer. colonies because he believed that the Amer. colonies were in the wrong, and he fought right to the end; he was the last to give in to the opening of the negotiations for peace.

During the Amer. struggle the constitutional struggle had gone on at home. The king had insisted upon the retention of office by Lord North; only when the surrender of Yorktown drove even Lord North to resign did he send for the Whig, Lord Rockingham. The peace of Versailles (1763) gave America her independence, but gave England better terms than had at one time seemed possible, since the victories of Rodney and the Fr. and Sp. failures had strengthened her hand. The whole struggle, however, is illustrative of the fact that England was plunged into a world war, in which she lost a great deal of her prestige, simply because of the obstinacy of a king working on apparently constitutional lines through his Parliament. Rockingham d. in 1783, and was succeeded by Lord Shelburne, whose short-lived ministry was overthrown by a coalition of Fox and North. The coalition ministry took office only in turn to be dismissed when their India Bill was rejected by the Lords. The king sent for Wm. Pitt, and the famous son of a famous father became the Prime Minister. On the surface, at any rate, the king had triumphed; he had overthrown the coalition, and he had appointed his own minister; the influence of the Crown was apparently restored. The means employed by the king to bring about this end were, however, questionable; the coalition had been overthrown in the House of Lords solely by means of the influence of the Crown. The king had intimated through Lord Temple that any peer voting for the India Bill would be regarded as a personal enemy of the king. Pitt, without a majority of the House of Commons to support him, had been appointed minister, and was supported by the influence of the Crown until finally, two months later, a dissolution and general election returned a majority in favour of the king and his minister. The dissolution was the work of the Crown entirely, but the country supported the king and Pitt, and from the moment that a majority

of the House of Commons gave their adherence to Pitt it may be said that his period of office became really constitutional. Of the king's personal popularity in the country there can be no possible question. In 1788 he became ill and his mind gave way. During this period of insanity the regency question was debated in the House of Commons, and Pitt was probably only saved from dismissal by the recovery of the king. The thanksgiving service which the king attended in 1789 was one great ovation for the king himself, and the outbreak of the revolution in France did much to increase his popularity. He was regarded as the centre of all opposition to the Fr. and to the ideals which the revolutionists put forward. Probably his quiet home life and the purity of his family life had much to do with his popularity, but above everything it must be remembered that when G. was obstinate he usually had the nation behind him. The next great question which arose was the question of Catholic emancipation. The Act of Union had been accompanied by a promise of relief to the Catholics. Pitt's proposals were brought to the ears of the king, and he rejected them entirely. He averred that his honour and his coronation oath were at stake. Pitt, rather than force his proposals on the king, resigned, but the attitude of the king was approved and supported by the vast majority of the nation. Addington, a man of mediocre abilities, succeeded Pitt, and retained office until the outbreak of war, when Pitt again came into office. The king's mind was again for a season unbalanced, and the attacks now became more and more recurrent. The ministry of Pitt had included no one of outstanding ability save Pitt himself; he had proposed the inclusion of Fox, but the king declined him for personal reasons. The death of Pitt, however, changed the situation, and the king accepted Fox in the ministry of "All the Talents." A mild form of Catholic emancipation was proposed but rejected by the king, who demanded a promise that the question should not again be raised during the reign. The promise was not given, and the ministry was turned out of office. The duke of Portland succeeded as Prime Minister, and was himself replaced later by Perceval, the real leader of the ministry. The reign may definitely be taken as closing in 1811, when the king's reason finally failed him. He lived on for nine years blind and insane. To his people G. was always a most popular king. He had said at the beginning of his reign that he gloried in the name of Britain, and it is because his good and bad qualities were so essentially Eng. that he achieved the success that he did. He was above all things like a typical Englishman of the time, a man with all the prejudices and virtues of the Eng. nation of the eighteenth century. He married in 1761 Charlotte Sophia of Mecklenburg-Strelitz, and had nine sons and six daughters. The death of his youngest daughter, the Princess Amelia, in 1810, brought on the final attack of insanity, from which he never recovered.

His eldest son, George, was appointed regent until his father's death in 1820. See W. Donne (ed.), *Correspondence of George III. with Lord North*, 1867; J. H. Jesse, *Memoirs of the Life and Reign of George III.*, 1867; L. Melville, *Farmer George*, 1907; B. Willson, *George III. as Man, Monarch, and Statesman*, 1907; Sir G. O. Trevelyan, *George III. and Charles Fox*, 1912; Sir C. G. Robertson, *Chatham and the British Empire*, 1946; and H. Butterfield, *George III., Lord North, and the People*, 1779-80, 1948.

George IV. (George Augustus Frederick) (1762-1830), king of Great Britain and Ireland, was the eldest son of George III., and was b. at St. James's Palace on Aug. 12. He grew up to be exceedingly well gifted and of exceptionally handsome appearance. The strictness and the seclusion of his home life helped to drive him to a life of extravagance and profligacy, and he plunged heavily into the gay life of London society. His first mistress was the actress, Mary Robinson. Gradually he became more and more estranged from the king, the wildness of his life and his political associates, Fox and Sheridan, both Whigs, helping to widen the breach. In 1783, having come of age, he was given a separate estab. at Carlton House, his debts were paid, and he was granted £50,000 per annum from the Civil List. Shortly after his coming of age he became madly in love with a beautiful widow, Maria Fitzherbert, who came of a good Shropshire family, and who had been married twice before she met the prince. She was a Catholic, and marriage with her was impossible under the Act of Settlement of 1689, and further, the Royal Marriage Act of 1772 forbade any marriage without the knowledge of the king. She refused to contemplate becoming the mistress of G., and finally, in 1785, they were married by a clergyman of the Eng. Church. This marriage was acknowledged secretly by his friends and denied openly for political reasons. Their relations were broken off in 1794, and again renewed in 1800, and she remained his wife in name until 1811. By the relations of the prince she was always regarded as his wife, although not acknowledged so. In 1795 the prince, having broken off relations with Mrs. Fitzherbert, was married to a Ger. Protestant princess, Princess Caroline of Brunswick. His treatment of his wife was unjustifiable and cruel, and after the birth of the Princess Charlotte, their only child, they were separated. The position of the prince was peculiarly important in view of his father's disease. He and his friends claimed that he had the right of becoming regent without the consent of Parliament, but the Regency Bill only provided for his appointment with certain restrictions. In 1811 he became Prince Regent, and continued in that office until the end of the reign. His treatment of his wife, his extravagance, and his loose living, especially at a time of almost universal distress, made him exceedingly unpopular in the country. His appearance in the streets of London was a sign for the outburst of hissing, and in

1817 he was stoned on his way to open Parliament. In 1820 he succeeded his father, and immediately there arose the great trouble with his discarded wife. Her name left out of the Prayer Book, her title withheld, and her honour doubted, she came to England to enforce her claims. Already the king had tried to divorce her, now she was accused of adultery, and a Bill of Pains and Penalties was passed hurriedly by ever-decreasing majorities. Her cause was warmly espoused by the nation, who held that even were the charges true, the life of the king was not such as to justify him in making any charges. The disowned queen tried to force her way into the abbey during the coronation proceedings, failed, and retired to die in the Aug. of 1821. The king visited Ireland and Scotland during the early days of his reign, and his popularity there was much greater than it was in England. He attempted in a feeble way to continue the policy of royal influence, but was forced to give in. He hated Canning, but was compelled by circumstances to accept him as a minister, and later as Prime Minister. He also later strove to oppose Catholic emancipation, but again he was compelled to give in, and the Bill passed in 1829. In the following year (G. d. Though he reigned for ten years, he exercised no great influence on public affairs, and, as a ruler, he was neither successful nor popular. His only child, the Princess Charlotte, d. in 1817. She had married Leopold of Saxe-Coburg in the previous year. See R. Hulse, *Memoirs of George the Fourth*, 1830; R. Grenville, duke of Buckingham, *Memoirs of the Court of England during the Regency*, 1811-20, 1856, and *Memoirs of the Court of George IV.*, 2 vols., 1859; P. H. Fitzgerald, *The Life of George the Fourth*, 1881, 1906; J. McCarthy, *History of the Four Georges*, 1831-1901; S. Walpole, *A History of England from the Conclusion of the Great War in 1815*, 1890; W. H. Wilkins, *Mrs. Fitzherbert and George IV.*, 1905; G. M. Trevelyan, *British History in the Nineteenth Century, 1782-1901*, 1922; and Dormer Creston, *The Regent and his Daughter*, 1932.

George V. (George Frederick Ernest Albert) (1865-1936), king of Great Britain, Ireland, and the Brit. dominions beyond the seas, emperor of India; second son of King Edward VII., was b. at Marlborough House, London. In 1877 he and his brother the duke of Clarence became naval cadets. Two years later they cruised to the W. Indies in H.M.S. *Racehorse*, and in the following year they made a more prolonged cruise in the same ship. Prince George was intended to remain in the naval service; for that reason he was appointed to H.M.S. *Canada* in the N. Amer. and W. Indian station, and became a sub-lieutenant. In 1885, after a course at the Royal Naval College at Greenwich, he became a lieutenant; and in 1889 he commanded a torpedo boat in the naval manoeuvres. In 1890 he commanded the gunboat H.M.S. *Thrush*; and in 1892 he relinquished his commission in the navy on becoming heir apparent through the

death of the duke of Clarence. In 1892 he was created duke of York; on July 6, 1893, he married the Princess Victoria Mary of Teck. The duke and duchess visited the Commonwealth of Australia in 1901. They visited during the return journey S. Africa and Canada. In Nov. 1901 the duke was created Prince of Wales. He succeeded his father May 6, 1910, as George V. He was crowned June 22, 1911; and at the end of that year he visited India, being the first Brit. emperor to do so. At his Durbar at Delhi, the transference of the Indian cap. to that place was announced. In July 1914 he called a conference at Buckingham Palace of all

Optical Press

KING GEORGE V.

Brit. and Irish parties to attempt settlement of the Ulster difficulty. During the First World War he frequently visited the W. Front. On July 17, 1917, he proclaimed an alteration in the style of the royal house: in future to be known as 'of Windsor'—all Ger. titles having been renounced. Immediately after the Armistice he made sev. triumphal progresses through London; and he attended service in St. Paul's. In Nov. and Dec. he visited Paris and the battlefields; in Dec. he entertained President Wilson in Buckingham Palace. On June 22, 1921, at Belfast, he inaugurated the Parliament of N. Ireland. He visited Belgium again in May 1922; in May 1923 he visited Rome, and was received by the pope. In April 1924 he opened the Brit. Empire Exhibition at Wembley; on July 19 of same year he was present at the consecration of Liverpool cathedral. In the spring of 1925 he was absent from the kingdom sev. weeks, on a health-cruise in the Mediterranean. At the end of Nov. 1928 he fell

ill of pleurisy, underwent an operation, and was in so serious a condition that councillors of state were nominated, and all members of the royal family summoned to Buckingham Palace; but he made recovery, and in Feb. 1925 was able to go to Bognor to recuperate. He did not resume opening Parliament in person until Oct. 28, 1930. In the period of social and economic turmoil which followed the First World War the popularity of the throne and personal affection for the king and queen steadily increased, as was shown by the anxiety manifested during the king's illness in 1928, the unprecedented enthusiasm which marked his silver jubilee in May 1935, and the universal grief which followed his death on Jan. 20, 1936, at Sandringham. Some of the most important events of his reign, apart from the First World War, were the extension of the franchise to women, the estab. of the Irish Free State (1922), the formation of the first Labour Gov. (1924), the General Strike (1926), the economic crisis (1931), and the introduction of the new Indian constitution. King George VI, on Oct. 22, 1947, unveiled the statue of his father, which is part of the national memorial. The statue stands in the grounds of Westminster Abbey, exactly opposite the entrance to the House of Lords, and is the work of Sir Wm. Reid Dick. *See also* KING GEORGE'S FIELDS FOUNDATION. He had five sons (one, John, dead) and one daughter; the eldest son, Edward, was created Prince of Wales, 1910. *See* J. Buchan, *The King's Grace*, 1935; J. Gore, *King George V.: a Personal Memoir*, 1941; also life by A. Bryant, 1936.

George VI. (Albert Frederick Arthur George of Windsor), king of Great Britain, Ireland, and the Brit. dominions beyond the seas (the title 'Emperor of India' was dropped from the royal style in 1947 on the passing of the Indian Independence Act of that year); b. Dec. 14, 1895, at York Cottage, Sandringham; second son of George V. Educated Royal Naval College, Osborne and Dartmouth; Trinity College, Cambridge. Present at battle of Jutland, 1916. On staff of commander-in-chief, Portsmouth, 1916-17. Lieutenant, R.N., 1918. Made Baron Killarney, earl of Inverness, and duke of York, June 3, 1920. Married Elizabeth, daughter of the earl of Strathmore, on April 26, 1923, at Westminster Abbey. A councillor of state during the illness of his father, 1924-29. On the abdication of his brother, King Edward VIII, he succeeded to the throne on Dec. 10, 1936. His coronation took place at Westminster Abbey on May 12, 1937. Through their strongly democratic appeal the king and queen soon won great popularity, besides restoring the prestige of the Crown. King George himself is distinguished by a kind and unceremonious manner, and a high sense of duty. With the queen he made a seven-week tour of Canada, the U.S.A., and Newfoundland in May and June 1939, meeting with a memorable popular reception. He was the first reigning Brit. sovereign to visit America. For the first time in hist. he performed

royal functions in a dominion, appearing in the Canadian Parliament, giving the royal assent to Bills, receiving the U.S. minister to Canada for the delivery of his credentials and signing the Canadian-Amer. treaty of commerce. This was a landmark in the constitutional hist. of the Brit. Empire and Commonwealth of Nations; yet it was the corollary to the Statute of Westminster (*q.v.*), and indeed followed naturally from the relations between Britain and the self-governing dominions as they had evolved for many years before the statute. Commonwealth relations to-day have emphasised that in matters pertaining to the dominions the king is advised by the ministers of the

Ellis and Perry

H.M. KING GEORGE VI.

dominion concerned, and not by United Kingdom ministers. After visiting Canada King George visited President Roosevelt at Washington, was welcomed by the U.S. Congress at the Capitol, and inspected the New York World's Fair. During the visit he laid a wreath at the tomb of George Washington at Arlington.

Early in the Second World War he visited the Brit. Army in France (Dec. 10, 1939). On the resignation of Mr. Neville Chamberlain he sent for Mr. Winston Churchill (May 10, 1940), who formed a Coalition Gov. Throughout the war he shared the common suffering of his people, and thereby promoted a spirit of harmony. Always interested in industry he paid numerous visits to factories, shipyards, and docks. During the air raids Buckingham Palace was three hit. A delayed-action bomb dropped on Sept. 11, 1940, and the windows of the apartments of the king and queen were blown out, while on a later occasion the royal chapel was wrecked. Made many visits to severely bombed areas in London, and to all the great prov. cities which had been attacked.

He visited Malta (June 20, 1943) to convey his appreciation of the fortitude of the Maltese during their long ordeal. The George Cross instituted by the king (Sept. 1940) for deeds of conspicuous civilian gallantry had previously been conferred upon the people of the is. by the king (April 1942). After Germany's surrender he received Gen. Eisenhower at Buckingham Palace, and conferred on him the O.M. (June 12, 1945). Later he met President Truman in the *Renown* in Plymouth Sound (Aug. 2). After the war he entertained the delegates to the General Assembly of the United Nations at St. James's Palace, when he pledged the full co-operation of the Brit. people (Jan. 9, 1946). He took the salute of the Victory Parade in the Mall (June 5, 1946). With the queen and the two princesses he sailed in H.M.S. *Vanguard* on the first visit of a reigning monarch to S. Africa, arriving Feb. 17, 1947. Loyal addresses were presented by both Houses of the S. African Parliament, although at the time both Houses stood prorogued. He stayed five days at Durban, where no fewer than 65,000 Indians gathered at Currie's Fountain to greet the royal family. The most striking political result of the visit was the complete split in the Indian community, owing to the ill-advised attempt of the Congress extremists to boycott the visit, an attempt which was hotly opposed by the majority of the Indian community, and in general the mass of the Indian pop. refused to carry out the boycott. He arrived in Pretoria Mar. 29, where the administrator, Gen. Pienaar, presented the prin. dignitaries of the Transvaal and the city to the king and queen. At a state banquet Gen. Smuts said that time and mutual understanding had healed the wounds of the past, and enabled the two great stocks to come together, and go forward together to their greater united destiny. In reply the king referred to the evidences he had found everywhere of the sympathy felt by S. Africans for the Brit. people for the burdens they were bearing (an allusion to the economic crisis in Britain). On Palm Sunday the king and royal family made their devotions among the Dutch Reformed community in the Groot Kerk of Pretoria. On April 7 the king and royal family arrived by air at Salisbury, S. Rhodesia, on the first visit by a reigning sovereign to that country. Here he opened the S. Rhodesian Parliament, this being the first time that a royal state opening had taken place in a building that, prior to its conversion, had been a public-house. The king also visited the grave of Cecil Rhodes and the Victoria Falls. The royal tour ended on April 24 with the embarkation of the royal family on the *Vanguard* at Capetown. A further tour to Australia and New Zealand was planned for the spring of 1949, but it was cancelled owing to the illness of the king, who underwent an operation in March 1949 for the relief of an affection of the right leg.

King George and Queen Elizabeth have two daughters, Princess Elizabeth Alexandra Mary, duchess of Edinburgh (b.

April 21, 1926), heiress presumptive to the throne; and Princess Margaret Rose (b. Aug. 21, 1930). His grandson, Prince Charles Philip Arthur George of Edinburgh, was b. on Nov. 14, 1948. See Lt. Fulford, *George VI*, 1948.

George V., king of Hanover (1851-86), only son of Ernest Augustus, king of Hanover and duke of Cumberland, and grandson of George III. of England, b. in Berlin, May 27, 1819. When still quite a child he lost the sight of one eye, and an accident which occurred in 1833 resulted in his being totally blind. He succeeded to the throne in Nov. 1851. Imbued from his earliest childhood with a belief in the divine right of kings, coupled with strong religious views, he was soon in conflict with his Landtag or Parliament, his blindness making him an easy prey to unscrupulous and disloyal advisers. When Ger. affairs reached a crisis in 1866 he was unable to meet the situation. Against the advice of his Parliament he refused Prussia's demand that Hanover should maintain an unarmed neutrality while the war lasted, and immediate occupation by Prussia followed; his army was compelled to surrender, and the result was the formal annexation of Hanover by Prussia, Sept. 1866. The king made many unavailing attempts at restoration, but was never reconciled to Prussia. He retired to Gmünden in Austria, and d. while on a visit to Paris in 1878. His remains are buried in St. George's Chapel, Windsor. He married (Feb. 1843) Marie, daughter of Joseph, duke of Saxe-Altenburg, and left a son, Ernest Augustus, duke of Cumberland, and two daughters.

George I. (1845-1913), king of the Hellenes, b. at Copenhagen, the second son of King Christian IV. of Denmark, and brother of Queen Alexandra of Great Britain. On the throne falling vacant at the expulsion of King Otto in 1882, he was recognised by the powers and elected king of the Hellenes in 1883. It was shortly after this that Christian IV. became king of Denmark, and on becoming king of Greece, G. signed an act resigning his right of succession to the throne of Denmark, in favour of his younger brother, Prince Waldemar. The Gks. accorded him an enthusiastic welcome, and he ruled in strict accordance with constitutional principles, adopting as his motto, 'My strength is the love of my people.' He was one of the prin. artificers of the Balkan League, consummated in 1912, and directed against Turkey. He d. by the hand of an assassin (a Gk. named Alexander Skinas), on March 15, 1913, while walking in the streets of Salonika, a city then in the occupation of the victorious Gk. Army. He married the grand duchess Olga of Russia in 1867, and the result of this union was five sons and one daughter.

George II. (1890-1917), king of the Hellenes; b. at Tatol near Athens; eldest son of King Constantine, on whose first deposition he was excluded from succession on account of his pro-Ger. sympathies, his younger brother Alexander succeeding, Alexander dying in 1920, and the restored Constantine being again deposed, G.

succeeded Sept. 28, 1922. Disputes with Italy, culminating in bombardment of Corfu, marked the earlier years of his reign. His first gov. was republican in sympathy, its leading figure being Venizelos (see VENIZELUS). A group of royalist generals tried unsuccessfully to overthrow the gov. by force and G., being implicated, was deposed and banished, while Greece was proclaimed a republic (March 25, 1924). During eleven years of exile G. lived in London, but his kingship was not recognised by the Court of St. James to which the Gk. republic had sent an ambas. In 1935 the Liberal Venizelists attempted a coup against the Conservative Populists, who were now in power. Gen. Kondylis, war minister, proclaimed himself regent, and held a plebiscite (Nov. 1935) which produced the incredible result of 97.5 in favour of G.'s return and G. returned to Athens for the second time as king. He now held scrupulously fair parliamentary elections which ironically enough brought the republican parties back in a majority, and G. remained in the background for six months, when Gen. Metaxas, a leader of the Royalist party with the aid of Gen. Kondylis became dictator, abolished the constitution, dissolved Parliament, and claimed royal authority for his new regime. When Mussolini attacked Greece (April 1941) G. and Metaxas declared war on the Allies' side, but when the Germans invaded Greece the Gks. were defeated and G. left the country for honourable exile as the head of his occupied state. When the war was drawing to a close, however, the country was riven with the bitter conflict of opposing factions. The Communist led Gks. (I. A. M.) sought to seize power by violence and a bloody civil war resulted, but gradually the Royalist led Gks. captured the stop gap gov. and eventually on Sept. 1, 1946 a plebiscite once again resulted in a clear majority in favour of G.'s return. G., however, died suddenly on April 1 of a heart attack, only a few months after his second return to Greece, and was succeeded by his brother Prince Paul.

George Frederick Augustus (1832-1904), king of Saxony, b. at Dresden, the youngest son of King John of Saxony. He received a careful military training and entered the active army as a lieutenant of artillery in 1846. His name is inseparably associated with the Austro-Prussian war of 1866, and during the campaign he distinguished himself by his military ability and integrity. He succeeded his brother Albert on the throne of Saxony in 1902.

George, David Lloyd see LLOYD GEORGE, F.R.S.

George, Henry (1893-1971), Amer. economist, b. in Philadelphia. He left school at an early age in order to support himself and first went to sea. He afterwards learned the trade of printer, and in 1898 worked his way to California, where he became a journeyman printer. He was, however, soon obliged to leave this trade, owing to its slackness, and for the next few years he drifted from one employment to another. In 1895 he began to write for

the press, and became a reporter on the San Francisco Times, where he rapidly obtained promotion. His most important work *Progress and Poverty*, was first pub. in 1879, and in a few years obtained great popularity, and, by 1883, G. found himself regarded as the apostle of a new social creed. He wrote numerous articles for magazines and papers on economic and political subjects, but his literary activities brought him little pecuniary return, and he remained in poor circumstances till his death. See life by his son Henry, 1900 (also included in G.'s collected works, 1906-11), also A. N. Young *History of the Single Tax Movement in the United States*, 1916, and J. R. Commons and others, *History of Labour in the United States*, 1918.

HENRY GEORGE

George the Scholar, see GRONADIER II.
George, Stefan (1868-1933) (Ger. poet, b. at Büdeshelm near Bingen). In 1892 he founded his far famed *Die Blätter für die Kunst* and gathered around him a band of writers who were destined to have a profound influence on Ger. letters. George the poet and Friedrich Gundolf, the literary critic were the most prominent of these. Nietzsche and Mallarmé were G.'s literary gods. His own poetry has much of the polish as well as the obscurity of Mallarmé. Among his principal poetical works are (titles trans.) *Hymns* (1890), *The Year of the Soul* (1897), *The Tapestry of Life* (1899), *Songs of Dream and Death* (1900), *Days and Deeds* (1903), and *The War* (1917). His complete works were pub. in 18 vols. (1927-31). See studies by L. Kluge, 1902, F. Dübberg, 1908, W. Scheller, 1918 and F. Gundolf, 1920, also L. Walters *Stefan George und die Blätter für die Kunst*, 1930, and A. A. Milner, *Stefan George und Thomas Mann*, 1946.

George of Trebizond (1395-1484), Gk. philosopher and scholar, b. in the city of Trebizond, but descended from a family of Trebizond. As a scholar he was famous in connection with the revival of the study of Gk. in Italy. He became prof. of rhetoric

and philosophy at Venice, and gained a great reputation as a teacher and translator of Aristotle, engaging in controversy with his contemporary Gnostics Ploton, the Platonic philosopher. *Rhetorica* (1470) is among his writings. He d. in great poverty at Rome.

George, Walter Goodall (1858-1943). Brit. athlete, b. at Calne, Wiltshire. He was the winner of the record number of twelve Amateur Athletic Association championships, and his time for the mile - 1 min. 12½ sec. - stood as the world's record for thirty-seven years. The amateur championships he won were the m. and 4 m., each four times, and the ½ m. and 10 m. each twice. He turned professional in 1884, and his famous record in the mile was made against W. Cummings of Paisley, at Lillie Bridge in 1886. In 1882 and 1884 he also won the national cross-country titles. In all he won more than 1000 cups and medals. In his prime, tall, slim, and dark haired. Although, on comparative times, Wooderson in 1937 did the mile in 4 min. 6 sec., G. had not the same advantages from artificial aids; he had little help from the runner, he had no massour, tracks were slow and badly laid, and there was no scientific dieting.

George Cross, honor. awarded in 1940 to reward the performance of deeds of valour by civilians, both men and women. It ranks with and immediately after the Victoria Cross, and is worn before the insignia of all orders and before all other decorations. It takes the place of the medal of the Order of the Brit. Empire for Gallantry (E.G.M.), holders of the E.G.M. receiving the G.C. in substitution. There is a small military div. of the Cross to permit its award to members of the fighting services who perform acts coming within the terms of the warrant. Among the first recipients were persons who rendered heroic service during Ger. air raids on Britain. Another notable award was to the is. of Malta in recognition of its gallant resistance in the Second World War.

George, Lake: 1. Lake in the E. part of the state of New York, U.S.A., in the Adirondack Mts., connected with Lake Champlain by Tonawanda Creek, famed for its beautiful scenery, which makes it a favourite summer resort. It is about 34 m. long, and from 2 to 4 m. wide, and is fed by brooks and springs. 2. Lake in New S. Wales, Australia, 25 m S.W. of Goulburn. It is a salt-water lake, 25 m. long and 8 m. broad, and is 2129 ft. above the level of the sea. 3. Port in Cape Colony, S. Africa, pop. 3500. 4. Lake in central Africa, formerly known as Albert Edward Nyanza.

Georgetown: 1. Tn., now included with the limits of Washington, but formerly in the dist. of Columbia. Many famous people have lived here, amongst them being Francis Scott Key, J. H. Payne, and J. M. Mason. It was settled in the latter part of the seventeenth century, chartered in 1789, and annexed to Washington in 1878. In the early days it was an important social centre. It has a number of large flour mills. 2. The cap. of Brit.

Gulana and its chief port, situated on the Demarara R. The chief exports are sugar, coffee, and rum. There are two foundries, a dry dock, and factories for the manuf. of rice, cigars, chocolate, candles, aerated water, ice, etc. A modern system of sewage disposal, and electricity was installed in 1929. It is connected by rail and ferry with New Amsterdam and the W. coast, and by steamer with the coastal dists. and rivs. Owing to the swampy nature of the surrounding dist., the climate is somewhat unhealthy, though it has much improved of late years. Artesian wells supply the city with water. The (pre-1945) city was well built on low, flat land, and most of the houses were made of wood. The tn. was devastated by a fire on Feb. 23, 1945. Fed by inflammable chemicals the fire demolished, in Church Street, the buildings of the G. Chamber of Commerce, the Tourist Board, the library of the Royal Agric. and Commercial Society, the Natural Hist. Museum, the G. Club and Assembly Rooms, and some gov. offices; and in High Street, the General Post Office, Broadcasting Station, Barclay's Bank, and the Royal Bank of Canada. The heart of the city's business section was wiped out. It is an unhappy coincidence that two similar conflagrations in 1864 swept much the same section of the tn. There was, however, only one life lost in the fire of 1945. The damage was estimated at \$2,000,000. Pop. 54,500. 3. Municipality in Penang Is., off the W. coast of the Malay Peninsula. Next to Singapore G. is the chief port of the Straits Settlements. It is fortified, and has a large harbour. Pop. 165,000. 4. Tn. in Cape Prov. off the Cape of Good Hope, laid out in accordance with the anct. Dutch modelling. Pop. (white) 7000. 5. City and the co. seat of G. co., S. Carolina, U.S.A. It is a seaport of some importance, and has steamship communication with New York. It is served by the Seaboard Airline railway, and by steamer service. It has turpentine distilleries, and exports rice, cotton, fish, lumber, etc. G. is famous as the landing-place of Lafayette on his first visit to the U.S.A., and the tn. was settled about 1700, incorporated in 1807, and chartered as a city in 1895. Pop. 5500.

Georgia (or Sakartvelo), former kingdom of Transcaucasia, which existed historically for more than 2000 years, comprising the ter. S. of the Caucasian Mts., between the Black and Caspian Seas. Its native and earliest name was Kartvel; Vrasian is the Armenian name, and Gruzia the Russian. It includes the two autonomous republics of Abkhazia and Adjara, and an autonomous region, S. Ossetia. Prior to the First World War G. was divided into the Russian govs. of Tiflis, Kutais, Elisavetpol, Baku, and Erivan. G. was conquered by Alexander the Great, but after his death the Georgians succeeded in establishing themselves as an independent people with a gov. of their own, and they managed to maintain their political position as a state until the beginning of the nineteenth century, in

spite of being conquered and made tributary sev. times by the Arabian caliphs, and by Persia. It was annexed by Russia in 1801 in violation of the treaty of alliance of 1783. In 1801 G. was converted into a Russian prov. Many of the Georgians are at the present day Moslem, though they were converted to Christianity early in the fourth century (A.D. 318). Their language forms a very interesting intermediate link between the Indo-European languages and the monosyllabic tongues of E. Asia. It resembles them chiefly in its phonetic system and presents great facilities for composition, the laws of which are very regular. Georgian is written in a native alphabet, obviously based on the Armenian, and there are sev. varieties of the language. The Georgian trans. of the Bible dates from the eighth century, and is the most ant. work known to exist in the language. The curious poem entitled *The Man clothed in the Panther's Skin*, attributed to Rustavel, who lived during the eleventh century, is the next most important composition, whilst others of note are national epics and prose romances. Other than these, the great bulk of Georgian literature consists of eccles. writings, national codes and chronicles, and hymns, both sacred and profane. The Georgians proper number about 400,000, and together with the highland Georgians (consisting of the Khevsurs, Pshavs, and Tushes), Imeritians, Gurians, Mingrelians, Lazes, etc., they make up a total of about 1,400,000. Their race is distinguished by some excellent qualities, and they are specially noted for great personal courage, and a passionate love of music. Physically, they are a fine athletic race, and their women are noted for their beauty. Before their incorporation with the Russian empire, the social organisation rested on a highly aristocratic basis, but these relations were modified to a considerable extent, and a more sharply defined middle class of merchants, artisans, and traders was developed. The power of life and death, formerly freely exercised by the nobles over their serfs, had been abolished before the Russian Revolution. Under the tsars G. was divided between the provs. of Tiflis and Kutais. After the 1917 revolution civil war prevailed until 1921, when G. became an Autonomous Socialist Soviet Republic in the Transcaucasian Federation. The mass of the pop. is illiterate and agriculture is the chief occupation. Cotton and tobacco are grown, also bamboo and medicinal plants. The cultivation of tea has increased of late. The problem of irrigation is very difficult. The country is heavily timbered, but the industry is little developed owing to the lack of communications and the unavailability of the streams for floating the logs. The chief mineral product is manganese and the manganese ore beds are among the richest in the world, more than one-half of the world's supply being derived in 1914 from the Chikatury mines in the dist. of Sharo-pansky. Abundant coal, but of poor quality, is mined, and naphtha exists;

mineral springs are numerous. The chief industries are tobacco, leather, and bricks, also the weaving of carpets and silks. Wine is produced in considerable quantities. There are 970 m. of railway, the trunk line connecting the Black Sea ports of Poti and Batum, on the Caspian. Batum and Baku are also connected by a petroleum pipe line. The cap. is Tiflis. Area 37,500 sq. m. Pop. (including Armenians, Russians, Tartars, etc.) (1939) 3,512,200.

Georgia. One of the original thirteen states of the U.S.A. It is a S. Atlantic state, bounded on the N. by Tennessee and N. Carolina, on the E. by S. Carolina and the Atlantic Ocean, on the S. by Florida, and on the W. by Alabama. The total area is 58,800 sq. m., of which 300 sq. m. are water. The surface of the state is divided between highlands and lowlands, the Blue Ridge Mts. terminating in the N. part of the state. Its drainage system is extensive, the prin. rvs. being the Savannah, the Altamaha, the Chattahoochee, and the Flint. The climate of G. shows a wide range of temp., and differs considerably in the various localities. In S. G. the climate is similar to that of N. Florida. The winters and summers are, however, free from extremes, and on the whole the climate is temperate. The greatest rainfall occurs in the extreme N., and the smallest in the E. G. is also notable for its variety of soils. In the N. part sands and clay predominate, but in the extreme N.W. the soil possesses great fertility, being of a loamy character. By far the greatest variety is found in the coastal plain region; here abound red clay, grey sandy soils, and a subsoil of yellow loam. The flora and fauna of G. have no distinctive features, but in mineral resources it shows as great a variety as in its climate and soils. The most important of these is stone. The marble industry, too, has steadily grown in importance during the past years, and the G. marble has gained a reputation throughout the U.S.A. Other mineral products are silver, copper, asbestos, talc, mica, slate, limestone, cement, etc. Coal is not extensively found. Gold was found in White County in 1829, and even diamonds have been discovered, though not exploited. The fisheries of G. are important, oysters and shad constituting the bulk of the catch. The leading industry of the state used to be agriculture. The products are extremely diversified, and with the exception of the tropical fruits of California and Florida, G. can cultivate almost everything produced by the U.S.A. The prin. cereals grown are corn, wheat, oats, and rice. G. ranks second among the cotton-growing commonwealths, and has an enormous cotton-growing area. The growth of sugar-cane is increasing. The chief industry is cotton goods; others are lumber, fertilizer, food products, printing, and publishing. Manufacturing has now passed agriculture in importance owing to the vast development of water-power. Since 1916 education has been compulsory. There are elementary schools, high schools, and normal schools,

with separate schools for whites and Negroes. The cap. is Atlanta and the chief port Savannah. G. was the last of the Eng. colonies to be estab. in America, and is called after George II. of Great Britain. It was founded by Oglethorpe as a refuge for poor debtors. It took an important part in the Revolutionary war. In 1861 it passed the ordinance of secession and in 1870 was re-admitted into the Union. Pop. 3,123,000. Prin. cities are Atlanta 302,200, Savannah 95,900, Augusta 65,900, Macon 57,800, Columbus 53,200. See C. Howell, *History of Georgia*, 1926; E. M. Coulter, *A Short History of Georgia*, 1933; and A. B. Sayce, *New Viewpoints in Georgian History*, 1913.

Georgia, Gulf of. This strait separates Vancouver Is. from Brit. Columbia; it is 30 m. broad and about 250 m. long. It meets the Pacific Ocean at Queen Charlotte Sound on the N. and Juan de Fuca Strait on the S.

Georgian Architecture. The characteristic features of the Georgian (and Queen Anne) houses are the sash-windows symmetrically arranged with wooden bars, the central doorway with consoles, entablature, and pediment; a boldly projecting consoled cornice projecting the walls from rain, and generally a plain hipped roof, with simple dormer windows. A good illustration is No. 10 Downing Street, Whitehall. Generally the smaller Georgian house is set back from the road behind simple iron railings, and shows a straight, two-storeyed front raised upon a basement flat. Blenheim, designed by Vanbrugh, and Somerset House, by Chambers, are good examples of this style.

Georgian Bay constitutes the N.E. section of Lake Huron in N. America, and is divided from the lake by Manitoulin Is. and the peninsula containing the two cos. Grey and Bruce. The bay is nearly 100 m. long and 50 m. broad. It is fed by many rivs., chief among which are the Rs. French, Maganatawan, and Muskoka. The S. portion of the bay is watered by the R. Nottawasaga. The Trent Valley Canal connects the bay with the bay of Quinte and Lake Ontario.

Gephyrea, name given to a large class of marine worms, which includes the four orders Sipunculoides, Priapuloides, Echiuroidea, and Epithetosomatoides. The Sipunculoides are elongated and vermiform in shape, and live in the ooze and sand at the bottom of the sea; occasionally they bore into coral rock; *Phyllosoma* and *Sipunculus* are the most important genera. The Priapuloides contain the two genera *Priapulus* and *Halicryptus*, cylindrical animals with the mouth at one end and the anus at the other. The Echiuroidea are distinguished by the presence of a long contractile dorsal outgrowth, forming the proboscis. The Epithetosomatoides contain a single family which are remarkable for their long, tubular proboscis, and for a series of pores which lie on each side of the body.

Gera, tn. in Germany, on the White Elster, 35 m. S.W. of Leipzig. It has broad

streets and fine buildings, with a castle and an old municipal hall. Manus. woollens, machinery, and musical instruments. Pop. 84,000.

Geraldton, tn. 230 m. from Perth in W. Australia, situated on Campion Bay. It is noted as being the port for the Murchison goldfield. It has a good harbour; the chief exports are gold, copper, sandalwood, and wool. Pop. 5900.

Gérando, Joseph Marie de, see **DÉGÉRANDO**, BARON.

Geranium, genus of plants belonging to the natural order Geraniaceae. Chiefly ann. or perennial herbaceous plants with palmately lobed leaves and regular five-petalled flowers. A characteristic elongated beak-like process attached to the ovary gives the genus the popular name of 'Crane's-bill'. The Gs. are widely distributed, species being found in all climates; sev. occur naturally in the Brit. Is., of which perhaps the most familiar is Herb Robert, or Stinking Crane's-bill, from its pungent odour. The common garden Gs. are not correctly so called, being really members of the genus *Pelargonium*, which, however, is also included in the order Geraniaceae.

Gérard, Etienne Maurice, Comte (1773-1852), celebrated Fr. general and marshal of France under Louis-Philippe. He served as a volunteer under Dumouriez and Jourdan, became captain in 1794, and accompanied Bernadotte to Vienna as aide-de-camp in 1798. He was present at Jena (1806), Erfurt (1806), and commanded the Saxon cavalry at Wagram (1809). G. first won fame by his splendid charge at Austerlitz in 1805. He went to Portugal from 1810 to 1811, and then did great service to France during Napoleon's Russian campaign, helping to save the rearguard of the Grande Armée during the retreat, 1812. He distinguished himself at Bautzen in 1813, was wounded at Leipzig, but fought at La Rothière and Montereau. Joining Napoleon after his escape from Elba, G. fought at Ligny in 1815 with Grouchy. Louis XVIII. named him Grand Cross of the Légion d'Honneur. G. was a member of the Chamber of Deputies in 1822 and 1827, took part in the revolution of 1830, besieged and took Antwerp, 1832, and succeeded Mortier as grand chancellor of the Légion d'Honneur, 1835. Napoleon III. made him senator in 1852.

Gérard, François Pascal, Baron (1770-1837), Fr. painter, b. in Rome. He entered the Pension du Roi at Paris at the age of twelve, and from there went to the studios of Pajon, the sculptor, and Brenet, the painter, whom he left shortly to study under David. He competed for the Prix de Rome in 1789, but was unsuccessful. Two years later he again presented himself, but his father's death prevented the completion of his work. He then went to Rome for a year, but returned to Paris in 1791, and obtained employment under his former master, David. In 1796 he painted his famous 'Bélisaire', and the following year 'Psyché et l'Amour'. From 1808 to 1810 he exhibited quite a

number of pictures at the Fr. Salon. He is best remembered by his portraits, notably of Napoleon, Talleyrand, Mme de Staël, and Mme Récamier. See —. Deléclazé, *Louis David, son école et son temps*, 1855.

Gerard, James Watson, Amer. lawyer and ambas., b. 1867, at Geneseo, New York; his father was a lawyer and historical writer. G. graduated at Columbia Univ. in 1890. In 1892 he was admitted to the Bar, and began practice in New York city. He was chairman of the Democratic campaign committee of New York co. for four years. Elected associate justice of supreme court of New York for term 1908–21, but resigned Sept. 9, 1913, in order to become U.S. ambas. to Germany. In his first year in Berlin he came to the conclusion that Germany was trying for a *rapprochement* with Great Britain as against the Monroe doctrine of U.S.A. He formed and retained a high opinion of the Crown Prince Friedrich Wilhelm (q.v.); but he bears witness to the intolerable arrogance of the Prussian military caste, who, he believed, hurried the preparations for a war because of the beginning of an anti-militarist movement in Germany after the Zabern affair. On the eve of the First World War he wrote to the Brit. ambas. offering mediation by the U.S.A., but his letter was never answered. Before the entry of America into the war G. was most energetic in seeing to the interests of oppressed Brit. prisoners in Germany. He gives a detailed and most interesting account of his experiences in *My Four Years in Germany* (1917), written when he had resumed practice in New York. He has also written *Face to Face with Kaiserism* (1918). He holds the Brit. distinction of K.C.M.G.

Gerard, Jean Ignace, see GRANDVILLE.

Gerard, John (1545–1612), Eng. herbalist and writer on gardening. He lived for some time at Holborn, London, keeping a large physic garden there, and practising as a barber-surgeon. He kept Lord Burghley's gardens for over twenty years. In 1596 G. pub. his *Catalogus arborum fructuum ac plantarum . . . in horto Jovannis Gerard . . .* (1100 varieties). His *Herball*, or *Generall Historie of Plantes* (1537), was based on Dodonæus's *Stirpium historiarum pemptades* (1583). An enlarged ed. was issued by Thomas Johnson in 1633. G. became master of the Company of Barber-Surgeons, 1607. See M. Woodward, *Gerard's Herball*, 1636; E. Arber (editor), *A Transcript of the Registers of the Company of Stationers of London*, in. 21, 1875; and Alice Tudor, *A Little Book of Healing Herbs, gathered from an Old Herball*, 1927.

Gérardmer, or **Géromé**, health resort and tn. of Vosges, France, 18 m. from Saint-Dié, on G. Lake, near Lakes Longemer and Retourneimer. It was named in honour of Gérard of Alsace, who built a tower by the lake (c. 1070). Noted for its picturesque position, it is a tourist centre. It has manufs. of linen, household utensils, and hemp, and large trade in Géromé cheese. Part of the tn. was

destroyed by fire in the Second World War. Pop. (com.) 8500.

Gerard of Cremona (1114–87), medieval translator of Ptolemy's astronomy. He studied auct. wisdom in the Sp. and Muslim schools of Toledo, and having acquired a knowledge of Arabic, devoted the remainder of his life to the making of Lat. trans. from its literature. His most celebrated work is the trans. of Ptolemy's *Almagest*. He is also said to have trans. about sixty-six other treatises. He d. at Cremona in Lombardy.

Gerasa (Γερασά, modern Jerash), auct. city of the Decapolis, Palestine, 56 m. from Jerusalem. It is among the mts. of Gilead, about 20 m. E. of Jordan. Grove identifies it with Ramoth-gilead. In 83 B.C. it was captured by Alexander Jannæus of the Maccabean line, and rebuilt by the Romans, 65 B.C. G. was very important in the time of the Antonines (A.D. 138–80). It was a bishop's see in early Christian times. It cannot be the 'country of the Gerasenes' (see Wilson, *Recovery of Jerusalem*, p. 369). The ruined forum, colonnaded streets, theatres, and temple probably date from the second and third centuries A.D. (see photographs by Palestine Exploration Fund, 1867). See GADARA.

Gerfalco, see FALCON.

Gerhardt, Karl Friedrich (Charles Frederic) (1816–56), famous Fr. chemist, native of Strasburg. He studied under Liebig at Giessen, and with Hovrenl, and trans. sev. works of Berzelius and Liebig. He went to Paris, and in collaboration with Laurent and Cahours contributed to the *Annales de chimie et de physique*. With Cahours he wrote a memoir on essential oils, embodying new theories. G. was prof. at Montpellier, 1841–48, and then returned to Paris, the greater part of his work being done in that city. In 1855 he became prof. of chem. at Strasburg. His chief works are *Précis de chimie organique* (1844–45); *Introduction à l'étude de la chimie par le système unitaire* (1848); *Précis d'analyse chimique* (1855); *Traité de chimie organique* (1853–56). See Cahours, *Notice sur Charles Gerhardt*, 1856, and E. Grimaux, *Charles Gerhardt, sa vie, son œuvre, sa correspondance*, 1900.

Gerhardt, Paulus (Paul) (1607–76), great Ger. hymn-writer of Saxony, second only to Luther. He studied at Wittenberg, became pastor at Mittenwalde (1651), in Berlin (1657–67). He removed to Lubben, 1669, and was pastor there in the Spreewald till his death. G. supported the Lutherans in their controversies with the reformed churches. Among his most celebrated hymns are 'Nun ruhen alle Wälder,' 'Wach auf mein Herz, und singe' (1648); 'Warum sollt ich mich denn grämen?' (1653); 'Befiehl du deine Wege' (1656) (Wesley's 'Commit thou all thy ways'); 'O Haupt voll Blut und Wunden' (Alexander's 'O sacred head once wounded'). His *Collected Hymns* first appeared 1667. A good ed. is that of A. Ebeling (1908). See F. Roth, *P. Gerhardt*, 1832 (new ed. by Lommatsch, 1893); K. Langbecker, *P. Gerhardt's Leben und Lieder*, 1841; J. Kelly (trans.), *Gerhardt's*

Spiritual Songs, 1867; and studies by P. Wernle, 1907; H. Petrich, 1914; and E. Kochs, 1926.

Géricault, Jean Louis André Théodore (1791-1824), Fr. painter, leader of the Romantic as opposed to the Classical school. He was pupil of Vernet (1808) and Gudin (1810). G. spent much time in Versailles, and entered the army for a time (c. 1814). He soon returned to his art, visiting Italy (1816-18) and England in 1819. 'Le Radeau de la Méduse' (1819), his most famous work, is now in the Louvre. The Wallace Collection, London, has his 'Equestrian Portrait of the Prince Regent.' His horses are especially fine. Other pictures are 'A Cavalry Officer on Horseback' (1812); 'Wounded Cuirassier' (1814), and studies for a picture of a horse-race in the Corso during Carnival. G. also produced a few bronzes and wax-sketches. See E. Coquatrix, *Géricault, prose et vers*, 1846; G. Clément, *Géricault*, . . . 1868; and lives by L. Rosenthal, 1905, and L. Deltell, 1924; also W. Brownell, *French Art, Classic and Contemporary*, 1901.

Gerizim and Ebal, in scriptural geography two hills of Samaria, Palestine. The former (c. 2850 ft. high) stands opposite the latter (c. 3000 ft. high), which is on the N. side of the Jezreel valley in which lies Nablus (anc. Shechem). The curse for disobedience to the law was pronounced from Mt. Ebal, the blessing for obedience from Mt. Gerizim (Joshua viii. 33). After the conquest of Canaan Joshua erected an altar to Jehovah on Ebal (modern Arabic name *Jebel Eslamiyah*). The Samaritans built their temple on G.

Germ, see BACTERIA; BIOLOGY.

German, Sir Edward (Edward German Jones) (1862-1936), Eng. musical composer, b. in Shropshire, educated at Bridgton House School, Chester. He entered the Royal Academy of Music, 1880, leaving it as associate, 1887. He was made a fellow, 1895. His opera, *The Rival Poets*, was first produced at St. George's Hall, 1886, and revived by the pupils of the Academy, 1901. In 1889 G. became director of music at the Globe Theatre, London, under Mansfield's management. His incidental music to *Richard III.* (1889) was the first of a series of similar compositions for Shakespearean and other plays. *Henry VIII.* appeared at the Lyceum, 1892—the three dances performed during Wolsey's reception at York Place (Act I) becoming immensely popular; *Romeo and Juliet* (1895); *As You Like It* (St. James's Theatre) (1896); symphonic poem, *Hamlet* (1897); and *Much Ado About Nothing* (1898). G. also wrote two symphonies, in E. minor ('Crystal Palace') (1890) and A. minor (1893). He conducted at many great musical festivals. Other works are *Nell Gwynn* (1900); *The Emerald Isle* (finished for Sullivan) (1901); *Merric England* (1902); *The Princess of Kensington* (1903); *Just So Song Book* (with Kipling) (1904); *Tom Jones* (1907); and *Fallen Fairies* (with Gilbert) (1909). His coronation march and hymn were performed at Westminster at the coronation of George V., 1911. The *Willow Song* was per-

formed at the R.A.M. Centenary in London in 1922. He wrote numerous songs, part songs, and duets. The melodist and the scholar were happily combined in G. His music is of the school of Sullivan, but has a character of its own, and apart from his symphonic works, has a strong O.E. flavour and a spring-time rhythm. See life by W. H. Scott, 1932.

German Art. Germany has never occupied a leading position, comparable to that of Italy or France, in the hist. of visual art in W. Europe, but the works produced there have an interesting individual character, and the best of them are acknowledged to approach to the masterpieces of more famous schools.

The medieval art of Germany developed out of that of the Carolingian Empire of the ninth century. Carolingian art itself was a W. European rather than a specifically Ger. phenomenon, but it has left some monuments on Ger. soil, of which the most important is the octagonal domed chapel, which still forms the nucleus of the cathedral at Aachen, the central seat of Charlemagne's Gov. A specifically national style first appeared in the Ottonian period during the latter part of the tenth and the first half of the eleventh century. This was a period of great activity in architecture and MS. illumination and, to a lesser extent, in sculpture. The churches of this period were built in the Romanesque style, with round-headed arches, and were elaborately decorated on the outside with arcading. A peculiar feature of their plan was the frequent presence of an apse at the W. as well as at the E. end of the church, instead of the doorway usual in that position in the rest of Europe. Among the most famous surviving buildings of this period are the abbey of Gernrode and the cathedrals of Mainz, Speyer, and Worms in the Rhineland, and the church of St. Michael at Hildesheim. The monastery of Reichenau was specially celebrated for the production of illuminated MSS., of which a fine example is the Gospels of Otto III., now in Munich, executed about the year 1000. The finest surviving sculptures are the bronze doors of the cathedral of Hildesheim executed in 1015. Both the painting and the sculpture of this period, though based on Rom. and Carolingian models, are distinguished by a vigour of emotional expression that is characteristically Ger. The twelfth century was a period of less artistic activity, though some fine churches were built such as that of the Apostles at Cologne. The rock carving of the Deposition at the Eternelselne, near Detmold, executed in 1215, is an extraordinarily moving composition. Towards the end of the first quarter of the thirteenth century the Gothic style of architecture began to reach Germany from France, and is first seen in such transitional works as the nave of the church of St. Gerson at Cologne and the cathedral at Münster, begun in 1225. One of the earliest fully Gothic churches in Germany is that of St. Elisabeth at Marburg, begun in 1233, which shows

already the most striking feature of Ger Gothic construction, the aisles being carried to the same height as the nave. The resulting type of church is called a 'hall church' (*Hallenkirche*) and Ger Gothic churches generally conform to it. Cologne Cathedral, begun in 1248 but not finally finished until 1880 is of the more familiar type with triforium and clerestory. In N Germany the absence of suitable local building stone led to interesting developments of Gothic construction in brick especially in the great ports of the Hanseatic League like Lübeck while further S a tendency to over-elaboration in the stonework already noticeable in the earlier parts of Cologne Cathedral steadily increased throughout the fourteenth and fifteenth centuries and culminated in the Late Gothic style of the beginning of the sixteenth. A characteristic example of this elaborate style is the cathedral at Ulm, begun in 1377 but, like Cologne, not finished until the nineteenth century. There was also a revival of sculpture in the thirteenth century contemporary with the first introduction of the Gothic style in architecture but itself representing rather a last flowering of the Romanesque. The most important surviving monuments of this style are the series of figures decorating the cathedrals of Freiberg in Saxony, Bamberg, Naumburg, Strasbourg, Paderborn and Münster dating from between 1240 and 1260. This grand monumental style was succeeded in the fourteenth century by the pretty but over-elaborate 'international style' of Gothic common to the whole of Europe at that period and an individual Ger style in sculpture hardly reasserted itself before the second half of the fifteenth century.

There are no monuments of painting surviving comparable in importance to the great sculptured decorations of the thirteenth century, but in the later fourteenth and earlier fifteenth century the 'international style' was developed in interesting and individual ways by such artists as Bertram von Minden and Konrad von Soest in Westphalia, Stephan Lochner in Cologne, and Meister Francke in Hildesheim whose work prepared the way for the great movement of the end of the fifteenth and the beginning of the sixteenth century. This period is justly the most famous in the history of G Art. The leading sculptors were Veit Stoss (1433-1533) and Peter Vischer the elder (1452-1529), both of Nuremberg and Tilman Riemenschneider (1460-1531) of Würzburg, all of whom combine a manner of angular development of Gothic drapery with greatly increased freedom of movement and naturalism of expression. Vischer is especially famous for his bronze statues on the tomb of the Emperor Maximilian at Innsbruck (1513). In painting we find a parallel development in the work of Martin Schongauer (d 1490) who is well known as an engraver, and in whose work the influence of the school of the Van Eyck is evident. The works of the artists of the next generation show a greater originality of style, and it is on

them that the claim of Germany to have produced a school of painting of major European importance must chiefly rest. Matthias Grünewald (1470/80-1529) is an expressionist painter of unsurpassed emotional force, but the greatest figure is Albrecht Dürer of Nuremberg (1471-1528) unrivalled in his country as painter, engraver and draughtsman. Dürer twice visited Venice and was influenced by the developed Renaissance art which he saw there. This influence was mainly confined to his paintings and was not wholly

THE STADTWINKELHAUS OF MÜNSTER

A masterpiece of the Late Renaissance style (thirteenth to fifteenth century)

beneficial as may be seen in his two panels of apostles in Munich. He is at his best as a portrait painter and as an engraver and draughtsman where he combines clarity of design with rich and exquisite detail. His water-colour sketches are remarkable for the breadth of handling. Gifted young contemporaries of Dürer's were Hans Baldung Grien (1474-80-1545) and Albrecht Altdorfer (c 1480-1538), while Lucas Cranach the elder (1472-1553), a painter of delightful mythological pictures and excellent portraits, carries to the middle of the century something of the spirit of its opening years. The troubles of the Reformation brought about a decay of artistic activity after

about 1530. In architecture a mannered style of Renaissance decoration, of Flem. inspiration, supersedes the elaborate late Gothic, but in plan and construction buildings retain their essentially Gothic character, as may be seen in the churches of St. Adolph and Wollfenbüttel, which date from the early seventeenth century. In sculpture there are no figures of outstanding importance. In painting there are some good local schools of portraiture, but the only really important artist is Adam Elshelmer of Frankfurt (1578-1610), who spent the last decade of his life in Rome. The Thirty Years war checked even this reduced activity and the art that we find in the second half of the seventeenth century is mainly a court art, based on imported Baroque models and with little connection with anything that had gone before. Recovery from the Thirty Years war was slow, and it is not until the end of the century that Germany produced an architect and sculptor of note in Andreas Schlüter (1661-1714), who built part of the Schloss at Berlin and made the equestrian statue of the Great Elector there.

During the first half of the eighteenth century a development of the Baroque style took place in N. Germany in which architecture, sculpture, and painting were combined to produce the most striking theatrical effects. Though the origins of this style are to be found in Italy it represents an important and original German contribution to the Baroque movement. The prin. architects in this style were the brothers Asam of Munich. A rather more sober handling of the Baroque distinguishes the work of Balthazar Neumann (1688-1753), architect of the Bishops' Palace at Witzsburg. The eighteenth century produced no very notable native painting. The most important painter working in Germany during the first half of the century, Antoine Pesne (1683-1757), was a Frenchman, and the great Venetian, G. B. Tiepolo, worked some years at Würzburg in the middle of the century. Anton Raffael Mengs of Dresden (1728-79), the most prominent artist of the second half of the century, worked much in Italy and based his style on the It. painters of the High Renaissance. At the end of the century the Neo-Classical style was enthusiastically adopted in Germany and retained its popularity until the middle of the nineteenth century. An early and famous architectural example is the Brandenburg Tor (Gate) in Berlin built at the end of the eighteenth century by J. G. Longhaus (1733-1808), but its most important exponent was Karl Friedrich Schinkel (1781-1841). In the middle of the nineteenth century there was the same revival of Gothic architecture in Germany as in other European countries, but perhaps because in Germany the Gothic spirit had never wholly died out such imitations were often more lively and successful than elsewhere. Many Gothic churches left unfinished in the sixteenth century were completed at this period. In the present century, until

1933, Germany held a leading position in the development of a new style of architecture, based on the possibilities of new constructional methods, with the work of such architects as Walter Gropius (b. 1883) and Erich Mendelsohn (b. 1887). Official Nazi architecture rather favoured a return to the Neo-Classical style of the early nineteenth century.

In sculpture the Neo-Classical style is found in the works of Gottfried Schadow (1784-1850). In the second half of the century Adolf Hildebrand (1847-1921) based his style on a wider traditionalism, drawing inspiration from the great masters of the Renaissance as well as from classical models. More interesting movements are found in the painting of the nineteenth century. Contemporary with the Neo-Classical style in architecture and sculpture was the Romantic movement in painting which was distinguished by a clarity of form which it owed to Neo-Classical influence. At the beginning of this movement stands a group of painters active in Rome, and known as the Nazarenes, who in their aims and methods in some respects anticipated the Eng. pre-Raphaelite Brotherhood. Their leader was Friedrich Overbeck (1783-1869). Philip Otto Runge of Hamburg (1777-1810) followed a similar line, and but for his early death would have probably occupied a dominating position. More frankly Romantic was the work of the great landscape painter Caspar David Friedrich (1774-1840). The Romantic style was carried on in the next generation by Ludwig Richter (1813-84), Moritz von Schwind (1803-71), and Alfred Rethel (1816-59). A more straightforward realist painter was Adolf von Menzel (1815-1905), while a richer and more impressionist style of painting distinguished the Romanticism of Arnold Böcklin (1827-1901), Anselm Feuerbach (1829-80), and Hans von Marées (1837-87). Franz von Lenbach (1836-1904) and Wilhelm Liebig (1844-1900) were portrait painters of distinction. The influence of the Fr. Impressionist movement can be seen in the work of Max Lieberman (1847-1935), while post-Impressionism was reflected in the Expressionism of Paula Modersohn-Becker (1876-1907) and Franz Marc (1880-1916). During the period between the First World War and the advent of Hitler German artists tried a bewildering variety of experiments both in sculpture and painting, ranging from revival of primitive styles to complete abstraction, but in no direction was the achievement outstanding. The policy of Dr. Goebbels favoured a negative academic traditionalism or an hysterically expressive propaganda. See G. Dehio, *Geschichte der deutschen Kunst*, 1919-34; W. Museler, *Deutsche Kunst im Wandel der Zeiten*, Berlin, 1938; H. Pfeiffer, *Early German Art and its Origins*, 1939; and *Works of Art in Germany (British Zone of Occupation: Losses and Survivals in the War* (H.M.S.O.), 1946.

German Baptist Brethren Religious body founded in Germany during the seventeenth century by Andrew Mack of

Schwartz, whose doctrine and discipline were based upon literal interpretation of the O.T. and N.T. Owing apparently to the unpopularity of some of their opinions they experienced many difficulties and hardships in Europe, but their emigrant members were able to obtain greater freedom and security in America, where many of them settled during the early part of the eighteenth century. Here they became known as the Dunkers, or Tunkers (from *tunken*, to dip), adult baptism being one of their important rites. They have always been careful to observe certain of the N.T. customs, which other Christian churches regard as unimportant or as being local customs of Palestine. These include the 'washing of feet' and the 'salutation with a holy kiss.' The main body has now a membership of about 120,000. The G. B. B. came into some prominence during the First World War owing to their belief in the doctrine of non-resistance. Faith-healing is also a prominent teaching in their church, but they are not so well known for this tenet as Amer. bodies of more recent origin.

German Boarhound, see GREAT DANE.

German Bulldog, see BOXER.

German Catholics, name given to a religious sect in Germany, who broke away from the Rom. Catholic Church in 1844, under the leadership of Rouge, an ex-priest of Silesia, and Czerski, a priest of Schneidemühl, who seceded from the Church of Rome and formed a congregation of Christian Apostolic Catholics. Their first general council was held at Leipzig in 1845. The essentials of belief were restricted to a few doctrines, and the scripture was laid down to be the sole rule of faith, no external authority being allowed to interfere with its free interpretation. By the end of the year 1845 the G. C. had some 300 congregations. Internal dissension, however, soon set in, and strong measures were taken against the G. C. They were expelled from Austria, and their clergy were not recognised in Prussia. Many of the congregations either dissolved or returned to Rome, and in 1859 the majority joined the free-thinking association known as the Free Congregations. Six years later this council refused to commit itself to the belief in a personal God. The G. C. movement may be said to have been superseded by the Old Catholics.

German Colonies. Under the treaty of Versailles (q.v.), 1919, Germany surrendered all her overseas colonies and protectorates. Ger. E. Africa was ceded to Britain, being renamed Tanganyika Ter., Ger. S.W. Africa went to the Union of S. Africa; Cameroon and Togoland were jointly partitioned between France and Britain (see AFRICA; CAMEROONS; TOGOLAND). The Ger. lease of Kiaochow and other interests in Shantung, together with the Ger. Pacific Is. N. of the equator, were ceded to Japan; the Ger. portion of Samoa to N. Zealand, and Ger. New Guinea and the remainder of the possessions in the Pacific to Australia. In addition Germany renounced all her special rights and privileges in China, Siam, Morocco, Liberia,

and Egypt. Conformably with the development of a sense of common responsibility for the welfare of mankind, these colonies were received by the victorious Allies not as absolute, sovereign possessions, but as mandated ter. In this way the administration of Ger. colonies in S. Africa was entrusted to Britain, France, and S. Africa; the Pacific Is. to Australia, New Zealand, and Japan. See also under the various countries named.

Germander, name given to the Brit. species of *Teurrium*, a genus of labiate plants. The wood is *T. scorodonia*; the wild G., *T. Chamædris*.

German Dogge, see GREAT DANE.

German East Africa. Formerly a Ger. colony in Equatorial E. Africa, and Germany's largest dependency, this area, which is bounded by Uganda, Victoria Nyanza, and Kenya Colony on the N., the Indian Ocean on the E., Portuguese E. Africa and Lake Nyassa on the S., and N. Rhodesia, Lake Tanganyika, and Belgian Congo on the W., was conquered by the Allies during the First World War. It then became known as Tanganyika Ter., and, with the exception of the dists. of Ruanda and Urundi, which were joined to the Belgian Congo, and a small dist. in the S., which was added to Portuguese E. Africa, passed into the possession of Great Britain, under the mandate of the League of Nations. See under TANGANYIKA TERRITORY, and for the campaign see AFRICA, GERMAN EAST, CAMPAIGN (FIRST WORLD WAR).

Germanic Laws. The designation of the systems of law evolved and codified by the prin. Teutonic tribes on the establishment of native kingdoms on the retirement of the Romans from Germania. The codes date back to the fifth and sixth centuries, and show in general a blend of native tribal law and of Rom. law. The following tribes possessed coded laws: Alemanni, Bavarians, Burgundians, Frisians, Saxons, Thuringians, and Visigoths. The codes were framed in the Lat. language with scraps of barbaric legal terminology. The need for codification seems to have arisen from the difficulties experienced by the Romans in endeavouring to administer their system of law with various tribes, each possessing a system of its own.

Germanicus, Cæsar (Tiberius) Drusus Nero (c. 15 B.C.-A.D. 19), famous Rom. general, son of Nero Claudius Drusus and Antonia (Mark Antony's daughter). He fought against the Dalmatians and Pannonians (A.D. 7-10), early holding consular rank. G. was a favourite with Augustus, who gave him command of eight legions on the Rhine (A.D. 14), and gained his adoption by his uncle, Tiberius. On the death of Augustus the legions tried to make G. emperor, but he was loyal to Tiberius, and with difficulty checked their ardour. Undertaking dangerous campaigns in Germany he defeated Arminius and recaptured the eagles taken from Varus (A.D. 9). Tiberius, jealous of his success, recalled him (A.D. 17) to Rome, where he enjoyed a triumph. He was then sent out to the E., where his moderate measures won him gratitude from all. He

d. at Antioch, probably poisoned by C. Piso, a favourite of Tiberius. Caligula and the younger Agrippina were his children. See Tacitus, *Annals*, vol. II.; Lagerloof, *Vita C. Germanici*, 1698; L. de Beaufort, *Histoire de C. Germanicus*, 1741; J. Hillebrand, *Germanicus*, 1817; monographs by A. Zingerle, 1867, and A. Broyer, 1892; and F. Knoke, *Die Kriegszüge des Germanicus in Deutschland*, 1922.

Germanium, chemical element discovered in 1886 by Winkler in argyrodite ($\text{GeS}_2, 4\text{Ag}_2\text{S}$), a mineral found at Freiberg. It also occurs to a minute extent in the mineral euxenite. In almost all its compounds it is quadrivalent, and it has marked affinities with silicon and other elements of that group. In properties it agrees very closely with Mendeléef's hypothetical eka-silicon. Atomic weight 72.5; melting-point 900°C .

German Literature, see GERMANY, Literature.

German Measles, infectious disease resembling a mild form of measles and scarlet fever, and chiefly affecting children. The symptoms are a slight fever, headache, shivering, and enlargement of the glands of the neck, accompanied by a rash appearing first on the face and spreading downwards. The rash lasts from 24 to 48 hrs. Treatment consists in confinement to bed with a light and nourishing diet.

German Ocean, see NORTH SEA.

German Silver, or **Nickel Silver**, alloy consisting approximately of six parts copper, three parts zinc, and one part nickel, with sometimes a trace of iron. It forms a white, tough metal, taking a good polish, and is largely used for the manufacture of spoons, forks, and other similar articles, but, as it soon tarnishes, it is usually electro-plated. G. S. has a high electrical resistance, and is largely used for making resistance coils.

German South-West Africa, see AFRICA, South-West.

Germantown, former suburb, now a ward, in the N. of Philadelphia, Pennsylvania, U.S.A. It contains many historic houses, i.e. the Chew House, built by Benjamin Chew, who was imprisoned as a loyalist in 1777, and the Morris House, the headquarters of Gen. Howe, and the residence of President Washington when Philadelphia was the cap. of the U.S.A. In this vicinity, too, the first paper mill in America was erected in 1690, and the first Bible printed in America was pub. here in 1743. G. was founded in 1683 by thirteen families from Germany, incorporated in 1869, and annexed to Philadelphia in 1851. A famous battle in the War of Independence took place here Oct. 4, 1777. The prin. manufs. are knitted goods, yarns, and textiles.

Germanus, Saint (c. 650-740), patriarch of Constantinople, being transferred from Cyzicus to this see in 715. He defended the practice of the Church against the Emperor Leo, who espoused the cause of the Iconoclasts, and received a letter of encouragement from Pope Gregory II. In 730 he was ejected from his office. His prin. works are *A Defence of the Orthodoxy of the Writings of St. Gregory of*

Nyassa; *A Treatise on the First Six Ecumenical Councils*; and *A Collection of Sermons and Hymns*.

German Volga Republic. Until 1947 one of the autonomous republics included in the R.S.F.S.R. Except for a short distance in the S.E., where it adjoined Kazak in Asiatic Russia, it was enclosed by the Lower Volga area. It was formed chiefly of portions of the old provs. of Saratov, Samara, and Astrakhan. The chief industry of the region is agriculture, which is helped by irrigation from the Volga. Wheat, barley, maize, and other cereals, and sunflower seeds are the chief crops, and there are manufs. of flour, tobacco, leather, and motor tractors. The area of the republic is 27,000 sq. km. The ter. was settled in 1760 by Ger. colonists, invited by Catherine the Great, and Gers. still comprise most of the pop. The republic was governed by a Central Executive Committee and a Council of People's Commissioners. In 1947 the republic lost its status, and was incorporated in the Saratov region of the R.S.F.S.R. Pokrovsk (pop. 40,000), on the Volga opposite Saratov, was the cap.; Uzbakh is the junction for railways running from Moscow to Astrakhan and Tashk.

Germany (Deutschland), republic of central Europe, which has a total land area of about 181,000 sq. m. Of its 4569 m. of frontier, 1220 m. only are bounded by the sea. The N. boundaries are the North Sea, the Dan. peninsula, and the Baltic; the E. Poland and Russia; the S., Austria and Switzerland; and the W., France, Belgium, and the Netherlands. The area of the former Ger. Empire estab. in 1871 with accessions of ter. as a result of the Franco Ger. war was reduced by some 27,250 sq. m. by the treaty of Versailles after the First World War, and the area of the Ger. republic which came into being in 1919 was 140,976 sq. m. (1933 frontiers). The states of the republic were seventeen in number: the free state of Prussia (including Waldeck), 113,043 sq. m.; Bavaria (free state), 29,334 sq. m.; also the free states of Saxony, 3789 sq. m.; Mecklenburg-Schwerin, 6996; Oldenburg, 2480; Brunswick, 1118; Anhalt, 888; Lippe, 469; Mecklenburg-Strelitz, 1131; Schaumburg-Lippe, 131, also the Hanse states of Hamburg, 160 sq. m.; Bremen, 99; and Lübeck, 11; the people's states of Württemberg, 7532 sq. m., and of Hesse, 2970; the federated state of Thuringia, 1527 sq. m.; and the republic of Baden, 3819 sq. m. Under the Third Reich the federal states became administrative provs. with minor alterations to the boundaries, particularly of Prussia, Oldenburg, and Hamburg. Lübeck became part of Prussia, and in 1931 Mecklenburg-Strelitz and Mecklenburg-Schwerin were united to form the prov. of Mecklenburg. By annexation the ter. of the Third Reich incorporated the Saarland (738 sq. m.), Austria (12,369 sq. m.), which became the prov. of Ostmark, and the Sudetenland (10,892 sq. m.), making a total area of Greater G. in 1939 of 224,965 sq. m.

Physical characteristics. -The coast line

is interrupted only by the small isthmus of Schleswig, yet it contains hardly any good harbours. The reasons for this are (1) that on the Baltic shallow lagoons, or land-locked bays called *Haffs*, prevent good anchorage; (2) that the shore waters are not deep enough for vessels of any size; and (3) that, owing to the lack of protection N. and E., the Baltic ports are constantly choked with ice. Along the North Sea shores are numerous dykes which serve, as in Holland, to keep out the sea, where the sand-dunes are not strong enough. The surface of G. falls naturally into three divs.: the lowlands in the N., the tableland of the S., and the basin of the middle Rhine. The lowlands are part of the great European plain, and are largely occupied with sandy tracts, with here and there peaty deposits. They are well watered, and in certain dists. fertile, whilst the monotony of their level is broken by two lines of hills whose heights vary from 500 to 800 ft., and which may be said to extend roughly from the Mecklenburg to the Vistula, and from the moors of Lüneburg in Hanover to Silesia. In the S. plateau of Bavaria, the Fichtelgebirge is clearly the pivot round which the other mt. systems revolve. Thus to its N.W. there rise the Thuringian forest and the Harz Mts., and to the N.E. the Erzgebirge, the Riesengebirge, and the Sudetic Mts. S.W. radiate the Franconian and Swabian Juras and the Schwarzwald or Black forest heights. Westward stretch the Taunus Mts., whilst beyond these, and divided only by the Rhine, are the ridges of the Vosges. In the extreme S.E. of Bavaria the Tyrols or Noric Alps follow the N. bank of the Inn, and from this range rises the Zugspitze (9700 ft.), which is the highest summit in G. Between Basle and Mannheim the Middle Rhine is splendidly sheltered by the Vosges and the Black Forest, which guard its course to left and right. Within Ger. ter. the chief tribs. of the Rhine are on the right the Neckar, Main, Lahn, Sieg, Ruhr, and Lippe, and on the left the Moselle. Fortunately the watersheds are both far from the sea (which accounts for the considerable length of many of the rvs.) and also comparatively low, so that there are no great falls in the main streams. They are therefore navigable for the greater part of their course. Steamers can reach Ratisbon on the Danube, Prague on the Elbe, Schaffhausen on the Rhine, Ratisbon on the Oder, beyond Warsaw on the Vistula, and Cassel on the Elbe. The Vistula and the Oder are Baltic waterways, but more important from a commercial point of view are the Elbe, with its chief affluents the Mulde, Havel, and the Saale, and the great Rhine, which both empty into the North Sea along with the smaller Ems and the Weser, which is the only purely Ger. stream. This latter fact is worth noticing, as the sources of the Oder, Elbe, and Vistula must be traced into Austria, and sections only of the Rhine and Danube traverse G.

Climate.—Broadly speaking, the general contours are not favourable to climate;

for the level exposed flats, N. and E., offer no resistance to the passage in winter of the dry, piercing winds from Siberia and the Arctic, whilst to the S. and W. the mountainous tracts form effectual barriers against the moist anti-trades. As regards temp., the extremes increase eastward in proportion to the distance from the Atlantic. In the warmer lat. of the S., the elevation of the plateaus counteracts the natural tendency to grow hotter, so that Ratisbon lies on the same isotherm as Hamburg. In the Upper Harz the rainfall reaches 68 in., as the Harz Mts. are far enough N. to catch the rains borne by the winds sweeping across Holland, but the mean ann. precipitation is only about 20 in. On the whole the climate may briefly be described as continental. It should be noted that the general slope of the country is from the S.E. to N.W., that is, away from the sun, and also that the Rhine valley is so sheltered that it reaps the full benefit of its warm lat., and thus enjoys excellent weather conditions.

Forests.—As would be expected the boisterous winds from the sea dwarf the scanty trees in the N.W., the land being covered for the most part with moors and heaths. Trees are still plentiful in the Bohemian, Black, and Thuringian forests, and large masses of timber are floated down the Neckar and Vistula. Chief among the deciduous trees are the beech and oak, but these do not cover more than a third of the forest lands; the Scots pine (*Kiefer*), however, is ubiquitous and, together with the white birch, makes up nearly a half. In 1939 the forest area amounted to some 42,797,000 ac., of which over 31,600,000 were state controlled, 9,000,000 ac. being deciduous and the remainder pine, larch, and fir.

Flora and Fauna.—The flora and fauna are fairly extensive, including over 2000 varieties of vascular plants and as many as 18,000 species of insects. All plants peculiar to the temperate zone are cultivated with success, and in general the flora may be said to be largely such as would be expected from the union, which occurs here, of the Alpine and Baltic elements. As regards the fauna, there are hardly any species found only in G. The elk still exists in the forests of E. Prussia, and the wild boar, stag, and roe continue to occupy the remoter and more hilly dists. All larger game have been extinguished. The rvs and seas teem with fish, the former abounding in members of the carp and salmon tribes.

Agriculture.—In 1939 the total area under cultivation was over 71,000,000 ac., divided between arable land (48,000,000 ac.), grass and pasture (21,284,000 ac.), orchards and market gardens (1,888,000 ac.), vineyards (203,000 ac.), tobacco (33,000 ac.), hops (21,000 ac.). The following year (1939) the acreages placed under crops were as follows: wheat (6,049,000 ac.), rye (12,079,000 ac.), barley (4,833,000 ac.), oats (8,205,000 ac.), potatoes (7,310,000 ac.), sugar beet (1,421,000 ac.), hay (18,780,000 ac.). The crop yields for that year (1939) in metric

tons were as follows: wheat 5,584,500, rye 9,281,000, barley 4,244,000, oats 6,827,000, potatoes 66,300,000, sugar beet 17,390,000, hay 25,017,000. It is and oats grow in the N. despite the drawbacks of poor climate and soil. Flax, hemp, and the beet—the last for the sugar industry—grow in Saxony and in the Baltic provs., especially in Hanover. The vine covers the dry, sunny slopes of the Mosel, and is also grown along the Rhine. The rich alluvial soils of the sheltered valleys in the S.W. are also favourable to the production of tobacco and hops,

agric. land) into smaller holdings with compensation to the previous owners. Gers. expelled from areas under Polish rule were settled in these smaller holdings.

Minerals.—G. is rich in minerals, especially in coal and iron. The industrial activity of the country was founded on the fact that these two minerals are found together, and moreover in proximity to navigable water-courses. In the Rhine basin the coal beds follow the courses of the Ruhr, Saar, and Ill, and excellent iron ore is found in both the Ruhr and Saar coalfields. The Saxon

BERNKASTEL AND THE MOSEL (MOSELLE)

which were cultivated with success in Baden, Hesse, and Bavaria. The co-operative system was a marked feature of Ger. agriculture, and the societies numbered nearly 40,000 with a membership of over 4,000,000. In normal times over 13,000,000 were employed in agriculture in G. Small estates and peasant holdings were to be found mostly in the W. and S. Ger. states while the large estates were in the N.E. As a result of measures of land reform in Brandenburg, Mecklenburg, Saxony, Thuringia, and W. Pomerania during the Russian occupation the large estates, representing about 40 per cent of agric. land, were broken up in 1945 and divided among landless peasants, farm workers, and peasants resettled from central and E. Europe. A similar law in the U.S. occupied zone provided for the div. of large estates (some 5 per cent of the total

mines in the Elbe basin yield lignite coal. Almost one half of the zinc produced in the world was at one time mined in G., the chief centres being at Anchen in the Rhineland and Königshütte (Krolewski-Huta, now in Poland), whilst the silver, lead and copper mines in the Harz Mts. and in Saxony are in normal times highly productive. Most of the Ger. copper came from the Harz and Erzgebirge Mts., whilst large quantities of rock and potassium salts were produced in Hanover, Saxony, Thuringia, and Anhalt. The mineral springs of Baden-Baden, Wiesbaden, Ems, etc., are world famous. After the collapse of G. in 1945 the Ruhr coal-mines were taken over by the Brit and the Saar coal-mines by the Fr., while the Silesian coalfields and other mines were incorporated in ter. allocated provisionally to Poland (see POMERAN AGREEMENT). The total production of

coal, including lignite. In the first year after the Second World War was 15,000,000 tons, comprising in the Brit., U.S., and Fr. zones of occupation 4,000,000 tons of steam coal and 3,000,000 tons of lignite (34 per cent and 64 per cent of pre-war output respectively), and in the Russian zone 168,000 tons of steam coal and 7,900,000 tons of lignite (58 per cent and 71 per cent of pre-war output respectively).

Manufactures.—The industrial development of G. proceeded at an almost unprecedented rate throughout the last century. The following catalogue will give some idea of the local distribution of the various industries. Iron goods and machinery are manufactured in the former provs. of Prussia, Saxony, and Bavaria; steel goods in the Ruhr and Rhineland. The electrical industry is centred principally in Berlin. Woollens and worsteds are produced in Saxony and the Rhine prov.; cotton goods in Prussia, Saxony, Baden, and Bavaria; silk at Elberfeld (Rhenish Prussia) and in Baden; and linen goods in Westphalia, Silesia, and Saxony. The Rhine and Moselle dists. are important centres for light wines; Bavaria is famous for its toys, Nuremberg for its watches and pencils, and Meissen, Dresden, and Berlin for their porcelain. Finally there are manufacturing up and down the country of chemicals, beer, sugar, tobacco, leather (in Hesse-Darmstadt), and paper. The whole of Ger. industry suffered severely as a result of the Second World War. In the textile industry alone it was estimated in the Brit., U.S., and Fr. occupation zones that 30 per cent of the looms were destroyed in the cotton, rayon, and silk industries and 70 per cent in the woollen. Under the conditions imposed by the Allies Ger. industry was limited to civilian consumer goods, and the output of steel to under 10,000,000 tons.

Commerce.—The growth in the commercial prosperity of G. during the nineteenth century was extraordinarily rapid, but the First World War, with the subsequent treaty of Versailles, did much to check the expansion. The previous development was, in great measure, due to the Zollverein, or Ger. Customs Union, which since 1879 incorporated G. among protectionist countries. In 1938 imports were valued at 5,449,000,000 marks and exports at 5,236,000,000 marks. Grain and flour, textile goods, raw minerals, chemicals, hides, and leather comprise the chief goods imported, whilst sugar, all forms of textile manufactured articles, leather goods, iron and iron wares, including machinery, coal, paper, and glass are the staple exports. In both the above lists the various groups of merchandise are tabulated, broadly speaking, in order of value, but the war economy of the years preceding the outbreak of war in 1939 entirely upset this order. In normal times a large proportion of Ger. merchandise passed out through Rotterdam and Antwerp, the overland commerce being at least as extensive as its maritime. Trade with the United Kingdom in 1938 was valued at £30,150,000 (imports from

G. into United Kingdom) and £20,551,000 (exports of Brit. produce into G.). In the year before the Second World War Ger. trade was at its largest with the following countries (figures in brackets for 1938 in millions of marks): United Kingdom (imports 309, exports 374); Netherlands (imports 208, exports 460); Italy (imports 284, exports 349); U.S.A. (imports 454, exports 157); Sweden (imports 267, exports 275); Argentina (imports 240, exports 153); France (imports 150, exports 229); Brazil (imports 220, exports 163).

Shipping.—Before the Second World War the Ger. mercantile marine stood third among the merchant navies of the world in respect of tonnage and fourth in respect of the number of ships. In 1939 the Ger. merchant navy numbered some 2300 ships of over 4,000,000 gross tonnage. Of this number only about 400 were sailing vessels. Over 15,000 foreign ships with cargo entered and cleared Ger. ports annually, with tonnage of over 15,000,000. Ger. merchant shipping in May 1918 showed a total of 227,785 registered tons.

Colonies.—G. pursued a vigorous colonial policy from the time of Bismarck, but by the treaty of Versailles (1919) the Ger. colonial empire was entirely destroyed. During the First World War all Ger. colonies fell into the hands of England, France, and Japan, while secret treaties existed to perpetrate the occupation in the event of an allied victory. By the treaty of Versailles the former Ger. colonies were partitioned as follows: The Kamerun was divided into the New Cameroons (107,000 sq. m.; native pop., 2,800,000), which was incorporated into Fr. Equatorial Africa, and the Old Cameroons, which were placed, in part, under a Fr. mandate (166,189 sq. m.; pop. 3,000,000) and in part under a Brit. mandate (31,000 sq. m.; pop. 555,000). As 'B' mandates of a similar class, 22,000 sq. m. of Togoland (pop. 717,000) went to France and the remaining 12,600 sq. m. (pop. 185,000) to Great Britain. Former Ger. E. Africa was renamed Tanganyika Ter. and became a Brit. possession, Ger. S.W. Africa was awarded to the Brit. Union of S. Africa; New Guinea (Ger. Kaiser Wilhelm Land, Bismarck Archipelago, and Ger. Solomon Is.) to Australia; (Ger. Samoa to New Zealand; Nauru Is. to Great Britain; and the Caroline, Marshall, Mariana, and Pelew Is. to Japan, which country received also Kiau-Chau.

Allied Zones of Occupation.—Following G.'s unconditional surrender (June 5, 1945), the powers of government were taken over by the govs. of Great Britain, the U.S.A., Soviet Russia, and France, and were exercised through the Allied Control Council. It was decided by the Potsdam Agreement (q.v.) that for the time being no central Ger. Gov. would be estab. The administration of G. thus became the responsibility of the Control Council, but, subject to the council's overriding authority, state and prov. govs. have been set up within the four

zones of occupation. Local self-government is also estab.

In 1946 the state of Prussia, as it had existed in the Third Reich, ceased to exist and the whole country was redivided into states or *Länder* for administrative purposes. Thus the Brit. zone consists of four *Länder*: Lower Saxony with Hanover as cap., and comprising the former Prussian prov. of Hanover and the former *Länder* of Brunswick, Oldenburg, and Schaumburg-Lippe; N. Rhine-Westphalia with Düsseldorf as cap., and comprising the former Prussian prov. of Westphalia, the former Land Lippe, and the governmental dists. (Regierungsbezirke) of Köln (Cologne), Aachen, and Düsseldorf; Hamburg, comprising the former Land Hamburg; and Schleswig-Holstein with Kiel as cap. and comprising the former Prussian prov. of Schleswig-Holstein. Powers previously exercised by the Brit. regional commissioner in each Land have been transferred to the Land govs., which have executive and legislative powers and are empowered to draw up the prov. constitutions. Hamburg and Bremen in the U.S. zone have regained Hanseatic status which they lost under the Third Reich.

The U.S. zone also contains four *Länder*: Bavaria with Munich as cap., and, except for the Palatinate on the l. b. of the Rhine and the tn. and rural dist. of Lindau, corresponding to the former Land Bavaria; Württemberg-Baden with Stuttgart as cap., and corresponding to the U.S. occupation zone of the former *Länder* of Württemberg and Baden; Hessen with Wiesbaden as cap., and comprising the ter. of the former Land Hessen on the r. b. of the Rhine and the former Prussian prov. of Hessen-Nassau, with the exception of the four rural dists. St. Goarshausen, Unterhainkreis, Unterwesterwald, and Oberwesterwald; and Bremen, corresponding with the former Land Bremen. Each of these states has a Land gov. under a Ger. Prime Minister, whose Cabinet has to be approved by the Amer. authorities. The Land govs. have executive and legislative powers, and a uniform policy throughout the zone is ensured by regular meetings of the three Prime Ministers, forming a *Länderrat*.

The Fr. zone is governed by a commissioner-general, who is responsible for co-ordinating all administrative services in the zone. It consists of the following four *Länder*: Rhineland-Palatinate with Koblenz as cap., and including the Palatinate, the former Land Hessen on the l. b. of the Rhine, the Regierungsbezirke Koblenz and Trier of the former Prussian Rhine prov. and the four rural dists. of former Hessen-Nassau which were not included in the Land Hessen in the U.S. zone; Baden with Freiburg as cap., and including the Fr.-occupied part of the former Land Baden; Württemberg-Hohenzollern with Tübingen as cap. It includes the former Prussian dist. of Hohenzollern and the Fr.-occupied part of the former Land Württemberg; and the Saar dist. with Saarbrücken as cap., comprising the Saar ter. as defined by the

treaty of Versailles, enlarged (Oct. 1946) by a number of adjacent rural dists. of the former Prussian Rhine prov. A prov. gov. was set up with the task of framing a constitution. Zonal administration as a whole continues to be the responsibility of the Fr. military gov.

The Russian zone is administered by a central body, consisting of various depts. with Ger. nationals at the head of each under the chairmanship of the Russian commander-in-chief. The Soviet zone includes the following *Länder*: Brandenburg, with Potsdam as cap., consisting of the former prov. of Brandenburg on the l. b. of the Oder and the W. Neisse; Saxony, with Dresden as cap., includes the former Land Saxony and the part of the former prov. of Silesia on the l. b. of the W. Neisse; Saxony-Anhalt, with Halle as cap., comprising the former Land Anhalt and the former Prussian prov. of Saxony with the exception of the Regierungsbezirke of Erfurt, Thuringia, with Weimar as cap., including the above-mentioned dist. of Erfurt and the former Land Thuringia; Mecklenburg with Schwerin as cap., comprising the former Land Mecklenburg and the part of the former prov. of Pomerania on the l. b. of the R. Oder. Prov. Ger. Govs. operate in the provs. of Brandenburg and Saxony-Anhalt, while Saxony, Mecklenburg, and Thuringia are governed by separate Ger. Govs., each with a Prime Minister as in the U.S. zone, which possess executive, legislative, and judicial authority, subject to the requirements of the Control Council and the Soviet military gov.

In 1946 and 1947 local elections and elections on advisory or constituent assemblies or state parliaments took place in all four zones.

Population. The pop. of the Ger. Reich (census 1939) was 69,622,483, an increase of 3,451,000 or 5.2 per cent since the 1933 census. In 1939 the pop. was divided among the various states as follows: Prussia 11,762,040; Bavaria 8,280,090; Saxony 5,206,861; Württemberg 2,907,166; Baden 2,518,103; Thuringia 1,760,397; Hamburg 1,682,220; Hesse 1,469,909; Mecklenburg 910,826; Saarland 863,536; Brunswick 599,208; Oldenburg 582,400; Anhalt 430,213; Bremen 400,086; Lippe 188,598; Schaumburg-Lippe 51,162. The pop. of Austria (Ostmark) in 1939 was 7,009,014 and of the Sudetenland 2,945,261, so that the pop. of Greater Germany in that year (excluding the remainder of Czechoslovakia) was 79,576,758. After the Second World War the area of G. was approximately one-fifth smaller than in 1933 and according to a census taken in 1946 the pop. was 65,910,999. The pop. of the various zones of occupation was as follows: Brit. zone 22,794,655; Russian zone 17,313,581; Amer. zone 16,682,573; Fr. zone 5,939,807; Berlin 3,180,383.

The pop. figures include some three to four million Gers. repatriated from Poland and Czechoslovakia. These increases helped to offset the heavy losses during the war estimated at 7,500,000, and it is estimated that by the time all Ger.

prisoners of war have been repatriated, the pop. will have been increased to over 70,000,000. In April 1949 small frontier areas in the W. were ceded to Holland, Belgium, and Luxembourg. Holland received the Zelfkant near Maastricht, with a pop. of 10,000; Belgium, 20 sq. m., with a pop. of 500 (near Aachen and Rotgen); and Luxembourg, the forest of Kammerveld.

Chief Towns.—In 1939 two tns. had a pop. of over 1,000,000, twenty-one others over 250,000, and thirty-two over 100,000. The pop. of the largest tns. (census 1939) was Berlin 4,332,242; Hamburg 1,682,220; Munich 828,325; Cologne 768,426; Leipzig 701,606; Essen 659,871; Dresden 625,174; Frankfurt-on-Main 546,649; Düsseldorf 539,905; Dortmund 537,000; Hanover 472,627; Stuttgart 459,538; Duisburg-Hamborn 431,256; Nuremberg 430,851; Wuppertal 398,099; Bremen 342,113; Chemnitz 334,563; Magdeburg 334,338; Gelsenkirchen 313,003; Bochum 303,288; Mannheim 283,801; Kiel 272,311; Stettin 268,915; Halle-on-Saale 220,364; Cassel 217,083; Brunswick 201,306; Oberhausen 191,305; Karlsruhe 189,960; Augsburg 185,704; Wiesbaden 172,039; Krefeld-Uerdingen 169,485; Erfurt 166,661; Aachen 165,710; Mainz 158,971; Lübeck 163,630; Hagen 151,870; Münster 143,748; Ludwigshafen 143,417; Solingen 138,587; Mülheim 136,805; Potsdam 136,165; Saarbrücken 135,080; Bielefeld 128,714; München-Gladbach 127,115; Hindenburg 126,402; Rostock 122,399; Dessau 120,732; Harburg-Wilhelmsburg 118,193; Gleiwitz 117,666; Darmstadt 115,526; Freiburg 111,560; Plauen 110,342; Würzburg 108,617; Remscheid 103,437; and Bonn 101,391.

The pop. according to the pop. census of Oct. 29, 1946, was in Berlin 3,187,500, Hamburg 1,427,000.

Internal Communications.—In 1924 the Ger. railways, which since 1920 had been operated through the central gov., were put under the management of a private company—the Ger. Railways Company—but they remained state property. In 1937 the operation of the railways was again taken over by the State. The total length of line at that time was 42,300 m. Road construction was considerably advanced under the Third Reich. Over 1300 m. of motor roads were opened between 1933 and 1939, making a total of over 132,000 m. of road, including 25,600 m. of motor road and 52,200 m. of first-class country road, approximately 2000 m. of the new roads being the well-known *Autobahnen*. Additional to these communications, G. possesses an elaborate network of canals. By far the most important of these is the Kaiser-Wilhelm Canal (61 m. long), which unites the North Sea and the Baltic. The Midland canal, opened in 1938 (90 m. long), joins Berlin with the Oder, Elbe, Weser, and Rhine. Other important canals are the Dortmund-Ems (150 m. long) and the Elbe-Trave (43 m. long) in a system of 5000 m. of artificial waterway, including 1500 m. of ship canal, linked with some 6000 m. of navigable rivs. In the field of civil

aviation, G. reached a high standard of development. In the years preceding the Second World War Ger. air lines were carrying over 200,000 passengers annually, with some 400 tons of luggage, 1000 tons of goods traffic, and 6000 tons of mail. In 1874 the postal and the telegraphic depts. were amalgamated and since that date have made remarkable strides forward. They were controlled by the State, and in 1938 the post, telegraph, telephone, and radio offices numbered 64,766, employing some 398,000 persons. Telephone and telegraph lines extended over a distance of 236,000 m. After the conclusion of the Second World War, postal communications were in April 1946 resumed between G. and all other countries, excluding Spain and Japan.

Constitution and Administration.—The Republican constitution adopted at Weimar in 1919 formed G. into a federation of individualist states. The Bundesrat or Federal Council under the Ger. Empire was replaced by the Reichsrat, which was equally federal, each state being represented by members of its own gov. A state had at least one representative, while the larger states sent one delegate for every 700,000 inhab. The Reichsrat was not superior to the Reichstag or National Assembly to the same degree as was the former Bundesrat. Election to the Reichstag was by universal suffrage and proportional representation. The Reichsrat became a consultative rather than a legislative chamber. The gov. had to ask its consent before introducing a Bill, and if this was refused the gov. explained to the Reichstag the difference of opinion. If the two Chambers could not agree the president might call a referendum. The president of the Reich was elected by an absolute majority in the National Assembly for a period of seven years and could be re-elected. He had command of the army, but his powers were limited in that all orders required the counter signature of the federal chancellor. The president might summon any one he chose to form a ministry, but the chancellor depended on the support of the Reichstag. After the revolution some of the old political parties changed their names. The Conservatives (Junker party) became the National People's party (Nationalists), and their policy was to extend the powers of the president and to limit those of the Reichstag. The National Liberals became the People's party, representing industry and commerce, and their policy was one of capitalistic enterprise. The Centre party retained its position, relying on the support of the Catholics. The individualist radicals reorganized themselves as the Democratic party and were bourgeois and republican in sympathy. The remaining parties were the Majority Socialists and the Independent Socialists.

With the rise to power of the Nazi party the Weimar Constitution was virtually, although not *de jure*, set aside, and the Reichstag elected in 1933 vested absolute power in Hitler and his Cabinet. The Enabling Act of that year gave Hitler

power to legislate by ordinance. Under this act he set up a personal dictatorship with himself as chancellor, in which all the activities of the country—political, economic, industrial, commercial, and cultural—were *gleichgeschaltet* (totalitarianized). Freedom of speech and even of thought and of the press was abolished, equality before the law was limited by racial laws, and personal freedom from arrest was curtailed. No political parties were tolerated save the Nationalist Socialist (Nazi) party. There continued to be only one legislative assembly, the Reichstag, elected according to the provisions of the Weimar Constitution by universal, equal direct and secret votes.

code of civil procedure was effected to bring it into harmony with the civil code, and these codes came into force in 1900. A further revision of the code of civil procedure took place in 1924. The code of criminal law was revised in 1876. The arrangement of the civil code was based on Roman law, which in a modernized form was the 'common law' of G before the introduction of the civil code. The code is divided into five books: the first is general, the second third, fourth, and fifth books treat of the 'law of obligations,' the 'law of things,' 'family law,' and the 'law of inheritance.' The commercial code contains three parts, the first deals with mercantile trade generally, the

THE MANNHEIM HIGHLIGHTS AT LOBACH

of male and female voters. It came to be composed exclusively of the supporters of Hitler and was relegated to an ordinary function. In matters of supreme importance to the nation a referendum was provided for. The independence of the federal states was curtailed under the Third Reich. By the Unification Act of April 7, 1933, they were brought under the rule of *Reichsstatthalter* or governors directly responsible to Hitler. The following year the sovereign rights formerly possessed by the states passed into the hands of the Reich Gov. the *Reichsstatthalter* passed under the jurisdiction of the minister of the interior and the Reich Cabinet arrogated to itself the promulgation of new constitutional laws for the whole of G. The federal states thus became merely administrative units.

Law and Justice—German civil law a model of codification was first drawn up in 1857, and after revision became law in 1896. At the time an entire transformation of the commercial code and the

second with mercantile partnerships, and the third with mercantile transactions. There is no actual guide to the interpretation of German law but precedent, although theoretically not binding, carries great authority in practice.

There were four kinds of courts: the ordinary, the special, the administrative, and the *Staatsgerichtshof* which last was a court for settling constitutional questions. With the exception of this state court and the supreme court (*Reichsgericht*) the establishment of courts was the business of the individual states, and the new constitution of 1918 did not interfere with this. The *Reichsgericht*, situated at Leipzig, was composed of five criminal and seven civil senates consisting of five judges each. The court exercised advisory jurisdiction over all inferior courts. Directly under this supreme court were twenty-nine courts which had original jurisdiction in serious offences, and which contained criminal and civil senates consisting of three to five judges. These were the

Oberlandesgerichte, and they exercised appellate jurisdiction over the *Landsgerichte* in civil cases and a revisory jurisdiction in criminal cases. There were 173 *Landgerichte* and they had a fairly extensive jurisdiction in civil and criminal cases and in divorce proceedings. There were five judges in the criminal chamber of a *Landgericht*, four votes being required to make a conviction valid. Three judges from such a court presided at intervals over jury courts (*Schwurgerichte*), and juries did not therefore form a permanent part of the system. Not the least important work of the *Landgerichte* was to revise the decisions of the *Amtsgerichte* or people's courts, of which there were (1939) nearly 2000. They were the lowest courts of the first instance, being controlled by single judges, who were competent to hear only petty civil and criminal cases. Among the special courts were the courts of arbitration and labour courts. These latter, instituted in 1927, had a specified jurisdiction, especially over cases between employers and employees. Under the Third Reich the *Reichsgerichte* and the *Amtsgerichte* became organs of the central gov. A law promulgated in 1935 estab. the novel principle in criminal law that the courts punish offences under the criminal code if they were considered deserving of punishment, 'according to the underlying idea of a penal code or according to healthy public sentiment.' By a later decree (Aug. 24, 1942) statutory justice was abolished, and Hitler became the supreme arbiter of law, administering justice arbitrarily through the minister of justice and the president of the Secret People's Court. After the fall of the Hitler regime the Allied Control Council announced on Oct. 22, 1945, the estab. of a reformed judicial system whereby all persons are equal before the law and cannot be deprived of their legal rights whatever their race, nationality, or creed. No person may be deprived of life, liberty, or property without the process of law.

Defence.—By the law of Dec. 30, 1920, the Ger. Army was constituted at the strength allowed by the terms of the treaty of Versailles, the limit being 100,000 men, of which no more than 4000 were to be officers, the men serving for twelve and the officers for twenty-five years. Only a certain number of discharges were allowed each year to avoid the formation of a reserve force of men who had undergone military training. The former Ger. general staff was proscribed, but in spite of this Gen. von Seeckt was given the rank of commander-in-chief of the Reichswehr. The federal armies were abolished, but a decentralised body of police (*Schutzpolizei*) was formed, trained on military lines. By the Boulogne note of June 22, 1920, the number of police permitted to G. was fixed at 150,000, of which 85,000 were allotted to Prussia. By the same terms the police were allowed one rifle to every three men, a machine pistol to every twenty men, and one armoured car to every thousand men. In addition to the

police there was an armed citizen guard called the *Einwohnerwehr*. This force was disbanded owing to allied pressure after the Kapp *putsch* in Aug. 1920, but the Bavarian *Einwohnerwehr* remained. Conscription for the Ger. Army was abolished. Under the Nazi regime, however, the obligations of the treaty of Versailles in respect of armaments were repudiated (March 16, 1935), and conscription was reintroduced. The army was accordingly expanded, and by 1938 it was made known publicly that the army comprised 39 infantry divs., 4 light divs., 5 armoured divs., 3 mt. divs., and a cavalry brigade. An infantry div. was reckoned to number approximately 15,000 men, and the total armed forces were estimated at nearly 900,000 men, excluding reserves. On mobilisation on the outbreak of the Second World War a conservative estimate was double this number of men. By 1914 it was estimated that there were over 300 divs., including 50 armoured divs., and in Oct. of that year the *Volkssturm* was also brought into existence on the lines of the Brit. Home Guard. Following G.'s unconditional surrender on June 5, 1945, the work of demobilising and disarming the Ger. army was put in hand by the Allied Control Commission, and was largely completed by the end of 1946.

The treaty of Versailles restricted the Ger. Navy to 6 battleships, 6 cruisers, 12 destroyers, and 12 torpedo boats, while submarines were prohibited. These restrictions were disregarded and were virtually replaced by the Anglo-Ger. Naval Agreement (1935), which allowed G. a maximum tonnage equal to 35 per cent of the Brit. tonnage for each class of vessel with the exception of submarines in which parity was permissible with, however, a corresponding reduction in other classes. G. entered the Second World War with three so-called 'pocket battleships,' the *Deutschland* (later renamed the *Lutnow*), *Admiral Graf Spee*, and *Admiral Scheer*, each of 10,000 tons, heavily armed and with a cruising range of 10,000 m. In addition the *Gneisenau* and the *Scharnhorst*, battleships of 26,000 tons, were completed in 1938. Three battleships of 35,000 tons were also under construction. There were 6 light cruisers and 2 of 10,000 tons—the *Admiral Hipper* and the *Prinz Eugen*. Destroyers and torpedo boats numbered about 40. At least 50 submarines were in commission, built since 1935 when building was resumed. At the end of the war the surviving ships of the Ger. fleet were distributed between Great Britain, France, U.S.A., and U.S.S.R. The *Prinz Eugen* and the *Nürnberg*, which were the only two surviving capital ships, were allotted to the U.S.A. and the U.S.S.R. respectively.

G. under the Nazi regime built a formidable air force in defiance of the provisions of the treaty of Versailles. Its size was not revealed, but it was estimated at the outbreak of the Second World War that there were over 3000 first-line aircraft. The *Luftwaffe* consisted of 420 squadrons, each with 12 aircraft, including

reserves. At the conclusion of the war the air force was abolished.

Finance.—The greatest factors in Ger. public finance since the First World War were the enlarged scope of governmental activities and the operations on the terms of the treaty of Versailles. Under the new constitution the tax system and administrative charges became centralised. The right of direct taxation belonged to the federal gov., and as compensation the various states received a share in the revenues. The payments to the states represented a proportion of the federal taxes, especially the income and turnover taxes. Prior to the Nazi regime it was customary for the Ger. Gov. to publish the text of the ann. budget law, together with an explanatory memorandum. But after 1933 no budget was pub. It is therefore impossible to ascertain the expenditure of the gov., but returns of certain revenues are issued officially. Between 1933 and 1938 the revenue from taxation and customs rose from 6850 million marks to nearly 14,000 million marks. Of the total of 14,000 million marks (for 1937-38) taxes on property and business accounted for 9820 millions, excise 2550 millions, and customs 1630 millions. At the end of 1938 the total debt of the Ger. Reich amounted to 23,821 million Rm. Of this total long and medium dated internal loans accounted for 11,305 million Rm. and short dated internal loans for 4,753 millions, pre-First World War debt for 2,807 millions, and external loans for 1285 millions. To these figures must be added the *Sonderwechsel* (special bills) for financing the special needs of the State, which do not necessarily carry any claim for repayment. At the close of 1937 12,600 milliards of marks-worth of these bills were in circulation. In addition there were 60.7 million Rm. of irredeemable loans and 117 million Rm. of tax certificates, which after a certain lapse of time were accepted in payment of taxes. The national income, which in 1913 was officially given as 45,693 million Rm. and about the same in 1933 (it had fallen from 76,000 millions in 1929), was shown as nearly 71,000 million Rm. in 1937.

Education.—G. stood high in the field of state education, and was conspicuous for admirable systematisation and for the variety and thoroughness of the technical training provided. It was estab. by law that every child from the age of six to fourteen must attend some recognised school. By the law of April 28, 1920, Ger. children were bound to receive a four years' course of instruction in the 'foundation school' or *Grundschule*. The next highest school for elementary education was the 'people's school' (*Folk-school*). Besides these, there was the 'middle school' (*Mittlere Schule*), where instruction was given *inter alia* in Eng. and Fr. The Republican constitution abolished all private preparatory schools, making the public elementary school common to all. To prepare for the univs. and for admission to certain professions, there were secondary schools with a course of study extending over eight years

(*Gymnasium*). Two other kinds of schools were estab. experimentally—the high school (*Deutsche Oberschule*) and the *Aufbanschule*, the former specialising in Ger. subjects and modern languages, the latter providing an intensive and curtailed high school education for the more promising pupils of the elementary schools. The univs were the centres of intellectual life. All of these have the four faculties of theology, law, medicine, and philosophy, and many are some of the oldest foundations of their kind in Europe. Outside the country the best known are probably Berlin, Munich, Leipzig, and Bonn, which also have the largest numbers of undergraduates, and Göttingen, Heidelberg, Rostock, Greifswald, Freiburg, Tübingen, and Jena. Four teach theology according to the Rom. Catholic doctrine, whilst in four others the theological faculty is open to both Protestants and Rom. Catholics; the remaining univs. are Protestant. The Catholic faculty in Munich was closed in 1939. Three new univs. have been founded at Hamburg, Frankfurt, and Cologne. In addition to the univs. there are the *Technische Hochschulen*, which were state institutions of univ. rank, where such special subjects as architecture, engineering, chem., mining, forestry, shipbuilding, etc., could be studied, although arrangements were also made for a more liberal education. Below these there were the *Handels Hochschulen*, which were set up in most of the big cities to facilitate adult education. The high standard of Ger. education throughout the grades was maintained under the republic, while the compulsory religious instruction, common to all schools during the empire, was replaced by optional classes in religion at the discretion of parents. On his accession to power Hitler promised absolute equality in education to all Gers. This promise was not kept. As a result Ger. secondary education steadily declined under the Third Reich. Less than 20 per cent of the Ger. people had completely free education. In 1920 823,000 children were receiving secondary education, in 1938 only 661,000. One of the first tasks of the Allied Control Council after the occupation of G. was to 'denazify' the schools. In the Third Reich the whole of education had been geared to the Nazi doctrine, and text-books and teaching falsified to that end wherever necessary. Teaching staff had therefore to be renewed and proper text-books provided. By Oct. 1, 1945, schools were reopened in all four zones of occupation. In the Brit. zone on that date full-time elementary education was provided for a million children, and part-time facilities for a further million. In the U.S. zone 1,500,000 children were put to school, representing 90 per cent of the total. Similar steps were taken to restart education in the Fr. and Russian zones. Univ. life which suffered severely under Hitler and still more severely as a result of the war began again. In the autumn of 1945 the univs of Bonn, Göttingen, Hamburg, and Kiel opened in the Brit.

zone, and Heidelberg and Marburg in the Amer. In the Fr. zone Tübingen and Freiburg Univs. reopened, while the Univ. of Mainz, a fifteenth-century foundation, dissolved in 1815, was re-established. (May 22, 1946). In the Soviet zone teaching began again at Greifswald and Rostock in Nov. 1945, while on Jan. 29, 1946, Berlin Univ. reopened under Russian auspices with 3000 students. In the spring of 1948 Gen. Robertson, commander-in-chief of the Brit. zone of occupation, appointed a commission to consider the Ger. univs. in that zone and, in particular, 'to report to the military governor on the extent to which they are making their full contribution to the democratic development of the German nation and to recommend any measures which may appear necessary to increase this contribution.' Ger. univs. are justly famous, but their fame is due to qualities that are not ordinarily ascribed to G., to their freedom and to the individuality in research that they encourage. Their essential shape was given them by von Humboldt in the early years of last century. He created what the Gers. call the idea of a univ. as the home of free research, and through all the hundred years or more since the von Humboldt pattern began to show itself in Ger. univs. they have remained is. of freedom in an authoritarian country. The commission's report was to be concerned directly only with the univs. and technical 'high schools'; it was not to be concerned with the present plight of Ger. univs., their ruined buildings, destroyed libraries, lost endowments, and the poverty of their students, but only with the shape which the commission hoped they might assume in the future. The commission was a Ger. body, with two attached non-Gers. As befitting a Ger. commission, their report begins by stating in general terms the function of a univ.: 'to serve mankind by the teaching of that truth which comes from scientific research into reality.' The main proposals are: (i) univ. education is to be made possible for all classes of the pop. (the proportion of working-class students in Ger. univs. is much lower than it is in England.); (ii) a new institution called a univ. council for each univ. is to help to make closer the relation between the univ. and all sections of the pop.; (iii) there is to be a wider conception of the function of the teaching staff, in which the teacher is to take his place alongside of the research worker; and (iv) the Ger. univs. are to aim at the education, in the full sense of the word, of their students, teaching them the unity of culture through what the Gers. call a *Studium generale*, a general education which is to be given to all students alongside of their specialist training. The proposal for a univ. council is a characteristically Ger. adaptation of the constitution of Scottish and modern Eng. univs. The proposals for a *Studium generale* are of interest to Eng. educationists, for they imply the existence of a departmentalism and over-specialisation which are just as rife in England and America as they are in Germany. Some

plans to combat these evils are already being tried in G., in Heidelberg and in Göttingen, for example, and also in the great Ger. technical univs.

Religion.—The disestablishment of the Church under the new republic helped further the decline of church influence during the First World War, but the Catholic religion, being outside state control, was less affected, and retained its influence, especially in Bavaria and S. G., although a Catholic minority existed in Prussia. Ger. Protestantism was the result of the fusion between Lutherans and members of the Reformed Church, and after the disestablishment the Protestants banded themselves together in the 'Ger. Evangelical Church League.' In 1931 an attempt was made to unite the Evangelical churches into the Ger. Evangelical Church under the direction of a Reich bishop, 'called' by the National Synod at the nomination of the heads of the regional churches. The attempt completely failed, and the state authority found itself in conflict with the Evangelical regional churches. In Sept. 1935 a law was promulgated for the security of the Ger. Evangelical Church, giving absolute powers in eccles. matters to the minister for eccles. affairs. Throughout 1937 and 1938 the state authorities were in conflict with both the Protestant and Catholic Church organisations, the state striving to establish a Ger. National Church closely associated with the neo-paganism of the doctrines of Alfred Rosenberg. There are five Rom. Catholic archbishops, seventeen suffragan bishops, and one bishopric immediately subject to Rome. The 'Old Catholics' have a bishop at Bonn. In 1939 further state control of the Ger. Evangelical Church was decreed by the minister for eccles. affairs, particularly by the order that pastors might be removed from office 'for official reasons' and by the application of the Nazi conception of leadership in church administration. (In the same year both Rom. Catholic and Protestant Churches in Austria were disestablished by the Nazi Gov. of G.) After the war the Nazi-influenced constitution of the Ger. Evangelical Church was abrogated and a council of the Evangelical Church in G. was elected. The Evangelical Church was admitted to the World Council of Churches in Feb. 1946. Pre-war statistics of religious confessions gave: Protestants, 40,865,000; Rom. Catholics, 21,172,000; Jews, 199,700; and others, 2,646,000. To-day in Bavaria, Lower Saxony, Württemberg-Baden, Schleswig-Holstein, and Hamburg there are approximately 12,367,000 Protestants and 8,910,000 Rom. Catholics.

History.—As far back as 213 B.C. there is mention of certain Germanic tribes, the Cimbric and Teutones, who had to be driven back across the Rom. border. In the course of his Gallic conquests, Caesar came up against the valiant Ger. chieftain, Ariovistus, and banished him and his followers across the Gallic frontiers and beyond the Rhine. In 65 B.C. Caesar beat back the Suevi and Marcomanni from their settlements in modern Belgium.

An attempt in the reign of Augustus to Romanise the Germanic peoples led to a patriotic rising under Arminius, the champion of the Cherusi. From the third century onward the N. confines of the empire were continually threatened by the Saxons, Frisians, Thuringians, Goths, Alemanni, and Franks, tribes which now entered great confederacies against their common enemy, Rome, and which were obliged to trespass on Rom. ter. by the incursions into their own ter. of the savage hordes of N. folk, referred to usually as Huns and Magyars. Henceforward till the treaty of Verdun (843) G. was occupied by chieftains perpetually at war with one another, except when invasions from without forced them into transitory alliance. Charles the Great, the Frankish king, was crowned emperor of Rome by the pope in 800, and after his death his empire was partitioned. His grandson, Lewis, received the lands between the Rhine and Elbe, known as the 'Tentonic Kingdom of Francia,' or as the 'Kingdom of the E. Franks.' This infant G. consisted not of a single people, but of a number of fairly homogeneous tribes, the Saxons, Swabians, Bavarians, Thuringians, and Franks.

Descendants of the Carolingian Lewis ruled over G. till 911, when the line became extinct, and a mass meeting of the Diet, or National Assembly, arrogated to itself the privilege of choosing a king, so that from this time forward G. became virtually, at least, an elective in place of an hereditary monarchy. Their first choice was Conrad of Franconia. His successor, Henry of Saxony, popularly called Henry the Fowler, founded the Saxon dynasty which lasted till 1024, and was remarkable for the energy of its rulers. In 902 his son, Otto I. was crowned emperor of the Holy Rom. Empire at Rome by the pope. From this dates the tradition to which the Ger. rulers jealously cling, that he who had been crowned Ger. emperor at Aachen was entitled also to be crowned king of Italy at Milan and emperor at Rome.

From 1024 to 1125 G. was governed by Franconian emperors. The most noteworthy is Henry IV. (1056-1106), whose profound humiliation before the haughty Hildebrand at Canossa (1075) still remains one of the most dramatic episodes in hist. Ever since Otto I. had revived the title of Rom. emperor, there had been a rivalry, which daily assumed larger proportions, between emperor and pope. But in Henry IV.'s day the papacy was supported by a number of Christian sovereigns, among whom the Ger. emperor was not necessarily pre-eminent. It is clear at least that Gregory VII. was determined once for all to assert his freedom from imperial domination. Thus disregarding the very foundations of the feudal system, which was estab. in G. as elsewhere, he refused to allow any officers of the church to do homage to a temporal lord, and insisted that the papacy alone should exercise the privilege of investiture. Henry exerted all his powers in opposition to Gregory, but the latter, by formally deposing and excommunicating him, made his life so intolerable that he preferred to

stand for three days clothed in sackcloth and with bare feet amid the perishing snows of Canossa rather than go home without the papal pardon. The pope finally received his submission, and the question of principle was thus settled, but Gregory was afterwards forced to seek exile when Henry captured Rome (1084). Though the struggle effectually ruined the Hohenstaufen dynasty which reigned in G. from 1138 to 1254, the status and position of the pope at the close of that period suggested failure rather than victory. The most celebrated of the Hohenstaufen emperors was undoubtedly Frederick

THE PALZ OR PFALZGRAFENSTEIN NEAR LAUB, ON THE RHINE

A hexagonal building founded by Emperor* was the Bivann (1314-47)

Barbarossa, or 'Red-beard' (1152-90). He entertained ambitious schemes of it. conquests, but the Lombard League defeated him at Legnano (1176). His successors continued his battles, and so the Guelph and Ghibelline factions, that is, the adherents of the pope on the one hand and of the emperor on the other, spread insidiously all over the empire, so that on the fall of the Hohenstaufens (1254) even the Ger. kingdom had become like the Holy Rom. Empire, a phantom. It was now split up into over 270 virtually independent states.

There now followed an interregnum (till 1273), which is important for the formation of the Hanseatic and Rhenish Leagues. The towns were growing strong and resorted to union as the one defence against the anarchy of the times, and especially against the arbitrary oppression of the barons. In 1273 began the vicious practice of selling the imperial title to the

highest bidder. Theoretically the kingship was still elective, although four secular and three spiritual princes now claimed exclusive rights to choose the emperor. They gave the title to the count of Hapsburg, who accordingly reigned as Rudolph I. Hapsburg was the name of a paltry Swiss principality, yet the house of Hapsburg was destined to furnish a long and illustrious succession of Ger. emperors. Louis the Bavarian, emperor from 1311 to 1347, was involved in struggles both with his rival Frederick of Austria and with the pope John, who refused to recognise his title. Louis gained the support of the Ghibelline faction, and of the electors, who in 1338 stood out for their elective rights, and in the Frankfurt diet denied the necessity of papal approval of the Ger. king's election. For a time allied with Edward III. of England against the pro-papal Philip of France, Louis aroused hostility by an acquisitive policy, and was saved only by his sudden death. In 1438 Albert II. of Austria was chosen emperor by the seven electors, and from that date till the dissolution of the empire by Napoleon the imperial crown may be said to have been hereditary in the Hapsburg line.

Maximilian I. (1493-1519) was one of the last of the great medieval rulers as he was also in another sense the first representative of a new order; for not only may he be said to have assured the long succession of his own family, the proud Hapsburgs of Austria, but also to have made an earnest effort towards unification and peace. Anxious to check the aggressions of Charles VIII. of France, he summoned a Diet at Worms with the result that a perpetual national peace was declared, and an imperial court was established, so that that peace was maintained. Further, the empire was divided into ten circles and districts, the object of which was to enforce the execution of the imperial chamber's recommendations.

Behind the death of Maximilian (1519) lie the Dark Ages and in front loom Luther and the Reformation. After Maximilian the steady growth of the free imperial cities shows that the people were building up an active municipal life, whilst the great Gothic cathedrals, like those of Strasburg and Cologne (begun in 1248), bear testimony to the faith and religious zeal of the masses. But although religion was thus a vital part of the lives of Ger. citizens, the great schism and the abuses produced by the sale of indulgences gradually aroused in men's minds at first a distrust and then an open contempt for the pope and for the higher clergy. The smouldering resentment was set ablaze by Martin Luther (1483-1546) in reaction against Tetzel's abuse of the indulgences for the building fund of St. Peter's at Rome. This is not the place to speak of the career of this first, and probably the greatest, Protestant reformer. Suffice it to say his ninety-five theses were printed and circulated throughout G., and that, in spite of the papal bull of 1520, and the great Diet of Worms of 1521, men of all ranks rallied round him, so much so that

a gathering of seven princes and many cities issued a formal protest against the intolerance of the Second Diet of Spire (1529) and thus became known everywhere as Protestants. The world-famous emperor, Charles V. (1519-56), exercised all his personal influence, and, what is more, employed the exceptional facilities offered by his exalted position as ruler over so many European states, completely in the service of Rom. Catholicism. The Peasants' war of 1525 revealed the wretched condition of the labourers and the wanton cruelties perpetrated by the Ger. barons. It was a misfortune to Luther that the Swabian and Franconian peasants should choose a critical period of his lifetime for their revolt; for his opponents fastened on him the responsibility for their insensate if excusable actions.

Charles V.'s theory that church and state were indissoluble and his uncompromising attitude towards the Protestants, sowed the seeds of the Thirty Years war. During a respite the Lutherans published a statement of their doctrine known as the 'Confession of Augsburg' (1530), and formed the league of Schmalkald, which may be regarded as the outward expression of their determination not to submit to the emperor. Solyman the Magnificent, the martial Turkish sultan, had already besieged Vienna (1529), and was advancing westward with overwhelming forces to attack the emperor's dominions. Charles lost no time in making a patriotic appeal to the Gers. to forget their differences in the face of the common foe, and in a short time was surrounded with a splendid army, more than sufficient to intimidate the Turks. To the Protestants he had granted provisional toleration by the peace of Nuremberg. The expedition against the Turks at Tunis (1535), the punishment of rebellious Ghent (1539-40), attacks on the Algerian corsairs, and two more ravaging wars with the Fr. king, Francis, kept him fully occupied till the treaty of Crecy (1544). But in the year of Luther's death (1546) he began his work of crushing the Protestant league. This proved an easy task, for at the eleventh hour Maurice of Saxony, one of the pillars of the Reformation, deserted to the imperial side, the Protestant forces broke up, and the league melted away. The leaders were executed and fines exacted from Protestant cities. But the Protestant cause was not so to be uprooted. The Saxon Maurice atoned for his former desertion, and Francis's successor on the Fr. throne was eager to snatch at any means of humbling his father's rival, and accordingly lent substantial aid to the oppressed Lutherans. At the epoch-making Diet of Augsburg (1555) Charles was obliged to make notable concessions to his triumphant foes. It was arranged that in future every Ger. prince should be allowed a free choice between the Augsburg confession—which was accepted as a summary of Lutheran orthodoxy—and Rom. Catholicism, and that once his choice was made he should be at liberty to enforce his religion upon his subjects and to drive the latter out of the kingdom should they

refuse his faith. Thus establishing the principle of *ejus regio illius religio* Charles's policy was far-reaching, for it precipitated the subsequent religious wars and persecutions of the old religion in the new Protestant states.

Before leaving the reign of this emperor, who abdicated in 1556, it is necessary to say a word of his rivalry and struggles with the Fr. king. The beginning of the mischief was the defeat of Francis I. when he came forward as a candidate for the empire; the electors rejected him in favour of Charles. Thenceforward Francis and Charles engaged in four useless but bloody wars, most of the campaigns being fought in Italy, which seems to have been regarded by both as their lawful prey. On the whole the advantage was with the emperor, who at the final peace secured Naples, Artois, and Flanders, though he was obliged once and for all to renounce his claims to Burgundy, which, as a fact, had never since its acquisition in 1032 been attached to the empire by other than the loosest ties. At the time these wars decimated the Fr. and imperial troops, but the evil of it all was that the Fr. kings never forgot the humiliation that their predecessor, Francis, had suffered at the hands of Charles V. at Pavia (1525) and elsewhere. And it is this fact that accounts for the jealousy of the house of Hapsburg, which France ever continued to evince, and which explains primarily the vindictive policy pursued by the Bourbons and their ministers, Richelieu and Mazarin, during the Thirty Years war, and which finally enables one to appreciate the transports of joy experienced by the Fr. at the dissolution of the empire by Napoleon in 1806.

The foreign wars of Charles V. have been passed over, as their causes and results form part of European rather than of Ger. hist. A similar course will be adopted in the treatment of the Thirty Years war. The peace of Augsburg had treated the Calvinists as non-existent, yet in G. as elsewhere many had come to prefer the confession of Geneva to that of Augsburg. The result was perpetual strife among the various Protestant sects, for the Lutherans showed small mercy to the Calvinists or to any reformers who ventured to follow a different creed from that drawn up by Melancthon. To make good their position the Catholics relied chiefly on the 'eccles. reservation' embodied in the peace of 1555. This enacted that the penalty which every bishop or abbot must pay for turning Protestant was the loss not only of his office, but of all the lands and revenues attached to it. After Charles there were two moderately enlightened emperors, and then followed Rudolf II. (1576-1612), who was an ardent Catholic. Dread of oppression impelled the Protestant states towards mutual alliance, and in 1608 a confederation was duly formed, called the Evangelical Union, the moving spirit of which was the Calvinist Prince Christian of Anhalt. This was followed, in 1609, by a counter-move on the part of the Catholics, who founded the Holy League, at the head of which was Maxi-

milian of Bavaria. It wanted small additional provocation to induce these leagues to fly at one another's throats, and that provocation was given by a band of Protestant nobles of Bohemia, who, infuriated by the vacillating policy of the emperor, marched to the royal castle at Prague, and hurled the two imperial representatives and their secretary out of the castle window.

The first chapter in the Thirty Years war (1618-48) was the subversion of the Protestant cause in Bohemia. The second chapter centres on the personality of Christian IV. of Denmark, who now came forward to stake his fortunes alongside those of his fellow religionists, the Protestants. Other notable Protestant leaders on his side were the Ger. prince, Christian of Anhalt, and Count Mansfeld, whilst ranged against them were two of the most formidable generals G. has ever produced, namely, Tilly and Wallenstein. Adversity still dogged the reformers' footsteps; Mansfeld d. shortly after his crushing defeat by Wallenstein at Dessau on the Elbe (1626), and his death was soon followed by that of the Ger. Christian; the Dan. king was utterly vanquished by Tilly at the field of Lutter; the remnants of Lutheranism were wiped out from Austria as well as from Bohemia; Wallenstein swept with his plundering armies over the greater part of N. G., and completed his destruction by breaking the backbone of the once flourishing and influential Hanseatic League. The year 1629 is marked by the retirement from the war of Christian IV., and also, as a striking pendant to that event, by the Edict of Restitution, which restored to the Catholics all the church properties which the Protestants had appropriated since the treaty of Passau (1552). Then appears a second and greater champion in the person of the Swedish king, Gustavus Adolphus, the Lion of the N., subsidised from France by Richelieu. With his advent opens the third period of the war. For the time being Gustavus changed the fortunes of the day and twice defeated Tilly, first at the battle of Leipzig (1631), whilst in the course of the second engagement Tilly received a mortal wound and d. Ferdinand, the emperor, a staunch Catholic, composed his differences with Wallenstein, who returned to the arena of bloodshed and met Gustavus on the memorable field of Lutzen (1632). Here the noble Swede fell, though his warriors carried the day.

The final chapter opened in 1635. The war had now lost its early character of a religious conflict between irreconcilable Christians, and had degenerated, or perhaps only developed, into a European contest in which the one object of the combatants was either to despoil the empire themselves, or to hinder their rivals from territorial expansion. At last the peace of Westphalia was arranged, the terms of which were eminently prejudicial to the interests and prestige of the empire. France received a great part of Alsace and the three Lotharingian bishoprics, Metz, Toul, and Verdun; Sweden received important tracts of land in N. G., to hold as

fiefs of the empire, and the independence of Switzerland and of the Netherlands was finally acknowledged. Lutherans, Catholics, and Calvinists were placed on an equal footing, but princes might still impose their own creeds upon their states. A crushing blow was dealt to the empire; for its dismemberment was for the time being sealed by the recognition of the practical independence of the sev. states, which might even contract their own foreign alliances. It is said that the pop. fell during the brief space of thirty years from 30,000,000 to 12,000,000; the proud Hansa cities and their union were broken up; flourishing tns. were levelled to the ground, their sites being marked by charred masses and scattered hovels; agriculture was hopelessly neglected, and it was hard to find a stretch of countryside not disfigured nor wasted by the brutal devastations; industries and commercial routes were obliterated, and education, science, and the fine arts belonged to a forgotten era now gloriously by contrast; patriotism and hope were dead. In fact it must, in fairness, be admitted that 'in character, in intelligence, and in morality, the German people were set back two hundred years.'

The meteoric ascendancy of Prussia forms the next great chapter in Ger. hist. Prussia, the name of which was taken from the Borussi, a Slavonic tribe of fierce pagans, lay along the Baltic coast E. of the Vistula. These had been converted and their ter. occupied by the military religious Teutonic order. In 1525 Albert Hohenzollern the Grandmaster, declaring himself a Protestant, arrogated the land to himself as a duchy independent of Poland. In 1611 the duchy of Prussia was united with the electorate of Brandenburg, and when these ters. fell into the hands of the great elector, Frederick William (1640-88), the foundation of the future greatness of Prussia may be said to have been laid. Frederick was an able ruler who determined to make himself felt in European politics. For this purpose he drilled an excellent and permanent military force. Moreover, he came forward as the champion of Protestantism, and made his dominions a place of refuge for the persecuted Huguenots. It was, however, in the reign of his son Frederick III. (1688-1713) that Prussia achieved the status of a kingdom. Frederick was succeeded by Frederick William I. (1713-40), who, in spite of his eccentricities, proved an energetic if somewhat brutal tyrant, and what was of first importance to his son, Frederick the Great (1740-88), he left a thoroughly disciplined standing army of 80,000 men. Frederick the Great was gifted with a genius for war, and it was largely on this that he relied in lifting his little kingdom to the level almost of the great powers in Europe. When the Pragmatic Sanction of Charles VI. was disregarded and the possessions of Maria Theresa were assailed, Frederick stole Silesia. His claim to his conquest was acknowledged in the peace of Aix-la-Chapelle, which ended the War of Austrian Succession (1748). The Seven Years war

(1756-63) was an attempt to humble the upstart Prussia. The empress of Austria, Maria Theresa, blazoned abroad her wrongs, and France, Russia, Saxony, Sweden, and Poland rallied round her, whilst Frederick, the robber, could rely on England alone of all the foreign nations. He defeated the Fr. at Rossbach and the Russians at Zorndorf, but his one ally deserted him. He was, however, saved by the accession to the Russian throne of Peter III., who was his enthusiastic admirer. Victory once more attended the Prussian armies, and thus, at the peace of Paris (1763), Frederick came well out of an exasperating war.

During the next epoch the historical arena is filled with the rivalry between Catholic Austria and Protestant Prussia—a rivalry for which the consistent policy of the successive Fredericks had paved the way. Napoleon's victory at Austerlitz (1805) was the death-knell of the Holy Rom. Empire, and Ferdinand II., in 1806, was obliged to content himself with the much less pretentious title of emperor of Austria. Thus the long Hapsburg ascendancy over G. was brought to an end. The confederation of the Rhine, that is, a union of sixteen Ger. states under the protectorate of Napoleon, was short-lived. The year 1815 saw the federation of thirty-nine petty kingdoms under the presidency of the Austrian emperor. At the time of the revolution in France, July 1830, there was a sympathetic wave of revolt in many quarters of G., but it was not strong enough to extort any lasting concessions from the various courts. Finally the sev. states, with the exception of Austria, entered into a commercial treaty with one another by which they agreed to set up no protective barriers between themselves, but to encourage free trade everywhere within their boundaries. This treaty grew into the famous Customs Union, or *Zollverein*.

Once again in 1818, as in 1830, Ger. patriots were stirred to open demonstrations of their dissatisfaction with the existing state of affairs by the tidings of the summary dismissal by the Fr. of the reactionary Louis Philippe, and their inauguration of another commonwealth. The govts. of the smaller states were at once intimidated into carrying into effect a series of liberal measures. In Austria the Conservative Prime Minister, the redoubtable Prince Metternich, was obliged to flee the country, and a representative Diet was summoned whose members were chosen by a popular suffrage. The same process was gone through in Prussia; a national assembly was convened and Frederick William IV. swore to observe the new constitution. The convocation at Berlin in 1848 of an assembly representative of all the Ger. states to take the place of the now effete Diet ended in failure.

William I. ascended the Prussian throne in 1861, and it was not long before he had advanced the astute and vigorous Bismarck to the premiership of his kingdom. The methods of this statesman were rough and ready. He had long made up his

mind that the sword only could cut the Gordian knot tied by the mutual jealousies of his country and Austria, and eagerly seized on the miserable disputes about the duchies of Schleswig-Holstein as an efficient *casus belli*. Prussia was determined to annex Holstein when the royal house of Denmark, which had so far held it as a foreign dependency, became extinct in 1863. The duchy was useless to Austria, but the latter nevertheless could not brook any annexation which would aggrandise her rival. War broke out in 1866. In Aug. of the same year the peace of Prague was signed, and Austria

into the great Germanic confederation, which, in 1871, was recognised by Europe as an empire and as a nation. But this is anticipation. It is necessary to understand what occasioned the united resistance against a common danger. The Franco-Prussian war (1870-71) was really the climax of that perpetual enmity on the part of the Bourbons against the Austrian Hapsburgs, an enmity which was somehow transferred to the Hohenzollern dynasty of Prussia when that kingdom began to overtop the older seat of empire. A pretext for the commencement of hostilities was offered by the gift

MIRRORS AT VERSAILLES

A painting by Anton von Werner

paid the penalty of her successive defeats, which had culminated in the historic battle of Sadova (in Bohemia), by being debarred once and for all from participation in the 'Ger. Union'. It should be mentioned that this union had been formed as early as 1819, whilst Austria was preoccupied with quelling the Hungarian rebellion headed by Kossuth. It was, in short, a federation of a number of the states which agreed to recognise the supremacy of Prussia. The year after the war (1867) this earlier federation was enlarged so as to merit the title of N. Ger. Union. Frankfurt, Nassau, and Hanover were now part of Prussia, and the only kingdoms of importance still outside the union were Bavaria, Baden, and Württemberg, that is the Catholic states of the S. The knowledge that a Pan-Ger. army was besieging Paris finally broke down the resistance of the recalcitrant states and forced them

of the sp. throne to Leopold, a member of the house of Hohenzollern, in 1870. In deference to the Fr. king, Napoleon III., Leopold did not accept the proffered crown, but thereupon, after the manner of the wolf in the fable, Napoleon demanded a guarantee that no Hohenzollern ever should unite together Spain and Prussia, a foolish demand which was refused. The Ger. forces were better trained and better armed than the Fr. and success attended them everywhere. Thus they blockaded one Fr. army in Metz, forced another to surrender at Paris, and besieged a third in Paris. The cap. fell and the peace of Frankfurt ended a war which had proved nothing but humiliation to the defeated. Alsace and part of Lorraine became Ger. once more, after being Fr. for over two centuries, and France had to pay an enormous indemnity of £200,000,000, which crippled her finances for years. But before Paris had

yielded or the war was at an end, King William I. had received from all the princes and free cities of G., whilst he was in the great hall of Louis Quatorze at Versailles, the title of emperor over a united G.

The man who mapped out the path of advance for the young empire was Prince Bismarck, who became Reichskanzler or Imperial Chancellor (1871). Broadly speaking, his aims were to concentrate all power in the person of the emperor and to fortify his dignity and the dignity of the empire by diverting as large a portion of the national expenditure as he dared towards enlarging and increasing the efficiency of the army. His policy towards the Socialists, who were constantly in revolt against his administration, was to disarm their criticism by remedying the evils against which they cried. Thus, those measures for compulsory insurance of workmen and for old age pensions, etc., measures which are sometimes described as state socialism, were really the outcome of the chancellor's recommendations. Bismarck's first struggle was with the pope. In 1872 the Jesuits were expelled, and during the next three years the famous Falk or May Laws were promulgated, their object being to undermine papal authority and to establish the legality of state interference in eccles. affairs. In 1874, moreover, the validity of civil marriage was upheld. This struggle is known as the *Kulturkampf*, and the title Falk refers to the minister who drafted the anti-church bills. The former ended in compromise, for in 1879 Falk was forced to resign, and Bismarck was later obliged to make substantial modifications in the laws.

The contest between the Reichstag and the chancellor over whether or not the former should retain a constitutional control over the army centres on the 'Septennial' (1874), by which the army grants were fixed for periods of seven years at a time. The second period would expire in 1888, and Bismarck was determined to make considerable additions to the peace estab. in view of the rapid increase of the Fr. military forces. Parliament stubbornly refused to countenance his plans, and accordingly was dissolved in 1887. In the election that followed the Socialists and Radicals (*Freisinnigen*) suffered a humiliating defeat. Bismarck triumphed; subsequent budgets showed an enormous increase in army supplies, and the obligations to serve was extended from twelve to eighteen years (1888). Conscription had one serious drawback, and one which Bismarck tried to remove when in his famous speech of 1885 he declared that 'Germany does not want colonies', the extraordinary increase each year in the number of emigrants, most of whom found new homes in America, seemed for the time being (1879-1884) to threaten the home country with grave depopulation. In spite, however, of Bismarck's dictum, G. had aspirations towards colonial expansion. In 1882 a Ger. colonisation society was started at Frankfurt, and from that time date

the Ger. acquisitions in Africa and the Pacific, but the colonies did not prove a successful enterprise from the financial standpoint. The task of meeting the national expenditure, which increased annually, soon developed into a problem of the first importance, but for this problem as for so many others the indefatigable Bismarck was ready with a solution. The 1879 session of the Reichstag was exhausted by an animated controversy between Free Traders and Protectionists. Victory fell to the latter, and Bismarck's suggestions were in the main adopted.

Bismarck showed himself an adept in diplomacy. Ever since the meeting of the three emperors in 1872 there had been an alliance between G., Austria, and Russia, but after the upheavals in the E., G. was obliged to choose between the friendship of her two former allies. Thus in 1879 Bismarck publicly renewed amicable relations with Austria, and when Italy agreed to join the two empires in 1883, there was constituted a triple alliance which lasted down to the First World War. In his choice Bismarck was guided by the consideration that with Austria at his back there would be less danger of a combined attack of France and Russia.

In 1888 the emperor, William II., the grandson of the first Ger. emperor William I. (1871-88), ascended the throne with the determination to continue his grandfather's and Bismarck's policy. But it soon became clear that two strong personalities such as himself and Bismarck could not work together, and as he could not submit to the latter's contention that the chancellor must always be the intermediary between the emperor and his other ministers, he commanded Bismarck to send in his resignation (1890). Caprivi now became chancellor, and managed to negotiate a series of commercial treaties with the countries of Central Europe (Austria, Belgium, Switzerland, Italy), and later with Serbia and Rumania, the purpose of which was to lower the import duty on corn on condition that the foreign states favoured Ger. manufactures. (1892-94).

A wave of popular feeling which lifted high its head in the twilight of the nineteenth century was that which rose against the strengthening and reinforcement of the provisions of the criminal code known as the *Unterschieds Vorlage*. A Conservative Gov. attempted to remedy the prevailing indifference to Christianity, which was undoubtedly accompanied by alarming immorality and licence, by a number of restrictive measures, introduced as amendments to the old criminal code. Unfortunately these amendments were so framed as to interfere largely with the freedom of the press and the personal liberties of the people. The proposed censorship of pictures, books, and papers gave rise to a storm of indignation, and when in 1900 the *Lex Heinke* was brought forward to cope with prostitution, and to it was appended another bill proposing to give the police censorial powers over art and literature, public feeling ran so high that the Socialists were actually applauded

for introducing obstructive tactics into the Reichstag, and the objectionable clauses had all to be withdrawn. It was against the Socialists, or rather the Social Democrats, that the emperor and Gov. turned their strongest weapons. The blow delivered against the thousand and one political communities and organisations, most of which were socialistic in tendency, was a glaring failure, as the Imperial law of 1899, to the effect that 'societies of every kind might enter into union with one another,' clearly showed. Indeed the Social Democrats whom Mommsen declared in 1901 to be 'the only great party in Germany which has any claim to political respect,' embracing as they did a very considerable latitude of opinion ranging between Moderates and followers of Karl Marx, were obviously in the ascendant, as the elections of 1912 showed, and might without exaggeration be said to have included the mass of the working classes in the Protestant states.

It remains only to note one other salient feature of modern G., and that is her naval policy prior to the First World War. The emperor conceived the idea that G. was a world empire, and must have a great navy to defend her trade and exports, on which her wealth and prosperity depended. This desire for naval expansion was stimulated by the knowledge of the huge fleet which England possessed; for it was felt that, as things were, the supremacy of the latter at sea would confer upon her an overwhelming advantage in the event of open hostilities breaking out. The causes of Ger. antipathy towards England were not far to seek. To begin with both countries had had a similar industrial development; only as Great Britain had almost a century's start in the field of foreign trade and of manufactures, there was in G. the natural jealousy of her rival competitor. Moreover the Liberal party in G., which played so conspicuous a part some forty or fifty years before, was always looking across to Great Britain as the seat of liberty and constitutional government; it was part of Bismarck's policy to create a revision of feeling and to turn this respect and admiration into jealousy and contempt, for whereas Great Britain upheld free trade he had adopted protection, and whereas her system of rule was purely parliamentary he had determined to give the Ger. constitution a solid military basis and to make Imperial control a thing of reality and force. However this may be, it is patent that this antipathy reached a fever heat at the time of the Boer war, and largely accounts for the ease with which the Navy Bill of 1900 was passed, in spite of alarming increase in the naval estimates. Throughout the war the sympathy of the Gers. was entirely with the Dutch colonists, who were, of course, Low Ger. in origin, and accordingly every one of their victories was regarded as a triumph for the Teutonic civilisation. In the year 1913 it seemed that the relations between Great Britain and G. had improved, and hopes were being widely expressed that

some arrangement between the govts. might be come to by which the race in naval armaments might be checked, but the Ger. Army Bill of March 1913 raised the total of the forces by 145,000 and put their peace strength in 1914 at some 870,000. The Ger. chancellor could not yield to Winston Churchill's suggestion of 'a naval holiday.' There were also the beginnings of fiscal discontent in G. which could be overcome only by invoking an extreme patriotism. During the Austro-Serbian crisis after the murder of the Archduke Ferdinand at Sarajevo, G. refused to aid Austria against Serbia, but endeavoured to prevent Russia mobilising in aid of Serbia. There was, however, in G. a div. between the diplomatists and the soldiers, and at an important council meeting at Potsdam on July 29, 1914, the latter evidently triumphed. Immediately after this meeting the Ger. chancellor made overtures to the Brit. ambas. to secure Brit. neutrality, but the 'infamous proposals' were rejected. On July 31 G. demanded complete demobilisation of Russia within twenty-four hours, but did not require the same measure from Austria. Receiving no reply from Russia, G. declared war on Aug. 1. France stood by her alliance with Russia, but G.'s declaration of war against France did not arrive until Aug. 3. The neutrality of Belgium and Luxembourg was violated by the Ger. armies, and England, receiving no assurances, declared war on G., Aug. 4. (See WAR, THE FIRST WORLD.—EVENTS IMMEDIATELY PRECEDING OUTBREAK OF WAR. *Diplomatic Franchises*.) The Ger. people showed a remarkable unanimity over the question of war, propaganda concerning the Russian mobilisation rallying all parties, including the Socialists, to the support of the gov. policy. As the war progressed the conflict of opinion between 'Easterners' and 'Westerners' became more marked, and the rivalry between the E. and W. commands was a handicap to Ger. military aims. After the battle of the Marne had stalemated the Ger. offensive in Flanders, it was in the E. that Ger. arms were spectacularly successful. The Russians were defeated at Tannenberg, and Rumania in 1916 was put out of the war almost as soon as she had entered it. After the Marne Moltke was succeeded by Falkenhayn as minister of war, but in the rivalry between him and the victors of the E. front, Hindenburg and Ludendorff, he succumbed. Ludendorff became a virtual dictator. Both the Kaiser and his chancellor, Bethmann-Hollweg, took second place. In the Reichstag Bethmann-Hollweg had little influence, the only strong man in the gov. being the financier Helfferich. Meanwhile the Socialist minority, opposed to the continuation of the war, was increasing. Early in 1916 Haase openly announced in the Reichstag his disagreement with the policy of the gov. However, on May Day, 1916, Liebknecht, who with Rosa Luxemburg was the author of the celebrated *Spartacus Letters*, was arrested and imprisoned. Moreover, the Auxiliary Service Bill which was passed

at this time impressed all men between the ages of seventeen and sixty into the service of the state. Diplomatically, however, G. no longer looked forward to a decisive military victory. Peace negotiations were tentatively proposed by the Ger. chancellor on Dec. 12, soon after the defeat of Rumania. The peace offers were rejected by the Allies, and the intervention of President Wilson as arbitrator was cut short by the decision of the Ger. militarists to pin their faith to the submarine. The 'sink at sight' U-boat campaign which brought America into the war against G. was at first comparatively successful, and this, combined with the disaffection of Russia, made Ger. prospects bright at the beginning of 1917. Austria however, since the death of Francis Joseph in Nov. 1916 was anxious for peace, but the Emperor Karl was unable to come to terms with Italy, and Austria was forced back into line with G. (see also AUSTRIA-HUNGARY). In domestic affairs G. was troubled. In June 1917 Bethmann-Hollweg was ousted by the military party and was succeeded by the even more ineffective Michaelis, who was shortly after replaced by Count Hertling. The Socialist agitation towards peace and parliamentary reform was now joined by the Majority Socialists, represented by Ebert, Scheidemann, David, and Müller, who were opposed to both annexations and indemnities. The Minority Socialists, represented by Haase, Bernstein, Ledebour, and Kautzky, wished, in addition, to compensate Belgium and to take a plebiscite in Alsace-Lorraine. In the beginning of 1918 there was a strike in the munition factories, fostered by the Independent Socialists and Spartacists. It was suppressed, but by June it was admitted by von Kuhlmann, secretary of state for foreign affairs, that the war could not be ended by a military success. Adm. Tirpitz formed a 'Fatherland party,' but its influence was not great enough to resist the forces disrupting the empire. At the eleventh hour Prince Max of Baden was called upon by the Kaiser to form a Cabinet to overthrow absolutism and introduce parliamentary government. After the failure of Ludendorff's final offensive Prince Max signed the petition for an armistice. On Nov. 5, 1918, conditions were announced, and included evacuation of all occupied ter., withdrawal beyond the Rhine, together with a neutral zone on the r. b., and the surrender of all guns, aeroplanes, and ships. The naval mutiny at Kiel which had broken out on Nov. 4 marked the collapse of the will to war, and on Nov. 9 a republic was proclaimed in Berlin. The same day the Kaiser abdicated and fled to Holland. A provisional gov. under Ebert replaced that of Prince Max, and the terms of the armistice were accepted. The Majority and Minority Socialists united in this gov. and a Cabinet of six was formed, called the Council of the People's Commissaries. Opposed to them were the Workers' and Soldiers' Councils animated by the Independent Socialists and the Spartacists (Communists). At a meeting of repre-

sentatives from the state assemblies, Ebert endeavoured to pave the way for the National Assembly which was to meet to decide the constitution. The date of meeting was fixed for Feb. 14, 1919. The Spartacists were against the holding of a National Assembly, being in favour of a Soviet regime, and a conflict became inevitable. Noske, a member of the People's Council, accepted the task of upholding the bourgeois republic against the Communists. The forces at his disposal were small, but he trained others. On Jan. 5, 1919, there was a rising of the proletariat which would have succeeded in overthrowing the gov. had the leaders shown greater decision. A revolutionary committee did indeed set up a gov., declaring Ebert to be deposed. On Jan. 10 Noske's troops took command of the city. There was severe fighting, during which Rosa Luxemburg and Liebknecht, the leaders of the Spartacists, were brutally killed. On Jan. 19 the election was held for the National Assembly, which was summoned to meet on Feb. 6. The assembly met at Weimar, and after deliberation and amendment the provisional constitution was adopted. Ebert was elected president, while Scheidemann formed a Coalition Cabinet, containing eight Majority Socialists, four Democrats, and three of the Centre party. The new gov. attempted some financial rehabilitation, but all measures were unstable, pending the presentation of the allied terms of peace. These were received by G. on May 7. There was an immediate outcry against their acceptance. They involved tremendous sacrifices of ter., the payment of reparations in money and produce, and also complete disarmament. The Independent Socialists were the only party in favour of unconditional acceptance. Scheidemann, believing the Reich to be doomed in either event, resigned on June 19. Bauer (q.v.) formed a gov. for the purpose of accepting the terms with reservations over the question of the admission of G.'s war guilt and the surrender of the so-called 'war criminals.' He obtained sufficient support with the help of the Socialists and the Centre party. The Allies rejected the reservations, and demanded unconditional acceptance. This was at length forthcoming, and G. signed the treaty of Versailles (q.v.), which came into force from Jan. 1920. The terms of the treaty were so severe that the gov. which had accepted them became unpopular in the country, and this unpopularity was fostered not by the Communists, whose hopes had been destroyed at Weimar, but by the reactionaries—disbanded soldiers and royalists. A counter-revolution, known as the Kapp *putsch*, was set on foot on March 28 by Dr. Kapp and Gen. Luttwitz. Ludendorff lent his countenance to the movement, but Kapp's initial success was short-lived. For a week he acted as chancellor, the Ebert-Bauer Gov. having fled to Stuttgart, but Berlin was isolated by a general strike, and Kapp was put to flight. A similar movement overthrew the Bavarian Gov., but the leader, Hitler,

who planned to march on Berlin, did not find his chance until ten years later, when in the elections of 1930 he put himself at the head of the 'Nazi' party and combined with the Nationalists to create a Fascist G.

After the Kapp *putsch* the chancellor Bauer lost his prestige, and was succeeded, on May 27, 1920, by Müller, with Wirth as finance minister. The Müller Gov. paved the way for the general elections of June 6, in which the Socialists lost ground. A Coalition Gov. was formed on June 20, with Fehrenbach as chancellor. The prin. work of this ministry was in connection with reparations. G. received the estimated allied demands at the conference at Spa in July, and for the next ten years the question of reparation payments dominated the foreign policy of G. (see under REPARATIONS). At this time also the allied demands for disarmament to within the treaty limit of 100,000 men became pressing, and were the basis of the Paris terms of Jan. 1921. They were countered by a widespread secret traffic in armaments and the formation of societies devoted to the purposes of military training. Foreign affairs at this time centred also on the Silesian plebiscite in which G. polled some 700,000 votes to Poland's 500,000, while 664 coms. were for G. and 597 for Poland. G., however, was disappointed by the boundary line which the League of Nations eventually drew through the dist., the Allies being unable to agree among themselves. In May the London ultimatum with respect to reparations was presented to G., and Wirth succeeded Fehrenbach as chancellor of a gov. prepared to accept the ultimatum. As a result, however, of the Silesian award and the fall of the mark consequent on the effort to meet reparation requirements, G. by July 1922 was no longer able to cover her obligations, and the following year the Ruhr dist. was occupied by Fr. and Belgian troops (see under RUHR).

This drastic move, however, had been preceded by allied conferences, the chief of which was at Cannes at the beginning of 1922, but the effort to recognise G.'s limitations was thwarted by the recall of Briand to Paris. At the economic conference at Genoa which followed in April, G. secured some definite result by concluding a treaty with Soviet Russia, renouncing mutual indemnities and conceding economic advantages, and this treaty further antagonised the Fr. The Ger. policy of passive resistance to the Fr. occupation of the Ruhr was initiated by chancellor Cuno, who succeeded Wirth on Nov. 11 1922. With the failure of the Ger. policy in the Ruhr to secure anything except impoverishment of the country, Cuno went out of office, and Stresemann came forward and formed a Cabinet in Aug. 1923. The problems which confronted him were to liquidate the struggle in the Ruhr, to restore internal order, and to stabilise the mark. The order for passive resistance was withdrawn on Sept. 27, and this step was only opposed by Bavaria where a separatist movement was

aiming at the restoration of the Bavarian monarchy and the overthrow of the Ger. republic. It assumed serious proportions, but was divided into two parties, one purely monarchist under von Kahr, the other Fascist under Hitler and Ludendorff. Owing to this div. the plans of both parties miscarried (see under BAVARIA). In Saxony also there was a revolt against the Reich on the part of the Communists, and a Republican Proletarian Gov. was set up. Stresemann issued an ultimatum, ordering this gov. to resign, and appointed a military commissioner with dictatorial powers. To cope with the financial problem Stresemann inaugurated a Powers Bill which would give him special powers to act on his own initiative while keeping within the bounds of parl. gov. After resigning formally and returning with a new finance minister in Dr. Luther, Stresemann passed the Bill. The mark was then stabilised by the method of abolishing the old currency and substituting a new one. The introduction of the *rentenmark* scheme was retarded by a strike, and it became necessary to appoint Gen. von Seeckt dictator. Through his efforts the activities of the Ger. Fascists and Communists ceased to interfere with the State. Eventually in Nov. 1924 Wilhelm Marx, chairman of the Ger. Centre party, formed a Cabinet, with Stresemann as foreign minister. A second Powers Bill was passed. Economic stabilisation was further helped by the introduction of the Dawes plan (q.v.), which secured the evacuation of the Ruhr and put the question of reparation payments on an economic basis. The London Conference in 1924, at which the Dawes plan was adopted, paved the way for the Locarno treaties (q.v.) the following year, and for G.'s entry into the League of Nations in Sept. 1926.

On Oct. 20, 1924, the Reichstag was dissolved, and at the subsequent elections in Dec. the extremist Communists and Nationalists both lost a number of seats. During this period of transition towards more stable conditions, President Ebert d. on Feb. 28, 1925. According to the constitution of that time the president had to be elected by direct vote and an absolute majority. F.-M. von Hindenburg was put forward as a candidate, and although this appeared a reactionary move, he was elected to the presidency, in which office he remained until his death. Hindenburg, pledged to uphold the republic, exerted his utmost to reconcile the Royalists with the Republicans. At this time Luther was chancellor, and Stresemann, who was foreign minister, concluded the Locarno treaties with France, Belgium, Great Britain, and Italy. Before these treaties were ratified by G., however, Luther's Gov. was forced to resign, but was returned a month later, Jan. 1926, Stresemann again being foreign minister. The Locarno treaty was followed in April 1926 by a treaty with Soviet Russia much in the spirit of Locarno, but giving assurances that G.'s treaties with the W. powers were not directed against Russia. When Dr. Marx

became chancellor in Jan. 1927 Stresemann was again foreign minister, and the Locarno treaty and the League of Nations continued to receive Ger. support as a means of securing equality of treatment. In Feb. the Inter-Allied Military Commission of Control was withdrawn, and the chief obstacle was thus removed from the hitherto secret reconstruction of the Ger. Army.

Stresemann, who was working towards the rehabilitation of G. by gradual means, among which was the revision of the Dawes plan, was handicapped by the Nationalist element in the Marx Cabinet. With the fall of the gov. in 1928 the Socialists gained in the ensuing elections, and Stresemann became foreign minister, this time in a gov. with the Socialist Müller as chancellor. In these elections the National Socialist or Nazi party won twelve seats with a total of over 800,000 votes—evidence of the success with which Hitler had built up the party since its eclipse in the Munich *putsch* of 1923. The following year the Young plan superseded the Dawes plan, and the Allies agreed to evacuate the Rhineland by June 1930. The first stage in the reconstruction of G. was thus complete, and the end of the period is marked by the death of Stresemann (Oct. 3, 1929), his work largely accomplished.

Stresemann's methods had not, however, been thoroughgoing enough to please the Ger. Nationalist party, which was loud in its denunciation of the Young plan. Hugenberg, the leader of the Nationalists, became allied with Hitler in their joint opposition to the plan, and as a result the financial power of the industrialists and the propaganda machine of the Nationalists were of service in building up the Nazi party. The Socialist influence waned, and in Dec. 1929 Müller was succeeded by Brüning, leader of the Catholic Centre party. Brüning did not have a majority in the Reichstag, and governed mainly by decree during the two years he remained in office. In 1930 the Reichstag was dissolved, and the elections were a triumph for the Nazi party, which gained 107 seats as against their previous twelve, with a total vote of nearly 6,500,000. Hitler now sought to consolidate his victory by directing National Socialist propaganda against the Jews and Marxists, the alleged injustices of the Versailles treaty, and the Republican system of gov. Still in alliance with Hugenberg and with Dr. Schacht, former president of the Reichsbank, he became more open in his hostility to Brüning. But while his following and that of Thaelmann, the Communist leader, were large enough to disrupt parl. government, Ger. radicalism had not yet reached the point at which President Hindenburg and the Junkers were seriously threatened, and for a time the aged marshal became G.'s dictator. The accentuation of the world economic depression then began to turn the scales, and in the succeeding elections Hitler's following grew even larger until, when he stood against Hindenburg in the presidential elections in 1932, he secured

over 13,000,000 votes. Hindenburg was nevertheless elected by a majority of 6,000,000, and notwithstanding Hitler's success in the Reichstag elections Hindenburg denied him the chancellorship. In the Nov. election of 1932 Hitler actually lost ground, and Gen. von Schleicher, who became chancellor, tried to bring about a *coup d'état*, having for its double aim the removal of Hitler and of the reactionary clique around Hindenburg. This cabal, however, supported by a number of disillusioned industrialists and bankers, who hoped to restore their fortunes with financial aid from a gov. under Hitler, now decided to get rid of von Schleicher and to substitute Hitler. At the time when the cabal reached this decision and persuaded Hindenburg to make Hitler chancellor over a mixed Cabinet of Nazis and Nationalists, there is no doubt that they hoped Hitler would prove no more than a compliant figurehead, amenable to the wishes of the non-Nazi Nationalist party (Jan. 1933). But they had now set flowing a Nazi tide which was destined very soon to sweep down all barriers. Hitler's first act, as unscrupulous as all that since characterised his every move in both domestic and foreign policy, was to stoke the Reichstag fire, the responsibility for which he placed on the Communists. By this means he was able to restrict the activities of both Communists and Socialists at the subsequent elections, for not a few believed that he had saved G. from a threatened Communist uprising. It is noteworthy that even at this date (March 1933) he had no majority otherwise than by alliance with the Nationalist party, and that in spite of the unfair manner in which the election of that month was held. But he now had the substance of power, and could afford to disregard forms, though, having forcibly expelled the Communist and other opposition deputies, he went through the farce of obtaining from the Reichstag an Enabling Act, whereby he now meant to rule as a dictator, compelling submission by means of troops and secret police—*Sturmabteilung* (S.A.) and *Schutzstaffel* (S.S.) and *Geheimeschutzpolizei* (Gestapo) (see also S.A.; S.S.). His intensive propaganda three years previously had made a point of deriding the Republican polity. Now he could give the old constitution its death-blow. Their constitutional liberties gone, no resistance by any elements of the Ger. people could now avail. All opposition parties were suppressed, including even the Nationalists, who had naively believed that Hitler would be their tool. As yet, however, Hitler did not show his hand in foreign affairs—apart from the fact that in its general outlines his policy could have been found in *Mein Kampf*. For the next few years he intended to consolidate his position by giving the world the impression that he really believed himself to be the bulwark against Bolshevism (see ANTI-COMINTERN PACT), besides being a respecter of international obligations. He had not, however, disposed of all opposition and, like Mussolini in the case of the ill-fated Matteotti, the

Ger. dictator himself murdered or caused to be murdered those within the Nazi party who still offered resistance. This incident took place in the middle of 1934, when the armament firms, whose concerns had been reorganised with gov. subsidies, and the general staff were urging Hitler to throw all Socialist schemes to the winds and concentrate on a policy of Ger. imperialism backed by armaments. Hence on June 30, following a secret meeting in the house of Dr. Krupp at Essen, the Socialist or radical wing leaders were suddenly arrested and executed. These included a Capt. Roehm, chief of the S.A., the man to whom Hitler was largely indebted for his triumph, and various other leaders of that body and also a number of non-Nazis, including Gen. von Schleicher and von Kahr, now an aged man, who had suppressed the Munich *putsch*, and many Catholic politicians.

Now it was that Hitler began to put into execution his policy of interference in the affairs of neighbouring countries, and, notwithstanding his previous pledges not to meddle with Austria, he contrived, through a diligent use of fifth columnists (see FIFTH COLUMN), to bring about a rising of the Austrian Nazis and the assassination of Dollfuss, Austrian chancellor. The immediate result of this was the mobilisation of the It. Army by Mussolini, who at that time would seem to have had sufficient foresight to appreciate the seriousness of the menace of Ger. armed intervention in Austria. Soon after these events Hindenburg d. (Aug. 2, 1934), and Hitler, having gerrymandered plebiscites in his own favour by intimidation and fraud, became both president and chancellor and, later, adopted the title of Führer, appointing a number of Gauleiter (dist. leaders) or nominees to act in the various provs. or former state of G.

Attention was now focused on the Saar dist., in which a plebiscite was held on Jan. 13, 1935, under the terms of the Versailles Treaty to determine whether this area should return to G. The Nazi propaganda campaign was such that the result was a foregone conclusion, and on March 1 the important mining dist. of the Saar was returned to G. by a majority of over 90 per cent. The plebiscite safely over, Hitler's next move (March 16) was to denounce the armament clauses of the treaty of Versailles, and to declare G.'s intention of re-establishing compulsory military service. An army of 550,000 men was planned in place of the 100,000 permitted by the treaty. In the same year (June 18) an Anglo-Ger. agreement on naval ratios was concluded, under which appeasement policy the Brit. Gov. allowed G. to build up to 35 per cent of Brit. naval strength (see NAVY; SEA POWER). G.'s next act was to defy the Locarno Treaty, adherence to which Hitler had himself reaffirmed. Both this treaty and the treaty of Versailles were repudiated when on March 7, 1936, the demilitarised Rhineland zone was reoccupied by Ger. troops. France and Britain made no opposition, their fears in some sort allayed by Hitler's undertaking not to fortify the zone, and

by his declaration that 'he had no territorial demands to make in Europe.' Relations between France and G. inevitably deteriorated, particularly as the result of the clash of interests aroused by the Sp. civil war. A crisis arising from the alarm that G. was infiltrating into Sp. Morocco was only narrowly averted. The end of the Abyssinian war brought a rapprochement between Italy and G., and the so-called Berlin-Rome axis came into being in the autumn of 1936. This was followed on Nov. 25 by the agreement which G. signed with Japan. Announced as a defence against the interference of the Communist international in the internal affairs of the nations, this agreement was viewed as a dangerous military alliance by the rest of the world.

The following year (1937) G. continued to work towards a position of self-sufficiency, and to emancipate herself still further from the Versailles Treaty. The agitation for the return of the former Ger. colonies was intensified. Intervention on behalf of Gen. Franco in the Sp. civil war also helped to bring G. and Italy into line with each other in a joint policy versus the rest of Europe. The Italy of Mussolini accordingly joined the Ger.-Jap. Anti-Comintern Pact in Nov. The strengthening of the anti-Bolshevist element in National Socialism became a means of building up the corporate state, in which the lives of its members, almost from infancy, were directed solely for the benefit of the State. The firmer grip which the Nazi regime took on the lives of the people brought it into conflict with both the Protestant and Catholic Churches. Both churches were persecuted, and there were numerous arrests of clergymen, notably that of Pastor Niemöller on July 1. With the resignation of Dr. Schacht from the post of minister of economic affairs on Nov. 26, the harnessing of industry to the needs of the State was further evident, and the ministry was taken over temporarily by Goering, to whom was entrusted the direction of the Four Year Plan, begun in Oct. 1936. By the spring of the first phase of the Nazi war economy was completed; the point of 'full employment' had been reached through rearmament and an unlimited spending policy. Expenditure on armaments, however, continued to increase, and the requisite resources were obtained partly by reducing the consumption of the people, partly by levying on the Jews and other minorities, and partly by enforced measures of rationalisation and extended hours of labour (trades unions had long been suppressed). It was now that G., emboldened by previous successes and by the knowledge that she alone among the nations was rearming at top speed, began the policy of piecemeal absorption of European ter. (see further under WAR, SECOND WORLD, and 'ARIN KAMEF'). In each case the technique was the same: to trump up charges of ill usage of Ger. minorities or nationals, and stir up disorder with the aid of spies, coupled with the widely disseminated but hollow

allegation of the hostile encirclement of G. Steps taken by other nations in self-defence were inevitably construed as proofs of encirclement. By the Franco-Soviet Pact of 1935 France had, to some extent, played into Hitler's hands. This pact, designed as a counter to G's introduction of compulsory military service, the reoccupation of the Saar valley, and the Anglo-Ger naval ratio agreement, was promptly seized on by Hitler as a justification for the denunciation of the Locarno Treaty and the reoccupation of the Rhineland. So long as the Rhineland zone had remained demilitarised G. was denied the use of her network of strategic railways in the zone

Blomberg and Fritsch were dismissed. Hitler became commander-in-chief and Gen. Keitel was raised to be his chief of staff. On the political side the conservative Baron von Neurath gave place as foreign minister to Joachim von Ribbentrop, until then German ambassador in London. The way was now ready for expansion. On Feb. 12 Dr. von Schuschnigg, the Austrian chancellor, was summoned to Hitler's residence at Berchtesgaden, and forced under threats to sign an agreement opening the way to Nazism in Austria. When Schuschnigg on returning to Austria proposed to hold a plebiscite to determine the union with G. Hitler, fearing the result, invaded Austria, which

and in the Rhineland for the forward concentration of her armies G. was therefore forced back to the line Cassel-Wurzburg which might have meant that the first clashes between Fr. and Ger. forces would be on German territory—always the aim of the Fr. general staff. The offer by G. of a substituted zone would have been valueless to France who, in order to offset her inferiority in numbers, had constructed the Maginot line.

There was, however, still some opposition in G. to Hitler's policy of Nazi domination of Europe. His plans were therefore preceded by a change in the direction of the army and of the Foreign Office. The commander-in-chief, F. M. von Blomberg, was subservient to Hitler but was unpopular with the more conservative of his colleagues. These generals, led by Gen. von Fritsch, took exception to von Blomberg's marriage, said to be beneath his rank and dignity. In the trial of strength that ensued both von

was occupied without resistance. On March 13 the union of G. and Austria was announced. Hitler made his customary proclamation that he had no further territorial demands to make in Europe, and Marshal Goring was instructed to inform the Brit. Gov. that Czechoslovakia would not be attacked. Italy's acquiescence in the annexation of Austria served outwardly to strengthen the ties with which she was bound to G., and the accord between the two countries was affirmed at a meeting between Hitler and Mussolini in Rome during May. Thus Italian support was assured for Hitler's next move against Czechoslovakia. Propaganda was intensified on behalf of the Sudeten-Germans in Czechoslovakia, while to protect G. in the West the fortification of the Siegfried line was hastily erected. In Sept. the crisis came to a head. G. demanded the cession of the Sudetenland under threat of war. These demands were formulated by Hitler at

conferences with the Brit. Prime Minister, Neville Chamberlain, at Berchtesgaden on Sept. 15 and at Godesburg on Sept. 22. Finally on Sept. 28 a conference was held at Munich between Hitler, Mussolini, Chamberlain, and Daladier, at which Hitler gained his demands. The Sudeten Ger. dists. were accordingly occupied and the Czech fortifications taken over. An Anglo-Ger. declaration repudiating war was signed on Sept. 30, followed in Dec. by a pact between G. and France. Neither of these agreements, however, served to prevent the deterioration of the European situation.

In order to pay for her successive ventures G. fell heavily into debt, and it was with the aim of easing their economic difficulties that the Nazi party organised one of the worst pogroms against the Jews in Nov. 1938. By various decrees in Nov. and Dec. the Jews were dispossessed of shops, houses, and farmlands, and the Jewish pop. generally was ordered to pay a collective fine amounting to the equivalent of over £50,000,000. Economic pressure and the wish for raw materials turned Hitler's attention towards the Ukraine, and hostility began to be shown towards Poland as being an obstacle to Ger. expansion in the E. The return of Danzig was demanded, and the demands renewed in the early part of 1939. This made nonsense of Hitler's assurances that the annexation of Czech Sudetenland was his last territorial claim, and his further assurances that he wanted no Czechs and that he was no longer interested in the Czech state were set aside when on March 15 the Czech president, Dr. Hacha, was summoned to Berlin. As a result the Czechoslovak state was dismembered. A Ger. protectorate was set up over Bohemia and Moravia, incorporating over 6,000,000 Czechs in the Ger. Reich, while Slovakia was formed into a republic, nominally independent but subject to G. This move was accompanied by a trade drive in Rumania and the Balkans, resulting in barter agreements to give G. the food-stuffs so greatly needed in exchange for manufactured articles.

In the E. Lithuania was subjected to the new fascist technique, and on March 21 the Lithuanian foreign minister, summoned to Berlin, was compelled to sign an agreement ceding Memel to the Reich. As regards Poland, Hitler, on April 28, denounced the Non-Aggression Pact concluded with Poland in 1934 and also the Anglo-Ger. naval agreement of 1935. To offset the supposed encirclement of G. by Great Britain, France, and Poland, a military alliance was made with Italy, thus openly directing the Berlin-Rome axis towards war. The demand for Danzig became more menacing with the accompaniment of frontier clashes. Hitler was undeterred by the Brit. promise of support for Poland, which he countered by a non-aggression pact with Soviet Russia. This was concluded on Aug. 26, and for the sake of it Hitler reversed the anti-Communist policy on which hitherto the Nazi state had been

largely based. Secure as he imagined from a war on two fronts Hitler forced the issue with Poland, which was invaded on Sept. 1. Great Britain and France then declared war on G. on Sept. 3 (see POLISH CAMPAIGN IN SECOND WORLD WAR).

The Polish campaign lasted not more than a month. G. was, however, forced to agree to Russian annexation of half the Polish ter., while at the same time Russia strengthened her position in the Baltic by securing bases from Latvia, Lithuania, and Estonia. G. entered the year 1940 increasingly dependent on Russian supplies, but the Russian alliance was unpopular in G. A supposed attempt on Hitler's life by a bomb explosion at Munich on Nov. 23 was thought to be the result of disunity in the country. Whether genuine or not, the incident was used to excite loyalty towards Hitler and hatred against England. In spite of the successes against Poland, it was a miserable winter for the Ger. people. Food was scarce and transport in a poor state. Nevertheless G. continued to build up its offensive strength in the W. With the spring of 1940 came the period of renewed military success. Norway was invaded on April 8 to protect the transport of iron ore from Sweden, which was essential to Ger. armaments. The invasion of the Netherlands, Belgium, and Luxembourg followed on May 10. With the occupation of these countries and the surrender of France, fighting in Europe had come to an end by July. Plans were made for the invasion of Britain, but the offensive and defensive successes of the Brit. Air Force caused these plans to be abandoned. Politically Hitler now sought to maintain his prestige by dictating settlements for the differences which prevailed between Hungary and Rumania, Slovakia and Bulgaria. These countries were accordingly brought within the orbit of G. The New Order in Europe was launched, by which the economy of each European country was linked to that of G. and made to sub-serve the aims and ambitions of the master people, the Ger. *Herrenvolk*. Meanwhile it was Hitler's hope to guard against Amer. intervention by means of a ten-year pact with Italy and Japan, concluded on Sept. 27, 1940. The mutual military and economic support which the three countries guaranteed to each other in the event of attack by a country not at that time at war was held to be directed towards the U.S.A. It did not, however, serve to hinder Amer. economic aid to Britain. Hitler's New Order meant the subjugation of the peoples of Europe to work for G., and the organisation of foreign labour was pushed forward in order to keep up the supply of men and materials necessitated by the Ger. campaign in Greece and the invasion of Russia. Luxembourg, Alsace-Lorraine, and part of Yugoslavia, formerly belonging to Austria, were incorporated in the Reich during 1941.

Political events which preceded the invasion of Russia on June 22, 1941, were a tightening of the bonds which reduced

Bulgaria, Rumania, and Croatia to the status of vassal states of G. Rumania, Finland, Hungary, and Slovakia lent armed aid to G. against Russia. At the same time a pact of friendship was concluded with Turkey. The war against Russia naturally gave great impetus to a revival of Ger. anti-Bolshevist propaganda. A conference was held in Berlin in Nov. to which countries in sympathy with the anti-Comintern Pact were invited. The Chinese puppet gov. in Nanking adhered to the pact at Jap. instigation, and was recognised by G. as the legitimate Chinese Gov. In Europe, however, Sweden, Switzerland, and Portugal withstood the overtures of the Gers. The prolongation of the war bringing reverses to the Gers. in Russia and N. Africa meant in the Ger. Reich itself an intensification of propaganda to stiffen morale and a tightening of the grip of the Gestapo. The New Order in Europe gave way to Ger. domination, and the appearance of collaboration began to disappear, particularly in relation to France. The persecution of the Christian religion and of the Jews continued. The former was led by Martin Bormann, who when Hess made his sensational flight to England in 1941, succeeded him as Hitler's deputy. By a decree in 1943 the Jews ceased to have any legal existence. The predominant position of the Gestapo was emphasised by the appointment of Himmler, leader of the S.S., to the post of minister of the interior. His position was further strengthened the following year as a result of the attempt on Hitler's life on June 20, 1944. This plot to destroy Hitler by a bomb explosion was organised by a number of high-ranking officers in the army. Hitler escaped with minor injuries, but a few of those around him were killed. Reprisals were severe, and were conducted by Himmler, who became supreme commander of the home army. He was thus the leader of the *Folksturm*, an army on the model of the Brit. home guard, which was levied in Oct. He was at this time at the height of his power, and it was he in place of Hitler who read the address to the people on Nov. 23, the anniversary of the Nazi *putsch* in Munich. Defeatism was everywhere ruthlessly suppressed, especially in the face of the Russian advance in the E. and an example was made of high officials, notably the deputy burgomaster of Breslau and the mayor of Königsberg, who were executed in the early months of 1945. In the W. the morale of the fighting forces was rallied for the offensive in the Ardennes, launched by Gen. Rundstedt. In Jan. 1945 the Russian advance again went forward, and the allied offensive in the W. began the following month. The leadership of the Nazi party began to disintegrate. Goering made a bid for the dictatorship, was discredited, and superseded as commander-in-chief of the *Luftwaffe* by Gen. Ritter von Greim. Himmler on his own initiative made an offer of surrender to the Brit. and Amer. forces through the intermediary of Count Bernadotte, but his offer was rejected. He then

fell from power, and when he was eventually captured by the Allies on May 24 he committed suicide.

On May 1, 1945, Adm. Doenitz broadcast the death of Hitler. It is now generally estab. that Hitler committed suicide in the last hours before Berlin fell into Russian hands. Doenitz announced himself as Hitler's successor, and proceeded to set up a gov. with Count Lutz von Schwerin-Krosigk as foreign minister. His gov. was centred at Flensburg, but did not survive the unconditional surrender which Doenitz announced by wireless on May 8. He was arrested as a war criminal and his gov. dissolved. The official terms of surrender were signed in Berlin in the early hours of May 8 by F.-M. Kettel for the Ger. Army, Adm. von Friedeburg for the navy, and Gen. Stumpf for the air force. G. was divided into zones of occupation, roughly corresponding to the areas conquered by each of the allied armies. The normal life of the country had come to a standstill. Nearly all the large cities suffered severe damage from bombing, and the countryside lost much either as a result of the actual fighting or by the Gers themselves in their retreat. An Allied Control Commission was set up, consisting of the allied commanders-in-chief, Gen. Eisenhower representing the U.S.A., F.-M. Montgomery for Great Britain, Marshal Zhukov for the U.S.S.R., and Gen. de Latre de Tassigny for France. The commission held its first meeting on June 8, and announced that it had taken over all powers of government.

The policy to be followed towards defeated G. was decided by a three-power conference held at Potsdam in July and attended by President Truman, Marshal Stalin, Mr. Winston Churchill, and Mr. Attlee (see POTSDAM AGREEMENT). The main decision of the conference was that the political and economic life of the country was to be decentralised. All laws of Nazi origin were to be abolished, and reorganisation of the judicial system and of education was to follow. There was to be complete disarmament and elimination of war potential. The W. frontier of Poland was fixed provisionally on the Oder-Neisse line, thus giving Prussia E. of the Oder and Silesia to Poland, also the S. part of E. Prussia, including Danzig, Königsberg and the N. part of E. Prussia was allotted to the U.S.S.R. As a result of the Potsdam Conference the zones of occupation were given a demarcation slightly different from the areas originally taken up by the occupying armies earlier in the year. The Brit. zone included the Ruhr, N. Rhineland, Westphalia, Hanover, Oldenburg, Schleswig-Holstein, Hamburg, Lippe, Schaumburg-Lippe, Brunswick, Helioland, and the Frisian Is. The Amer. zone included Bavaria, part of Württemberg, Bremen, Waldeck, Hesse, and Hesse-Nassau, and Baden N. of and including Karlsruhe. The Russian zone included Mecklenburg, Brandenburg W. of the Oder, Anhalt, Thuringia, and Saxony. The Fr. zone included S. Rhineland, the Saar basin, the

Rhenish Palatinate, Baden S. of Karlsruhe, and part of Württemberg. Berlin was created a fifth zone, divided into occupational areas among the four powers. In July Gen. Koenig succeeded Gen. de Tassigny as the representative of France on the Allied Control Commission. One of the first problems facing the commission was the supply of food. The world shortage of wheat, combined with insufficient transport, made it difficult to maintain an adequate ration. As great a task was provided by the numbers of homeless and wandering people, displaced persons as they came to be known, a category numbering some 8,000,000. After some months the majority were settled in their former homes. There remained about 500,000 for which U.N.R.R.A. (see UNITED RELIEF AND REHABILITATION ADMINISTRATION) became responsible.

By 1946 the four zones of occupation had hardened almost into the semblance of separate states. In the Brit. zone the foremost problems were the provision of food and the production of coal. Permission was granted for the formation of political parties with the prospect of free elections at a later date. The leading political parties were the Social Democratic led by Dr. Kurt Schumacher, the Communists, and the Christian Democrats. Minor parties were the Democratic Socialist Union under Erich Koch and the Catholic Centre under Dr. Hannacher. A start was made with local government in Hanover with the creation of a number of nominated representative councils. Parallel with the growth of political activity went the process of denazification. Education was restarted, a free press set going, and a postal system operated. In the Amer. zone the transfer of administrative authority to Gers. was carried further than in the Brit. zone at this stage. As early as the autumn of 1945 three *Länder* or states were created, and in each a Ger. Gov. was set up with executive and legislative authority under U.S. military supervision. The *Länder* were (1) Bavaria within its 1933 boundaries less Lindau (in the Fr. zone); (2) Württemberg-Baden, comprising the former states of Württemberg and Baden less those areas in the Fr. zone; (3) Greater Hesse, comprising Hesse-Nassau and the greater part of the former prov. of Hesse. In the Russian zone anti-Fascist political life was resumed as in the other zones. The Social Democratic, the Communist, Liberal Democratic, and Christian Democratic parties were the most active. Wilhelm Pieck and Walter Ulbricht, former leaders of the Communist party, returned to Berlin under Russian auspices, the former to become chairman of the party's central committee. Not without Russian pressure proposals were set on foot to fuse the Social Democratic party with the Communists. This caused a split in the Social Democratic party, and the dissension spread to the other zones. In the W. zones a plebiscite revealed a majority in favour of the anti-fusionists, of whom Dr. Schumacher was the chief protagonist. In the Russian zone the

fusion was formally effected in June 1946, and Pieck and Otto Grotewohl, the fusionist leader of the Social Democratic party, became joint chairmen of a single Socialist Unity party. The 'Independent' Social Democrats held a conference at Hanover in May, attended by representatives from all four zones, and elected Schumacher leader of the party. He came out strongly at this time against the dismemberment of G., and in favour of a free and democratic G. on a federal basis. In the Russian zone the large estates of Mecklenburg, Brandenburg, and Saxony were broken up, and land amounting to over 4,000,000 ac. was distributed to some 300,000 families of peasants, including refugees deported from Poland and Czechoslovakia. Administration in the three provs. and in Thuringia and W. Pomerania was carried out by representative Ger. govs. set up by the Soviet military authorities with executive, legislative, and judicial authority, while a central administration for the whole zone was created in Berlin. Elections for the prov. assemblies were held in 1946 with the Socialist Unity party in the majority throughout the zone. Municipal elections were held in all four zones in various stages throughout 1946—the first free elections since 1932. In the Brit., U.S.A., and Fr. zones the Christian Democrats proved the strongest party, with the Social Democrats a strong second. In the Russian zone the Socialist Unity party had the strongest vote. In all four zones together the Christian Democrats polled over 10,000,000 votes, and the Social Democrats over 7,000,000, while the Socialist Unity party counted 5,000,000 supporters in the Russian zone, and the Communists over 1,000,000 in the other three zones. In Berlin itself the Social Democrats won a victory in the face of strong Communist opposition.

Towards the end of 1946 the Brit. zonal administration fell more into line with the U.S.A. and Russian zones, in that four *Länder* were created, each with a measure of prov. autonomy under a constitution to be drawn up by the prov. gov. Co-ordination of the policies of the prov. govs. was the responsibility of a Ger. Zonal Advisory Council. In Dec. 1946 discussions were started between the United Kingdom and the U.S.A. towards an economic fusion of the Brit. and Amer. zones with the aim of achieving a self-sustaining economy. These zones were heavily subsidised by the occupying powers, and the deterioration of the food situation caused apathy and discontent among the pop. In Jan. the following year three joint executive agencies were set up to deal with food, agriculture, and transport, with a fourth advisory joint administration for finance, but fusion of the two zones was not at this stage carried further. The project, however, received greater impetus following the failure of the Council of Foreign Ministers at a conference in Moscow in March 1947 to reach agreement on any plan whereby G. could be governed as a single economic unit. By May negotiations between the Brit.

and U.S. Govts led to an agreement which accomplished a full economic fusion of the two zones while maintaining the political independence of the Länder govts concerned. A bi-zonal Economic Council was set up consisting of fifty-four members selected by the govts of the Länder in proportion to the pop of each Land. A coordinating body known as the Executive Committee was also created, consisting of a representative of each Land govt. The committee's task was to make recommendations to the council, and to co-ordinate and supervise the ordinances issued by the Economic Council which acts, as it were, as an economic parliament. Finally, executive directors were appointed by the council and placed at the head of each of the five bi-zonal depts, to deal with food, agriculture, transport, finance, and manpower. These depts superseded the joint executive agencies created earlier in the year. These arrangements were welcomed by the Gers in the W zones as the first step towards a planned reconstruction of their country, and it was hoped that the two zones concerned would achieve a balanced economy, thus relieving the occupying powers of a considerable financial burden. Developments in the Russian zone were more radical. The occupying power continued the transfer of properties to so-called *Altien Gesellschaften* to acquire Ger factories removed vast quantities of goods and equipment to Russia, and sought to tighten the hold of the one-party regime. Living conditions in the Russian zone were bad and, according to Ger reports from that zone, worse than in the W, but shortages were aggravated by the hardest winter in living memory.

In London (Dec 1947) four-power negotiations in the Council of Foreign Ministers broke down on the future of a politically and economically united G. The govts of Britain, France, and the U.S.A. therefore decided to carry out without Russia, the political and economic integration of their zones. G now became a pawn in the political conflict between the W world and Russia. Discussions between the three W Allies in which later the Benelux (71) countries joined—resulted in June (1948) in a six-power agreement providing for international control of the Ruhr, G's representation in the European recovery programme fusion of the Anglo-Amer zones and a federal system of gov for G. The Russians retorted with a declaration (June 24) condemning the plan to 'divide G', proposing four zones under control of the Ruhr and the setting up of a 'democratic gov for all G'. As a part of their plan to aid Ger recovery the W powers announced a drastic currency reform to apply to their zones but not to Berlin and on June 20 the Reichsmark was withdrawn and the new Deutschmark introduced. The Russians countered this move on the same day with an order forbidding all traffic between their zone and the W. Thus began the 'blockade of Berlin' and soon afterwards the Allies' measures to supply their sectors with

food and other goods through the 'air lift'.

The W. allies in June recommended that the Gers call together a parliament for W. G. by Sept 1. The assembly was to work out a constitution by the end of the year and elect a gov by the spring of 1949. There was considerable doubt in the minds of Ger politicians, who feared that a gov in W. G. would deepen or perpetuate the E-W. div of the country. But subsequently they decided to co-operate with the policy of the W. powers, mainly because the sixteen European recovery nations had accepted W. G. as a beneficiary under Marshall aid and this would give a chance of prosperity for G and the cutting down of the allied reparations demands. The W. Allies wanted a Ger gov in the W. because they could not get one for the whole of G. They wanted Gers to administer their own affairs under indirect allied control, because they wanted to ease the burden on the taxpayers at home, they wanted the political and economic integration of W. G. because it would be a good bargaining counter in their dealings with the Russians, and finally, they wanted an economically prosperous and politically stable G to play her part in the European recovery programme (see on this LEROY, *History*).

Meanwhile the W. powers following the breakdown of the London conference, met in Nov. (1948) on the question of the control of the Ruhr. Just previously the Brit and Amer military governors—Gen. Robertson and Clay—issued identical laws for their two zones to the effect that the ultimate decision as to the ownership of the mines and steel works should be decided by a freely elected Ger Parliament, whether for all G. or for W. G. secondly, as a sort of earnest of Brit and Amer intentions, they decided that ownership of the mines now vested in the allied military governors, should be vested in Ger trustees subject to the trustees being appointed by and responsible to, the military governors and with very narrowly limited powers. In Dec. the representatives of the six powers (Great Britain, U.S.A., France and the Benelux) countries, announced their agreement on an international authority for the Ruhr to control its development and general economic direction. In other words G. was told that sovereignty over the greatest concentration of coal, iron, and steel production in Europe was no longer hers alone but was to be shared with six other nations. Whether the Gers liked it or not, the first experiment was to be tried in a supranational control of a national group of heavy industries. It was part of a policy designed to make G. industrially strong but militarily harmless. This was the first of the last three great acts of will towards a defeated G. which were intended to mark the end of the immediate post-war period. The other two acts were, first the effort to make the W. Gers set up a gov with an acceptable constitution and, second, the attempt to lay down in a written Statute

of Occupation what should be the relations between the occupying powers and a Ger Gov. These three acts were, of course, connected; and one of the first tasks of the new Ger Gov. (when it was formed) would be to take its place in the new Ruhr International Authority—an authority in which Gers could be outvoted by twelve votes to three—this being a compromise between the views of six Allies with Amer views predominating. To the Fr it meant a new method of trying to make sure that G remained disarmed and did

mittee (the Humphreys Committee, composed of Amer industrialists) had been appointed (Oct. 27, 1948) to discover what plants marked for dismantling would serve European recovery better by being left in G, but the three powers had as yet hardly begun to consider the committee's report. Again, until the Occupation Statute was completed, it was hardly possible to complete the constitution for W. G. Similarly, the fusion of the Fr zone with the other two W. nations' zones, though long agreed 'in principle,' was still far from

BERLIN, 1948

A meeting of anti Communist parties outside the ruined Reichstag building in the British sector of the city

not dominate its neighbours by its industrial strength; to the Amers it meant a first step towards the co-operation of W. Europe into one economic system with G included; while to the Brit. it meant an element of each of these, combined with a chance of introducing into European recovery the kind of co-operative planning that should provide safeguards against cut throat competition in world markets.

By the end of Feb. (1949), however, progress in implementing the policy of the three W. powers was discouragingly slow. In principle, the Brit. Fr., and U.S. Govs. had been in agreement on the objects of their policy and on the steps necessary to attain them ever since the London conference of June 1948. But they had found it increasingly difficult to agree in practice. The Ruhr Authority and a Military Security Board had been estab., though neither was yet working. A com-

being accomplished. Still more serious, perhaps, was the delay over the Ger. constitution or basic law, though on Sept. 1 (1948) the Parli. Council met at Bonn to begin the work of drafting a constitution. The council had then only the general guidance contained in the London Agreement, that it should fashion 'a federal form of government which adequately protects the rights of the respective states (or Lander) and which at the same time provides an adequate central authority and which guarantees the rights and freedoms of the individual.' On reparations and economic policy the U.S. Gov. took a much more lenient attitude than the Brit. and Fr. Govs.; on the constitution, the Fr. and U.S. Govs. both wished to see a far more federal system, with far fewer powers for the central gov., than the Brit. There was always the difficulty, too, that the Fr. were by no

means convinced of the wisdom of establishing a Ger. Gov. at all and were, consequently, in no haste either to see it begun or to relinquish their hold on the Fr. zone of occupation. In March (1919) the Parl. Council at Bonn appointed a special commission to examine amendments to the draft constitution proposed by the three military governors. Criticism of these amendments of the military governors was varied but, in the main, reserved. Dr. Menzel, deputy leader of the Social Democrats, thought that the emphasis on Land sovereignty meant a retrogression, even from the Economic Council at Frankfurt. But the most outspoken criticism was that of the Christian Democratic leader, Jakob Kaiser, who strongly resented the allied decision to exclude Berlin from the federal republic of W. G. The chief protagonist of a political bridge from W. to E. through the Soviet zone and always an apostle of Ger. unity, he now thought all Berlin and even the Soviet zone should be included under the new constitution.

By April, however, the three W. powers had largely resolved their difficulties among themselves through the solidarity achieved by the conclusion of the N. Atlantic Treaty (see *ECRORE, History*), which was the corollary to the W. Union. The political effect of this treaty for strengthening the mutual defence of the W. nations from external aggression upon Russian opinion was soon manifested, for in the same month the gov. of the Soviet Union informed the U.S. Gov. that it was willing to raise the blockade of Berlin if a definite date were set for a Council of Foreign Ministers to discuss Ger. questions. It was, however, made clear by the W. powers that the holding of a council would not deflect the three gov. from their plans to establish a gov. for W. G. These plans were now easier of accomplishment by reason of the fact that the Parl. Council at Bonn had come to an agreement over the draft constitution. By May 20 the legislatures of some eight Länder had ratified the Bonn basic law by substantial majorities and the two-thirds majority required before promulgation was thus obtained.

In anticipation of the completion of the basic law, the gov. of the U.S.A., Great Britain, and France had drawn up in Washington (April 6 '51) an agreed memorandum to govern the exercise of their powers and responsibilities in G. following the estab. of a Ger. federal republic. The Allies, who retained their supreme authority, reserved the right to take direct action themselves in certain limited fields set out in the Occupation Statute when the Ger. federal republic should have been estab. Military gov. as such will terminate and the functions of the allied authorities will be divided—control functions being exercised by a high commissioner and military functions by a com. and-in-chief. The three high commissioners together will constitute an allied high commission—one of whose chief duties will be the unanimous approval of amendments to the federal constitution proposed by the federal gov. Responsibility for the super-

vision of U.S. relief funds to Ger. economy will rest with the Economic Co-operation Administration (see further under *EUROPE, History*). The 'understanding' is that the Ger. federal republic should become a party to the convention for European economic co-operation and execute a bilateral agreement with the U.S. Gov. The memorandum states that a major objective of the three allied gov. is to encourage and facilitate the closest integration on a mutually beneficial basis of the Ger. people under a democratic federal state within the framework of the European association. According to an annex to the memorandum the three gov. agree to enter into a trizonal fusion agreement prior to the coming into effect of the Occupation Statute. The representatives of the three occupying powers will make the necessary arrangements to establish tripartite control machinery for the W. zones of G., to become effective at the time of the estab. of a provisional Ger. gov. Though the Berlin blockade was lifted (May 12), the continuance by the Russians of various restrictions largely nullified the value of the removal. At the subsequent meeting of the foreign ministers' council it was found impossible to reach any agreement with Russia over the issue of Ger. economic unity. In all the circumstances it is not surprising that the Anglo-Amer. air-lift was not interrupted.

Art.—See *GERMAN ART*.

Language and Literature.—Anc. G., like other European nations in the years of their infancy, spoke a number of dialects, all of which grew out of the Aryan family of tongues. Most of these dialects may be affiliated to one of two branches, High Ger. and Low Ger. (Hoch Deutsch and Platt Deutsch), and both of these can be traced as far back as the seventh century. Besides these, evidence is afforded by the fourth-century Gothic trans. of the Bible, undertaken by Bishop Ulfilas, of a dialect quite independent of either of the two groups mentioned above. To-day High Ger. dialects are split up into the Swabian, commonly spoken in Württemberg; the Alemannic, spoken in S. Baden, Alsace, and Ger. Switzerland; and the Bavarian, which is the everyday language in Bavaria, Upper and Lower Austria, Styria, Tyrol, and Salzburg. The so-called Middle Ger. dialects, the Franconian, Thuringian, Silesian, and Saxon really belong to the High Ger. stock. The Low Ger. branch, on the other hand, comprises Old Saxon and Lower Franconian. In the former dialect was written *Der Heliand*, which is a Christian epic of the ninth century, and the celebrated *Heinrich von Orlamünde* (c. 1190) is in a dialect developing from Old Saxon. The latter is father to the modern Dutch and Flemish. The modern dialects, known as Frisian and Platt Deutsch, are relics of Low Ger. The names High and Low originally described the geographical areas where the different branches were spoken, that is, broadly speaking, S. and N. G. The disintegration of the empire into separate kingdoms offers an obvious explanation of the fact that rival dialects lingered so much longer

in G. than, say, in England. But from the Reformation period, when Luther trans. the Bible into a language which was a composite of various forms of High Ger., the doom of the other branch, at least as far as literature was concerned, may be said to have been sealed.

The primitive Ger. peoples fed their natural love of literature on old legends, heroic sagas, and 'beast epics' (*Tiersepos*), the atmosphere of which was invariably pagan and bloodthirsty. The virile and splendid animal satire of *Reinke Fuchs*, which fastened itself so firmly on the popular fancy, and which was retranslated into Ger. from the Fr., was probably compiled originally out of one of these 'beast epics.' As in England during the Norman period, the native tongue was under the Saxon emperors left entirely to the people, being supplanted at court by Lat., then the language of cultured social intercourse. But the fullness of medieval life soon inspired men to write of it in their vernacular. The ideas of chivalry, the pageantry and splendour of the courts, the spirit of faith, and also of adventure, both of which were quickened by the stirring episodes and E. glamour of the crusades, all combined to instil fresh vigour into the common peoples, with the result that in G. there sprang up the *Minnesänger* (Singers of Love), who correspond to the troubadours of France and the Welsh and Irish bards. During the thirteenth and fourteenth centuries these men roamed from castle to castle telling fragments of the great cycles of romance and singing little songs of love and passion. Many of these wandering poets were knights and men of courtly breeding such as Walther von der Vogelweide (c. 1170 c. 1230), the most famous of them all, and it was from their lips that the country folk learnt of the deeds of the great Alexander or Charlemagne, or of the exploits of King Arthur and his Knights, or of the Sargnail, or of the Dan. hero Beowulf. The immortal *Nibelungenlied* and *Gudrun* are a mine of national and heroic saga to which Wagner naturally turned when he dreamed of founding a national opera, and it is here that the epic and tragical grandeur of pagan folklore finds its noblest expressions. The names of a number of the minnesingers are still remembered with honour, among them Heinrich von Veldeke, Gottfried of Strassburg, Hartmann von der Aue, and Wolfram von Eschenbach, all of whom were authors of court epics (*Tristan und Isolde*, *Der arme Heinrich*, *Parzival*, by the three last-named authors respectively). It is important to note that in the thirteenth century laws began to be couched in the native Ger. instead of in Lat., as is clear from the two famous collections, *Sachsenspiegel* (1230) and *Schwabenspiegel* (1270). This displacement of Lat. is important, for the fact that the monks wrote a mass of scriptural paraphrase and religious poetry in the classical tongue seemed for the time being to stigmatise Ger. as unworthy of literary usage.

The fifteenth century was fruitful in all

kinds of truly popular literature. Thus passion plays and mysteries roused dramatic interest up and down the country and familiarised men in a most delightful manner with the leading figures of biblical story; *Volkslieder*, or national ballads, appealed to the inborn sentiments of patriotism; prose was for the first time handled with success in the romantic and wonder-telling *Volksbücher*, such as *Tytl Eulenspiegel*, *Dr. Faust*, and *Die Schidburger*, whilst the degeneracy of the Catholic Church offered a rich field both for mocking satires and serious theological discussions. Moreover this and the following century were the age of the craftsmen-poets or *Meistersänger*, the best known of whom is Hans Sachs (1494-1578), the cobbler of Nuremberg and the author of the metrical *Schwänke* and *Fastnachtsspiele*. These men were already associated into guilds for their trade, and conceived the quaint notion of founding also guilds of poetry, which should draw up a strict code of rules for the composition of correct and model verse. The greatest benefactor to literature was, however, Martin Luther. His Ger. Bible (1522-34) has already been referred to, but when it is remembered how, with amazing rapidity, this book found its way even to the most insignificant towns and solitary households, and further how eagerly it was read and re-read, it will be admitted that too much stress cannot be laid on its position as a milestone along the path of Ger. literary advancement. Luther was also a great hymn writer, and his collection of sacred songs is not the least of his priceless legacies.

On top of the Reformation came the Thirty Years war, which quenched the springs of literature just as it sapped the life-blood from all things that were already thriving and promising still greater good to come.

From 1621 to 1748 has been called the Age of Imitation. Real literary talent was scarce and men who had leanings towards letters unfortunately believed that the art of writing poetry could be taught. As in England during the years following the Restoration, the Fr. classicists, Racine, Corneille, and Molière, became the models for all youthful writers of inspiration. At the many courts the Fr. manners and language were zealously cultivated, and the people at large lost sight of their native tales and ballads. To such an extent had the Ger. dialects become adulterated with the steady infiltration of foreign words, that a number of language-reforming societies sprang up everywhere on the lines of the 'Fruit-bearing League' founded in Weimar (1617). To this somewhat lifeless epoch belong the Silesian poets who are usually divided into two schools. Of the first the chief ornament was the precise and servile Martin Opitz (1597-1639), whilst Hoffmann von Hoffmannswaldau (1618-79) is typical of the second. It was the representatives of this latter school whose attempts to infuse sweetness and sentiment into their poems have brought

down upon them the unflattering description of 'turgid' and 'bombastic.' Romances and windy tales of fiction and adventure steadily gained ground: many were the Ger. versions of *Robinson Crusoe*, and the stormy years of the First World War were reflected in numerous *Tales of Ups and Downs*, by far the liveliest and most absorbing of which was the 'Simplissimus' of Grimmelshausen (d. 1876). The healthy rivalry between the Leipzig and Zurich schools in the eighteenth century contributed much towards clearing away the pedantry and artifice which seemed likely to submerge any real stuff that was written. Thanks to the Swiss leaders, Bodmer and Breitinger, imagination and emotion reappeared in poetry, whilst Gotthe (1705-66), the foremost of the Leipzig men of letters, helped by his *Critical Art of Poetry* to wean men's tastes away from the Fr. to which they

GOTTHOLD EPHRAIM LESSING

had so long been blindly fettered. It remains to notice the two great writers of Protestant hymns after Luther, namely, Gerhardt (1607-76) and Gellert (1715-69), for it was through them chiefly that literature diffused itself among the common people. Gellert's *Fables* also, with their arresting simplicity, shared in this work of popular education.

The second classical period opens in 1748, and the great movement towards literary regeneration, which may be said to culminate in Goethe and Schiller, was nobly heralded by Klopstock (1721-1803), Lessing (1729-81), Herder (1744-1802), and Wieland (1733-1813). Klopstock's epic *Messias* inspired as it was by *Paradise Lost*, is the fullest and finest expression of the unstinted admiration which Gers. felt for the Eng. masterpiece, and is further remarkable for its tender and devout religious spirit which recalls the greatness of the old reformers. In his

Laocoön and other critical works, Lessing taught men the difference between the pseudo-classicism of the Fr. and the true Hellenic spirit as it is revealed to us in Gk. sculpture and drama. He was, moreover, brave enough to declare the superiority of the romantic Shakespeare over the slavish followers of the so called Aristotelian unities, and in his own plays strove to reproduce the merits of Eng. rather than of Fr. drama. The enthusiastic reception accorded to his comedy *Minna von Barnhelm* and his great tragedy *Nathan der Weise*, which may be said to have estab. the fitness of iambic blank verse as the vehicle for dramatic work, showed that like all true poets Lessing was only anticipating what was a popular tendency—a wider and a happier freedom in literature as in other fields of human endeavour. To pass away from Lessing who is justly esteemed a pioneer in the rationalistic movement of his age, it is necessary to note the high niches which the serious and witty romances of Wieland will ever occupy in the hist. of Ger. prose. But the command of this writer over all that is graceful and fantastic, his flowing verse, and the flexibility of his language are best appreciated in his celebrated fairy epic *Oberon* (1780). From an historical point of view the great merit of Herder was his deep love of all poetry that was truly national. Thus he gathered together the *Volkslieder* of many nations, studied and wrote about primitive Heb. poetry, and marvelled at the simplicity of the spurious *Ossian*. His was an essentially receptive nature, but he was born with a keen sense of the beautiful and a delight in humanity at large, and these personal qualities lend fascination to his poems. In that he was an apostle of 'Light, Love, (and) Life'—the three words which were graven on his tomb—he may be regarded as the source of inspiration for all that was noble in the *Sturm und Drang* movement, which now assailed literature, but in a broader sense this movement must be regarded as part of that unrest and desire of change which in France was manifested in the great revolution, and which in England is represented in literature by the 'Lyrical Ballads' and other productions of the Romantic school.

The term *Sturm und Drang* (Storm and Stress) was taken from a play of Klingler which bore this title. The intentions of the leading exponents, Klingler (1752-1831) and Mahr Müller (1749-1825), were undoubtedly good: they wished to fling away the shackles of art and to give free rein to all their enthusiasms and poetic ideals. Unfortunately, like the dramatist who followed Shakespeare, they were none of them gifted with outstanding literary talents, so that all their plays and novels are marred by extravagances of passion and hideous caricature, whilst their ideals of sublime action and character development, uncurbed as they were by any of the saving restrictions of art and moderation, resulted in pure licence. Moreover, in their efforts to substitute the

cult of reason for morality they succeeded only in shattering the poetic gifts they had in lives of dissipation and excess. To realise the full force of this period of temporary madness it is only necessary to recall the fact that Goethe's *Goetz von Berlichingen* and his *Die Leiden des jungen Werthers*, in which literature may have paid its highest tribute to sentimentalism, were both written under its influence.

Goethe (1749-1832), of course, stands aloof from the normal channels of literary development together with the other Shakespeares and Dantes whom the world at intervals of centuries begets. His *Faust* belongs to universal literature. It has been called 'a mystical unpersonation of a transition age,' where the anct. faith had *d.* and science was still a weak prop on which to lean, where, in short, the individual was, whichever way he turned, dependent solely on his own good and evil instincts. Whether this be so or not, *Faust* is certainly the summary of its author's mental life, and may thus be said to mirror forth the struggles between the sensual and the spiritual, between faith and reason, between the noble and the base—struggles which are eternally raging in every human breast. But what is of peculiar interest touching Goethe from a psychological point of view, and what perhaps may in some senses be regarded as typical of the modern as well as of the Ger. nationality, is that not only was he endowed with the highest creative genius, but he had himself taken the utmost pains to acquire the most profound and all-embracing culture. His *Iphigenia* (prose version 1779, verse version 1787), *Egmont* (1788), and *Torquato Tasso* (1790) rank with *Wallenstein* (1799), *Maria Stuart* (1800), *Die Jungfrau von Orléans* (1801), and *Wilhelm Tell* (1804), which are four of the finest dramatic productions of Schiller (1759-1805), his friend and almost rival. These two stand easily at the top of Ger. dramatists; and in the breadth of their outlook and of their historic sense in their passion for all forms of freedom and the vividness and variety of their portraiture, and above all in their grasp of the essence of tragedy and dramatic situation, challenge and almost deserve comparison with Shakespeare. Moreover both Goethe and Schiller outgrew the fevers of the *Sturm und Drang* period, and the former especially discovered the secret of that harmony which exists between the wonderful calm and self-restraint of the Hellenic spirit on the one hand and on the other the warmth, colour, and emotional fullness of the Romantic.

It is impossible to tie either Goethe or Schiller down to any one school or line of thought, and the same is true of the fertile Jean Paul Richter (1763-1825), who stands quite apart from the contemporary Romantic phase. In his lifetime his novels were even more welcomed and applauded than Schiller's or Goethe's works, and especially those classified as humorous, the first of which was *The Jewish Boy*. All his books are remarkable for their fund of wit and wealth of

exuberant fancies; tenderest sentiments are hedged around with the most pungent satire, whilst not a few may be described as 'a hodge-podge of the loveliest thoughts and the wildest absurdities.'

The aims of the Romantic school were not unlike those of Wordsworth and Coleridge and their successors in England. Novalis (1772-1801) was a precursor of this school, but the 'theoretic basis of Romanticism' was estab. by the brothers Schlegel (August Wilhelm, 1767-1845, and Friedrich, 1772-1829). These men and their followers widened the province of poetry so as to include music and philosophy and all the other elements of intellectual life; they were opposed to the shallow utilitarianism and unlovely rationalistic theories of their age, and

FRIEDRICH VON SCHLEGEL

turned back for their inspiration into the medieval days of knights and pagans, of miracles and mysticism. Mentally too they travelled further afield into the unexplored riches of the E. and away back into the world of folklore and weird pagan superstitions. It was a time of admirable taste, such as the elder Schlegel's *Shakespeare* (1797-1810), and it was also a time when Ger. philology and medieval literature were first seriously studied, for both the Grimms came under the influence of Romanticism.

In time the Romantic school began to lose its hold, and after the famous July Revolution of 1830 'young G.' occupies the literary field. Writers of this period no longer form a definite school, but they all reflect in their works the period of uncertainty and transition through which Europe was then passing. Furthermore, all manner of industrial, social, and economic problems begin to permeate literature, and it is customary also to associate together young G. and

the predominance of the Hegelian philosophy. The leading men of letters at this time were Laube (1806-84), the author of social works of fiction; Börne (1786-1837), whose philo fr. *Briefe aus Paris* are of vital importance in the progress of Ger. prose, and Heinrich Heine (1797-1856). The last-named was the greatest of them all. Undoubtedly he was a victim of the transitional age into which he was born and this explains how he could with justice be called 'the mocking-bird of the literary grove.' Yet in spite of his negative bias and unbeliefs his poetry will live; for to him was given with Schiller and Goethe that purely inborn gift of lyrical outpouring. From this time forward literature gradually grew more and more comprehensive, so that now it includes all branches of knowledge and every field of human interest. It is difficult any longer to trace broad tendencies, for the whole trend of modern life in G., as elsewhere, has been towards a still greater complexity, and time only will suffice to unravel the main threads which now seem so entangled. But no sketch of Ger. literature can be attempted without mention of the number and prominence of the philosophers. The first mark was Leibnitz (1646-1716), who wrote in fr. and Lat., and eighty years later came Kant (1724-1803), the author of the *Critique of Pure Reason*; whilst other thinkers of world wide repute are Fichte (1774-1814), Schopenhauer (1788-1860), and Hegel (1770-1831). The latest and one of the most original of the great philosophical writers is Nietzsche (1844-1900), whose doctrines of superman and the justice of self-assertion, etc., which are often summed up as individualism, have had, and are still having, a remarkable influence over the intellectual development, not only of his own countrymen, but of a great number of growing men and women in all parts of the world. His 'superman' doctrine had an obvious bearing on the Aryan propaganda of the Nazis and the racial 'theory' in Hitler's *Mein Kampf*, as well as the tachatur of Heinrich Brüning (q.v.), owe much to it. It is not too much to say that in the regions of higher philosophy G. stands quite without a competitor.

From 1850 to 1870 the novel engrossed most of the best writers. This form of literature became the favourite vehicle of expression all over Europe, probably because it is elastic that the author may freely bend it to his will and embody in it the whole sphere of his culture and experience. Thus there were many social novels on the basis of Gutzkow's *Italer vom Geiste*, there were political and anti-quarian novels, there were stories which dealt with the persons such as Auerbach's *Schwarzwalder* (1843-54), and there were tales in the form of biography, such as Keller's splendid *Der grüne Heinrich* (1855). For some time authors devoted themselves to realistic fiction, but *Buddenbrooks* (1902) by Thomas Mann and the work of the women writers, Clara Viebig, Helene Bollen, and Gabriele Reuter, deal rather with problems of emotion and

psychology which seem better suited to the Teutonic temperament.

In dramatic literature the two outstanding writers in the nineteenth century were F. Grillparzer (1791-1872), an Austrian, and Friedrich Hebbel (1813-63). In the period immediately preceding the first World War Hauptmann (q.v.) and Sudermann (q.v.) held the stage with their plays, which are real products of the time. The gloomily realistic *Wearies* (1892) is the best known of Hauptmann's works, though he has also produced quite notable romantic work in such plays as *Die Leier-sunkene Glocke* and *Hanneles Himmelfahrt*.
